i. The medication is concurrently used with gonadotropin-releasing hormone (GnRH) agonist; OR

152. Note: Examples of GnRH agonists include: leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant).

ii. The medication is used in combination with Firmagon (degarelix subcutaneous injection); OR

iii. Patient has had a bilateral orchiectomy.

4. **Prostate Cancer – Regional Risk Group.** Approve for 1 year if the patient meets all of the following (A, B, C, and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** The medication is used in combination with prednisone; AND
   - **C)** Patient has regional lymph node metastases and no distant metastases; AND
   - **D)** Patient meets one of the following (i, ii, or iii):
     - **i.** The medication is concurrently used with gonadotropin-releasing hormone (GnRH) agonist; OR

       153. Note: Examples of GnRH agonists include: leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant).
     - **ii.** The medication is used in combination with Firmagon (degarelix subcutaneous injection); OR
     - **iii.** Patient has had a bilateral orchiectomy.

5. **Prostate Cancer – Very-High-Risk Group**. Approve for 2 years (total) if the patient meets all of the following (A, B, C, D, and E):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** The medication is used in combination with prednisone; AND
   - **C)** According the prescriber, the patient is in the very-high-risk group; AND

     154. Note: Very-high-risk group includes patients who have one of the following: primary Gleason pattern 5; 2 or 3 high-risk features; > 4 cores with Grade Group 4 or 5; tumor that invades seminal vesicles; tumor that is fixed or invades adjacent structures other than seminal vesicles such as external sphincter, rectum, bladder, levator muscles, and/or pelvic wall.
   - **D)** The medication is used in combination with external beam radiation therapy; AND
   - **E)** Patient meets one of the following (i, ii, or ii):
     - **i.** The medication is concurrently used with gonadotropin-releasing hormone (GnRH) agonist; OR

       155. Note: Examples of GnRH agonists include: leuprolide injection, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant).
     - **ii.** The medication is used in combination with Firmagon (degarelix subcutaneous injection); OR
     - **iii.** Patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of abiraterone acetate is not recommended in the following situations:

156. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Akeega Prior Authorization Policy
- Akeega™ (niraparib and abiraterone acetate tablets – Janssen Biotech)

REVIEW DATE: 08/30/2023

OVERVIEW
Akeega is a combination of niraparib, a poly (ADP-ribose) polymerase (PARP) inhibitor, and abiraterone acetate, a cytochrome P450 (CYP)17 inhibitor, indicated with prednisone for the treatment of deleterious or suspected deleterious BReast CAncer (BRCA)-mutated **(BRCAm**) **metastatic castration-resistant prostate cancer** (mCRPC) in adults.[1]

GUIDELINES
National Comprehensive Cancer Network (NCCN) guidelines for prostate cancer (version 3.2023 – August 7, 2023) do not include Akeega yet.[2] In the first-line setting for mCRPC, the "preferred" regimens are abiraterone, docetaxel, or Xtandi® (enzalutamide tablets and capsules) [all category 1]; the following regimens are listed as "useful in certain circumstances": Lynparza® (olaparib tablets) + abiraterone for patients with *BRCA*m (category 1) and Talzenna® (talazoparib capsules) + Xtandi for patients with *HRR*m (category 1).

POLICY STATEMENT
90. Prior Authorization is recommended for prescription benefit coverage of Akeega. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Akeega is recommended in those who meet the following criteria:

FDA-Approved Indication
-

1. Prostate Cancer. Approve for 1 year if the patient meets the following (A, B, C, D, and E):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has metastatic castration-resistant prostate cancer; AND
- **C)** Patient has a BReast CAncer (*BRCA)* mutation; AND
- **D)** The medication is used in combination with prednisone; AND
- **E)** Patient meets one of the following (i or ii):
  - **i.** The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog; OR
    - Note: Examples are leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), and Orgovyx (relugolix tablets).
  - **ii.** Patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Akeega is not recommended in the following situations:

157. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

459. Akeega™ tablets [prescribing information]. Horsham, PA: Janssen; August 2023.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Alecensa Prior Authorization Policy
- Alecensa® (alectinib capsules – Genentech)

REVIEW DATE: 01/11/2023

OVERVIEW

Alecensa, a tyrosine kinase inhibitor, is indicated for the treatment of patients with anaplastic lymphoma kinase (*ALK*)-positive, metastatic **non-small cell lung cancer (NSCLC)**, as detected by an FDA-approved test.[1]

GUIDELINES

Alecensa has been addressed in National Comprehensive Cancer Network (NCCN) guidelines:[2]

- **Histiocytic Neoplasms:** Guidelines (version 1.2022 – May 20, 2022) recommend Alecensa as a "useful in certain circumstances" treatment option for *ALK*-positive Erdheim-Chester Disease (category 2A).[3]
- **Non-Small Cell Lung Cancer:** Guidelines (version 1.2023 – December 22, 2022) recommend testing for *ALK* rearrangements in eligible patients with NSCLC.[4] If *ALK* rearrangement is discovered prior to first-line systemic therapy, Alecensa is a preferred first-line treatment option (category 1). If *ALK* rearrangement is discovered during first-line systemic therapy, options are to complete the planned systemic therapy (including maintenance therapy) or to interrupt the systemic therapy and treat with Alecensa (preferred, category 2A) or another ALK inhibitor. NCCN recommendations for patients with disease progression often include continuing the first-line targeted therapy, depending on type of progression.
- **T-Cell Lymphomas:** Guidelines (version 1.2023 – January 5, 2023) recommend Alecensa as a treatment option for patients with relapsed or refractory *ALK*-positive anaplastic large cell lymphoma (ALCL).[5] NCCN notes a phase II study involving patients ≥ 6 years of age with relapsed or refractory *ALK*-positive ALCL. However, this was a small study involving 10 patients with a median age of 19.5 years.
- **Uterine Neoplasms:** Guidelines (version 1.2023 – December 22, 2022) recommend Alecensa as a treatment option for patients with inflammatory myofibroblastic tumor with *ALK* translocation (category 2A).[6]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Alecensa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Alecensa is recommended in those who meet one of the following criteria:

FDA-Approved Indication

1. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has advanced or metastatic disease; AND
   - **C)** Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND
   - **D)** The mutation was detected by an approved test.

Other Uses with Supportive Evidence

2. **Anaplastic Large Cell Lymphoma.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND
   - **C)** Patient meets one of the following criteria (i or ii):
     - **i.** Patient has relapsed disease; OR
     - **ii.** Patient has refractory disease.

3. **Erdheim-Chester Disease.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has anaplastic lymphoma kinase (*ALK*) rearrangement/fusion-positive disease.

4. **Inflammatory Myofibroblastic Tumor.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND
   - **C)** Patient meets one of the following criteria (i or ii):
     - **i.** Patient has advanced, recurrent, or metastatic disease; OR
     - **ii.** The tumor is inoperable.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Alecensa is not recommended in the following situations:

158. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Alunbrig Prior Authorization Policy
- Alunbrig® (brigatinib tablets – ARIAD/Takeda)

467.
REVIEW DATE: 07/12/2023

OVERVIEW
Alunbrig, a kinase inhibitor, is indicated for the treatment of adults with anaplastic lymphoma kinase (ALK)-positive, metastatic **non-small cell lung cancer (NSCLC)** as detected by an FDA-approved test.[1]

Guidelines
Alunbrig is addressed in National Comprehensive Cancer Network (NCCN) guidelines:[2-5]
- **Histiocytic Neoplasms:** Guidelines (version 1.2022 – May 20, 2022) recommend Alunbrig as a "useful in certain circumstances" treatment option for *ALK*-positive Erdheim-Chester disease (category 2A).[3]
- **Inflammatory Myofibroblastic Tumor (IMT):** NCCN Soft Tissue Sarcoma guidelines (version 2.2023 – April 25, 2023) and NCCN Uterine Neoplasms guidelines (version 2.2023 – April 28, 2023) recommend Alunbrig as a treatment option for IMT with *ALK* translocation.[5,6]
- **NSCLC:** Guidelines (version 3.2023 – April 13, 2023) recommend testing for *ALK* rearrangements in eligible patients with NSCLC.[4] If *ALK* rearrangement is discovered prior to first-line systemic therapy, Alunbrig is a preferred first-line treatment option (category 1). If *ALK* rearrangement is discovered during first-line systemic therapy, options are to complete the planned systemic therapy (including maintenance therapy) or to interrupt the systemic therapy and treat with Alunbrig ("preferred", category 2A) or another ALK inhibitor. NCCN recommendations for patients with disease progression often include continuing the first-line targeted therapy, depending on type of progression.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Alunbrig. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Alunbrig is recommended in those who meet one of the following criteria:

FDA-Approved Indication

71. Non-Small Cell Lung Cancer. Approve for 1 year if the patients meets the following (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has advanced or metastatic disease; AND
- **C)** Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND
- **D)** The mutation was detected by an approved test.

Other Uses with Supportive Evidence

2. **Erdheim-Chester Disease.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has anaplastic lymphoma kinase (*ALK*) rearrangement/fusion-positive disease.
   468.
3. **Inflammatory Myofibroblastic Tumor.** Approve for 1 year if the patients meets the following (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has anaplastic lymphoma kinase (*ALK*)-positive disease;
   C) Patient meets one of the following (i or ii):
      i. Patient has advanced, recurrent, or metastatic disease; OR
      ii. The tumor is inoperable.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Alunbrig is not recommended in the following situations:

159. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Augtyro Prior Authorization Policy
- Augtyro™ (repotrectinib capsules – Bristol-Myers Squibb Company)

REVIEW DATE: 11/29/2023

OVERVIEW
Augtyro, a kinase inhibitor, is indicated for the treatment of locally advanced or metastatic ***ROS1*-positive** non-small cell lung cancer **(NSCLC)** in adults.[1]

Guidelines
The National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 1.2024 – December 21, 2023) recommend Augtyro, Rozlytrek® (entrectinib capsules and oral pellets), and Xalkori® (crizotinib capsules) as "Preferred" first-line treatment options (all category 2A) for patients with *ROS1* rearrangement-positive NSCLC.[2] Zykadia® (ceritinib capsules and tablets) is also an option under "Other Recommended" therapy (category 2A) in the first-line setting.

POLICY STATEMENT
91. Prior Authorization is recommended for prescription benefit coverage of Augtyro. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Augtyro is recommended in those who meet the following criteria:

FDA-Approved Indication

3. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has locally advanced or metastatic disease; AND
- **C)** Patient has *ROS1*-positive non-small cell lung cancer; AND
- **D)** The mutation was detected by an approved test.

ZZZZ)
CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Augtyro is not recommended in the following situations:

160. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ayvakit Prior Authorization Policy
- Ayvakit™ (avapritinib tablets – Blueprint Medicines)

REVIEW DATE: 05/31/2023

OVERVIEW

Ayvakit, a kinase inhibitor, is indicated for the following uses in adults:[1]

- **Gastrointestinal stromal tumor (GIST),** unresectable or metastatic, harboring a platelet-derived growth factor receptor alpha (*PDGFRA*) exon 18 mutation, including *PDGFRA* D842V mutations. Patients should be selected for treatment with Ayvakit based on the presence of a *PDGFRA* exon 18 mutation; an FDA-approved test for the detection of this mutation is not currently available.
- **Advanced systemic mastocytosis,** including patients with aggressive systemic mastocytosis, systemic mastocytosis with an associated hematological neoplasm, and mast cell leukemia. Ayvakit is not recommended for the treatment of patients with advanced systemic mastocytosis with platelet counts of less than 50 x 10^9/L.
- **Indolent systemic mastocytosis**.

A)

Guidelines

Ayvakit is discussed in the guidelines from National Comprehensive Cancer Network (NCCN):[3]

- **GIST:** NCCN guidelines (version 1.2023 – March 13, 2023) note that Ayvakit is one of the primary treatment options for GIST with *PDGFRA* exon 18 mutation, including *PDGFRA* D842V mutations (category 2A).[2] Imatinib is a category 1 recommended option for primary treatment. The guidelines note that most mutations in the *PDGFRA* gene are associated with a response to imatinib, with the notable exception of *PDGFRA* D842V mutation. Ayvakit (for *PDGFRA* exon 18 mutation that is insensitive to imatinib, including the *D842V* mutation) is listed as a preferred regimen for neoadjuvant therapy for resectable GISTs with significant morbidity (category 2A). Ayvakit is listed as an additional option after failure on approved therapies. The approved therapies are imatinib and Ayvakit (for *PDGFRA* mutation) as first-line therapy; sunitinib; or Sprycel® (dasatinib tablets; for *PDGFRA* exon 18 mutations that are insensitive to imatinib [including the *PDGFRA D842V* mutation]) as second-line therapy; Stivarga® (regorafenib tablets) as third-line therapy; and Qinlock® (ripretinib tablets) as fourth-line therapy.
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions:** NCCN guidelines (version 1.2023 – May 19, 2023) note that since Ayvakit targets *PDGFRA* exon 18 mutation, it may have a role for use in patients with *FIP1L1-PDGFRA* positive myeloid/lymphoid neoplasms with eosinophilia harboring *PDGFRA* D842V mutation, which is resistant to imatinib (category 2A).[4] If this mutation is identified, a clinical trial with Ayvakit is preferred (if available), rather than off-label use.
- **Systemic Mastocytosis:** NCCN guidelines (version 1.2023 – May 24, 2023) recommend single-agent Ayvakit if the patient has platelets ≥ 50 x 10^9/L as preferred treatment of aggressive systemic mastocytosis, systemic mastocytosis with an associated neoplasm, and mast cell leukemia with or without an associated hematologic neoplasm (category 2A).[5]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Ayvakit. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Ayvakit is recommended in those who meet one of the following criteria:

FDA-Approved Indications

77. Gastrointestinal Stromal Tumor. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient meets ONE of the following criteria (i or ii):
  - **i.** The tumor is positive for platelet-derived growth factor receptor alpha (*PDGFRA*) exon 18 mutation; OR
    - **B)** Note: *PDGFRA* exon 18 mutation includes *PDGFRA* D842V mutations.
  - **ii.** Patient has tried each of the following (a, b, c, and d):
    - **a)** Imatinib; AND
    - **b)** One of sunitinib or Sprycel (dasatinib tablets); AND
    - **c)** Stivarga (regorafenib tablets); AND
    - **d)** Qinlock (ripretinib tablets).

78. Systemic Mastocytosis. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has a platelet count ≥ 50 x 10^9/L (≥ 50,000/mcL); AND
- **C)** Patient meets one of the following criteria (i or ii):
  - **i.** Patient has indolent systemic mastocytosis; OR
  - **ii.** Patient has one of the following subtypes of advanced systemic mastocytosis (a, b, or c):
    - **a)** Aggressive systemic mastocytosis; OR
    - **b)** Systemic mastocytosis with an associated hematological neoplasm; OR
    - **c)** Mast cell leukemia.

C)

Other Uses with Supportive Evidence

3. Myeloid/Lymphoid Neoplasms. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has eosinophilia; AND
- **C)** The tumor is positive for platelet-derived growth factor receptor alpha (*PDGFRA*) D842V mutation.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ayvakit is not recommended in the following situations:

12. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

D)

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Balversa Prior Authorization Policy
- Balversa® (erdafitinib tablets – Janssen)

REVIEW DATE: 04/12/2023

OVERVIEW

Balversa, a kinase inhibitor, is indicated for the treatment of **locally advanced or metastatic urothelial carcinoma** in adults with susceptible fibroblast growth factor receptor (FGFR)3 or FGFR2 genetic alterations, and progressed during or following at least one line of prior platinum-containing chemotherapy, including within 12 months of adjuvant or neoadjuvant platinum-containing chemotherapy.[1]

Patients are selected for treatment with Balversa based on the presence of susceptible FGFR genetic alterations in tumor specimens detected by an FDA-approved companion diagnostic.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) clinical practice guidelines for bladder cancer (version 1.2023 – February 9, 2023) recommend Balversa as a single agent, post-platinum or –checkpoint inhibitor therapy in patients with bladder cancer, upper genitourinary tract tumors, primary carcinoma of the urethra, and urothelial carcinoma of the prostate with susceptible FGFR2 or FGFR3 genetic alterations.[2,3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Balversa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Balversa is recommended in those who meet the following criteria:

FDA-Approved Indication

99. Urothelial Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has locally advanced or metastatic disease; AND
- **B)** Patient has susceptible fibroblast growth factor receptor 3 or fibroblast growth factor receptor 2 genetic alterations; AND
- **C)** Patient has progressed during or following prior platinum-containing chemotherapy or checkpoint inhibitor therapy.

  Note: Examples of platinum-containing chemotherapy include cisplatin and carboplatin. Examples of checkpoint inhibitors include: Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion), Tecentriq (atezolizumab intravenous infusion), Imfinzi (durvalumab intravenous infusion), and Bavencio (avelumab intravenous infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Balversa is not recommended in the following situations:

339. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

1086. Balversa® tablets [prescribing information]. Horsham, PA: Janssen; March 2023.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Bexarotene (Oral) Prior Authorization Policy
- Targretin® (bexarotene capsules – Bausch Health, generic)

REVIEW DATE: 11/22/2023

OVERVIEW

Oral bexarotene is indicated for the treatment of **cutaneous manifestations of cutaneous T-cell lymphoma** in patients who are refractory to at least one prior systemic therapy.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) Primary Cutaneous Lymphomas guidelines (version 1.2023 – January 5, 2023) recommend oral bexarotene as an option for the treatment of cutaneous lymphomas (e.g., mycosis fungoides, Sézary syndrome, anaplastic large cell lymphoma [ALCL], lymphomatoid papulosis), as initial therapy and for relapsed/refractory cases. NCCN notes there are limited data from case reports demonstrating efficacy of oral bexarotene for the treatment of ALCL with multifocal lesions and for lymphomatoid papulosis with extensive lesions.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of bexarotene capsules. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with bexarotene capsules as well as the monitoring required for adverse events and long-term efficacy, approval requires bexarotene capsules to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of bexarotene capsules is recommended in those who meet the following criteria:

FDA-Approved Indication

72. Cutaneous T-Cell Lymphoma. Approve for 1 year if the patient meets the following (A and B):
V) Patient has cutaneous manifestations/lesions; AND
W) The medication is prescribed by or in consultation with an oncologist or a dermatologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of bexarotene capsules is not recommended in the following situations:

161. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Bexarotene (Topical) Prior Authorization Policy
- Targretin® (bexarotene 1% gel – Bausch Health, generic)

REVIEW DATE: 11/22/2023

OVERVIEW

Bexarotene gel is indicated for the topical treatment of cutaneous lesions in patients with **cutaneous T-cell lymphoma** (Stage 1A and 1B) who have refractory or persistent disease after other therapies or who have not tolerated other therapies.[1]

Guidelines

National Comprehensive Cancer Network (NCCN) Primary Cutaneous Lymphomas guidelines (version 1.2023 – January 5, 2023) recommend topical bexarotene as an option for the treatment of cutaneous lymphomas (e.g., mycosis fungoides, Sézary syndrome, T-cell lymphoma), as initial therapy and for relapsed/refractory cases. NCCN notes there are case reports demonstrating efficacy of topical bexarotene in treating primary cutaneous B-cell lymphomas in children. The NCCN T-Cell Lymphomas guidelines (version 1.2023 – January 5, 2023) recommend skin-directed therapies (refers to bexarotene in primary cutaneous lymphomas guidelines) for first-line therapy (category 2A) of chronic/smoldering adult T-cell leukemia/lymphoma subtype.[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of bexarotene gel. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with bexarotene gel as well as the monitoring required for adverse events and long-term efficacy, approval requires bexarotene gel to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Bexarotene gel is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Cutaneous T-Cell Lymphoma.** Approve for 1 year if the patient meets the following (A and B):
   73. Patient has cutaneous manifestations/lesions; AND
   74. The medication is prescribed by or in consultation with an oncologist or a dermatologist.

Other Uses with Supportive Evidence

2. **Adult T-Cell Leukemia/Lymphoma.** Approve for 1 year if the patient meets the following (A, B, and C):
   A) Patient has chronic/smoldering subtype; AND
   B) The medication is used as first-line therapy; AND

C) The medication is prescribed by or in consultation with an oncologist or a dermatologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of bexarotene gel is not recommended in the following situations:

162. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Bosulif Prior Authorization Policy
- Bosulif® (bosutinib tablets – Pfizer)

REVIEW DATE: 05/31/2023; selected revision 10/04/2023

OVERVIEW

Bosulif, a tyrosine kinase inhibitor (TKI), is indicated for the following uses:[1]

- **Chronic myelogenous leukemia (CML)**, in chronic phase that is Philadelphia chromosome positive (Ph+) that is newly-diagnosed or resistant or intolerant to prior therapy in adults and pediatric patients ≥ 1 year of age.
- **CML**, Ph+, in accelerated, or blast phase, with resistance or intolerance to prior therapy in adults.

Guidelines

Bosulif is addressed in guidelines from National Comprehensive Cancer Network (NCCN):

- **Acute Lymphoblastic Leukemia (ALL):** NCCN guidelines (version 2.2023 – July 28, 2023) recommend Bosulif for Ph+ disease in many different clinical circumstances (e.g., induction, consolidation therapy, maintenance, or relapsed or refractory disease) [category 2A].[2] TKIs in combination with other agents (e.g., chemotherapy or corticosteroids) are recommended for induction therapy for Ph+ ALL. TKIs have also been incorporated into consolidation and maintenance therapy, as well as in the relapsed/refractory setting (category 2A). TKI options include: Bosulif, Sprycel® (dasatinib tablets), imatinib, Tasigna® (nilotinib capsules), or Iclusig® (ponatinib tablets) [category 2A]. NCCN panel notes that not all TKIs have been directly studied within the context of each specific regimen and there are limited data for Bosulif in Ph+ ALL. Use of a specific TKI should account for anticipated/prior TKI intolerance and disease-related features. For adults and adolescents, Iclusig has activity against T315I mutations and/or in whom no other TKI is indicated (category 2A).
- **CML:** NCCN guidelines (version 1.2024 – August 1, 2023) recommend Bosulif as a "preferred" primary regimen for newly diagnosed chronic phase Ph+ CML in patients with a low-, intermediate-, or high-risk score (category 1).[3] Bosulif is also recommended as a "preferred" regimen for patients with advanced phase or blast phase CML (category 2A). Bosulif is also recommended as an alternative TKI treatment (after primary treatment with imatinib, Sprycel, or Tasigna (category 2A). Bosulif is also recommended in a variety of other situations, including post-allogeneic hematopoietic stem cell transplantation (HSCT) [category 2A].
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Fusion Genes:** NCCN guidelines (version 2.2023 – July 14, 2023) recommend Bosulif as "other recommended regimens" for patients with *ABL1* rearrangements (category 2A).[4] It is also recommended as treatment in combination with ALL- or acute myeloid leukemia-type induction chemotherapy followed by allogeneic HSCT (if eligible) for lymphoid, myeloid, or mixed lineage neoplasms with eosinophilia and *ABL1* rearrangement in blast phase (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Bosulif. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Bosulif is recommended in those who meet one of the following criteria:

FDA-Approved Indication

75. Chronic Myeloid Leukemia. Approve for 1 year if the patient meets the following (A and B):
- **A)** Patient is ≥ 1 year of age; AND
- **B)** Patient has Philadelphia chromosome-positive chronic myeloid leukemia.

Other Uses with Supportive Evidence

2. Acute Lymphoblastic Leukemia. Approve for 1 year if the patient meets the following (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has Philadelphia chromosome-positive acute lymphoblastic leukemia; AND
- **C)** Patient has tried at least one other tyrosine kinase inhibitor for Philadelphia chromosome-positive acute lymphoblastic leukemia.
  Note: Examples include imatinib and Sprycel (dasatinib tablets).

2. Myeloid/Lymphoid Neoplasms with Eosinophilia. Approve for 1 year if the patient meets the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The tumor has an *ABL1* rearrangement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Bosulif is recommended in those who meet the following criteria:

163. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Braftovi Prior Authorization Policy
- Braftovi® (encorafenib capsules – Array BioPharma)

REVIEW DATE: 07/19/2023; selected revision 10/18/2023

OVERVIEW

Braftovi, a BRAF inhibitor, is indicated for the following uses:[1]

- **Colorectal cancer**, in combination with Erbitux® (cetuximab intravenous infusion), for the treatment of metastatic disease and a *BRAF V600E* mutation, as detected by an FDA-approved test, after prior therapy in adults.
- **Melanoma**, in combination with Mektovi® (binimetinib tablets), for the treatment of unresectable or metastatic disease and a *BRAF V600E* or *V600K* mutation, as detected by an FDA-approved test in adults.
- **Non-small cell lung cancer (NSCLC),** in combination with Mektovi, for the treatment of adult patients with metastatic NSCLC with a *BRAF V600E* mutation, as detected by an FDA-approved test.

It is a limitation of use that Braftovi is not indicated for treatment of patients with wild-type BRAF melanoma, wild-type BRAF colorectal cancer, or wild-type BRAF NSCLC.

Guidelines

National Comprehensive Cancer Network guidelines support use of Braftovi in the following cancers.[5]

- **Colon** and **Rectal Cancer:** Guidelines for colon cancer (version 2.2023 – April 25, 2023) and rectal cancer (version 3.2023 – March 26, 2023) recommend Braftovi for some situations in patients with *BRAF V600E*-mutated disease.[3] For primary treatment (following adjuvant chemotherapy) or as subsequent use, Braftovi + Erbitux or Vectibix® (panitumumab intravenous infusion) is a recommended treatment option.
- **Melanoma, Cutaneous:** Guidelines (version 2.2023 – March 10, 2023) recommend BRAF/MEK inhibitor combinations among the preferred therapies for first-line and subsequent treatment of metastatic or unresectable melanoma with a *V600*-activating mutation.[2] The combinations are also recommended for adjuvant treatment (category 2B). While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor (Tafinlar® [dabrafenib capsules] or Zelboraf® [vemurafenib tablets]) is a recommended option, especially in patients who are not appropriate candidates for checkpoint immunotherapy.
- **Non-Small Cell Lung Cancer:** Guidelines (version 3.2023 – April 13, 2023) recommend Tafinlar + Mekinist® (trametinib tablets) for first-line "preferred" and subsequent therapy (both category 2A) for *BRAF V600E* mutation-positive disease.[6] Zelboraf or Tafinlar monotherapy is also recommended under "useful in certain circumstances" (both category 2A). Braftovi + Mektovi combination is not yet addressed in the guidelines.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Braftovi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Braftovi is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Colon or Rectal Cancer.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   62. Patient is ≥ 18 years of age; AND
   63. Patient has *BRAF V600E* mutation-positive disease; AND
   64. Patient has previously received a chemotherapy regimen for colon or rectal cancer; AND

- Note: Examples of chemotherapy regimens include a fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine; oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).

   65. The medication is prescribed as part of a combination regimen for colon or rectal cancer.

- Note: Examples of combination regimens include Braftovi + Erbitux (cetuximab intravenous infusion), Braftovi + Vectibix (panitumumab intravenous infusion).
-

2. **Melanoma.** Approve for 1 year if the patient meets the following (A, B, and C):

- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has unresectable, advanced, or metastatic melanoma; AND
  - **C)** Patient has *BRAF V600* mutation-positive disease.
  -
  - **3. Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets the following (A, B, and C):
    - **A)** Patient is ≥ 18 years of age; AND
    - **B)** Patient has *BRAF V600E* mutation-positive metastatic disease; AND
    - **C)** The medication will be taken in combination with Mektovi (binimetinib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Braftovi is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Brukinsa Prior Authorization Policy
- Brukinsa® (zanubrutinib capsules – BeiGene)

REVIEW DATE: 04/19/2023

OVERVIEW

Brukinsa, a Bruton's tyrosine kinase inhibitor (BTK), is indicated for the treatment of the following conditions:[1]

- **Chronic lymphocytic leukemia or small lymphocytic lymphoma,** in adults.
- **Mantle cell lymphoma,** in adults who have received at least one prior therapy.
  - **Marginal zone lymphoma**, relapsed or refractory, in adults who have received at least one anti-CD20-based regimen.
- **Waldenström's Macroglobulinemia,** in adults.

Guidelines

Brukinsa is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):[4]

- **B-Cell Lymphomas**: NCCN guidelines (version 2.2023 – February 8, 2023) address marginal zone lymphoma and mantle cell lymphoma.[2] The guidelines recommend Brukinsa as a "Preferred Regimen" among several as second-line and subsequent therapy for marginal zone lymphoma for patients who have relapsed/refractory disease after at least one prior anti-CD20 monoclonal antibody (mAB)-based regimen (category 2A). For mantle cell lymphoma, Brukinsa is a "Preferred Regimen" for second-line or subsequent therapy (category 2A). There is a footnote that states that Brukinsa or Calquence has not been shown to be effective for Imbruvica-refractory mantle cell lymphoma with *BTK* C481S mutations. Patients with Imbruvica intolerance have been successfully treated with Brukinsa or Calquence without recurrence of symptoms.
- **Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma:** NCCN guidelines (version 2.2023 – January 25, 2023) recommend single-agent Brukinsa as first-line "Preferred Regimen" for patients without 17p deletion/TP53 mutation (category 1) and with 17p deletion/TP53 mutation (category 2A). Brukinsa is also recommended as second-line and subsequent therapy "Preferred Regimen" for patients with or without 17p deletion/TP53 mutation (category 1).[3] In the second-line and subsequent therapy setting, there is a footnote, which states that Brukinsa or Calquence have not been shown to be effective for Imbruvica-refractory chronic lymphocytic leukemia with BTK C481S mutations. Patients with Imbruvica intolerance have been successfully treated with Brukinsa or Calquence without recurrence of symptoms.
- **Waldenström Macroglobulinemia/Lymphoplasmacytic Lymphoma**: NCCN guidelines (version 1.2023 – July 6, 2022) recommend single-agent Brukinsa as a primary "Preferred Therapy" (category 1).[5] The guidelines also recommend Brukinsa as a "Preferred Therapy" option for previously treated disease (category 1). Brukinsa is also recommended for symptomatic management of Bing Neel Syndrome as a "Preferred Regimen" (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Brukinsa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Brukinsa is recommended in those who meet one of the following criteria:

FDA-Approved Indications

100. Chronic Lymphocytic Leukemia. Approve for 1 year if the patient is ≥ 18 years of age.

101. Mantle Cell Lymphoma. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets one of the following criteria (i or ii):

i. Patient has tried at least one systemic regimen; OR

Note: Examples of a systemic regimen contain one or more of the following products: rituximab, dexamethasone, cytarabine, carboplatin, cisplastin, oxaliplatin, cyclophosphamide, doxorubicin, vincristine, prednisone, methotrexate, bendamustine, bortezomib, lenalidomide

ii. According to the prescriber, patient is not a candidate for a systemic regimen (i.e., an elderly patients who is frail).

102. Marginal Zone Lymphoma. Approve for 1 year if the patient meets the following criteria (A and B):

92. Note: Marginal zone lymphoma includes gastric MALT lymphoma, non-gastric MALT lymphoma, nodal marginal zone lymphoma, and splenic marginal zone lymphoma.

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one systemic regimen.

Note: Examples of a systemic regimen contain one or more of the following products: bendamustine, rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone, lenalidomide, Gazyva (obinutuzumab intravenous infusion) or Imbruvica (ibrutinib tablets and capsules).

103. Small Lymphocytic Lymphoma. Approve for 1 year if the patient is ≥ 18 years of age.

104. Waldenström Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if the patient is ≥ 18 years of age.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Brukinsa is not recommended in the following situations:

164. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Cabometyx Prior Authorization Policy
- Cabometyx® (cabozantinib tablets – Exelixis)

REVIEW DATE: 03/22/2023

OVERVIEW

Cabometyx, a kinase inhibitor, is indicated for the following uses:[1]

- **Differentiated thyroid cancer**, for the treatment of patients ≥ 12 years of age with locally advanced or metastatic disease that has progressed following prior vascular endothelial growth factor receptor (VEGFR)-targeted therapy and who are radioactive iodine-refractory or ineligible.
- **Hepatocellular carcinoma,** for the treatment of patients who have been previously treated with sorafenib.
- **Renal cell carcinoma**, advanced, as monotherapy or in combination with Opdivo® (nivolumab intravenous infusion) as first-line treatment.

Guidelines

Cabometyx is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):[2]

- **Bone cancer:** NCCN guidelines (version 2.2023 – September 28, 2022) recommend Cabometyx as one of the "other recommended regimens" for second-line (relapsed/refractory or metastatic disease) for Ewing sarcoma and osteosarcoma (category 2A).[3]
- **Gastrointestinal stromal tumors:** NCCN guidelines (version 1.2023 – March 13, 2023) recommend Cabometyx as one of the options after progression on approved therapies as "useful in certain circumstances" (category 2A).[2,4] The approved therapies are imatinib and Ayvakit® (avapritinib tablets; for *PDGFRA* mutation) as first-line therapy; sunitinib or Sprycel® (dasatinib tablets; for *PDGFRA* exon 18 mutations that are insensitive to imatinib [including the *PDGFRA D842V* mutation) as second-line therapy; Stivarga® (regorafenib tablets) as third-line therapy; and Qinlock® (ripretinib tablets) as fourth-line therapy.[4]
- **Hepatocellular carcinoma:** NCCN guidelines (version 1.2023 – March 10, 2023) recommend Cabometyx (Child-Pugh Class A only; Category 1) as a subsequent therapy option, along with many other agents.[5]
- **Kidney cancer:** NCCN guidelines (version 4.2023 – January 18, 2023) state that the "preferred regimens" for first-line therapy in favorable risk patients with relapsed or Stage IV renal cell carcinoma (RCC) with predominant clear cell histology are: Inlyta® (axitinib tablets) + Keytruda® (pembrolizumab intravenous infusion), Cabometyx + Opdivo, Lenvima® (lenvatinib capsules) + Keytruda (all category 1). Cabometyx (category 2B) is one of the "other recommended regimens" in this setting.[6] For patients in the poor/intermediate risk grouping, the "preferred regimens" are Inlyta + Keytruda; Cabometyx + Opdivo; Yervoy (ipilimumab intravenous infusion) + Opdivo; Lenvima + Keytruda (all category 1); Cabometyx monotherapy is also recommended (category 2A). Subsequent therapy is categorized based on prior immune-oncology (IO) therapy status. There are no preferred regimens. Cabometyx is listed under "other recommended regimens" for both IO therapy naïve and with prior IO therapy; Cabometyx + Opdivo is also an option (both category 2A). For patients with non-clear cell histology RCC, sunitinib, Cabometyx, and enrollment in clinical trials are noted as preferred therapies (category 2A, preferred); Keytruda, Opdivo, Opdivo + Cabometyx, and Lenvima + everolimus are other recommended regimens (all category 2A). Many other agents are listed as "useful in certain circumstances".

- **Non-small cell lung cancer:** NCCN guidelines (version 2.2023 – February 17, 2023) recommend Cabometyx for *RET* rearrangement positive tumors (category 2A).[7]
- **Uterine neoplasms:** NCCN guidelines (version 1.2023 – December 22, 2022) recommend Cabometyx as one of the other recommended regimens for second or subsequent line of therapy for recurrent endometrial carcinoma (category 2A).[8]
- **Thyroid carcinoma**: NCCN guidelines (version 3.2022 – November 1, 2022) state that Cabometyx can be considered if patient has progression after Lenvima or sorafenib for the treatment of locally recurrent, advanced, and/or metastatic disease that is not amendable to radioactive iodine therapy. This recommendation is for follicular, Hürthle cell, and papillary cancer subtypes (all category 1).[9]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cabometyx. All approvals are provided for 1 year in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cabometyx is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Hepatocellular Carcinoma.** Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has been previously treated with at least one systemic regimen.
   324. Note: Examples of a systemic regimen include one of the following drugs: Tecentriq (atezolizumab intravenous infusion), bevacizumab, Imjudo (tremelimumab intravenous infusion), Imfinzi (durvalumab intravenous infusion), sorafenib, Lenvima (lenvatinib capsules), or Opdivo (nivolumab intravenous infusion).

2. **Renal Cell Carcinoma.** Approve for 1 year if the patient meets both of the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has relapsed or stage IV disease.

325.

3. **Thyroid Carcinoma, Differentiated.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   A) Patient is ≥ 12 years of age; AND
   B) Patient has differentiated thyroid carcinoma; AND
   Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and Hürthle cell thyroid carcinoma.
   C) Patient is refractory to radioactive iodine therapy; AND
   D) Patient has tried Lenvima (lenvatinib capsules) or sorafenib.

Other Uses with Supportive Evidence

4. **Bone Cancer.** Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient meets ONE of the following (i or ii):

326. **i.** Patient has Ewing sarcoma; OR
327. **ii.** Patient has osteosarcoma; AND

B) Patient has tried at least one previous systemic regimen.

328. Note: Examples of a systemic regimen include one of the following: vincristine, doxorubicin, cyclophosphamide, topotecan, irinotecan, cisplatin, ifosfamide, Stivarga (regorafenib tablets), sorafenib.

329.

5. Endometrial Carcinoma. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried one systemic regimen.

330. Note: Examples of a systemic regimen include one of the following: carboplatin, paclitaxel, trastuzumab, docetaxel, doxorubicin, cisplatin, and topotecan.

331.

6. Gastrointestinal Stromal Tumors. Approve for 1 year if the patient meets the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried each of the following (i, ii, iii, and iv):

i. One of imatinib or Ayvakit (avapritinib tablets); AND
ii. One of sunitinib or Sprycel (dasatinib tablets); AND
iii. Stivarga (regorafenib tablets); AND
iv. Qinlock (ripretinib tablets).

7. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has a *RET* rearrangement positive tumor.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cabometyx is not recommended in the following situations:

1. **Metastatic Castration-Resistant Prostate Cancer (mCRPC).** Results from the COMET-1 Phase III pivotal study with Cabometyx 60 mg tablets in men with mCRPC are published.[10] Patients included in the study had disease progression after treatment with docetaxel as well as abiraterone acetate and/or Xtandi® (enzalutamide capsules). The study failed to meet its primary endpoint of demonstrating statistically significant increase in overall survival (OS) compared with prednisone. The median OS with Cabometyx was 11.0 months vs. 9.8 months with prednisone, which was not statistically significant. Based on these results, the second Phase III study, COMET-2 has been discontinued.[11] In another small phase 1/2 study (n = 13), treatment with cabozantinib + docetaxel + prednisone vs. docetaxel + prednisone alone improved the median time to progression and overall survival.[13] There is an ongoing Phase III, randomized, open-label study (CONTACT-02) of cabozantinib + Tecentriq (atezolizumab for intravenous injection) in various tumor types, including CRPC.[12]

332.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

333.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Calquence Prior Authorization Policy
- Calquence® (acalabrutinib capsules and tablets – AstraZeneca)

REVIEW DATE: 07/12/2023

OVERVIEW

Calquence, a Bruton's tyrosine kinase (BTK) inhibitor, is indicated in adults for the following uses:[1,2]

- **Chronic lymphocytic leukemia (CLL) or small lymphocytic leukemia (SLL)**.
- **Mantle cell lymphoma**, in patients who have received at least one prior therapy. This indication is approved under accelerated approval based on overall response rate. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

Guidelines

Calquence is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **B-Cell Lymphomas**: NCCN guidelines (version 4.2023 – June 2, 2023) address mantle cell lymphoma and marginal zone lymphoma.[3,6] Calquence is recommended as one of several preferred agents as second-line and subsequent therapy for mantle cell lymphoma (category 2A); there is a footnote that states that Calquence has not been shown to be effective for Imbruvica® (ibrutinib tablets, capsules, or oral solution)-refractory mantle cell lymphoma with *BTK* C481S mutations. Patients with Imbruvica intolerance have been successfully treated with Calquence or Brukinsa® (zanubrutinib capsules) without recurrence of symptoms. For marginal zone lymphoma, NCCN guidelines recommend Calquence as a "preferred" regimen for second-line and subsequent therapy (category 2A). Calquence is also recommended as preferred aggressive induction therapy and maintenance therapy with chemotherapy (category 2B).
- **CLL/SLL**: NCCN guidelines (version 3.2023 – June 12, 2023) list Calquence as a "preferred" first-line therapy option as a single agent or in combination with Gazyva® (obinutuzumab intravenous infusion) for patients with deletion(17p)/TP53 mutation (category 2A) or without deletion(17p)/TP53 mutation (category 1).[4,6] The guidelines also list single-agent Calquence as a preferred second-line and subsequent therapy for patients with or without deletion(17p)/TP53 mutation (category 1); there is a footnote that states that Calquence has not been shown to be effective for Imbruvica-refractory CLL with *BTK* C481S mutations. Patients with Imbruvica intolerance have been successfully treated with Calquence or Brukinsa without recurrence of symptoms.
- **Waldenström Macroglobulinemia/Lymphoplasmacytic Lymphoma:** NCCN guidelines (version 1.2023 – July 6, 2022) recommend single-agent Calquence as an "Other Recommended Regimen" for previously treated disease (category 2A).[5,6]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Calquence. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Calquence is recommended in those who meet one of the following criteria:

FDA-Approved Indications

76. Chronic Lymphocytic Leukemia. Approve for 1 year if the patient is ≥ 18 years of age.

77. Mantle Cell Lymphoma. Approve for 1 year if the patient meets the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient meets one of the following (i or ii):
  - **i.** Patient has tried at least one systemic regimen; OR
    Note: Examples of a systemic regimen contain one or more of the following products: rituximab, dexamethasone, cytarabine, carboplatin, cisplatin, oxaliplatin, cyclophosphamide, doxorubicin, vincristine, prednisone, methotrexate, bendamustine, bortezomib, or lenalidomide,
  - **ii.** According to the prescriber, patient is not a candidate for a systemic regimen (i.e., an elderly person who is frail).

78. Small Lymphocytic Lymphoma. Approve for 1 year if the patient is ≥ 18 years of age.

Other Uses with Supportive Evidence

79. Marginal Zone Lymphoma. Approve for 1 year if the patient meets the following (A and B):
Note: Marginal zone lymphoma includes gastric mucosa-associated lymphoid tissue (MALT) lymphoma, non-gastric MALT lymphoma, nodal marginal zone lymphoma, and splenic marginal zone lymphoma.
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has tried at least one systemic regimen
  Note: Examples of a systemic regimen contain one or more of the following products: bendamustine, rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone, lenalidomide, or chlorambucil.

80. Waldenström Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if the patient meets the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has tried at least one systemic regimen.
  Note: Examples of a systemic regimen contain one or more of the following products: Brukinsa (zanubrutinib capsules), Imbruvica (ibrutinib tablets, capsules, and oral solution), rituximab, bendamustine, cyclophosphamide, dexamethasone, bortezomib, fludarabine, or cladribine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Calquence is not recommended in the following situations:

165. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Capecitabine Prior Authorization
- Xeloda® (capecitabine tablets – Genentech, generic)

REVIEW DATE: 08/23/2023

OVERVIEW

Capecitabine, a nucleoside metabolic inhibitor with antineoplastic activity, is indicated for the following uses:[1]

- **Breast cancer,** treatment of advanced or metastatic disease:
  - **i.** In combination with docetaxel after disease progression on prior anthracycline-containing chemotherapy.
  - **ii.** As a single agent if an anthracycline- or taxane-containing chemotherapy is not indicated.
- **Colorectal cancer**:
  - **i.** Adjuvant treatment of patients with Stage III colon cancer as a single agent or as a component of a combination chemotherapy regimen.
  - **ii.** Perioperative treatment of adults with locally advanced rectal cancer as a component of chemoradiotherapy.
  - **iii.** Treatment of patients with unresectable or metastatic colorectal cancer as a single agent or as a component of a combination chemotherapy regimen.
- **Gastric, esophageal, or gastroesophageal junction cancer,** treatment of adults with:
  - **i.** Unresectable or metastatic disease as a component of a combination chemotherapy regimen.
  - **ii.** HER2-overexpressing metastatic gastric or gastroesophageal junction adenocarcinoma who have not received prior treatment for metastatic disease as a component of a combination regimen.
- **Pancreatic Cancer,** adjuvant treatment of adults with pancreatic adenocarcinoma as a component of a combination chemotherapy regimen.

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium recommends use of capecitabine for the indications listed in the FDA-Approved Indications and Other Uses with Supportive Evidence sections.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of capecitabine. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of capecitabine is recommended in those who meet one of the following criteria:

FDA-Approved Indications

105. Breast Cancer. Approve for 1 year if the patient is ≥ 18 years of age.

106. Colon Cancer. Approve for 1 year if the patient is ≥ 18 years of age.

107. Esophageal and Esophagogastric Junction Cancers. Approve for 1 year if the patient is ≥ 18 years of age.

108. Gastric Cancer. Approve for 1 year if the patient is ≥ 18 years of age.

109. Pancreatic Adenocarcinoma. Approve for 1 year if the patient is ≥ 18 years of age.

Other Uses with Supportive Evidence

110. Ampullary Adenocarcinoma. Approve for 1 year if the patient is ≥ 18 years of age.

111. Anal Carcinoma. Approve for 1 year if the patient is ≥ 18 years of age.

112. Central Nervous System Cancers. Approve for 1 year if the patient is ≥ 18 years of age.

113. Gestational Trophoblastic Neoplasia. Approve for 1 year if the patient is ≥ 18 years of age.

114. Head and Neck Cancers. Approve for 1 year if the patient is ≥ 18 years of age.

115. Biliary Tract Cancer. Approve for 1 year if the patient is ≥ 18 years of age.

116. Neuroendocrine and Adrenal Tumors. Approve for 1 year if the patient is ≥ 18 years of age.

117. Occult Primary Tumors. Approve for 1 year if the patient is ≥ 18 years of age.

118. Ovarian Cancer/Fallopian Tube Cancer/Primary Peritoneal Cancer. Approve for 1 year if the patient is ≥ 18 years of age.

119. Penile Cancer. Approve for 1 year if the patient is ≥ 18 years of age.

120. Rectal Cancer. Approve for 1 year if the patient is ≥ 18 years of age.

121. Small Bowel Adenocarcinoma. Approve for 1 year if the patient is ≥ 18 years of age.

122. Squamous Cell Skin Cancer. Approve for 1 year if the patient is ≥ 18 years of age.

123. Thymomas and Thymic Carcinomas. Approve for 1 year if the patient is ≥ 18 years of age.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of capecitabine is not recommended in the following situations:

340. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Caprelsa Prior Authorization Policy
- Caprelsa® (vandetanib tablets – AstraZeneca)

REVIEW DATE: 06/07/2023

OVERVIEW

Caprelsa, a kinase inhibitor, is indicated for the treatment of symptomatic or progressive **medullary thyroid cancer** in patients with unresectable locally advanced or metastatic disease.[1]

GUIDELINES

Caprelsa is discussed in guidelines from the National Comprehensive Cancer Network (NCCN). NCCN thyroid guidelines (version 2.2023 – May 18, 2023) lists surgery as the main treatment option for medullary thyroid cancer.[2,3] Caprelsa (category 1) or Cometriq® (cabozantinib capsules) [category 1] are the preferred treatments for recurrent or persistent locoregional or distant metastatic disease. For differentiated thyroid cancer subtypes, the guidelines have changed the naming of Hürthle cell neoplasm to oncocytic carcinoma. The guidelines recommend that Caprelsa can be considered if clinical trials or other systemic therapies are not available or appropriate for the treatment of progressive and/or symptomatic locally recurrent, advanced, and/or metastatic disease that is not amendable to radioactive iodine (RAI) therapy; this recommendation is for differentiated thyroid cancer (e.g. follicular, oncocytic, and papillary cancer subtypes) [all category 2A].[2,3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Caprelsa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Caprelsa is recommended in those who meet one of the following criteria:

FDA-Approved Indication

81. Thyroid Carcinoma, Medullary. Approve for 1 year if the patient is ≥ 18 years of age.

Other Uses with Supportive Evidence

82. Thyroid Carcinoma, Differentiated. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has differentiated thyroid carcinoma; AND

- Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).

C) The disease is refractory to radioactive iodine therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Caprelsa is not recommended in the following situations:

166. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Cometriq Prior Authorization Policy
- Cometriq® (cabozantinib capsules – Exelixis)

REVIEW DATE: 06/07/2023

OVERVIEW

Cometriq, a kinase inhibitor, is indicated for the treatment of patients with progressive, metastatic **medullary thyroid cancer**.[1]

Guidelines

Cometriq is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Non-Small Cell Lung Cancer:** NCCN guidelines (version 3.2023 – April 13, 2023) recommend the use of Cometriq for *RET* gene rearrangements (category 2A).[2]
- **Thyroid Carcinoma:** NCCN guidelines (version 2.2023 – May 18, 2023) list surgery as the main treatment option for medullary thyroid cancer.[3] Cometriq or Caprelsa® (vandetanib tablets) (category 1) are the preferred treatments for recurrent or persistent disease that is locoregional or metastatic. The guidelines also state that cabozantinib can be considered if patient has progression after Lenvima® (lenvatinib capsules) and/or sorafenib for the treatment of locally recurrent, advanced, and/or metastatic disease that is not amendable to radioactive iodine therapy; this recommendation is for follicular, oncocytic, and papillary cancer subtypes (all category 2A).[4] For differentiated thyroid cancer subtypes, the guidelines have changed the naming of Hürthle cell neoplasm to oncocytic carcinoma.

94.
95.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cometriq. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cometriq is recommended in those who meet one of the following criteria:

FDA-Approved Indication

83. Thyroid Carcinoma, Medullary. Approve for 1 year if the patient is ≥ 18 years of age.

Other Uses with Supportive Evidence

96.

84. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has *RET* gene rearrangements.

85. Thyroid Carcinoma, Differentiated. Approve for 1 year if the patient meets the following criteria (A, B, C and D):

A) Patient is ≥ 12 years of age; AND

B) Patient has differentiated thyroid carcinoma; AND

97. Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).

C) The disease is refractory to radioactive iodine therapy; AND

D) Patient has tried Lenvima (lenvatinib capsules) or sorafenib tablets.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cometriq is not recommended in the following situations:

98. 1. Metastatic Castration-Resistant Prostate Cancer (mCRPC). Results from the COMET-1 Phase III pivotal study with cabozantinib 60 mg tablets in men with mCRPC are published.[5] Patients included in the study had disease progression after treatment with docetaxel as well as abiraterone acetate and/or Xtandi® (enzalutamide capsules). The study failed to meet its primary endpoint of demonstrating statistically significant increase in overall survival (OS) compared with prednisone. The median OS with cabozantinib was 11.0 months vs. 9.8 months with prednisone, which was not statistically significant. Based on these results, the second Phase III study, COMET-2 has been discontinued.[6]

99.

100. 2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Copiktra Prior Authorization Policy
- Copiktra® (duvelisib capsules – Secura Bio)

REVIEW DATE: 06/28/2023

OVERVIEW

Copiktra, a phosphatidylinositol 3-kinase (PI3K) inhibitor, is indicated for the treatment of adults for relapsed or refractory **chronic lymphocytic leukemia (CLL)/small lymphocytic lymphoma (SLL)** after at least two prior therapies.[1]

Guidelines

Copiktra is discussed in guidelines from the National Comprehensive Cancer Network (NCCN).

- **CLL/SLL:** NCCN guidelines (version 3.2023 – June 12, 2023) include Copiktra as subsequent therapy for relapsed or refractory disease after prior Bruton tyrosine kinase inhibitor and Venclexta (venetoclax tablets) based regimen in patients without deletion (del)[17p]/TP53 mutation as "other recommended regimens" (category 2A). Copiktra is also recommended as second-line and subsequent therapy for del(17p)/TP53 mutation as "other recommended regimens" (category 2A).[2]
- **T-Cell Lymphoma:** NCCN guidelines (version 1.2023 – January 5, 2023) recommend Copiktra as initial palliative intent therapy or second-line or and subsequent therapy for relapsed/refractory peripheral T-cell lymphoma; as second-line and subsequent therapy for relapsed/refractory disease for breast implant-associated anaplastic large cell lymphoma; and for hepatosplenic T-cell lymphoma as a single agent for refractory disease after two first-line therapy regimens.[3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Copiktra. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Copiktra is recommended in those who meet one of the following:

FDA-Approved Indications

86. Chronic Lymphocytic Leukemia. Approve for 1 year if the patient meets the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has tried one systemic regimen.
  Note: Examples of systemic regimens include one or more of the following products: Imbruvica (ibrutinib capsules, tablets, and oral solution); Brukinsa (zanubrutinib capsules), Calquence (acalabrutinib tablets), Venclexta (venetoclax tablets); rituximab; Gazyva (obinutuzumab intravenous infusion); chlorambucil; fludarabine; cyclophosphamide; bendamustine; high-dose methylprednisolone; Campath (alemtuzumab intravenous infusion), or Arzerra (ofatumumab intravenous infusion).

87. Small Lymphocytic Lymphoma. Approve for 1 year if the patient meets the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried one systemic regimen.

Note: Examples of systemic regimens include one or more of the following products: Imbruvica (ibrutinib capsules, tablets, and oral solution); Calquence (acalabrutinib tablets); Brukinsa (zanubrutinib capsules); Venclexta (venetoclax tablets); rituximab; Gazyva (obinutuzumab intravenous infusion); chlorambucil; fludarabine; cyclophosphamide; bendamustine; high-dose methylprednisolone; Campath (alemtuzumab intravenous infusion); or Arzerra (ofatumumab intravenous infusion).

Other Uses with Supportive Evidence

88. T-Cell Lymphoma. Approve for 1 year if the patient meets the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient meets one of the following criteria (i or ii):

i. Patient meets both of the following criteria (a and b):

a) Patient has relapsed or refractory disease; AND

b) Patient has breast implant-associated anaplastic large cell lymphoma or hepatosplenic T-cell lymphoma; OR

ii. Patient has peripheral T-cell lymphoma

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Copiktra is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Cotellic Prior Authorization Policy
- Cotellic® (cobimetinib tablets – Genentech/Roche)

REVIEW DATE: 07/19/2023

OVERVIEW

Cotellic is a MEK inhibitor indicated for the following uses:
- **Histiocytic neoplasms,** as a single agent in adults.
- **Melanoma,** in combination with Zelboraf® (vemurafenib tablets), for the treatment of unresectable or metastatic disease with the *BRAF V600E* or *V600K* mutation in adults.[1]

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use in multiple cancers.[5]
- **Central Nervous System Cancers:** Guidelines (version 1.2023 – March 24, 2023) recommend a BRAF/MEK inhibitor combination (i.e., Tafinlar® [dabrafenib capsules]/Mekinist® [trametinib tablets] or Zelboraf/Cotellic) for treatment of *BRAF V600E* activation mutations in adults in the following situations: adjuvant treatment of pilocytic astrocytoma, pleomorphic xanthoastrocytoma, or ganglioglioma; recurrent or progressive low-grade glioma; oliogdenroglioma, or isocitrate dehydrogenase-2 (*IDH2*)-mutant astrocytoma; and recurrent glioblastoma.[4] BRAF/MEK combination therapy is also recommended for melanoma with brain metastases.
- **Melanoma, Cutaneous:** Guidelines (version 2.2023 – March 10, 2023) for cutaneous disease recommend BRAF/MEK inhibitor combinations among the preferred therapies for first-line and subsequent treatment of metastatic or unresectable melanoma with a *V600*-activating mutation.[2] The combinations are also recommended for adjuvant treatment (category 2B). While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor is an option, especially in patients who are not appropriate candidates for checkpoint immunotherapy.
- **Histiocytic Neoplasms:** Guidelines (version 1.2022 – May 20, 2022) recommend Cotellic (preferred) or Mekinist (other recommended regimen) for histiocytic neoplasms (if there is a MAP kinase pathway mutation, or no detectable mutation, or testing is not available) for the following types: Langerhans cell histiocytosis (including multisystem, pulmonary or central nervous system lesions), Erdheim-Chester disease, and Rosai-Dorfman disease.[3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cotellic. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cotellic is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Histiocytic Neoplasm.** Approve for 1 year if the patient meets the following (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient meets one of the following (i, ii, or iii):
     - **i.** Patient has Langerhans cell histiocytosis and one of the following (a, b, or c):
       - **a)** Multisystem disease; OR
       - **b)** Pulmonary disease; OR
       - **c)** Central nervous system lesions; OR
     - **ii.** Patient has Erdheim-Chester disease; OR
     - **iii.** Patient has Rosai-Dorfman disease.

- **2. Melanoma.** Approve for 1 year if the patient meets the following (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has unresectable, advanced, or metastatic melanoma; AND
- **C)** Patient has *BRAF V600* mutation-positive disease; AND
- **D)** The medication is prescribed in combination with Zelboraf (vemurafenib tablets).

Other Uses with Supportive Evidence

3. **Central Nervous System Cancer.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** The medication is being used for one of the following (i, ii, or iii):
     - **i.** Adjuvant treatment of one of the following conditions (a, b, or c):
       - **a)** Pilocytic astrocytoma; OR
       - **b)** Pleomorphic xanthoastrocytoma; OR
       - **c)** Ganglioglioma; OR
     - **ii.** Recurrent or progressive disease for one of the following (a or d):
       - **a)** Glioma; OR
       - **b)** Isocitrate dehydrogenase-2 (IDH2)-mutant astrocytoma; OR
       - **c)** Oligodendroglioma; OR
       - **d)** Glioblastoma; OR
     - **iii.** Brain metastases due to melanoma; AND
   - **C)** Patient has *BRAF V600* mutation-positive disease; AND
   - **D)** The medication is prescribed in combination with Zelboraf (vemurafenib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cotellic is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Daurismo Prior Authorization Policy
- Daurismo™ (glasdegib tablets – Pfizer)

REVIEW DATE: 01/04/2023

OVERVIEW

Daurismo, a hedgehog pathway inhibitor, is indicated, in combination with low-dose cytarabine, for the treatment of newly diagnosed **acute myeloid leukemia** in adults who are ≥ 75 years of age or who have comorbidities that preclude use of intensive induction chemotherapy.[1]

Guidelines

Daurismo is addressed in the National Comprehensive Cancer Network (NCCN) guidelines:

- **Acute Myeloid Leukemia:** NCCN guidelines (version 2.2022 – June 14, 2022) recommend Daurismo with low-dose cytarabine for newly diagnosed patients ≥ 75 years of age, or who have significant comorbid conditions (i.e., severe cardiac disease, Eastern Cooperative Oncology Group performance status ≥ 2, baseline creatinine > 1.3 mg/dL).[2] This recommendation is for treatment induction in patients without actionable mutations who are not candidates for intensive remission induction therapy or who decline intensive therapy (category 2A).[2] It is also indicated for post-induction therapy following a response to previous lower intensity therapy with the same regimen (category 2A).[2] Daurismo is also indicated for relapsed/refractory disease as a component of repeating the initial successful induction regimen if late relapse (≥ 12 months since induction regimen), if not administered continuously and not stopped due to development of clinical resistance.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Daurismo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Daurismo is recommended in those who meet the following criteria:

FDA-Approved Indication

124. Acute Myeloid Leukemia. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient is using the medication in combination with cytarabine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Daurismo is not recommended in the following situations:

341. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Erivedge Prior Authorization Policy
- Erivedge® (vismodegib capsules – Genentech/Roche)

REVIEW DATE: 12/21/2022

OVERVIEW

Erivedge, an inhibitor of the hedgehog signaling pathway, is indicated for the treatment of adults with metastatic **basal cell carcinoma**, or with locally advanced basal cell carcinoma that has recurred following surgery or who are not candidates for surgery, and who are not candidates for radiation.[1]

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines address Erivedge.

- **Basal Cell Carcinoma:** Guidelines (version 2.2022 – March 24, 2022) note that surgical approaches offer the most effective and efficient means for accomplishing a cure; radiation therapy may be chosen as the primary treatment in order to achieve optimal overall results.[2] When surgery and radiation therapy are contraindicated and for recurrent disease with nodal or distant metastases, Erivedge is among the treatment options (category 2A).
- **Central Nervous System Cancers:** Guidelines (version 2.2022 – September 29, 2022) list Erivedge as a treatment option for adults with recurrent medulloblastoma, if chemotherapy has been tried and if there is a mutation of the sonic hedgehog pathway.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Erivedge. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Erivedge is recommended in those who meet one of the following criteria:

FDA-Approved Indications

89. Basal Cell Carcinoma, Locally Advanced. Approve for 1 year if the patients meets ONE of the following conditions (A or B):

~~**1.**~~ Initial Therapy. Approve if the patient meets BOTH of the following (i and ii):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Patient meets one of the following (a or b):
  - ~~**a)**~~ Patient has recurrent basal cell carcinoma following surgery or radiation therapy; OR
  - ~~**b)**~~ Patient meets BOTH of the following [(1) and (2)]:
    - **(1)** Patient is not a candidate for surgery; AND
    - **(2)** According to the prescriber, the patient is not a candidate for radiation therapy.

2. Patient is Currently Receiving Erivedge. Approve.

90. Basal Cell Carcinoma, Metastatic. Approve for 1 year if the patient is ≥ 18 years of age.

Note: This includes primary or recurrent nodal metastases and distant metastastatic disease.

Other Uses with Supportive Evidence

91. Central Nervous System Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
Note: This includes brain and spinal cord tumors.
A) Patient is ≥ 18 years of age; AND
B) Patient has medulloblastoma; AND
C) Patient has tried at least one chemotherapy agent; AND
Note: Examples of chemotherapy include etoposide, carboplatin, cisplatin.
D) According to the prescriber, the patient has a mutation of the sonic hedgehog pathway.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Erivedge is not recommended in the following situations:

167. Basal Cell Carcinoma (Locally Advanced or Metastatic), in a Patient with Disease Progression While on Odomzo (sonidegib capsules). Note: This does not apply to a patient already started on Erivedge. Refer to criteria for basal cell carcinoma, Locally Advanced for a Patient Currently Receiving Erivedge. There are no data to support the use of Erivedge in patients who have experienced disease progression on Odomzo. Previous use of a hedgehog inhibitor was not allowed in the pivotal study for Odomzo.[3] Patients who develop resistance to one of the hedgehog pathway inhibitors are not expected to respond to another hedgehog pathway inhibitor. There is an open-label study which evaluated patients (n = 9) with advanced basal cell carcinoma who had progressed on Erivedge that showed resistance to Odomzo, another hedgehog signaling pathway used in basal cell carcinoma.[7]

168. Metastatic Colorectal Cancer. Erivedge is not recognized in the treatment recommendations for colon cancer from the NCCN (version 3.2021 – September 10, 2021).[4] In combination with standard of care treatment for first-line disease, Erivedge did not confer incremental clinical benefit as measured by progression-free survival (PFS) compared with standard care therapy alone. A Phase II study was designed to assess whether Erivedge would prolong PFS when combined with standard of care therapy (FOLFOX [leucovorin, fluorouracil, oxaliplatin] or FOLFIRI [leucovorin, fluorouracil, irinotecan] in combination with Avastin® [bevacizumab injection]) in patients requiring first-line treatment for metastatic colorectal cancer.[3] Adults with histologically confirmed disease were randomized 1:1 to Erivedge or placebo (n = 199). There was not a significant difference is median PFS or 12-month survival with Erivedge vs. placebo.

169. Ovarian Cancer. The NCCN guidelines for Ovarian Cancer (version 3.2021 – September 9, 2021) do not address the use of Erivedge for the management of ovarian cancer.[6] The prespecified magnitude of PFS was not achieved in a Phase II, randomized, double-blind, placebo-controlled trial in adults with histologically confirmed epithelial ovarian carcinoma, primary peritoneal carcinoma, or fallopian tube carcinoma. The study was conducted to determine an estimate of clinical benefit of maintenance therapy with Erivedge in the setting of second or third complete remission as measured by PFS using radiographic assessment.[5] Eligible patients had received chemotherapy (platinum based and/or non-platinum based) for recurrent disease and had achieved complete response after their most recent chemotherapy regimen. PFS was not statistically different with Erivedge vs. placebo.

170. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Erleada Prior Authorization Policy
- Erleada® (apalutamide tablets – Janssen)

REVIEW DATE: 04/05/2023

OVERVIEW

Erleada, an androgen receptor inhibitor, is indicated for the treatment of patients with **non-metastatic, castration-resistant prostate cancer (nmCRPC)** and **metastatic castration-sensitive prostate cancer (CSPC)**.[1] Patients should also receive a gonadotropin-releasing hormone (GnRH) analog concurrently or the patient should have had a bilateral orchiectomy.

GUIDELINES

According to the National Comprehensive Cancer Network (NCCN) guidelines for prostate cancer (version 1.2023 – September 16, 2022)[2]:

- For nmCRPC, Erleada, Xtandi® (enzalutamide capsules or tablets), and Nubeqa® (darolutamide tablets) are all preferred category 1 recommended options, if the prostate specific antigen doubling time is ≤ 10 months.
- For mCSPC androgen deprivation therapy in combination with abiraterone + steroid, Erleada, docetaxel, and Xtandi are all preferred category 1 recommended options. Yonsa® (abiraterone acetate tablets) with methylprednisolone is a category 2B recommendation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Erleada. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Erleada is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Prostate Cancer – Non-Metastatic, Castration-Resistant.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient meets ONE of the following criteria (i, ii, or iii):
     - **i.** The medication is used in combination with a gonadotropin-releasing hormone (GnRH) agonist; OR
       Note: Examples of GnRH agonists include: leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant).
     - **ii.** The medication is concurrently used with Firmagon (degarelix subcutaneous injection); OR
     - **iii.** Patient has had a bilateral orchiectomy.

2. **Prostate Cancer – Metastatic, Castration-Sensitive.** Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient meets ONE of the following criteria (i, ii, or iii):
      i. The medication is used in combination with a gonadotropin-releasing hormone (GnRH) agonist; OR
      Note: Examples of GnRH agonists include: leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant)
      ii. The medication is concurrently used with Firmagon (degarelix subcutaneous injection); OR
      iii. Patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Erleada is not recommended in the following situations:

171. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Erlotinib Prior Authorization Policy
- Tarceva® (erlotinib tablets – Genentech, generic)

REVIEW DATE: 01/25/2023

OVERVIEW

Erlotinib, a tyrosine kinase inhibitor, is indicated for the following uses:[1]

- **Non-Small Cell Lung Cancer (NSCLC)**, treatment of patients whose tumors have epidermal growth factor receptor **(*EGFR*) exon 19 deletions** or **exon 21 (L858R) substitution mutations** as detected by an FDA-approved test, receiving first-line, maintenance, or second or greater line treatment after progression following at least one prior chemotherapy regimen. Limitations of use: The safety and efficacy of erlotinib have not been established in patients with NSCLC whose tumors have other *EGFR* mutations. Erlotinib is not recommended for use in combination with platinum-based chemotherapy.
- **Pancreatic Cancer**, in combination with gemcitabine as first-line treatment of patients with locally advanced, unresectable, or metastatic pancreatic cancer.

Guidelines

Erlotinib has been addressed in National Comprehensive Cancer Network (NCCN) guidelines.[2-7]

- **Bone Cancer:** Guidelines (version 2.2023 – September 28, 2022) note erlotinib as a treatment option for patients with chordoma (useful in certain circumstances).[3] The efficacy of erlotinib was demonstrated in patients with advanced chordoma resistant to imatinib.
- **Non-Small Cell Lung Cancer:** Guidelines (version 1.2023 – December 22, 2022) recommend erlotinib and other *EGFR* tyrosine kinase inhibitors as first-line treatment for patients with advanced or metastatic NSCLC with *EGFR* exon 19 deletions, exon 21 (L858R) substitution mutations, L861Q, G719X, and S768I.
- **Pancreatic Adenocarcinoma:** Guidelines (version 2.2022 – December 6, 2022) recommend the combination of gemcitabine and erlotinib as first-line treatment option for patients with locally advanced or metastatic disease (other recommended regimens).[5] In addition, the combination is recommended as a subsequent therapy option for locally advanced, metastatic, or recurrent disease (other recommended regimens).
- **Kidney Cancer:** Guidelines (version 4.2023 – January 18, 2023) note erlotinib as a treatment option for patients with recurrent or advanced renal cell carcinoma of non-clear cell histology (useful in certain circumstances).[6] The combination of bevacizumab with erlotinib is a treatment option for select patients with non-clear cell and papillary cell histology, including hereditary leiomyomatosis and renal cell carcinoma (useful in certain circumstances).
- **Vulvar Cancer:** Guidelines (version 1.2023 – December 22, 2022) recommend erlotinib as a treatment option for patients with advanced, recurrent, or metastatic vulvar cancer (other recommended regimens).[7]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of erlotinib. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of erlotinib is recommended in those who meet one of the following criteria:

FDA-Approved Indications

92. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
3. Patient is ≥ 18 years of age; AND
4. Patient has advanced or metastatic disease; AND
5. Patient has sensitizing *EGFR* mutation-positive non-small cell lung cancer as detected by an approved test.
Note: Examples of sensitizing *EGFR* mutation-positive non-small cell lung cancer include the following: exon 19 deletions, exon 21 (L858R) substitution mutations, L861Q, G719X, and S768I.

93. Pancreatic Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
A) Patient is ≥ 18 years of age; AND
B) Patient has locally advanced, metastatic, or recurrent disease; AND
C) The medication is used in combination with gemcitabine.

Other Uses with Supportive Evidence

3. Bone Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
A) Patient is ≥ 18 years of age; AND
B) Patient has chordoma; AND
C) Patient has tried at least one previous therapy.

4. Renal Cell Carcinoma. Approve for 1 year if the patient meets the following criteria (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient meets one of the following criteria (i or ii):
i. Patient has recurrent or advanced renal cell carcinoma of non-clear cell histology; OR
ii. Patient meets both of the following criteria (a and b):
a) Patient has hereditary leiomyomatosis and renal cell carcinoma; AND
b) The medication is used in combination with bevacizumab.

5. Vulvar Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient has advanced, recurrent, or metastatic disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of erlotinib is not recommended in the following situations:

1. **Breast Cancer.** One Phase II, non-randomized, open-label, bi-institutional trial did not demonstrate a beneficial effect of erlotinib plus bevacizumab in patients with metastatic breast cancer with stage IV disease that was stable or had progressed after treatment with one or two chemotherapy regimens. If the patient's tumor was human epidermal growth factor receptor-2 (HER-2) positive, prior therapy with trastuzumab was required (n = 38).[8] As single-agent therapy, erlotinib had minimal activity in unselected, previously treated women with locally advanced or metastatic breast cancer in one multicenter, Phase II study (n = 69).[9] Metronomic (frequent low-dose) capecitabine tablets and cyclophosphamide plus bevacizumab and erlotinib was effective in patients with untreated advanced metastatic HER-2 negative, estrogen receptor-negative, and progesterone receptor-poor advanced breast cancer (n = 26).[10] Among 24 patients assessable for response, 4% of patients had a complete response (CR) [n = 1], 58% of patients had partial response (PR) [n = 14], 21% of patients had stable disease (SD) > 9 weeks duration (n = 5) and 4% of patients (n = 1) had early progression of disease. The overall clinical benefit (CR + PR + SD > 24 weeks) was 75% (95% confidence interval [CI]: 53, 90). Median time to progression was 43 weeks (95% CI: 21, 69). Overall survival was 108 months (95% CI: 70, 110). NCCN Breast Cancer guidelines (version 4.2022 – June 21, 2022) do not mention erlotinib.[11]

2. **Colon Cancer, Advanced**. NCCN Colon Cancer guidelines (version 2.2022 – October 27, 2022) note several drug combinations, including bevacizumab plus erlotinib, produced negative results in phase III trials involving patients with advanced colorectal cancer and these regimens are not recommended.[12] In addition, the panel recommends against the use of several medications, including erlotinib, for the treatment of patients who progressed after treatment with standard therapies.

3. **Glioblastoma Multiforme (GBM).** In one Phase II study, concurrent radiation therapy (RT) and temozolomide in combination with erlotinib in patients newly diagnosed with glioblastoma (n = 27) was not efficacious.[13] In two Phase II studies, erlotinib plus temozolomide given during and after RT produced favorable median survival, and progression free survival (PFS), as well as 12- or 14-month survival rates in patients with newly diagnosed GBM or gliosarcoma.[14,15] In patients with newly diagnosed (untreated; could have had resection) GBM or gliosarcoma who received erlotinib plus temozolomide during and after radiation, median survival was longer with erlotinib plus temozolomide vs. historical controls (19.3 months vs. 14.1 months, respectively; hazard ratio for survival 0.64; 95% confidence interval [CI]: 0.45, 0.91; P = 0.01) in one open-label, single-center, Phase II trial (n = 65).[14] The historical controls were comparable in patients from two prospective, Phase II trials (n = 128); the first trial included the use of Thalomid® (thalidomide capsules) in combination with temozolomide during and after radiotherapy; the second included the use of *cis*-retinoic acid with temozolomide during and after radiotherapy. In one open-label, Phase I/II trial, treatment with erlotinib plus temozolomide during and after RT resulted in favorable survival rate (61% of patients were alive at 1 year) and median PFS (7.2 months) in patients with newly diagnosed GBM (following resection); however, there was no significant difference in overall survival with the addition of erlotinib compared with the temozolomide/RT arm of a historical control trial (15.3 months vs. 15 months, respectively).[24] Erlotinib has failed to demonstrate benefit in recurrent glioblastomas.[16-19] In a recent study involving patients with recurrent gliobastoma, the combination regimen of sorafenib and erlotinib failed to meet the predetermined efficacy endpoint and the study was terminated.[20] NCCN Central Nervous System guidelines (version 2.2022 – September 29, 2022) do not mention erlotinib as a treatment option for patients with glioblastoma.[21]

4. **Head and Neck Cancer, Squamous Cell, Recurrent and/or Metastatic.** Two Phase II studies assessed the use of erlotinib and bevacizumab in different settings and showed promising results.[2223] One multicenter, Phase II trial assessed the addition of bevacizumab and erlotinib to chemoradiation as first-line treatment for previously untreated patients with locally advanced squamous cell carcinoma of the head and neck (SCCHN) [n = 60].[22] After a median follow-up of 32 months the estimated 3-year progression free survival (PFS) and overall survival rates were 71% and 82%, respectively. After induction therapy, 65% of patients had major responses; after completion of therapy, 95% of patients had either partial or complete radiographic responses. One multi-institutional Phase I/II study enrolled patients with recurrent or metastatic SCCHN (previously treated with ≤ 1 prior regimen for recurrent disease) to receive erlotinib and bevacizumab (n = 56).[23] The median overall survival and PFS durations were 7.1 months (95% confidence interval [CI]: 5.7, 9.0) and 4.1 months (95% CI: 2.8, 4.4), respectively. Treatment with erlotinib monotherapy produced few partial responses in unselected (*EGFR* status not known at baseline) patients with locally recurrent and/or metastatic SCCHN in one open-label, Phase II clinical trial (n = 115); 38.3% of patients achieved stable disease for a median of 16.1 weeks.[24] In one Phase II study, 204 patients with locally advanced SCCHN were randomized to receive cisplatin in combination with radiation therapy (RT) with or without erlotinib.[25] Complete response rates evaluated by central review were reported in 40% of patients (n = 42/105) on cisplatin/RT vs. 52% of patients (n = 51/99) on cisplatin/RT/erlotinib (P = 0.08). At a median follow-up of 26 months and 54 progression events, there was no difference in PFS between the two treatment arms (hazard ratio 0.0; P = 0.71). In a Phase II study, patients with recurrent SCCHN were treated with erlotinib for 12 months (n = 31). The overall survival was 61% at 1 year and 56% at 2 years.[26] Disease-free survival was 54% at 1 year and 45% at 2 years. The mean time to recurrence (n = 16) was 8.7 months. Only 8 patients completed the full 12-month course of erlotinib; the median duration of erlotinib therapy was 5 months. NCCN Head and Neck Cancer guidelines (version 1.2023 – December 20, 2022) do not mention erlotinb.[27]

5. **Hepatocellular Carcinoma, Advanced**. NCCN Hepatobiliary Cancers guidelines (version 5.2022 – January 13, 2023) note the combination regimen of sorafenib and erlotinib did not significantly improve survival compared with sorafenib monotherapy in the treatment of patients with advanced hepatocellular carcinoma (sorafenib is one of several agents recommended for first-line treatment).[28] In addition, the disease control rate was significantly lower for patients who received the combination vs. those who received sorafenib monotherapy; treatment duration was also shorter for those received sorafenib and erlotinib. .

6. **Renal Cell Carcinoma, Advanced – Clear Cell Histology.** NCCN Kidney Cancer guidelines (version 4.2023 – January 18, 2023) do not note erlotinib as a treatment option for advanced clear-cell renal cell carcinoma.[6]

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

A) PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Everolimus Products Prior Authorization Policy
- Afinitor® (everolimus tablets – Novartis, generic)
- Afinitor Disperz® (everolimus tablets for oral suspension – Novartis)

REVIEW DATE: 03/08/2023; selected revision 03/29/2023

OVERVIEW

Afinitor, a kinase inhibitor, is indicated for the following uses:[1]

- **Breast cancer**, treatment of advanced hormone receptor-positive (HR+), human epidermal growth factor receptor 2 (HER2)-negative disease in combination with exemestane, after failure of treatment with letrozole or anastrozole in postmenopausal women.
- **Neuroendocrine tumors (NET)**, treatment of progressive disease of pancreatic origin and progressive, well-differentiated, non-functional NET of gastrointestinal or lung origin that are unresectable, locally advanced, or metastatic in adults. Limitation of Use: Afinitor is not indicated for the treatment of patients with functional carcinoid tumors.
- **Renal cell carcinoma**, treatment of advanced disease after failure of treatment with sunitinib or sorafenib in adults.
- **Tuberous sclerosis complex (TSC)-associated renal angiomyolipoma,** treatment of adults not requiring immediate surgery.
- **TSC-associated subependymal giant cell astrocytoma (SEGA)**, treatment of patients ≥ 1 year of age who require therapeutic intervention but cannot be curatively resected.

Afinitor Disperz, a kinase inhibitor, is indicated for the following uses:[1]

- **TSC-associated subependymal giant cell astrocytoma (SEGA)**, treatment of patients ≥ 1 year of age who require therapeutic intervention but cannot be curatively resected.
- **TSC-associated partial-onset seizures**, adjunctive treatment of patients ≥ 2 years of age.

AAAAA)

Of note, Zortress® (everolimus tablets) is indicated in combination with other drugs for prophylaxis of organ rejection in adults undergoing kidney or liver transplant.[2] The tablet strengths and dosing are different for Zortress and Afinitor. Zortress is not targeted in this policy.

i.

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium recommends use of everolimus for the indications listed in the FDA-Approved Indications and Other Uses with Supportive Evidence sections.[3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of everolimus products. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of everolimus products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

94. Breast Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, D, E, F, and G):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has recurrent or metastatic, hormone receptor positive (HR+) [i.e., estrogen receptor-positive {ER+} and/or progesterone receptor-positive {PR+}] disease; AND
- **C)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- **D)** Patient has tried at least one prior endocrine therapy (e.g., anastrozole, letrozole, or tamoxifen); AND
- **E)** Patient meets ONE of the following conditions (i or ii):
  - **i.** Patient is a postmenopausal woman* or a man*; OR
  - **ii.** Patient is a pre/perimenopausal woman* and meets one of the following (a or b):
    - **a)** Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR

      BBBBB) Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant).
    - **b)** Patient has had surgical bilateral oophorectomy or ovarian irradiation; AND
- **F)** Patient meets ONE of the following conditions (i or ii):
  - **i.** The medication will be used in combination with exemestane and the patient meets one of the following (a or b):
    - **a)** Patient is a man* and the patient is receiving a gonadotropin-releasing hormone (GnRH) analog; OR

      CCCCC) Note: Examples of a GnRH analog include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), and Orgovyx (relugolix tablet).
    - **b)** Patient is a woman*; OR
  - **ii.** The medication will be used in combination with fulvestrant or tamoxifen; AND
- **G)** Patient has not had disease progression while on everolimus.

DDDDD)

*Refer to the Policy Statement.

EEEEE)

95. Neuroendocrine Tumors of the Pancreas, Gastrointestinal Tract, Lung, and Thymus (Carcinoid Tumors). Approve for 1 year if the patient is ≥ 18 years of age.

96. Renal Cell Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has relapsed or Stage IV disease; AND
- **C)** Patient meets one of the following criteria (i or ii):
  - **i.** Patient has non-clear cell disease; OR
  - **ii.** Patient meets both of the following (a and b):
    - **a)** Patient has clear cell disease; AND
    - **b)** Patient has tried at least one prior systemic therapy.

    FFFFF) Note: Examples of prior systemic therapy include the following products: Inlyta (axitinib tablets), Lenvima (lenvatinib capsules), Cabometyx (cabozantinib tablets), Keytruda

(pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion), Votrient (pazopanib tablets), sunitinib.

GGGGG)

4. **Tuberous Sclerosis Complex-Associated Renal Angiomyolipoma.** Approve for 1 year.

5. **Tuberous Sclerosis Complex-Associated Subependymal Giant Cell Astrocytoma (SEGA).** Approve for 1 year if therapeutic intervention is required but SEGA cannot be curatively resected.

6. **Tuberous Sclerosis Complex-Associated Partial Onset Seizures.** Approve for 1 year.

Other Uses with Supportive Evidence

7. **Endometrial Carcinoma.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** The medication will be used in combination with letrozole.

8. **Gastrointestinal Stromal Tumors.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has tried each of the following (i, ii, iii, and iv):
     - **i.** One of imatinib or Ayvakit (avapritinib tablets); AND
     - **ii.** One of sunitinib or Sprycel (dasatinib tablets); AND
     - **iii.** Stivarga (regorafenib tablets); AND
     - **iv.** Qinlock (ripretinib tablets); AND
   - **C)** The medication will be used in combination with imatinib, sunitinib, or Stivarga (regorafenib tablets).

9. **Histiocytic Neoplasm.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **B)** Patient is ≥ 18 years of age; AND
   - **C)** Patient meets one of the following (i, ii, or iii):
     - **i.** Patient has Langerhans cell histiocytosis and one of the following (a, b, c, or d):
       - **a)** Bone disease; OR
       - **b)** Central nervous system lesions; OR
       - **c)** Multisystem disease; OR
       - **d)** Pulmonary disease; OR
     - **ii.** Patient has Erdheim-Chester disease; OR
     - **iii.** Patient has Rosai-Dorfman disease; AND
   - **D)** Patient has a *PIK3CA* mutation.

10. **Classic Hodgkin Lymphoma.** Approve for 1 year if the patient meets the following criteria (A and B):
    - **A)** Patient is ≥ 18 years of age; AND
    - **B)** Patient has relapsed or refractory disease.

HHHHH)

11. **Soft Tissue Sarcoma.** Approve for 1 year if the patient meets the following criteria (A and B):
    - **A)** Patient is ≥ 18 years of age; AND
    - **B)** Patient has one of the following conditions (i or ii):
      - **i.** Perivascular epithelioid cell tumor (PEComa); OR
      - **ii.** Recurrent angiomyolipoma/lymphangioleiomyomatosis.

12. **Thymomas and Thymic Carcinomas.** Approve for 1 year if the patient meets the following criteria (A and B):
    A) Patient is ≥ 18 years of age; AND
    B) Patient meets one of the following criteria (i or ii):
        i. Patient has tried chemotherapy; OR
        IIIII) Note: Examples are cisplatin, doxorubicin, and cyclophosphamide; cisplatin plus etoposide; carboplatin plus paclitaxel.
        ii. Patient cannot tolerate chemotherapy.

13. **Thyroid Carcinoma, Differentiated.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
    A) Patient is ≥ 18 years of age; AND
    B) Patient has differentiated thyroid carcinoma; AND
    Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and Hürthle cell thyroid carcinoma.
    C) The disease is refractory to radioactive iodine therapy.
    JJJJJ)
14. **Uterine Sarcoma**. Approve for 1 year if the patient meets the following criteria (A, B, C and D):
    A) Patient is ≥ 18 years of age; AND
    B) Patient has advanced, recurrent, metastatic, or inoperable disease; AND
    C) Patient has a perivascular epithelioid cell tumor (PEComa); AND
    D) Patient has tried at least one systemic regimen.

KKKKK) Note: Examples of systemic regimen include doxorubicin, docetaxel, gemcitabine, ifosfamide, dacarbazine.

15. **Waldenström's Macroglobulinemia/Lymphoplasmacytic Lymphoma.** Approve for 1 year if the patient meets the following criteria (A and B):
    A) Patient is ≥ 18 years of age; AND
    B) Patient meets one of the following (i or ii):
        i. Patient has not responded to primary therapy; OR
        Note: Examples of primary therapy are bortezomib, dexamethasone, and rituximab; bendamustine and rituximab; cyclophosphamide, rituximab and dexamethasone; Imbruvica (ibrutinib capsules); and Brukinsa (zanubrutinib capsules).
        ii. Patient has progressive or relapsed disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of everolimus products is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Exkivity Prior Authorization Policy
- Exkivity™ (mobocertinib capsules – Takeda)

REVIEW DATE: 09/13/2023; selected revision 10/11/2023

OVERVIEW

Exkivity, an epidermal growth factor receptor (*EGFR*) inhibitor, is indicated for the treatment of adults with locally advanced or metastatic **non-small cell lung cancer (NSCLC)** with *EGFR* exon 20 insertion mutation, as determined by an FDA-approved test, whose disease has progressed on or after platinum-based chemotherapy. Exkivity received accelerated approval for this indication in 2021; however, the drug has failed to meet its primary endpoint in its Phase III confirmatory study. Due to this, on October 2, 2023, the manufacturer announced the initiation of a voluntary withdrawal for Exkivity. The manufacturer noted that patients receiving Exkivity can continue to get access when the drug is withdrawn.

Guidelines

The National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 3.2023 – April 13, 2023) recommend Exkivity as a subsequent treatment option for patients with *EGFR* exon 20 insertion-positive metastatic NSCLC and disease progression on or after initial systemic therapy (category 2A recommendation).[2] Platinum-based chemotherapy is typically recommended as first-line for most patients with *EGFR* exon 20 insertion-positive metastatic NSCLC. Exkivity is also recommended as a treatment option for patients who progressed on Rybrevant™ (amivantamab-vmjw intravenous infusion) [category 2A recommendation]. The NCCN guidelines have not been updated to reflect Exkivity withdrawal from the market.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Exkivity. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Exkivity is recommended in those who meet the following criteria:

FDA-Approved Indication

3. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets the following (A, B, C, D, E, and F):
   - **A)** Patient is currently receiving Exkivity; AND
   - **B)** Patient is ≥ 18 years of age; AND
   - **C)** Patient has locally advanced or metastatic disease; AND
   - **D)** Patient has epidermal growth factor receptor (*EGFR*) exon 20 insertion-positive disease; AND
   - **E)** The mutation was determined by an approved test; AND
   - **F)** Patient has previously tried at least one platinum-based chemotherapy.

- Note: Examples of platinum-based chemotherapy include carboplatin, cisplatin, and oxaliplatin.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Exkivity is not recommended in the following situations:

13. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Farydak Prior Authorization Policy
- Farydak® (panobinostat capsules – Novartis)

REVIEW DATE: 05/31/2023

OVERVIEW

Farydak, a histone deacetylase inhibitor, was approved in combination with bortezomib injection and dexamethasone for the treatment of patients with **multiple myeloma** who have received at least two prior regimens, including bortezomib injection and an immunomodulatory drug (i.e., Thalomid® [thalidomide capsules], Revlimid® [lenalidomide capsules], Pomalyst® [pomalidomide capsules]).[1]

The FDA granted accelerated approval to Farydak in February 2015, based on progression free survival from a randomized, double-blind, placebo-controlled, multicenter, Phase III study. In December 2021, the manufacturer removed Farydak from the market because the required post-approval clinical studies were not feasible.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for multiple myeloma (version 3.2023 – December 8, 2022) note that due to market withdrawal, regimens containing Farydak were removed from the guideline.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Farydak. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Farydak is recommended in those who meet the following criteria:

FDA-Approved Indication

97. Multiple Myeloma. Approve for 1 year if the patient meets the following (A, B, C, and D):
- **6.** Patient is currently receiving Farydak; AND
- **7.** Patient has previously tried bortezomib injection; AND
- **8.** Patient has tried one immunomodulatory drug (i.e., Thalomid [thalidomide capsules], lenalidomide capsules, or Pomalyst [pomalidomide capsules]); AND
- **9.** The medication will be taken in combination with bortezomib injection and dexamethasone.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Farydak is not recommended in the following situations:

172. Pancreatic Cancer. A Phase II study evaluating Farydak + bortezomib injection in patients with pancreatic cancer who were progressing on gemcitabine-based therapy was discontinued early due to toxicity and a lack of response.[3]

173. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Fotivda Prior Authorization Policy
- Fotivda® (tivozanib tablets – AVEO)

REVIEW DATE: 04/19/2023

OVERVIEW

Fotivda, a kinase inhibitor, is indicated for the treatment of relapsed or refractory advanced **renal cell carcinoma (RCC)** following two or more prior systemic therapies in adults.[1]

Guidelines

In the National Comprehensive Cancer Network (NCCN) clinical practice guidelines for kidney cancer (version 4.2023 – January 18, 2023), Fotivda is given a category 2A recommendation as "useful in certain circumstances" for subsequent therapy for clear cell histology, with a footnote that states this recommendation applies to patients who have received ≥ two systemic therapies. It is also recommended under "Other recommended regimens" for subsequent therapy for clear cell histology in patients who have had prior immune-oncology therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Fotivda. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Fotivda is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Renal Cell Carcinoma.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
1. Patient is ≥ 18 years of age; AND
1. Patient has relapsed or Stage IV disease; AND
1. Patient has tried at least two other systemic regimens.

    101. Note: Examples of systemic regimens for renal cell carcinoma include Inlyta (axitinib tablets) + Keytruda (pembrolizumab intravenous infusion), Cabometyx (cabozantinib tablets) + Opdivo (nivolumab intravenous infusion), Lenvima (lenvatinib capsules) + Keytruda, Yervoy (ipilimumab intravenous infusion) + Opdivo, sunitinib, Votrient (pazopanib tablets), and Lenvima+ everolimus.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Fotivda is not recommended in the following situations:

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

102.

103.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Fruzaqla Prior Authorization Policy
- Fruzaqla™ (fruquintinib capsules – Takeda)

REVIEW DATE: 11/15/2023; selected revision 12/13/2023

OVERVIEW

Fruzaqla; a kinase inhibitor of vascular endothelial growth factor receptors (VEGFR)-1, -2, and -3; is indicated for the treatment of **metastatic colorectal cancer** in adults who have been previously treated with fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapy, an anti-vascular endothelial growth factor (VEGF) therapy, and if *RAS* wild-type and medically appropriate an anti-epidermal growth factor receptor (EGFR) therapy.

Guidelines

The National Comprehensive Cancer Network colon (version 4.2023 – November 16, 2023) and rectal (version 6.2023 – November 16, 2023) cancer treatment guidelines recommend Fruzaqla for the subsequent treatment of advanced or metastatic colon, rectal, or appendiceal cancer as a single agent.[2-4] Patients should have progressed through all available regimens except Fruzaqla, Lonsurf® (trifluridine, tipiracil tablet), and Stivarga® (regorafenib tablet).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Fruzaqla. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Fruzaqla is recommended in those who meet the following criteria:

FDA-Approved Indication

125. Colon, Rectal, or Appendiceal Cancer. Approve for 1 year if the patient meets the following (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has advanced or metastatic disease; AND
- **C)** Patient has previously been treated with the following (i, ii, and iii)
  - **i.** Fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapy; AND
    Note: Examples of fluoropyrimidine agents include 5-fluorouracil (5-FU) and capecitabine.
  - **ii.** An anti-vascular endothelial growth factor (VEGF) agent; AND
    Note: Examples of anti-VEGF agents include bevacizumab.
  - **iii.** If the tumor is *RAS* wild-type (*KRAS* wild-type and *NRAS* wild-type) [that is, the tumor or metastases are *KRAS* and *NRAS* mutation negative], the patient meets ONE of the following (a or b):
    - **a)** According to the prescriber, anti-epidermal growth factor receptor (EGFR) therapy is NOT medically appropriate; OR

b) The patient has received an anti-EGFR therapy.
Note: Examples of anti-EGFR therapy includes Erbitux (cetuximab intravenous infusion) and Vectibix (panitumumab intravenous infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Fruzaqla is not recommended in the following situations:

342. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Gavreto Prior Authorization Policy
- Gavreto® (pralsetinib capsules – Blueprint Medicines)

REVIEW DATE: 09/13/2023

OVERVIEW

Gavreto, a kinase inhibitor, is indicated for the following uses:[1]

- **Non-small cell lung cancer**, in adults with metastatic *RET* fusion-positive disease as detected by an FDA approved test.
- **Thyroid cancer**, in adults and pediatric patients ≥ 12 years of age with advanced or metastatic *RET* fusion-positive disease who require systemic therapy and who are radioactive iodine-refractory (if radioactive iodine is appropriate).
  This indication was approved under accelerated approval based on overall response rate and duration of response. Continued approval may be contingent upon verification and description of clinical benefit in confirmatory trial(s).

Guidelines

Gavreto is addressed in the National Comprehensive Cancer Network (NCCN) guidelines:

- **Non-Small Cell Lung Cancer:** Guidelines (version 3.2023 – April 13, 2023) recommend Gavreto and Retevmo® (selpercatinib capsules) as "preferred" first-line therapies for *RET* rearrangement-positive recurrent, advanced, or metastatic disease (both category 2A).[2] For patients who were started on other systemic therapy options and had disease progression, Gavreto and Retevmo are recommended as "preferred" subsequent therapies (category 2A). The NCCN compendium recommend Gavreto and Retevmo for locoregional recurrence or symptomatic local disease with *RET* rearrangement (both category 2B).[4]
- **Thyroid Carcinoma:** Guidelines (version 4.2023 – August 16, 2023) recommend the use of Gavreto and Retevmo in a variety of therapy settings.[3] The guidelines recommend Gavreto and Retevmo for differentiated thyroid carcinoma (papillary, follicular, oncocytic carcinoma) with *RET* fusion-positive tumors for unresectable locoregional recurrent or persistent disease, or distant metastatic disease that is not amenable to radioactive therapy as "useful in certain circumstances" (category 2A). For recurrent, persistent, locoregional or metastatic medullary thyroid cancer, Gavreto (category 2B) or Retevmo (category 2A) are listed as "preferred" options for *RET* mutation-positive disease. For anaplastic carcinoma, Gavreto or Retevmo can be used for *RET*-fusion positive tumors as neoadjuvant therapy for locoregional disease (category 2A). For metastatic anaplastic carcinoma, molecular testing for actionable mutations is recommended; if positive for *RET* fusion, Gavreto or Retevmo can be considered (category 2A).[3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Gavreto. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gavreto is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Differentiated Thyroid Cancer.** Approve for 1 year if the patient meets the following (A, B, C and D):

104. Note: Differentiated thyroid cancer includes papillary, follicular, and oncocytic thyroid cancer; see below for other types of thyroid cancer.

- **A)** Patient is ≥ 12 years of age; AND
- **B)** Patient has unresectable, recurrent, or metastatic disease; AND
- **C)** Patient has rearranged during transfection (*RET*) fusion-positive or *RET*-mutation-positive disease; AND
- **D)** Patient meets both of the following (i and ii):
  - **i.** The disease requires treatment with systemic therapy; AND
  - **ii.** The disease is radioactive iodine-refractory.

105.

2. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets the following (A, B, and C):

- **D)** Patient is ≥ 18 years of age; AND
- **E)** Patient has recurrent, advanced, or metastatic disease; AND
- **F)** Patient has rearranged during transfection (*RET*) fusion-positive disease as detected by an approved test.

Other Uses with Supportive Evidence

3. **Anaplastic Thyroid Cancer**. Approve for 1 year if the patient meets the following (A, B and C):

- **A)** Patient is ≥ 12 years of age; AND
- **B)** Patient has unresectable, recurrent, or metastatic disease; AND
- **C)** Patient has rearranged during transfection (*RET*) fusion-positive or *RET*-mutation-positive disease.

4. **Medullary Thyroid Cancer**. Approve for 1 year if the patient meets the following (A, B, C and D):

- **A)** Patient is ≥ 12 years of age; AND
- **B)** Patient has unresectable, recurrent, or metastatic disease; AND
- **C)** Patient has rearranged during transfection (*RET*) fusion-positive or *RET*-mutation-positive disease; AND
- **D)** Patient is continuing therapy with Gavreto.

106.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Gavreto is not recommended in the following situations:

343. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

107.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Gefitinib Prior Authorization Policy
- Iressa® (gefitinib tablets – AstraZeneca, generics)

REVIEW DATE: 09/06/2023

OVERVIEW

Gefitinib, a tyrosine kinase inhibitor, is indicated for the first-line treatment of patients with metastatic **non-small cell lung cancer (NSCLC)** whose tumors have epidermal growth factor receptor (*EGFR*) exon 19 deletions or exon 21 (L858R) substitution mutations as detected by an FDA-approved test.[1]

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 3.2023 – April 13, 2023) recommend testing for sensitizing *EGFR* mutations in patients with metastatic disease.[2] Patients with sensitizing *EGFR* mutations have a significantly better response to the *EGFR* tyrosine kinase inhibitors (TKIs) [erlotinib, Gilotrif, gefitinib, Tagrisso, and Vizimpro]. The most common *EGFR* mutations are exon 19 deletions and exon 21 (L858R) substitution mutations. Other less common mutations that are also sensitive to *EGFR* TKIs include L861Q, G719X, and S768I; these mutations cumulatively account for approximately 10% of all *EGFR* mutations. NCCN recommends the *EGFR* TKIs as first-line treatment for patients with advanced or metastatic NSCLC with *EGFR* exon 19 deletions, exon 21 (L858R) substitution mutations, L861Q, G719X, and S768I.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of gefitinib. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of gefitinib is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   - **98.** Patient is ≥ 18 years of age; AND
   - **99.** Patient has advanced or metastatic disease; AND
   - **100.** Patient has sensitizing *EGFR* mutation-positive disease; AND
     Note: Examples of sensitizing *EGFR* mutation-positive non-small cell lung cancer include the following: exon 19 deletions, exon 21 (L858R) substitution mutations, L861Q, G719X, and S768I.
   - **101.** The mutation was detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of gefitinib is not recommended in the following situations:

174. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

485. Iressa® tablets [prescribing information]. Wilmington, DE: AstraZeneca; May 2021.

486. The NCCN Non-Small Cell Lung Cancer Clinical Practice Guidelines in Oncology (version 3.2023 – April 13, 2023). © 2023 National Comprehensive Cancer Network, Inc. Available at: http://www.nccn.org. Accessed on August 28, 2023.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Gilotrif Prior Authorization Policy
- Gilotrif® (afatinib tablets – Boehringer Ingelheim)

REVIEW DATE: 11/29/2023

OVERVIEW

Gilotrif, a tyrosine kinase inhibitor (TKI), is indicated for the following uses:[1]

- **Non-small cell lung cancer (NSCLC)**, first-line treatment of patients with metastatic disease whose tumors have non-resistant epidermal growth factor receptor (*EGFR*) mutations as detected by an FDA-approved test.
  Limitations of use: The safety and efficacy of Gilotrif have not been established in patients whose tumors have resistant *EGFR* mutations.
- **NSCLC, squamous cell,** for the treatment of patients with metastatic disease progressing after platinum-based chemotherapy.

Guidelines

Gilotrif has been addressed in National Comprehensive Cancer Network (NCCN) guidelines.[2-4]

- **Head and Neck Cancer:** Guidelines (version 1.2024 – October 9, 2023) recommend Gilotrif as a single agent for the treatment of recurrent, unresectable, or metastatic non-nasopharyngeal cancers (lip, oral cavity, oropharynx, hypopharynx, glottis, larynx, supraglottic, larynx, ethmoid sinus, maxillary sinus, occult primary) in patients with disease progression or after platinum-based therapy (category 2B).[3]
- **Non-Small Cell Lung Cancer (NSCLC)**: Guidelines (version 5.2023 – November 8, 2023) recommend testing for sensitizing *EGFR* mutations in patients with metastatic disease.[4] Patients with sensitizing EGFR mutations have a significantly better response to the *EGFR* tyrosine kinase inhibitors (TKIs) [erlotinib, Gilotrif, Iressa®, Tagrisso®, and Vizimpro]. The most common *EGFR* mutations are exon 19 deletions and exon 21 (L858R) substitution mutations. Other less common mutations that are also sensitive to *EGFR* TKIs include L861Q, G719X, and S768I; these mutations cumulatively account for approximately 10% of all EGFR mutations. NCCN recommends the *EGFR* TKIs as first-line treatment for patients with advanced or metastatic NSCLC with *EGFR* exon 19 deletions, exon 21 (L858R) substitution mutations, L861Q, G719X, and S768I. NCCN does not recommend Gilotrif for use as second-line treatment for patients with squamous cell NSCLC (without *EGFR* mutations); NCCN notes Gilotrif to be less efficacious and safe compared with other available options.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Gilotrif. All approvals are provided for duration as noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gilotrif is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Non-Small Cell Lung Cancer – Epidermal Growth Factor Receptor (*EGFR*) Mutation-Positive.** Approve for 1 year if the patient meets the following (A, B, and C):
   10. Patient is ≥ 18 years of age; AND
   ~~**11.**~~ Patient has advanced or metastatic disease; AND
   ~~**12.**~~ Patient has sensitizing *EGFR* mutation-positive non-small cell lung cancer as detected by an approved test.
   Note: Examples of sensitizing *EGFR* mutation-positive non-small cell lung cancer include the following: exon 19 deletions, exon 21 (L858R) substitution mutations, L861Q, G719X, and S768I.

2. **Non-Small Cell Lung Cancer – Squamous Cell Carcinoma.** Approve for 1 year if the patient meets the following (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has metastatic squamous cell carcinoma; AND
   C) Patient has disease progression after treatment with platinum-based chemotherapy.

Other Uses with Supportive Evidence

3. **Head and Neck Cancer.** Approve for 1 year if the patient meets the following (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has non-nasopharyngeal head and neck cancer; AND
   Note: Examples of non-nasopharyngeal head and neck cancer are lip, oral cavity, oropharynx, hypopharynx, glottis, larynx, supraglottic larynx, ethmoid sinus, maxillary sinus, occult primary.
   C) Patient has disease progression on or after platinum-based chemotherapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Gilotrif is not recommended in the following situations:

175. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ibrance Prior Authorization Policy
- Ibrance® (palbociclib capsules and tablets – Pfizer)

REVIEW DATE: 02/22/2023

OVERVIEW

Ibrance, a cyclin-dependent kinase (CDK) 4/6 inhibitor, is indicated for the treatment of hormone receptor positive (HR+), human epidermal growth factor receptor 2 (HER2)-negative **advanced or metastatic breast cancer** in adults, in combination with:[1]

- An aromatase inhibitor (AI) as initial endocrine-based therapy.
- Fulvestrant in patients with disease progression following endocrine therapy.

176.

Guidelines

Ibrance is discussed in in guidelines from National Comprehensive Cancer Network (NCCN):

- **Breast Cancer:** NCCN guidelines (version 2.2023 – February 7, 2023) recommend Ibrance + AI or fulvestrant (category 2A) as a first-line "Preferred Regimen".[2,3] CDK4/6 inhibitor + fulvestrant is recommended for second- and subsequent-line therapy as a "Preferred Regimen", if CDK4/6 inhibitor was not previously used (category 1). However, the guidelines state in a footnote that if there is disease progression on Ibrance, there are limited phase II data to support the use of Kisqali® (ribociclib tablets) in the second-line setting.[2,3] The guidelines state that in Phase III randomized controlled trials, fulvestrant in combination with a CDK4/6 inhibitor has shown overall survival benefit in the second-line setting. The compendium recommends that men with breast cancer be treated similarly to postmenopausal women, except that the use of an AI is ineffective without concomitant suppression of testicular steroidogenesis.[3]
- **Liposarcoma:** NCCN guidelines on soft tissue sarcoma (version 2.2022 – May 17, 2022) recommend Ibrance as single-agent therapy for the treatment of unresectable well-differentiated/dedifferentiated liposarcoma for retroperitoneal sarcomas as "Useful In Certain Circumstances" (category 2A).[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ibrance. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ibrance is recommended in those who meet one of the following criteria:

FDA-Approved Indications

102. Breast Cancer in a Woman*. Approve for 1 year if the patient meets the following criteria (A, B, C, D, E, and F):

13. Patient is ≥ 18 years of age; AND

14. Patient has recurrent or metastatic disease; AND

15. Patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND

16. Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND

17. Patient meets ONE of the following criteria (i or ii):

i. Patient is postmenopausal; OR

ii. Patient is pre/perimenopausal and meets one of the following (a or b):

a) Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR

177. Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous injection).

b) Patient has had surgical bilateral oophorectomy or ovarian irradiation; AND

18. Patient meets ONE of the following criteria (i or ii):

i. Ibrance will be used in combination with anastrozole, exemestane, or letrozole; OR

ii. Ibrance will be used in combination with fulvestrant.

***** Refer to the Policy Statement.

2. Breast Cancer in a Man*. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

A) Patient is ≥ 18 years of age; AND

B) Patient has recurrent or metastatic disease; AND

C) Patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND

D) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND

E) Patient meets ONE of the following criteria (i or ii):

i. Patient meets BOTH of the following criteria (a and b):

a) Patient is receiving a gonadotropin-releasing hormone (GnRH) analog; AND
Note: Examples of a GnRH analog include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), Orgovyx (relugolix tablet).

b) Ibrance will be used in combination with anastrozole, exemestane, or letrozole; OR

ii. Ibrance will be used in combination with fulvestrant.

***** Refer to the Policy Statement.

Other Uses with Supportive Evidence

3. Liposarcoma. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has well-differentiated/dedifferentiated liposarcoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ibrance is not recommended in the following situations:

178. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

GnRH – Gonadotropin-releasing hormone.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Iclusig Prior Authorization Policy
- Iclusig® (ponatinib tablets – ARIAD/Takeda)

REVIEW DATE: 05/31/2023

OVERVIEW

Iclusig, a tyrosine kinase inhibitor (TKI), is indicated for the following uses in adults:[1]
- Philadelphia chromosome-positive (Ph+) **acute lymphoblastic leukemia** (ALL) for whom no other TKIs are indicated.
- Ph+ **ALL, T315I-positive**.
- **Chronic myeloid leukemia** (CML), chronic phase, with resistance or intolerance to at least two prior TKIs.
- **CML**, accelerated phase or blast phase.
- **CML, T315I-positive** (chronic phase, accelerated phase, or blast phase).

A limitation of use is that Iclusig is not indicated and is not recommended for the treatment of patients with newly diagnosed chronic phase CML.

Guidelines

Iclusig is addressed in guidelines from National Comprehensive Cancer Network (NCCN):[2-4]
- **Acute Lymphoblastic Leukemia (ALL):** NCCN guidelines (version 1.2022 – April 4, 2022) [adults] recommend Iclusig as a treatment option for patients with the T315I mutation and/or for patients for whom no other TKI is indicated (category 2A).[2] Iclusig has also shown promising activity when included in various regimens.
- **CML:** NCCN guidelines (version 1.2023 – March 24, 2023) recommend Iclusig as an option for patients with a T315I mutation and/or chronic phase CML with resistance or intolerance to at least two prior TKIs or for patients with accelerated-phase CML or blast-phase CML for whom no other TKI is indicated (category 2A).
- **Gastrointestinal Stromal Tumor (GIST)**: NCCN guidelines (version 1.2023 – March 13, 2023) recommend Iclusig as "useful in certain circumstances" after failure on approved therapies (category 2A); the guidelines state the Iclusig has demonstrated activity in advanced GIST, particularly in patients with *KIT* exon 11 mutant disease.[4] Imatinib is a preferred regimen for first-line therapy (category 1) for sensitive mutations (excluding platelet-derived growth factor receptor alpha [*PDGFRA]* exon 18 mutations that are insensitive to imatinib including D842V mutation). Ayvakit® (avapritinib tablets) is also a preferred regimen (category 2A) for GIST with *PDGFRA* exon 18 mutations that are insensitive to imatinib, including the *PDGFRA* D842V mutation. Second-line therapies include sunitinib as "preferred" (category 1) and Sprycel as "other recommended regimen" (category 2A). Stivarga® (regorafenib tablets) is a "preferred" third-line therapy (category 1). Qinlock™ (ripretinib tablets) is a "preferred" fourth-line therapy (category 1).
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions:** NCCN guidelines (version 1.2023 – May 19, 2023) recommend Iclusig for *ABL1* and *FGFR1* rearrangements in chronic phase or blast phase as "other recommended regimens" (category 2A).[5] It is also recommended as treatment in combination with ALL- or acute myeloid leukemia-type induction chemotherapy followed by allogeneic hematopoietic stem cell transplantation (HSCT)

[if eligible] for lymphoid, myeloid or mixed lineage neoplasms with eosinophilia and *ABL1* and *FGFR1* rearrangements in blast phase (category 2A).

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Iclusig. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Iclusig is recommended in those who meet one of the following criteria:

FDA-Approved Indications

103. Acute Lymphoblastic Leukemia. Approve for 1 year if the patient meets the following criteria (A, B, and C):
C) Patient is ≥ 18 years of age; AND
D) Patient has Philadelphia chromosome-positive acute lymphoblastic leukemia; AND
E) Patient meets one of the following criteria (i or ii):
i. The acute lymphoblastic leukemia is T315I-positive; OR
ii. Patient has tried at least two other tyrosine kinase inhibitors that are used for Philadelphia chromosome-positive acute lymphoblastic leukemia.
Note: Examples include imatinib and Sprycel (dasatinib tablets).

104. Chronic Myeloid Leukemia (CML). Approve for 1 year if the patient meets the following criteria (A, B, and C):
A) Patient is ≥ 18 years of age; AND
B) Patient has Philadelphia chromosome-positive chronic myeloid leukemia; AND
C) Patient meets one of the following criteria (i, ii or iii):
i. The chronic myeloid leukemia is T315I-positive, OR
ii. Patient has tried at least two other tyrosine kinase inhibitors indicated for use in Philadelphia chromosome-positive chronic myeloid leukemia; OR
Note: Examples include imatinib, Sprycel (dasatinib tablets), and Tasigna (nilotinib capsules).
iii. Patient meets the following criteria (a and b):
a) Patient has accelerated-phase CML or blast-phase CML; AND
b) No other tyrosine kinase inhibitor is indicated.

Other Uses with Supportive Evidence

3. Gastrointestinal Stromal Tumor. Approve for 1 year if the patient meets the following criteria (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient has tried each of the following (i, ii, iii, and iv):
i. One of imatinib or Ayvakit (avapritinib tablets); AND
ii. One of sunitinib or Sprycel (dasatinib tablets); AND
iii. Stivarga (regorafenib tablets); AND
iv. Qinlock (ripretinib tablets).

4. **Myeloid/Lymphoid Neoplasms with Eosinophilia.** Approve for 1 year if the patient meets the following criteria (A and B):

C) Patient is ≥ 18 years of age; AND

D) Patient meets one of the following criteria (i or ii):

i. The tumor has an *ABL1* rearrangement; OR

ii. The tumor has an *FGFR1* rearrangement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Iclusig is not recommended in the following situations:

179. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Idhifa Prior Authorization Policy
- Idhifa® (enasidenib tablets – Celgene/Servier/Bristol-Myers Squibb)

REVIEW DATE: 03/08/2023

OVERVIEW
Idhifa, an isocitrate dehydrogenase-2 *(IDH2*) inhibitor, is indicated for the treatment of relapsed or refractory **acute myeloid leukemia** in adults with an *IDH2* mutation as detected by an FDA-approved test.[1]

Guidelines
The National Comprehensive Cancer Network (NCCN) guidelines on acute myeloid leukemia (version 1.2023 – March 3, 2023) note Idhifa as an alternative for *IDH2* mutated AML in a variety of clinical scenarios, such as treatment induction, follow-up after induction therapy, consolidation therapy, or relapsed or refractory disease (category 2A).

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Idhifa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Idhifa is recommended in those who meet the following criteria:

FDA-Approved Indication

105. Acute Myeloid Leukemia. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has isocitrate dehydrogenase-2 (*IDH2*) mutation-positive disease as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Idhifa is not recommended in the following situations:

180. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Imatinib Prior Authorization Policy
- Gleevec® (imatinib tablets– Novartis, generic)

REVIEW DATE: 05/31/2023

OVERVIEW

Imatinib, a tyrosine kinase inhibitor (TKI), is indicated for the following uses:[1,2]

- **Acute lymphoblastic leukemia (ALL)**, Philadelphia chromosome positive (Ph+), in adults with relapsed or refractory disease.
- **ALL**, newly diagnosed and Ph+, in combination with chemotherapy in pediatric patients.
- **Aggressive systemic mastocytosis**, without the D816V c-Kit mutation or with unknown c-Kit mutational status, in adults.
- **Chronic myeloid leukemia (CML)**, newly diagnosed and Ph+, chronic phase in adult and pediatric patients.
- **CML**, Ph+, in blast phase, accelerated phase, or in chronic phase in patients after failure of interferon alfa therapy.
- **Dermatofibrosarcoma protuberans** in adults with unresectable, current, and/or metastatic disease.
- **Gastrointestinal stromal tumors (GIST)**, in patients with KIT (CD117) positive unresectable and/or metastatic malignant disease.
- **GIST**, Kit (CD117) positive, as adjuvant treatment of adults following resection.
- **Hypereosinophilic syndrome and/or chronic eosinophilic leukemia**, in adults who have the *FIP1L1-PDGFR* alpha fusion kinase (mutation analysis or fluorescence in situ hybridization demonstration of CICH2 allele deletion) and for patients with hypereosinophilic syndrome and/or chronic eosinophilic leukemia who are *FIP1l1-PDGFR* alpha fusion kinase negative or unknown.
- **Myelodysplastic/myeloproliferative diseases**, associated with *PDGFR* gene rearrangements in adults.

Guidelines

Imatinib is addressed in guidelines from National Comprehensive Cancer Network (NCCN):

- **ALL:** NCCN guidelines for adults and adolescents (version 1.2022 – April 4, 2022) recommend imatinib for Ph+ disease in many different clinical circumstances (e.g., induction, consolidation therapy, maintenance, or relapsed or refractory disease) [category 2A].[3] NCCN guidelines for pediatric ALL (version 2.2023 – March 10, 2023) feature imatinib prominently (category 2A) in a variety of clinical scenarios.[4]
- **Bone Cancer:** NCCN guidelines (version 3.2023 – April 4, 2023) recommend imatinib either as monotherapy or as "other recommended regimens" or in combination with cisplatin or Rapamune® (sirolimus tablets) for chordoma as "useful in certain circumstances" (both category 2A).[5]
- **CML:** NCCN guidelines (version 2.2023 – April 13, 2023) state that for patients with chronic phase CML with a low-risk score, the primary treatment recommendations includes a first-generation TKI (imatinib) or a second-generation TKI (Bosulif® [bosutinib tablets], Sprycel® [dasatinib tablets], or Tasigna® [nilotinib capsules] {all category 1}).[6] For patients with chronic phase CML with an intermediate- or high-risk score, a second-generation TKI is preferred (Bosulif, Sprycel, or Tasigna [all category 1]); imatinib is an alternative (category 2A); imatinib is also recommended for other clinical scenarios (category 2A).

- **Dermatofibrosarcoma Protuberans:** NCCN guidelines (version 1.2023 – December 8, 2022) recommend to consider neoadjuvant imatinib for unresectable/borderline disease (category 2A) and for recurrent or metastatic disease in cases where the disease is unresectable, or unacceptable functional or adverse cosmetic outcomes may occur with resection (category 2A).[7]
- **GIST:** NCCN guidelines (version 1.2023 – March 13, 2023) recommend imatinib as a "preferred regimen" for first-line therapy (category 1) in various scenarios (e.g., for sensitive mutations or for *PDGFRA* exon 18 mutations [excluding the D842V mutation) and is recommended in other clinical scenarios (e.g., neoadjuvant and adjuvant therapy)[category 2A].[8]
- **Graft-Versus-Host Disease (GVHD):** NCCN guidelines for hematopoietic cell transplantation (version 1.2023 – March 31, 2023) address GVHD.[9] Imatinib is cited as one of many therapies recommended for steroid-refractory, chronic GVHD (category 2A).
- **Kaposi Sarcoma:** NCCN guidelines (version 1.2023 – December 20, 2022) recommend imatinib for subsequent systemic therapy for relapsed/refractory therapy as "useful in certain circumstances".[10] First-line systemic therapy options are liposomal doxorubicin as "preferred regimen" and paclitaxel.
- **Melanoma: Cutaneous:** NCCN guidelines (version 2.2023 – March 10, 2023) recommend imatinib as second-line or subsequent therapy for metastatic or unresectable disease for tumors with activating mutations of *KIT* as "useful in certain circumstances" (category 2A).[11]
- **Myelodysplastic Syndromes:** NCCN guidelines (version 1.2023 – September 12, 2022) note that data have demonstrated that patients with chronic myelomonocytic leukemia who have *PDGFRβ* gene rearrangement at 5q32 may respond well to imatinib.[12]
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions:** NCCN guidelines (version 1.2023 – May 19, 2023) recommend imatinib for patients with *ABL1* rearrangements in the chronic phase or blast phase (category 2A).[13] Imatinib is also recommended for certain situations where the tumor has an FIP1L1-PDGFRA or PDGFRB rearrangement (category 2A). Imatinib is also recommended for treatment in combination with ALL- or acute myeloid leukemia-type induction chemotherapy followed by allogeneic hematopoietic stem cell transplantation (if eligible) for lymphoid, myeloid or mixed lineage neoplasms with eosinophilia and ABL1 rearrangement in blast phase (category 2A).
- **Soft Tissue Sarcomas:** NCCN guidelines (version 2.2023 – April 25, 2023) recommend imatinib for desmoid tumors (aggressive fibromatosis) as a "preferred regimen" (category 2A). For dermatofibrosarcoma protuberans with fibrosarcomatous transformation, imatinib is recommended as a "preferred regimen" (category 2A). For pigmented villonodular synovitis/tenosynovial giant cell tumor, imatinib is recommended as "useful in certain circumstances" (category 2A).[14]
- **Systemic Mastocytosis:** NCCN guidelines (version 1.2023 – May 24, 2023,) recommend imatinib (for *KIT* D816V mutation negative or unknown; well differentiated systemic mastocytosis; eosinophilia is present with *FIP1L1-PDGFRA* fusion gene) for aggressive systemic mastocytosis as "useful in certain circumstances" (category 2A).[15]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of imatinib tablets. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of imatinib is recommended in those who meet one of the following criteria:

FDA-Approved Indications

~~5.~~ **Acute Lymphoblastic Leukemia.** Approve for 1 year if the patient has Philadelphia chromosome-positive acute lymphoblastic leukemia.

~~6.~~ **Aggressive Systemic Mastocytosis.** Approve for 1 year if the patient is ≥ 18 years of age.

~~7.~~ **Chronic Myeloid Leukemia.** Approve for 1 year if the patient has Philadelphia chromosome-positive chronic myeloid leukemia.

8. **Dermatofibrosarcoma Protuberans.** Approve for 1 year if the patient is ≥ 18 years of age.

~~9.~~ **Gastrointestinal Stromal Tumors.** Approve for 1 year.

~~10.~~ **Hypereosinophilic Syndrome and/or Chronic Eosinophilic Leukemia.** Approve for 1 year if the patient is ≥ 18 years of age.

11. **Myelodysplastic/Myeloproliferative Disease.** Approve for 1 year if the patient meets the following criteria (A and B):
    A) Patient is ≥ 18 years of age; AND
    B) The condition is associated with platelet-derived growth factor receptor (*PDGFR*) gene rearrangements.

Other Uses with Supportive Evidence

~~12.~~ **Chordoma.** Approve for 1 year.

13. **Desmoid Tumors (Aggressive Fibromatosis.** Approve for 1 year

~~14.~~ **Graft-Versus-Host Disease, Chronic.** Approve for 1 year if the patient has tried at least one conventional systemic treatment for graft-versus-host disease.
    Note: Examples include corticosteroids (methylprednisolone, prednisone); cyclosporine; tacrolimus; mycophenolate mofetil; Imbruvica (ibrutinib capsules, tablets, and oral suspension); low-dose methotrexate; sirolimus; Rezurock (belumosudil tablets); and Jakafi (ruxolitinib tablets).

15. **Kaposi Sarcoma.** Approve for 1 year if the patient meets the following criteria (A, B and C):
    A) Patient is ≥ 18 years of age; AND
    B) Patient has tried at least one medication; AND
    Note: Examples include liposomal doxorubicin, paclitaxel, Pomalyst (pomalidomide capsules), lenalidomide, etoposide, and Thalomid (thalidomide capsules).
    C) Patient has relapsed or refractory disease.

~~16.~~ **Melanoma, Cutaneous.** Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
    A) Patient is ≥ 18 years of age; AND
    B) Patient has metastatic or unresectable disease; AND
    C) Patient has an activating *KIT* mutation; AND
    D) Patient has tried at least one systemic regimen.
    Note: Examples of a systemic regimen include: Opdivo (nivolumab intravenous infusion) + Yervoy (ipilimumab intravenous infusion), Opdivo + Opdualag (nivolumab/relatlimab-rmbw

intravenous infusion), Keytruda (pembrolizumab intravenous infusion), Opdivo, Tafinlar (dabrafenib capsules) + Mekinist (trametinib tablets), Zelboraf (vemurafenib tablets) + Cotellic (cobimetinib tablets), Braftovi (encorafenib capsules) + Mektovi (binimetinib tablets).

17. Myeloid/Lymphoid Neoplasms with Eosinophilia. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient meets one of the following criteria (i or ii):
  - **i.** The tumor has an *ABL1* rearrangement; OR
  - **ii.** The tumor has an *FIP1L1-PDGFRA* or *PDGFRB* rearrangement.

~~**18.**~~ **Pigmented Villonodular Synovitis/Tenosynovial Giant Cell Tumor.** Approve for 1 year if the patient meets one of the following criteria (A or B):
- **A)** Patient has tried Turalio (pexidartinib capsules); OR
- **B)** Patient cannot take Turalio, according to the prescriber.
  Note: Examples of reasons for not being able to take Turalio include patients with elevated liver enzymes or concomitant use of medications that are associated with hepatotoxicity.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of imatinib is not recommend in the following situations:

181. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Imbruvica Prior Authorization Policy
- Imbruvica® (ibrutinib tablets, capsules, and oral suspension – Pharmacyclics/Janssen)

REVIEW DATE: 07/12/2023

OVERVIEW

Imbruvica, a Bruton's tyrosine kinase inhibitor, is indicated for the following uses:[1]
- **Chronic lymphocytic leukemia (CLL)** or **small lymphocytic lymphoma (SLL),** in adults.
- **CLL** or **SLL,** with 17p deletion, in adults.
- **Graft-versus-host disease, chronic**, after failure of one or more lines of systemic therapy in adults and pediatric patients ≥ 1 year old.
- **Waldenström macroglobulinemia,** in adults.

Guidelines

Imbruvica is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):
- **B-Cell Lymphomas:** NCCN guidelines (version 4.2023 – June 2, 2023) address mantle cell lymphoma, marginal zone lymphoma, gastric mucosa-associated lymphoid tissue (MALT) lymphoma, non-gastric MALT lymphoma, diffuse large B-cell lymphomas, Acquired Immune Deficiency Syndrome (AIDS)-related B-Cell lymphomas, and post-transplant lymphoproliferative disorders.[2] For mantle cell lymphoma, Imbruvica + rituximab can be used as pretreatment in order to limit the number of cycles of aggressive induction therapy with RHyperCVAD (rituximab, cyclophosphamide, vincristine, doxorubicin, and dexamethasone) regimen (category 2A); Imbruvica ± rituximab is recommended as second-line and subsequent therapy as "other recommended regimen" and Imbruvica + venetoclax as "useful in certain circumstances" (both category 2A).[2] Imbruvica is recommended a preferred aggressive induction therapy as a component of TRIANGLE regimen: alternating RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, and prednisone) + covalent Bruton tyrosine kinase inhibitor (Imbruvica)/RDHAP (rituximab, dexamethasone, and cytarabine) + carboplatin regimen (category 2A). Imbruvica can also be used in combination with rituximab as maintenance therapy (category 2A). For marginal zone lymphoma, Imbruvica is recommended as second-line and subsequent therapy as "other recommended regimens" (category 2A). For mantle cell and marginal zone lymphoma, there is a footnote that states head-to-head clinical trials in other B-cell malignancies have demonstrated a more favorable toxicity profile for Calquence and Brukinsa compared to Imbruvica without compromising efficacy. The NCCN compendium recommends Imbruvica as a second-line and subsequent therapy for diffuse large B-cell lymphomas, HIV-related B-Cell lymphomas, post-transplant lymphoproliferative disorders, and high-grade B-cell lymphoma (category 2A).[3]
- **Central Nervous System (CNS) Cancers**: NCCN guidelines (version 1.2023 – March 24, 2023) recommend Imbruvica as one of the options for patients with relapsed or refractory disease for primary CNS lymphoma as "other recommended regimens" (category 2A).[4] The guidelines also recommend Imbruvica for induction therapy as a single agent as "useful in certain circumstances" if the patient is unsuitable for or intolerant to high-dose methotrexate (category 2A).[4] Imbruvica is used with high-dose methotrexate and rituximab in some clinical scenarios.[4] Imbruvica is also recommended as treatment for brain metastases in lymphoma (category 2A).
- **CLL/SLL:** NCCN guidelines (version 3.2023 – June 12, 2023) recommend Imbruvica as a treatment option in various scenarios (e.g., first-line therapy for patients with or without 17p deletion/TP53 mutation and as second-line and third therapy [category 1 recommendations for

many scenarios]) as "other recommended regimens".[5] Imbruvica plays a vital role in the management of CLL/SLL and many trials describe its efficacy.[5]

- **Hairy Cell Leukemia**: NCCN guidelines (version 1.2023 – August 30, 2022) recommend Imbruvica as one of the options for treatment of progressive disease after therapy for relapsed or refractory disease (category 2A).[6]
- **Graft-Versus-Host Disease:** NCCN guidelines for hematopoietic stem cell transplantation (version 1.2023 – March 31, 2023) recommend Imbruvica as a systemic agent for steroid-refractory chronic graft-versus-host disease after failure of one or more lines of systemic therapy (category 2A).[7] The guidelines note that Imbruvica should be used with caution in patients with of heart arrhythmias or heightened risk of bleeding.
- **Waldenström Macroglobulinemia/Lymphoplasmacytic Lymphomas:** NCCN guidelines (version 1.2023 – July 6, 2022) recommend Imbruvica, with or without rituximab, as a primary therapy option as one of several "preferred" regimens (category 1).[8] For previously treated patients, Imbruvica, with or without rituximab, is also cited as a "preferred" regimen (category 1). Imbruvica is also a "preferred" regimen for symptomatic management of Bing Neel Syndrome (category 2A).[8]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Imbruvica. All approvals are provided for the duration noted below.

Automation: When available, the ICD-9/ICD-10 codes for patients ≥ 18 years of age with chronic lymphocytic leukemia (ICD-9: 204.1* [lymphoid leukemia chronic] and ICD-10: C91.1* [chronic lymphocytic leukemia of B-cell type]), small lymphocytic lymphoma (ICD-10: C83.0* [small cell B-cell lymphoma]) and Waldenström macroglobulinemia (ICD-9: 273.3* [macroglobulinemia] and ICD-10: C88.0* [Waldenström macroglobulinemia]) will be used as part of automation to allow approval of the requested medication.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Imbruvica is recommended in those who meet one of the following criteria:

FDA-Approved Indications

106. Chronic Lymphocytic Leukemia. Approve for 1 year if the patient is ≥ 18 years of age.

107. Graft-Versus-Host Disease, Chronic: Approve for 1 year if the patient meets the following (A and B):

A) Patient is ≥ 1 year of age; AND

B) Patient has tried at least one conventional systemic treatment for graft-versus-host disease.
Note: Examples of conventional systemic treatments include: corticosteroids (methylprednisolone, prednisone), imatinib, low-dose methotrexate, sirolimus, mycophenolate mofetil, and Jakafi (ruxolitinib tablets).

108. Small Lymphocytic Lymphoma. Approve for 1 year if the patient is ≥ 18 years of age.

A)

109. Waldenström Macroglobulinemia. Approve for 1 year if the patient is ≥ 18 years of age.
Note: This includes lymphoplasmacytic lymphoma and Bing-Neel syndrome.

Other Uses with Supportive Evidence

110. B-Cell Lymphoma. Approve for 1 year if the patient meets the following (A and B):
Note: Examples of B-cell lymphomas include: diffuse large B-cell lymphomas, Human immunodeficiency virus (HIV)-related B-cell lymphomas, post-transplant lymphoproliferative disorders, and high-grade B-cell lymphoma.
A) Patient is ≥ 18 years of age; AND
B) Patient has tried at least one systemic regimen.
Note: Examples of a systemic regimen include one or more of the following products: cisplatin, cytarabine, rituximab, oxaliplatin, gemcitabine, ifosfamide, carboplatin, etoposide, or rituximab.

111. Central Nervous System Lymphoma (Primary). Approve for 1 year if the patient meets the following (A and B):
A) Patient ≥ 18 years of age; AND
B) Patient meets one of the following criteria (i or ii):
i. According to the prescriber, the patient is not a candidate for or is intolerant to high-dose methotrexate; OR
ii. Patient has tried at least one therapy.
Note: Examples of therapies include methotrexate, rituximab, vincristine, procarbazine, cytarabine, thiotepa, carmustine, intrathecal methotrexate, cytarabine, or rituximab.

112. Hairy Cell Leukemia. Approve for 1 year if the patient meets the following (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient has tried at least two systemic regimens.
Note: Examples of a systemic regimen include one or more of the following products: cladribine, Nipent (pentostatin injection), rituximab, or Pegasys (peginterferon alfa-2a subcutaneous injection).

113. Mantle Cell Lymphoma. Approve for 1 year if the patient meets the following (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient meets one of the following (i, iii, or iii):
i. Patient is continuing therapy with Imbruvica and meets one of the following criteria (a or b):
a) Patient has tried at least one systemic regimen; OR
Note: Examples of a systemic regimen include one or more of the following products: bendamustine, rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone, cytarabine, carboplatin, cisplatin, oxaliplatin, or lenalidomide.
b) According to the prescriber, patient is not a candidate for a systemic regimen (i.e., an elderly person who is frail); OR
ii. Imbruvica is used in combination with rituximab prior to induction therapy; OR
Note: Examples of induction therapy include: rituximab, cyclophosphamide, vincristine, doxorubicin, and dexamethasone.
iii. Imbruvica is used as induction or maintenance therapy in combination with chemotherapy.

114. Marginal Zone Lymphoma. Approve for 1 year if the patient meets the following (A, B and C):
B) Note: Marginal zone lymphoma includes gastric mucosa-associated lymphoid tissue (MALT) lymphoma, non-gastric MALT lymphoma, nodal marginal zone lymphoma, and splenic marginal zone lymphoma.
C) Patient is ≥ 18 years of age; AND
D) Patient is continuing therapy with Imbruvica; AND
E) Patient has tried at least one systemic regimen.
Note: Examples of a systemic regimen include one or more of the following products: bendamustine, rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone, or lenalidomide.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Imbruvica is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Inlyta Prior Authorization Policy
- Inlyta® (axitinib tablets – Pfizer)

REVIEW DATE: 06/07/2023

OVERVIEW

Inlyta, a kinase inhibitor, is indicated for **advanced renal cell carcinoma**, in combination with Bavencio® (avelumab intravenous infusion) as first-line treatment; in combination with Keytruda® (pembrolizumab intravenous infusion) as first-line treatment; and as a single agent after failure of one prior systemic therapy.[1]

Guidelines

Inlyta is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Kidney Cancer:** NCCN guidelines (version 4.2023 – January 18, 2023) for relapse or stage IV disease with clear cell histology recommend the following: Inlyta + Keytruda as a "preferred regimen" (category 1), Inlyta + Bavencio as one of the "other recommended regimens" (category 2A), and single agent Inlyta as "useful in certain circumstances" (category 2B). For subsequent therapy for clear cell histology, Inlyta monotherapy and Inlyta + Keytruda are category 2A options; Inlyta + Bavencio is a category 3 option. Single agent Inlyta is one of the systemic therapy options listed under "useful under certain circumstances" for relapse or Stage IV renal cell carcinoma with non-clear cell histology (category 2A).[2]
- **Soft Tissue Sarcoma:** NCCN guidelines (version 2.2023 – April 25, 2023) recommend Inlyta in combination with Keytruda as a preferred regimen for alveolar soft part sarcoma (category 2A).[3]
- **Thyroid Carcinoma:** For differentiated thyroid cancer subtypes, the NCCN guidelines (version 2.2023 – May 18, 2023) have changed the naming of Hürthle cell neoplasm to oncocytic carcinoma.[4] The guidelines recommend Inlyta as one of the kinase inhibitors to be considered if clinical trials or other systemic therapies are not available or appropriate for the treatment of progressive and/or symptomatic iodine refractory thyroid cancer. This recommendation is for all differentiated thyroid cancer subtypes (follicular, oncocytic, and papillary cancer) [all category 2A].

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Inlyta. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inlyta is recommended in those who meet one of the following criteria:

FDA-Approved Indication

115. Renal Cell Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has relapsed or advanced disease.

Other Uses with Supportive Evidence

116. Soft Tissue Sarcoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has alveolar soft part sarcoma; AND
- **C)** The medication will be used in combination with Keytruda (pembrolizumab intravenous infusion).
-

117. Thyroid Carcinoma, Differentiated. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has differentiated thyroid carcinoma; AND
- Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).
- **C)** The disease is refractory to radioactive iodine therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Inlyta is not recommended in the following situations:

182. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.
-

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Inqovi Prior Authorization Policy
- Inqovi® (decitabine and cedazuridine tablets – Taiho Oncology/Otsuka)

REVIEW DATE: 08/30/2023

OVERVIEW

Inqovi, a combination of decitabine (a nucleoside metabolic inhibitor) and cedazuridine (a cytidine deaminase inhibitor), is indicated for the treatment of **myelodysplastic syndrome** (MDS), including previously treated and untreated, de novo and secondary MDS with the following French-American-British subtypes (refractory anemia, refractory anemia with ringed sideroblasts, refractory anemia with excess blasts, and chronic myelomonocytic leukemia [CMML]) and intermediate-1, intermediate-2, and high-risk International Prognostic Scoring System (IPSS) groups in adults.[1]

Decitabine is available as a parenteral product (Dacogen® [decitabine intravenous infusion]; generic) and possesses the same FDA-approved indication as Inqovi.[2] The oral bioavailability of decitabine is limited due to rapid degradation by cytidine deaminase in the gut and liver.[1] As a cytidine deaminase inhibitor, cedazuridine increases decitabine concentrations to therapeutic levels. Oral decitabine has systemic exposure equivalent to the intravenous form with similar clinical response rates in the population in which Inqovi is approved.[1,2] The recommended dose of Inqovi is one tablet taken orally once daily on Days 1 through 5 of each 28-day cycle for a minimum of four cycles until disease progression or unacceptable toxicity. A complete or partial response may take longer than four cycles. In the two pivotal trials, the median treatment duration was up to 8 months. Do not substitute Inqovi for the intravenous decitabine product within a cycle.

Guidelines

Inqovi is discussed in guidelines from the National Comprehensive Cancer Network (NCCN) for MDS. These guidelines (version 1.2023 – September 12, 2022) state that Inqovi can be considered as a substitute for intravenous decitabine. The guidelines recommend intravenous decitabine in patients with IPSS intermediate-1 and above, CMML, and MDS/myeloproliferative neoplasm overlap neoplasms.[3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Inqovi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inqovi is recommended in those who meet one of the following criteria:

FDA-Approved Indications

126. Chronic Myelomonocytic Leukemia. Approve for 1 year if the patient is ≥ 18 years of age.

127. Myelodysplastic Syndrome. Approve for 1 year if the patient is ≥ 18 years of age.
Note: Examples of myelodysplastic syndromes include: refractory anemia, refractory anemia with ringed sideroblasts, and refractory anemia with excess blasts.

Other Uses with Supportive Evidence

128. Myelodysplastic Syndrome/Myeloproliferative Neoplasm Overlap Neoplasms. Approve for 1 year if the patient is ≥ 18 years of age.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Inqovi is not recommended in the following situations:

344. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Inrebic Prior Authorization Policy
- Inrebic® (fedratinib capsules – Celgene)

REVIEW DATE: 10/11/2023

OVERVIEW

Inrebic, a Janus Associated Kinase 2 (*JAK2*)-selective kinase inhibitor, is indicated for the treatment of **intermediate-2 or high-risk primary or secondary (post-polycythemia vera or post-essential thrombocythemia) myelofibrosis** in adults.[1]

Guidelines

Inrebic is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions**: Guidelines (version 2.2023 – July 14, 2023) recommend Inrebic for treatment of myeloid/lymphoid neoplasms with eosinophilia and *JAK2* rearrangement in chronic phase or blast phase (category 2A).[2] The guidelines also recommend Inrebic for treatment in combination with acute lymphocytic leukemia or acute myeloid leukemia-type induction chemotherapy followed by allogeneic hematopoietic stem cell transplantation (if eligible) for lymphoid, myeloid, or mixed lineage neoplasms with eosinophilia and *JAK2* rearrangement in blast phase (category 2A).[2]
- **Myeloproliferative Neoplasms**: Guidelines (version 2.2023 – August 29, 2023) recommend Inrebic for higher-risk patients with a platelet count $\geq 50 \times 10^9$/L (category 1) who are not transplant candidates and for patients who did not have a response or lost response to Jakafi® (ruxolitinib tablets) or Vonjo® (pacritinib capsule) [category 2A].[3,4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Inrebic. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inrebic is recommended in those who meet one of the following criteria:

FDA-Approved Indication

- **Myelofibrosis.** Approve for 1 year if the patient meets the following (A and B):

Note: Examples of myelofibrosis include primary myelofibrosis, post-polycythemia vera myelofibrosis, and post-essential thrombocythemia myelofibrosis.

  - Patient is ≥ 18 years of age; AND
  - Patient has intermediate-2 or high-risk disease.

Other Uses with Supportive Evidence

- **Myeloid or Lymphoid Neoplasms.** Approve for 1 year if the patient meets the following (A, B, and C):

E) Patient is ≥ 18 years of age; AND
F) Patient has eosinophilia; AND
G) The tumor has a Janus Associated Kinase 2 (*JAK2)* rearrangement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Inrebic is not recommended in the following situations:

345. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Iwilfin Prior Authorization Policy
- Iwilfin™ (eflornithine tablets – US WorldMeds)

REVIEW DATE: 01/03/2024

OVERVIEW

Iwilfin, an ornithine decarboxylase inhibitor, is indicated to reduce the risk of relapse in high-risk neuroblastoma in adults and pediatric patients with who have demonstrated at least a partial response to prior multiagent, multimodality therapy including anti-glycolipid disialoganglioside (GD2) immunotherapy.[1]

Guidelines

Iwilfin is not addressed in the National Comprehensive Cancer Network (NCCN) guidelines. NCCN does not have neuroblastoma clinical practice guidelines. The treatment of high risk neuroblastoma is divided into three phases: induction, consolidation, and post-consolidation.[2] In the induction phase, treatment includes multiagent chemotherapy, peripheral blood stem cell harvest, and surgical resection of the primary site. In the consolidation phase, treatment includes high-dose chemotherapy, autologous stem cell transplantation (ASCT), and radiation or radiotherapy. In the post-consolidation phase, treatment includes anti-GD2 immunotherapy (Unituxin® [dinutuximab intravenous infusion]) in combination with isotretinoin, interleukin-2, and granulocyte-macrophage colony-stimulating factor. For patients who have recurrent or refractory neuroblastoma, treatment options include clinical trial, chemotherapy combined with immunotherapy (e.g. temozolomide, irinotecan, and Unituxin), iodine-131 meta-iodobenzylguanidine alone or in combination with other therapy, or followed by stem cell rescue, novel therapies, chemotherapy, or immunotherapy (e.g. Danyelza® [naxitamab-gqgk intravenous infusion]).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Iwilfin. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Iwilfin is recommended in those who meet the following criteria:

FDA-Approved Indication

129. Neuroblastoma Approve for 1 year if the patient meets the following (A, B and C):
- **A)** Patient has high-risk disease; AND
- **B)** The medication is being used to reduce the risk of relapse; AND
- **C)** Patient has had at least a partial response to prior multiagent, multimodality therapy including anti-GD2 immunotherapy.

Note: Examples of anti-glycolipid disialoganglioside (GD2) immunotherapy includes Unituxin® (dinutuximab intravenous infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Iwilfin is not recommended in the following situations:

346. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

1106. National Cancer Institute: PDQ® Neuroblastoma treatment. National Cancer Institute. Date last modified: August 22, 2023. Available at http://www.cancer.gov/cancertopics/pdq/treatment/neuroblastoma/HealthProfessional. Accessed on December 22, 2023.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Jakafi Prior Authorization Policy
- Jakafi® (ruxolitinib tablets – Incyte)

REVIEW DATE: 03/22/2023

OVERVIEW

Jakafi, an inhibitor of Janus Associated Kinases (*JAKs*) *JAK1* and *JAK2*, is indicated for the following uses:[1]

- **Graft versus host disease**, acute treatment of steroid-refractory disease, in patients ≥ 12 years of age.
- **Graft versus host disease**, chronic treatment, after failure of one or two lines of systemic therapy in patients ≥ 12 years of age.
- **Myelofibrosis**, intermediate or high risk, including primary myelofibrosis, post-polycythemia vera myelofibrosis, and post-essential thrombocythemia myelofibrosis in adults.
- **Polycythemia vera**, in adults who have had an inadequate response to or are intolerant of hydroxyurea.

Guidelines

Jakafi is discussed in guidelines by the National Comprehensive Cancer Network (NCCN):[2]

- **Graft versus host disease:** NCCN has guidelines regarding hematopoietic cell transplantation that discuss graft versus host disease (version 3.2022 – January 24, 2023) that include Jakafi.[3] Jakafi is recommended among patients with steroid-refractory acute graft versus host disease, or chronic graft versus host disease, after failure of one or two lines of systemic therapy (both category 1).[3]
- **Myelodysplastic syndromes:** NCCN guidelines (version 1.2023 – September 12, 2022) recommend Jakafi for patients with chronic myelomonocytic leukemia-2, with hypomethylating agents (HMA) and/or allogenic hematopoietic stem cell transplant (category 2A).[4] Jakafi ± HMA is also recommended for myelodysplastic syndrome/myeloproliferative neoplasm with neutrophilia (atypical chronic myeloid leukemia); there is a footnote, which states that rare patients with *CSF3R* or *JAK2* mutations may respond to Jakafi due to their JAK-STAT pathway activation (category 2A).
- **Myeloid/lymphoid neoplasms with eosinophilia and tyrosine kinase fusion genes**: NCCN guidelines (version 2.2022 – October 18, 2022) recommend Jakafi for treatment of myeloid/lymphoid neoplasms with eosinophilia and *JAK2* rearrangement in chronic or blast phase (category 2A).[5] The guidelines also recommend Jakafi for treatment in combination with acute lymphocytic leukemia or acute myeloid leukemia type induction chemotherapy followed by allogeneic hematopoietic stem cell transplantation (if eligible) for lymphoid, myeloid, or mixed lineage neoplasms with eosinophilia and *JAK2* rearrangement in blast phase (category 2A).
- **Myeloproliferative neoplasms:** NCCN guidelines (version 3.2022 – August 11, 2022) recommend Jakafi among patients with lower- or higher-risk myelofibrosis (category 2A; category 1 for the initial treatment of higher-risk myelofibrosis).[6] It is also a recommended "Preferred" therapy for patients with symptomatic low-risk (category 2A) or high-risk (category 1) polycythemia vera after other agents (e.g., hydroxyurea or Pegasys® [peginterferon alfa-2a subcutaneous injection]). The guidelines also recommend Jakafi for treatment of essential thrombocythemia for inadequate response or loss of response to hydroxyurea, Pegasys therapy, or anagrelide as "Useful in Certain Circumstances" (category 2A).
- **Pediatric acute lymphoblastic leukemia:** NCCN guidelines (version 1.2023 – November 9, 2022) recommend Jakafi in a variety of regimens for pediatric patients and young adults with acute

lymphoblastic leukemia (category 2A).[7] The utility of Jakafi is described primarily in patients in which the mutation/pathway is *JAK*-related.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Jakafi. All approvals are provided for the duration noted below.

Automation: The ICD-9/ICD-10 codes for myelofibrosis (ICD-9: 289.83 and ICD-10: D75.81) will be used as part of automation to allow approval of the requested medication.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Jakafi is recommended in those who meet one of the following criteria:

FDA-Approved Indications

118. Graft versus Host Disease, Acute. Approve for 1 year if the patient meets the following criteria (A and B):
A) Patient is ≥ 12 years of age; AND
B) Patient has tried one systemic corticosteroid.

119. Graft versus Host Disease, Chronic. Approve for 1 year if the patient meets the following criteria (A and B):
A) Patient is ≥ 12 years of age; AND
B) Patient has tried one conventional systemic treatment for graft versus host disease.
Note: Examples include systemic corticosteroids (methylprednisolone, prednisone), cyclosporine, tacrolimus, mycophenolate mofetil, Imbruvica (ibrutinib capsules and tablets), and imatinib.

120. Myelofibrosis (MF), including Primary MF, Post-Polycythemia Vera MF, and Post-Essential Thrombocythemia MF. Approve for 1 year if the patient is ≥ 18 years of age.

121. Polycythemia Vera. Approve for 1 year if the patient meets the following criteria (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient has tried hydroxyurea or Pegasys (peginterferon alfa-2a subcutaneous injection).

Other Uses with Supportive Evidence

122. Acute Lymphoblastic Leukemia. Approve for 1 year if the patient meets the following criteria (A and B)
A) Patient is < 21 years of age; AND
B) The mutation/pathway is Janus Associated Kinase (*JAK*)-related.

123. Atypical Chronic Myeloid Leukemia. Approve for 1 year if the patient meets one of following criteria (A or B):
A) Patient has a *CSF3R* mutation; OR
B) Patient has a Janus Associated Kinase 2 (*JAK2*) mutation.

124. Chronic Myelomonocytic Leukemia-2. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient is ≥ 18 years of age; AND
B) Patient is also receiving a hypomethylating agent.
Note: Examples of hypomethylating agents include azacitidine and decitabine.

125. Essential Thrombocythemia. Approve for 1 year if the patient meets the following criteria (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient has tried hydroxyurea, Pegasys (peginterferon alfa-2a subcutaneous injection), or anagrelide.

126. Myeloid or Lymphoid Neoplasms. Approve for 1 year if the patient meets the following criteria (A, B, and C):
H) Patient is ≥ 18 years of age; AND
I) Patient has eosinophilia; AND
J) The tumor has a Janus Associated Kinase 2 (*JAK2)* rearrangement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Jakafi is not recommended in the following situations:

183. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Jaypirca Prior Authorization Policy
- Jaypirca® (pirtobrutinib tablets – Eli Lilly)

REVIEW DATE: 12/13/2023

OVERVIEW

Jaypirca, a Bruton tyrosine kinase (BTK) inhibitor, is indicated for the treatment of:

- Chronic lymphocytic leukemia (CLL) or small lymphocytic leukemia (SLL), in adults who have received at least two prior lines of therapy, including a BTK inhibitor and B-cell lymphoma-2 (BCL-2) inhibitor.
- Mantle cell lymphoma, relapsed or refractory in adults after at least two lines of systemic therapy, including a BTK inhibitor.[1]

  Both indications are approved under accelerated approval based on response rate. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

Guidelines

Jaypirca is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **B-Cell Lymphoma**: NCCN guidelines (version 6.2023 – October 10, 2023) discuss mantle cell lymphoma.[2,4] Brukinsa® (zanubrutinib capsules) and Calquence® (acalabrutinib tablets) [both covalent BTK inhibitors] are cited as "Preferred Regimens" for second-line and subsequent therapy (both category 2A). Imbruvica® (ibrutinib capsules, tablets and oral suspension) [also a covalent BTK inhibitor], given with or without rituximab, is cited as an "Other Recommended Regimen" for second-line and subsequent therapy (category 2A). Jaypirca, a non-covalent BTK inhibitor, is recommended as a third-line and subsequent therapy (category 2A). Jaypirca inhibits both wild type and C481S mutant BTK and has been shown to be effective in patients with intolerance or disease that is refractory to prior covalent BTK inhibitors without recurrence of prior symptoms; the agent may be used for disease progression or intolerance to covalent BTK inhibitor therapy. It is noted that head-to-head clinical trials in other B-cell malignancies have demonstrated a more favorable toxicity profile for Brukinsa and Calquence compared with Imbruvica without compromising efficacy. Imbruvica + Venclexta (venetoclax tablets) is cited as "Useful in Certain Circumstances" for second-line and subsequent therapy (category 2A).
- **Chronic Lymphocytic Leukemia (CLL)**: NCCN guidelines (version 1.2024 – November 3, 2023) recommend Jaypirca for CLL or SLL with or without del(17p)/TP53 mutation as second-line or third-line therapy as "Useful in Certain Circumstances" for resistance or intolerance to prior covalent BTK inhibitor (category 2A). Jaypirca is also listed as "Other Recommended Regimens" for relapsed or refractory disease after prior BTK inhibitor and venetoclax-based regimens (if not previously used) [category 2A]. Jaypirca is also recommended as additional therapy for histologic (Richter's) transformation to diffuse large B-cell lymphoma (clonally related or unknown clonal status) as a single agent in patients with del(17p)/TP53 mutation or who are chemotherapy refractory or unable to receive chemoimmunotherapy (category 2A).[3,4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Jaypirca. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Jaypirca is recommended in those who meet one of the following criteria:

FDA-Approved Indication

130. Chronic Lymphocytic Leukemia. Approve for 1 year if the patient meets the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient meets one of the following (i or ii):
  - **i.** Patient has resistance or intolerance to Imbruvica (ibrutinib tablets, capsules, or oral solution), Calquence (acalabrutinib tablets), or Brukinsa (zanubrutinib capsules); OR
  - **ii.** Patient meets both of the following (a and b):
    - **a)** Patient has relapsed or refractory disease; AND
    - **b)** Patient meets both of the following [(1) and (2)]:
      - **(1)** Patient has tried a Bruton tyrosine kinase (BTK) inhibitor; AND
        Note: Examples of Bruton tyrosine kinase inhibitor include: Imbruvica (ibrutinib tablets, capsules, or oral solution), Calquence (acalabrutinib tablets), or Brukinsa (zanubrutinib capsules).
      - **(2)** Patient has tried Venclexta (venetoclax tablet).

131. Mantle Cell Lymphoma. Approve for 1 year if the patient meets the following (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient meets one of the following (i or ii):
  - **i.** Patient has tried at least one systemic regimen; OR
    Note: Examples of a systemic regimen contain one or more of the following products: rituximab, dexamethasone, cytarabine, carboplatin, cisplastin, oxaliplatin, cyclophosphamide, doxorubicin, vincristine, prednisone, methotrexate, bendamustine, Velcade (bortezomib intravenous or subcutaneous injection), and lenalidomide.
  - **ii.** According to the prescriber, patient is not a candidate for a systemic regimen (i.e., an elderly patient who is frail); AND
- **C)** Patient has tried one Bruton tyrosine kinase inhibitor (BTK) for mantle cell lymphoma.
  Note: Examples of BTK inhibitors indicated for mantle cell lymphoma include Brukinsa (zanubrutinib capsules), Calquence (acalabrutinib tablets), and Imbruvica (ibrutinib capsules, tablets, and oral suspension).

132. Small Lymphocytic Lymphoma. Approve for 1 year if the patient meets the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient meets one of the following (i or ii):
  - **i.** Patient has resistance or intolerance to Imbruvica (ibrutinib tablets, capsules, or oral solution), Calquence (acalabrutinib tablets), or Brukinsa (zanubrutinib capsules); OR
  - **ii.** Patient meets both of the following (a and b):
    - **a)** Patient has relapsed or refractory disease; AND
    - **b)** Patient meets both of the following [(1) and (2)]:
      - **(1)** Patient has tried a Bruton tyrosine kinase (BTK) inhibitor; AND

Note: Examples of Bruton tyrosine kinase inhibitor include: Imbruvica (ibrutinib tablets, capsules, or oral solution), Calquence (acalabrutinib tablets), or Brukinsa (zanubrutinib capsules).

(2) Patient has tried Venclexta (venetoclax tablet).

Other Uses with Supportive Evidence

133. Richter's Transformation to Diffuse Large B-Cell Lymphoma. Approve for 1 year if the patient meets the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets one of the following (i or ii):

i. Patient has tried at least one chemotherapy regimen; OR
Note: Examples of a chemotherapy regimen include: EPOCH-R (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin, rituximab); HyperCVAD (cyclophosphamide, vincristine, doxorubicin, and dexamethasone) alternating with high-dose methotrexate and cytarabine + rituximab, oxaliplatin; OFAR (oxaliplatin, fludarabine, cytarabine, rituximab); RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone); and venetoclax + RCHOP

ii. Patient is not a candidate for a chemotherapy regimen.
Note: Examples of a chemotherapy regimen include: EPOCH-R (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin, rituximab); HyperCVAD (cyclophosphamide, vincristine, doxorubicin, and dexamethasone) alternating with high-dose methotrexate and cytarabine + rituximab, oxaliplatin; OFAR (oxaliplatin, fludarabine, cytarabine, rituximab); RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone); and venetoclax + RCHOP

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Jaypirca is not recommended in the following situations:

347. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Kisqali and Kisqali Femara Co-Pack Prior Authorization Policy
- Kisqali® (ribociclib tablets – Novartis)
- Kisqali® Femara® Co-Pack (ribociclib tablets; letrozole tablets – Novartis)

REVIEW DATE: 02/22/2023

OVERVIEW

Kisqali, a cyclin-dependent kinase (CDK) 4/6 inhibitor, is indicated for the treatment of adults with hormone receptor-positive (HR+), human epidermal growth factor receptor 2 (HER2)-negative **advanced or metastatic breast cancer** in the following settings:[1-3]
- In combination with an aromatase inhibitor (AI) as initial endocrine-based therapy;
- Kisqali (not Co-Pack) in combination with fulvestrant as initial endocrine based therapy or following disease progression on endocrine therapy in postmenopausal women or in men;
- Kisqali Femara Co-Pack has the same indication with AI, letrozole, included.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on breast cancer (version 2.2023– February 7, 2023) recommends Kisqali + AI or fulvestrant as a first-line "Preferred Regimen" for HR+ and HER2-negative recurrent unresectable (local or regional) or Stage IV disease in postmenopausal women or premenopausal patient receiving ovarian ablation or suppression (category 1).[3,4] The guidelines state in a footnote that in phase III randomized controlled trials, Kisqali + endocrine therapy has shown overall survival benefit in the first-line setting. CDK4/6 inhibitor + fulvestrant is recommended as a "Preferred Regimen" for second- and subsequent-line therapy, if CDK4/6 inhibitor was not previously used (category 1). However, the guidelines also state in a footnote that if there is disease progression on Ibrance® (palbociclib tablets or capsules), there are limited data to support the use of Kisqali in the second-line setting.[3,4] The guidelines state that in phase III randomized controlled trials, fulvestrant in combination with a CDK4/6 inhibitor has shown overall survival benefit in the second-line setting. For men with breast cancer, the compendium recommends they be treated similarly to postmenopausal women, except that the use of an AI is ineffective without concomitant suppression of testicular steroidogenesis.[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Kisqali and Kisqali Femara Co-Pack. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Kisqali is recommended in those who meet one of the following criteria:

FDA-Approved Indications

127. Breast Cancer in Women*. Approve for 1 year if the patient meets the following criteria (A, B, C, D, E, and F):
19. Patient is ≥ 18 years of age; AND
20. Patient has recurrent or metastatic disease; AND
21. Patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
22. Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
23. Patient meets ONE of the following criteria (i or ii):
i. Patient is postmenopausal; OR
ii. Patient is pre/perimenopausal and meets one of the following (a or b):
a) Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR
184. Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant).
b) Patient has had surgical bilateral oophorectomy or ovarian irradiation; AND
24. Patient meets ONE of the following criteria (i or ii):
185. i. Kisqali will be used in combination with anastrozole, exemestane, or letrozole; OR
186. ii. Kisqali will be used in combination with fulvestrant.

***** Refer to the Policy Statement.

2. Breast Cancer in Men*. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
F) Patient is ≥ 18 years of age; AND
G) Patient has recurrent or metastatic disease; AND
H) Patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
I) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
J) Patient meets ONE of the following criteria (i or ii):
i. Patient meets BOTH of the following criteria (a and b):
a) Patient is receiving a gonadotropin-releasing hormone (GnRH) analog; AND
Note: Examples of GnRH analog include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), Orgovyx (relugolix tablet).
b) Kisqali will be used in combination with anastrozole, exemestane, or letrozole; OR
ii. Kisqali will be used in combination with fulvestrant.

***** Refer to the Policy Statement.

II. Coverage of Kisqali Femara Co-Pack is recommended in those who meet one of the following criteria:
187.
FDA-Approved Indications

1. **Breast Cancer in Women***. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
   128. Patient is ≥ 18 years of age; AND
   129. Patient has recurrent or metastatic disease; AND
   130. Patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
   131. Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
   132. Patient meets ONE of the following criteria (i or ii):
   i. Patient is postmenopausal OR
   ii. Patient is pre/perimenopausal and meets one of the following (a or b):
   a) Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR
   188. Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant).
   b) Patient has had surgical bilateral oophorectomy or ovarian irradiation.

   ***** Refer to the Policy Statement.

2 **Breast Cancer in Men*.** Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has recurrent or metastatic disease; AND
   C) Patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
   D) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
   E) Patient is receiving a gonadotropin-releasing hormone (GnRH) analog.
   189. Note: Examples of a GnRH analog include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), Orgovyx (relugolix tablet).

   ***** Refer to the Policy Statement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Kisqali or Kisqali Femara Co-Pack is not recommended in the following situations:

190. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

GnRH – Gonadotropin-releasing hormone.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Koselugo Prior Authorization Policy
- Koselugo™ (selumetinib capsules – AstraZeneca)

REVIEW DATE: 04/12/2023

OVERVIEW

Koselugo, a kinase inhibitor, is indicated for the treatment of pediatric patients ≥ 2 years of age with **neurofibromatosis type 1** (NF1) who have symptomatic, inoperable plexiform neurofibromas.[1]

Koselugo is a mitogen-activated protein kinase kinases 1 and 2 (MEK1/2) inhibitor.[1]

Disease Overview

Neurofibromatoses are a group of tumor suppressor syndromes that predisposes patients to an increased risk of nervous system tumors including neurofibromas, malignant peripheral nerve sheath tumors, and gliomas.[5,6] NF1 is the most common of the neurofibromatoses, occurring in approximately one in 2,500 to 3,000 individuals worldwide.[7,8] NF1 is an autosomal dominant disorder, with 50% of children of affected parents inheriting the mutated NF1 tumor-suppressor gene.[5,7] However, up to 50% of the cases occur spontaneously in patients without a family of NF1.[5-9]

Plexiform neurofibromas are benign nerve sheath tumors that can occur anywhere in the body,[8] affect up to 50% of patients with NF1,[5] and are often present at birth.[7,8] These tumors tend to grow the fastest in the first decade of life,[7,8] and can continue to grow into adolescence and early adulthood.[7] Plexiform neurofibromas may be asymptomatic and only detected with MRI,[5,8] or may cause significant pain,[5,7] disfigurement,[5] bone destruction,[7] and loss of nerve function.[5] Due to the risk of transformation to malignant peripheral nerve sheath tumors, patients with any change in the signs or symptoms of plexiform neurofibromas should be assessed for malignant transformation.[5,8]

Other Uses with Supportive Evidence

In a Phase II, open-label trial, the efficacy of Koselugo was assessed in patients 3 to 21 years of age with recurrent, refractory, or progressive pilocytic astrocytoma with either *KIAA1549-BRAF* fusion or *BRAF V600E* mutation.[2] Koselugo 25 mg/m^2/dose was administered twice daily for up 2 years if the patient did not have progressive disease or unacceptable adverse events. A total of 25 patients were enrolled with a median age of 9.2 years, and 52% were female. A partial response was achieved in 36% of patients, 36% of patients had stable disease, and 28% had disease progression. The 2 year progression-free survival was 70% and 44% of patients have not progressed after a median of 36.4 months of follow-up.

Guidelines

Koselugo is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **Central nervous system cancers:** Clinical practice guidelines (version 1.2023 – March 24, 2023) recommend Koselugo for the treatment of recurrent or progressive circumscribed glioma with *BRAF* fusion or *BRAF V600E* activating mutation positive; or neurofibromatosis type 1 mutated glioma, as a single agent.[3,4]
- **Histiocytic Neoplasms:** Clinical practice guidelines (version 1.2022 – May 20, 2022) recommend Koselugo as a single agent for the first-line or subsequent treatment of mitogen-activated protein kinase pathway mutation, no detectable mutation, or testing not available for multisystem

Langerhans cell histocytosis (LCH), single-system lung LCH, multifocal (> 2 lesions) single system bone LCH not responsive to a bisphosphonate, and central nervous system LCH.[10]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Koselugo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Koselugo is recommended in those who meet the following criteria:

FDA-Approved Indication

134. Neurofibromatosis Type 1. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient meets ONE of the following (i or ii):
  - **i.** Patient is 2 to 18 years of age; OR
  - **ii.** Patient meets both of the following (a and b):
    - **a)** Patient is ≥ 19 years of age; AND
    - **b)** Patient has been previously started on therapy with Koselugo prior to becoming 19 years of age; AND
- **B)** Prior to starting Koselugo, the patient had symptomatic, inoperable plexiform neurofibromas, according to the prescriber.

Other Uses with Supportive Evidence

135. Circumscribed Glioma. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient meets ONE of the following (i or ii):
  - **i.** Patient is 3 to 21 years of age; OR
  - **ii.** Patient meets both of the following (a and b):
    - **a)** Patient is > 21 years of age; AND
    - **b)** Patient has been previously started on therapy with Koselugo prior to becoming 21 years of age; AND
- **B)** Patient has recurrent, refractory, or progressive disease; AND
- **C)** Tumor meets one of the following (i, ii, or iii):
  - **i.** Tumor is *BRAF* fusion positive; OR
  - **ii.** Tumor is *BRAF V600E* activating mutation positive; OR
  - **iii.** Patient has neurofibromatosis type 1 mutated glioma; AND
- **D)** The medication will be used as a single agent.

136. Langerhans Cell Histiocytosis. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient meets one of the following (i, ii, iii, or iv):
  - **i.** Patient meets both of the following (a and b):
    - **a)** Patient has multisystem Langerhans cell histiocytosis; AND
    - **b)** Patient has symptomatic disease or impending organ dysfunction; OR

ii. Patient has single system lung Langerhans cell histiocytosis; OR
iii. Patient meets all of the following (a, b, and c):
a) Patient has single system bone disease; AND
b) Patient has not responded to treatment with a bisphosphonate; AND
Note: Examples of bisphosphonates include pamidronate and zoledronic acid.
c) Patient has more than 2 bone lesions; OR
iv. Patient has central nervous system disease; AND

B) The medication is used as a single agent.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Koselugo is not recommended in the following situations:

348. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Krazati Prior Authorization Policy
- Krazati™ (adagrasib tablets – Mirati Therapeutics)

REVIEW DATE: 12/20/2023

OVERVIEW

Krazati, a Kirsten RAt Sarcoma virus (KRAS) inhibitor, is indicated for the treatment of ***KRAS G12C*-mutated locally advanced or metastatic non-small cell lung cancer (NSCLC)**, as determined by an FDA-approved test, in adults who have received at least one prior systemic therapy.[1]
This indication is approved under accelerated approval based on objective response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of a clinical benefit in a confirmatory trial(s).

Mutations in the *KRAS* gene most commonly occur at codon 12.[2] Data suggest that approximately 30% of patients with NSCLC have *KRAS* mutations. The prognosis of survival of patients with tumors with *KRAS* mutation is poorer compared with that of patients with tumors without *KRAS* mutation.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines recommend Krazati for the following cancer types:

- **Non-Small Cell Lung Cancer:** Guidelines (version 5.2023 – November 8, 2023) recommend Krazati as a subsequent treatment option, for use after at least one prior systemic treatment (i.e., second-line and beyond) if the patient has not received previous *KRAS G12C*-targeted therapy (category 2A). Patients who progressed on Lumakras™ (sotorasib tablets), another *KRAS* inhibitor directed at *KRAS G12C*-mutated NSCLC, should not be treated with Krazati; and vice-versa. The NCCN Central Nervous System Cancers guidelines (version 1.2023 – March 24, 2023) recommend use of Krazati for *KRAS G12C* mutation-positive NSCLC that has metastasized to the brain (category 2A).[3]
- **Colon and Rectal Cancer:** Guidelines for colon cancer (version 4.2023 – November 16, 2023) and rectal cancer (version 6.2023 – November 16, 2023) recommend Krazati for some situations in patients with *KRAS G12C*-mutated disease.[4,5] For initial treatment in combination with Erbitux® (cetuximab intravenous infusion) or Vectibix® (panitumumab intravenous infusion) or as monotherapy if patient is unable to tolerate Erbitux or Vectibix due to toxicity. Krazati is also recommended as subsequent therapy after previous therapy with oxaliplatin, irinotecan, FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Krazati. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Krazati is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Non-Small Cell Lung Cancer (NSCLC).** Approve for 1 year if the patient meets the following (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has *KRAS G12C*-mutated locally advanced or metastatic NSCLC, as determined by an approved test; AND
   - **C)** Patient has been previously treated with at least one systemic regimen.
     Note: Examples of systemic regimens include those containing one or more of the following products: Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion), Tecentriq (atezolizumab intravenous infusion), Alimta (pemetrexed intravenous infusion), Yervoy (ipilimumab intravenous infusion), Abraxane (albumin-bound paclitaxel intravenous infusion), bevacizumab, cisplatin, carboplatin, docetaxel, gemcitabine, paclitaxel, vinorelbine.

Other Uses with Supportive Evidence

2. **Colon or Rectal Cancer.** Approve for 1 year if the patient meets the following (A, B, C, D, and E):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has unresectable, advanced, or metastatic disease; AND
   - **C)** Patient has *KRAS G12C* mutation-positive disease; AND
   - **D)** Patient meets one of the following (i or ii):
     - **i.** The medication is prescribed as part of a combination regimen for colon or rectal cancer; OR
       Note: Examples of combination regimens included Krazati + Erbitux (cetuximab intravenous infusion), Krazati + Vectibix (panitumumab intravenous infusion).
     - **ii.** As per the prescriber, the patient is unable to tolerate combination therapy; AND
   - **E)** Patient has previously received a chemotherapy regimen for colon or rectal cancer.
     Note: Examples of chemotherapy regimens include a fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine; oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Krazati is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lapatinib Prior Authorization Policy
- Tykerb® (lapatinib ditosylate tablets – Novartis, generic)

REVIEW DATE: 02/22/2023

OVERVIEW

Lapatinib, a tyrosine kinase inhibitor, is indicated for the following uses:[1]

- **Breast cancer**, in combination with capecitabine tablets for the treatment of patients with **advanced or metastatic disease** whose tumors overexpress human epidermal growth factor receptor 2 (HER2) and who have received prior therapy including an anthracycline, a taxane, and trastuzumab.
  Limitation of Use: Patients should have disease progression on trastuzumab prior to initiation of treatment with lapatinib in combination with capecitabine tablets.
- **Breast cancer**, in combination with letrozole for the treatment of postmenopausal women with **hormone receptor (HR)-positive metastatic disease** that overexpresses HER2 for whom hormonal therapy is indicated. Lapatinib in combination with an aromatase inhibitor (AI) has not been compared with a trastuzumab-containing chemotherapy regimen for the treatment of metastatic breast cancer.

Guidelines

Lapatinib is discussed in guidelines from National Comprehensive Cancer Network (NCCN):

- **Breast Cancer:** NCCN guidelines (version 2.2023 – February 7, 2023) recommend lapatinib in combination with trastuzumab (without cytotoxic therapy) or capecitabine for HER2-positive recurrent unresectable (local or regional) or stage IV disease that is HR-negative or HR positive with or without endocrine therapy as fourth-line therapy or beyond (category 2A).[2] Lapatinib is also recommended in combination with an AI with or without trastuzumab for the treatment of recurrent unresectable (local or regional) or Stage IV HR+, HER2+ disease in postmenopausal women or premenopausal women receiving ovarian ablation or suppression (category 2A).[2] Men with breast cancer should be treated similarly to postmenopausal women except that using an AI is ineffective without suppression of testicular steroidogenesis (category 2A). The NCCN clinical practice guidelines on central nervous system cancers (version 2.2022 – September 28, 2022) recommend treatments for patients with brain metastases from breast cancer.[3,4] Capecitabine with lapatinib is recommended as primary treatment in select patients (e.g. patients with small asymptomatic brain metastases), as treatment for recurrent disease or relapsed disease with stable systemic disease or reasonable systemic treatment options.
- **Bone Cancer:** NCCN guidelines (version 2.2023 – September 28, 2022) recommend the use of lapatinib for epidermal growth factor receptor (*EGFR)*-positive recurrent conventional or chondroid chordoma as "Useful In Certain Circumstances" (category 2A).[3,5]
- **Colon or Rectal Cancer:** The NCCN Compendium supports the use of lapatinib in colon or rectal cancer for HER2-amplified, *RAS* and *BRAF* wild-type disease, in combination with trastuzumab, if not previously treated with a HER2 inhibitor.[3]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of lapatinib. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; a man is defined as an individual with the biological traits of a man, regardless of the individual's gender identity or expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of lapatinib is recommended in those who meet one of the following criteria:

FDA-Approved Indications

3. Breast Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **C)** Patient has recurrent or metastatic breast cancer; AND
- **D)** Patient meets one of the following criteria (i or ii):
- **i.** Patient meets both of the following criteria (a and b):
  - **a)** The medication will be used in combination with capecitabine or trastuzumab; AND
  - **b)** Patient has tried at least three prior anti-HER2 based regimens; OR
    Note: Examples of anti-HER2 regimens include: Perjeta (pertuzumab intravenous infusion) + trastuzumab + docetaxel, Perjeta + trastuzumab + paclitaxel; Enhertu (fam-trastuzumab deruxtecan-nxki intravenous infusion); Kadcyla (ado-trastuzumab emtansine intravenous infusion); Tukysa (tucatinib tablet) + trastuzumab + capecitabine.
- **ii.** The medication will be used in combination with an aromatase inhibitor (that is, letrozole, anastrozole, or exemestane) AND patient meets the following criteria (a and b):
  - **a)** Patient has hormone receptor-positive (HR+) [i.e., estrogen receptor positive {ER+}- and/or progesterone receptor positive {PR+}]disease; AND
  - **b)** One of the following ([1] [2] or [3]) applies:
    - **(1)** Patient is a postmenopausal woman*; OR
    - **(2)** Patient is a premenopausal or perimenopausal woman* and is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist, surgical bilateral oophorectomy, or ovarian irradiation; OR
      Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous injection).
    - **(3)** Patient is a man* and is receiving a gonadotropin-releasing hormone (GnRH) analog.
      Note: Examples of a GnRH analog include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), Orgovyx (relugolix tablet).

***** Refer to the Policy Statement.

Other Uses with Supportive Evidence

2. **Bone Cancer.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has recurrent chordoma; AND
   - **C)** Patient has epidermal growth-factor receptor (*EGFR*)-positive disease.

3. **Colon or Rectal Cancer.** Approve for 1 year if the patient meets the following criteria (A, B, C, D, E, F, and G)
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has unresectable, advanced, or metastatic disease; AND
   - **C)** Patient has human epidermal receptor 2 (HER2)-amplified disease; AND
   - **D)** Patient has wild-type *RAS* and *BRAF* disease; AND
   - **E)** Patient meets ONE of the following (i or ii):
     - **i.** Patient has tried at least one chemotherapy regimen; OR
       Note: Examples of chemotherapy are fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine; oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).
     - **ii.** Patient is not a candidate for intensive therapy, according to the prescriber; AND
   - **F)** The medication is used in combination with trastuzumab; AND
   - **G)** Patient has not been previously treated with a HER2-inhibitor.
     Note: Examples of HER2-inhibitors are trastuzumab products, Nerlynx (neratinib tablets), Kadcyla (ado-trastuzumab emtansine intravenous infusion) Perjeta (pertuzumab intravenous infusion), Enhertu (fam-trastuzumab deruxtecan-nxki intravenous infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of lapatinib is not recommended in the following situations:

1. **Head and Neck, Squamous Cell Carcinoma.** In one Phase III study in 688 patients with squamous cell carcinoma of the head and neck, adding lapatinib to chemoradiotherapy and as maintenance monotherapy was not more effective than placebo in improving disease-free survival or overall survival.[6]

2. **Urothelial Carcinoma.** In one Phase III trial, 232 patients with HER1/HER2 metastatic urothelial bladder cancer who did not have progressive disease during chemotherapy were randomized to receive lapatinib or placebo after completing first-line or initial chemotherapy.[7] Median progression-free survival was the primary endpoint, for lapatinib and placebo was 4.5 months and 5.1 months respectively; no statistically significant difference was detected between the two group.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lenalidomide Prior Authorization Policy
- Revlimid® (lenalidomide capsules – Celgene, generic)

REVIEW DATE: 05/10/2023

OVERVIEW

Lenalidomide, a thalidomide analog, is indicated for the following uses in adults:[1]
- **Follicular lymphoma**, previously treated, in combination with a rituximab product.
- **Mantle cell lymphoma**, in patients whose disease has relapsed or progressed after two prior therapies, one of which included bortezomib subcutaneous or intravenous bolus injection).
- **Marginal zone lymphoma**, previously treated, in combination with a rituximab product.
- **Multiple myeloma**, as maintenance following autologous hematopoietic stem cell transplantation.
- **Multiple myeloma**, treatment, in combination with dexamethasone.
- **Myelodysplastic syndrome**, for transfusion-dependent anemia due to low- or intermediate-risk disease, associated with a deletion 5q abnormality with or without cytogenetic abnormalities.

A limitation of use with lenalidomide is that it is not indicated and is not recommended for the treatment of patients with chronic lymphocytic leukemia outside of controlled clinical trials.[1]

Guidelines

Lenalidomide is incorporated into various guidelines by the National Comprehensive Cancer Network (NCCN).[2-11]

- **B-Cell Lymphomas:** The NCCN guidelines for B-Cell lymphomas (version 2.2023 – February 8, 2023), discuss therapeutic options for diffuse large B-cell lymphoma (DLBCL), the most common type of other B-cell lymphoma.[2] Lenalidomide, with or without rituximab, is mentioned as a second-line therapy as "useful in certain circumstances" (category 2A). Monjuvi® (tafasitamab-cxix intravenous infusion) plus lenalidomide is recommended as a preferred regimen in second-line therapy (category 2A). Many examples of first-line therapies are recommended (e.g., RCHOP [rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone] {category 1}, dose-adjusted EPOCH [etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin] + rituximab [category 2A]). One example of a first-line therapy for patients with poor left ventricular function or in those who are frail is RGCVP (rituximab, gemcitabine, cyclophosphamide, vincristine, prednisone). NCCN also recommends optional first-line consolidation therapy of lenalidomide maintenance (category 2B) for patients 60 to 80 years of age. Other types of B-cell lymphomas (high grade B-cell lymphomas [not otherwise specified], post-transplant lymphoproliferative disorders, acquired immunodeficiency [AIDS]-related B-cell lymphomas, high-grade B-cell lymphomas with translocations of MYC and BCL2 and/or BCL6 [double/triple hit lymphoma]) are also cited in the guidelines and note a place in therapy of lenalidomide. Regimens recommended in these clinical scenarios are similar to those used in DLBCL.
    - **Castleman's Disease:** Lenalidomide is recommended as an option as second-line and subsequent therapy, with or without rituximab, for multi-centric Castleman's disease that is relapsed/refractory or progressive disease.[2]
    - **Follicular Lymphomas:** Lenalidomide plus rituximab is a first-line recommended therapy (category 2A). Many second-line and subsequent therapies are listed, usually with or without rituximab. Lenalidomide with Gazyva® (obinutuzumab intravenous infusion) is an "other recommended regimen" in this setting (category 2A).

- **Mantle Cell Lymphoma:** Lenalidomide, in combination with rituximab, is recommended as a preferred, less aggressive induction therapy (category 2A). Lenalidomide with rituximab is recommended as a preferred second-line and subsequent therapy (category 2A). The regimen of lenalidomide, rituximab, and Imbruvica is cited as and second-line and subsequent therapy that is useful in certain circumstances (category 2A).
- **Marginal Zone Lymphoma:** Lenalidomide plus rituximab has a category 2B recommendation for first-line therapy as an "other recommended regimen" and a category 2A recommendation for second-line and subsequent therapy as a "preferred regimen".

- **Central Nervous System (CNS) Cancers:** The NCCN guidelines for CNS cancers (version 1.2023 – March 24, 2023) recommend lenalidomide, with or without rituximab, as one of the options for patients with relapsed or refractory disease.[3]
- **Histiocytic Neoplasms:** The NCCN guidelines for histiocytic neoplasms (version 1.2022 – May 20, 2022) recommend lenalidomide for Langerhans cell histiocytosis as first-line or as subsequent therapy for single system multifocal skin disease (including mucosa) and for relapsed/refractory disease (category 2A).[4]
- **Hodgkin Lymphoma:** The NCCN Hodgkin lymphoma guidelines (version 2.2023 – November 8, 2022) recommend lenalidomide as a subsequent option for treatment of classical Hodgkin lymphoma as a single agent for refractory or relapsed disease in patients ≥ 18 years of age (category 2A) who have tried at least three prior lines of therapy. Many other therapies are recommended as primary systemic therapy regimens before lenalidomide is recommended.[5]
- **Kaposi Sarcoma:** The NCCN guidelines for Kaposi sarcoma (version 1.2023 – December 20, 2022) recommended lenalidomide as an agent "useful under certain conditions" for subsequent systemic therapy options for relapsed/refractory advanced cutaneous, oral, visceral or nodal disease that has progressed on or not responded to first-line systemic therapy and progressed on alternative first-line systemic therapy (category 2A).[9] This includes use when given alone (in patients without human immunodeficiency virus [HIV]) or with antiretroviral therapy for patients with HIV. First-line systemic therapy options include liposomal doxorubicin (preferred) and paclitaxel. Other subsequent systemic therapy options for relapsed/refractory therapy are also cited (e.g., Pomalyst® [pomalidomide capsules] {preferred}, Thalomid® [thalidomide capsules], imatinib).
- **Multiple Myeloma:** The NCCN guidelines for multiple myeloma (version 3.2023 – December 8, 2022) feature lenalidomide prominently in a variety of scenarios with several category 1 recommendations (e.g., lenalidomide with dexamethasone for other recommended regimens for primary therapy, monotherapy for maintenance therapy).[6] The agent is also cited in other regimens with category 2A and 2B recommendations. Lenalidomide is also indicated for treatment in combination with dexamethasone for the management of POEMS (polyneuropathy, organomegaly, endocrinopathy, monoclonal protein, skin changes) syndrome as induction therapy for transplant eligible patients and for transplant ineligible patients (category 2A).
- **Myelodysplastic Syndrome (MDS):** The NCCN guidelines for MDS (version 1.2023 – September 12, 2022) recommend lenalidomide in a variety of clinical scenarios among patients with symptomatic anemia both with and without 5q deletion abnormalities (category 2A).[7]
- **Myeloproliferative Neoplasms:** The NCCN has guidelines regarding myeloproliferative neoplasms (version 3.2022 – August 11, 2022) discuss myelofibrosis with related anemia.[8] Lenalidomide is recommended in the management of anemia associated with myelofibrosis (useful in certain circumstances), with or without prednisone, for a variety of clinical scenarios (category 2A) including patients with erythropoietin levels ≥ 500 mU/mL and with erythropoietin levels < 500 mU/mL and no response or loss of response to erythropoietic stimulating agents.
- **Systemic Light Chain Amyloidosis:** The NCCN guidelines for systemic light chain amyloidosis (version 2.2023 – November 28, 2022) cite lenalidomide as a therapeutic option used in combination dexamethasone, and in some circumstances with additional medications, in several clinical scenarios, including as primary therapy (category 2A).[10] Also, lenalidomide in

combination with dexamethasone, and an additional medication recommended in some situations, is also recommended in patients with previously treated disease (category 2A).

- **T-Cell Lymphomas:** The NCCN guidelines for T-cell lymphomas (version 1.2023 – January 5, 2023) make several recommendations that include lenalidomide.[11] Lenalidomide is recommended as a second-line and subsequent therapy for adult T-cell leukemia/lymphoma (category 2A). For peripheral T-cell lymphomas, lenalidomide is recommended as second-line and subsequent therapy (other recommended regimens) as a monotherapy (category 2A). Indications regarding peripheral T-cell lymphomas include the following: peripheral T-cell lymphoma not otherwise specified, angioimmunoblastic T-cell lymphoma; enteropathy-associated T-cell lymphoma; monomorphic epitheliotropic intestinal T-cell lymphoma; nodal peripheral T-cell lymphoma with T-follicular helper (TFH) phenotype; follicular T-cell lymphoma; and hepatosplenic gamma-delta T-cell lymphomas. Other regimens are recommended as first-line or preferred in both of these clinical scenarios.

Safety

In a prospective randomized clinical study in the first-line treatment of patients with CLL, use of lenalidomide as a single agent increased the risk of death compared with chlorambucil given as a single agent.[1] Lenalidomide is only available through the lenalidomide Risk Evaluation Mitigation Strategy program. Males and females must follow the required reproductive precautions.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of lenalidomide. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of lenalidomide is recommended in those who meet the one of following criteria:

FDA-Approved Indications

1. **Follicular Lymphoma.** Approve for 1 year if the patient meets the following (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient meets one of the following (i or ii)
     - **i.** Patient is using lenalidomide in combination with rituximab; OR
     - **ii.** Patient has tried at least one other regimen.
       Note: Examples include bendamustine plus Gazyva (obinutuzumab intravenous infusion) or rituximab; bendamustine plus Gazyva; CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) plus Gazyva or rituximab; CVP (cyclophosphamide, vincristine, prednisone) plus Gazyva or rituximab; chlorambucil with or without rituximab; cyclophosphamide with or without rituximab; rituximab; Gazyva; or Aliqopa (copanlisib intravenous infusion).

2. **Mantle Cell Lymphoma**. Approve for 1 year if the patient meets the following (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient meets one of the following (i or ii).
     - **i.** Patient is using lenalidomide in combination with rituximab; OR
     - **ii.** Patient has tried at least two other regimens.
       Note: Examples include HyperCVAD (cyclophosphamide, vincristine, doxorubicin, and dexamethasone alternating with high-dose methotrexate and cytarabine) + rituximab; the

NORDIC regimen (dose-intensified induction immunochemotherapy with rituximab + cyclophosphamide, vincristine, doxorubicin, prednisone alternating with rituximab and high-dose cytarabine); RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone); bendamustine injection plus rituximab; RDHA (rituximab, dexamethasone, cytarabine) + platinum (carboplatin, cisplatin, or oxaliplatin); Imbruvica (ibrutinib capsules, tablets, and oral suspension) with or without rituximab; Calquence (acalabrutinib tablets and capsules); or Brukinsa (zanubrutinib capsules).

3. **Marginal Zone Lymphoma.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient meets one of the following (i or ii).
      i. Patient is using lenalidomide in combination with rituximab; OR
      ii. Patient has tried least one other regimen.
      Note: Examples include CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) + rituximab; bendamustine + rituximab; CVP (cyclophosphamide, vincristine, prednisone) + rituximab; rituximab; chlorambucil with or without rituximab; cyclophosphamide with or without rituximab; bendamustine + Gazyva (obinutuzumab intravenous infusion); Copiktra (duvelisib capsules); Aliqopa (copanlisib intravenous infusion); or Zydelig (idelalisib capsules).

4. **Multiple Myeloma.** Approve for 1 year if the patient is ≥ 18 years of age.

5. **Myelodysplastic Syndrome.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient meets one of the following (i, ii, or iii):
      i. Patient has symptomatic anemia; OR
      ii. Patient has transfusion-dependent anemia; OR
      iii. Patient has anemia that is not controlled with an erythropoiesis-stimulating agent
      Note: Examples include Epogen/Procrit (epoetin alfa injection), Aranesp (darbepoetin alfa injection).

Other Uses with Supportive Evidence

6. **B-Cell-Lymphomas (Other):** Approve for 1 year if the patient meets the following criteria (A and B):
   Note: Examples include diffuse large B-cell lymphoma (DLBCL); high grade B-cell lymphomas (not otherwise specified), post-transplant lymphoproliferative disorders, AIDS-related B-cell lymphomas, high-grade B-cell lymphomas with translocations of MYC and BCL2 and/or BCL6 (double/triple hit lymphoma).
   A) Patient is ≥ 18 years of age; AND
   B) Patient has tried at least one other regimen.
   Note: Examples include RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone); dose-adjusted EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin) + rituximab; RCEPP (rituximab, cyclophosphamide, etoposide, prednisone, procarbazine); DHA (dexamethasone, cytarabine) plus platinum (carboplatin, cisplatin, oxaliplatin) ± rituximab; ICE (Ifex, carboplatin, etoposide) ± rituximab; RGCVP (rituximab, gemcitabine, cyclophosphamide, vincristine, prednisone); GDP (gemcitabine, dexamethasone, cisplatin) ± rituximab or gemcitabine, dexamethasone, carboplatin) ± rituximab; R-HyperCVAD (rituximab, cyclophosphamide, vincristine, doxorubicin, and dexamethasone alternating with high-dose methotrexate and cytarabine); or bendamustine ± rituximab.

7. **Castleman's Disease.** Approve for 1 year in patients with relapsed/refractory or progressive disease.

8. **Central Nervous System Lymphoma.** Approve for 1 year if according to the prescriber the patient has relapsed or refractory disease.

9. **Hodgkin Lymphoma, Classical.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has tried at least three other regimens.
   Note: Examples include ABVD (doxorubicin, bleomycin, vinblastine, and dacarbazine); BEACOPP (bleomycin, etoposide, doxorubicin, cyclophosphamide, vincristine, procarbazine, and prednisone); Adcetris (brentuximab vedotin intravenous infusion); Adcetris + AVD (doxorubicin, vinblastine, and dacarbazine); DHAP (dexamethasone, cisplatin, high-dose cytarabine); ICE (ifosfamide, carboplatin, etoposide); or GVD (gemcitabine, vinorelbine, liposomal doxorubicin).

10. **Kaposi Sarcoma.** Approve for 1 year if the patient meets the following (A and B):
    A) Patient has relapsed or refractory disease; AND
    B) Patient has tried at least one other medication; AND
    Note: Examples include liposomal doxorubicin, paclitaxel, Pomalyst (pomalidomide capsules), Thalomid (thalidomide capsules), and imatinib.

11. **Langerhans Cell Histiocytosis:** Approve for 1 year for patients with multifocal skin disease.

12. **Myelofibrosis.** Approve for 1 year if the patient meets the following (A or B):
    A) Patient meets the following (i, ii, and iii):
       i. Patient is ≥ 18 years of age; AND
       ii. According to the prescriber the patient has anemia; AND
       iii. Patient has serum erythropoietin levels ≥ 500 mU/mL.
    B) Patient meets the following (i, ii, iii, and iv):
       i. Patient is ≥ 18 years of age; AND
       ii. According to the prescriber the patient has anemia; AND
       iii. Patient has serum erythropoietin levels < 500 mU/mL; AND
       iv. Patient has experienced no response or loss of response to an erythropoiesis-stimulating agent.

13. **Peripheral T-Cell Lymphomas.** Approve for 1 year if the patient meets the following (A and B):
    Note: Indications regarding peripheral T-cell lymphomas include peripheral T-cell lymphoma not otherwise specified (PTCL-NOS), angioimmunoblastic T-cell lymphoma (AITL); enteropathy-associated T-cell lymphoma (EATL); monomorphic epitheliotropic intestinal T-cell lymphoma (MEITL); nodal peripheral T-cell lymphoma (nodal PTCL) with T-follicular helper (TFH) phenotype; follicular T-cell lymphoma (FTCL); and hepatosplenic gamma-delta T-cell lymphomas.
    A) Patient is ≥ 18 years of age; AND
    B) Patient has tried at least one other regimen.
    Note: Examples of regimens include Beleodaq (belinostat intravenous infusion); Adcetris (brentuximab vedotin intravenous infusion); DHAP (dexamethasone, cisplatin, cytarabine); ESHAP (etoposide, methylprednisolone, cytarabine, cisplatin); GDP (gemcitabine, dexamethasone, cisplatin); GemOX (gemcitabine, oxaliplatin); ICE (ifosfamide, carboplatin, etoposide); or Istodax (romidepsin intravenous infusion).

14. **POEMS (polyneuropathy, organomegaly, endocrinopathy, monoclonal protein, skin changes) Syndrome.** Approve for 1 year if the patient meets the following (A and B):
    A) Patient is ≥ 18 years of age; AND

B) Use of lenalidomide is in combination with dexamethasone.

15. Systemic Light Chain Amyloidosis. Approve for 1 year if the patient meets the following (A and B):
A) Patient is ≥ 18 years of age; AND
B) Use of lenalidomide is in combination with dexamethasone.

16. T-Cell Leukemia/Lymphoma. Approve for 1 year if the patient meets the following (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient has tried at least one other regimen.
Note: Examples include Adcetris (brentuximab vedotin intravenous infusion) plus CHP (cyclophosphamide, doxorubicin, and prednisone); CHOP (cyclophosphamide, doxorubicin, vincristine, and prednisone); CHOEP (cyclophosphamide, doxorubicin, vincristine, etoposide, and prednisone); dose-adjusted EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, and doxorubicin); HyperCVAD (cyclophosphamide, vincristine, doxorubicin, and dexamethasone) alternating with high-dose methotrexate and cytarabine; or Beleodaq (belinostat intravenous infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of lenalidomide is not recommended in the following situations:

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lenvima Prior Authorization Policy
- Lenvima® (lenvatinib capsules – Eisai)

REVIEW DATE: 06/07/2023

OVERVIEW

Lenvima, a kinase inhibitor, is indicated for the following uses:[1]

- **Differentiated thyroid cancer** for treatment of locally recurrent or metastatic, progressive, radioactive iodine refractory disease.
- **Endometrial cancer**, in combination with Keytruda® (pembrolizumab intravenous infusion), for advanced disease that is mismatch repair proficient (pMMR), as determined by an FDA-approved test, or not microsatellite instability-high (MSI-H) who have disease progression following prior systemic therapy in any setting and are not candidates for curative surgery or radiation.
- **Hepatocellular carcinoma** for first-line treatment of patients with unresectable disease.
- **Renal cell carcinoma**, advanced in combination with everolimus tablets, following one prior anti-angiogenic therapy.
- **Renal cell carcinoma,** advanced, for first-line treatment of adult patients in combination with Keytruda.

Guidelines

Lenvima is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):[2]

- **Hepatocellular Carcinoma**: NCCN guidelines (version 1.2023 – March 10, 2023) recommend Lenvima as "other recommended regimen" for first-line systemic therapy (Child-Pugh Class A only) for hepatocellular carcinoma (category 1). It is also recommended as subsequent-line therapy upon disease progression (Child-Pugh Class A only) [category 2A].[3]
- **Kidney Cancer**: NCCN guidelines (version 4.2023 – January 18, 2023) recommend Lenvima + everolimus as a "preferred regimen" as subsequent therapy for relapse or stage IV disease with clear cell histology (category 2A); this combination is also listed as systemic therapy, "other recommended regimens", for relapsed or stage IV disease for non-clear cell histology (category 2A). Lenvima + Keytruda is listed as a "preferred regimen" for first-line therapy for relapsed or stage IV disease for clear cell histology (category 1); this combination is also listed as "other recommended regimen" for subsequent therapy for relapsed or stage IV with clear cell histology (category 2A).[4]
- **Melanoma**: **Cutaneous**: NCCN guidelines (version 2.2023 – March 10, 2023) recommend use of Lenvima + Keytruda (category 2A) for metastatic or unresectable disease, as second-line or subsequent therapy after treatment with anti-programmed death-1 (PD-1)/programmed death-ligand 1 (PD-L1) -based therapy, including in combination with anti-CTL antigen 4 (CTLA-4) for at least two doses.[8]
- **Thymomas and Thymic Carcinomas**: NCCN guidelines (version 1.2023 – December 15, 2022) recommend single-agent Lenvima (category 2A) as second-line systemic therapy for thymic carcinoma.[5]
- **Thyroid Carcinoma**: NCCN guidelines (version 2.2023 – May 18, 2023) indicate that first-line treatment for differentiated thyroid cancer is surgery, whenever possible, followed by radioactive iodine therapy in selected patients, and levothyroxine therapy in all patients.[2] Systemic therapy options include cytotoxic chemotherapy and kinase inhibitors. The guidelines state that for progressive and/or symptomatic disease, Lenvima is a preferred systemic therapy regimen

(category 1) for locally recurrent, advanced, and/or metastatic disease not amenable to radioactive iodine therapy. There is a footnote that states that kinase inhibitor therapy may not be appropriate for patients with stable or slowly progressive indolent disease. Lenvima can be considered for treatment of progressive or symptomatic medullary thyroid disease if clinical trials or preferred systemic therapy options are not available or appropriate, or if there is progression on preferred systemic therapy options (category 2A).[6]

- **Uterine Neoplasms**: NCCN guidelines (version 2.2023– April 28, 2023) recommends Lenvima with Keytruda combination therapy for biomarker directed systemic therapy for second-line treatment for recurrent or metastatic endometrial carcinoma for non-MSI-high [MSI-H]/non-MMR-deficient [dMMR] tumors. This combination is a category 1 recommendation as preferred therapy.[7]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lenvima. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lenvima is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Endometrial Carcinoma**. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has advanced endometrial carcinoma that is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
   - **C)** The medication is used in combination with Keytruda (pembrolizumab intravenous injection); AND
   - **D)** Patient has tried at least one systemic therapy; AND
     Note: Examples of systemic therapy include carboplatin, paclitaxel, docetaxel, cisplatin, doxorubicin, or ifosfamide.
   - **E)** Patient is not a candidate for curative surgery or radiation.

2. **Hepatocellular Cancer**. Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has unresectable or metastatic disease.

3. **Renal Cell Cancer**. Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has advanced disease; AND
   - **C)** Patient meets ONE of the following (i or ii):
     - **i.** Lenvima is being used in combination with Keytruda (pembrolizumab intravenous infusion); OR
     - **ii.** Lenvima is being used in combination with everolimus tablets/Afinitor Disperz (everolimus tablets for oral suspension) AND patient meets one of the following (a or b):
     - **a)** Patient has clear cell histology and patient has tried one antiangiogenic therapy; OR

Note: Examples of antiangiogenic therapy include Inlyta (axitinib tablets), Votrient (pazopanib tablets), sunitinib, or Cabometyx (cabozantinib tablets).

b) Patient has non-clear cell histology.

4. Thyroid Carcinoma, Differentiated. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has differentiated thyroid carcinoma.
Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).

C) The disease is refractory to radioactive iodine therapy.

Other Uses with Supportive Evidence

5. Melanoma. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Patient has unresectable or metastatic melanoma; AND

C) The medication is used in combination with Keytruda (pembrolizumab intravenous injection); AND

D) Patient has disease progression on anti-programmed death receptor-1 (PD-1)/programmed death-ligand 1 (PD-L1)-based therapy.
Note: Examples of anti-PD-1/PD-L1 therapies include Opdivo (nivolumab intravenous infusion) + Yervoy (ipilimumab intravenous infusion), Opdualag (nivolumab and relatlimab-rmbw intravenous infusion), Keytruda, Opdivo.

6. Thymic Carcinoma. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one chemotherapy regimen.
Note: Examples of a chemotherapy regimen include carboplatin plus paclitaxel, cisplatin, doxorubicin plus cyclophosphamide, cisplatin plus etoposide.

7. Thyroid Carcinoma, Medullary. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one systemic therapy.
Note: Examples of systemic therapy include Caprelsa (vandetanib tablets), Cometriq (cabozantinib capsules), Retevmo (selpercatinib capsules), and Gavreto (pralsetinib capsules).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lenvima is not recommended in the following situations:

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lonsurf Prior Authorization Policy
- Lonsurf® (trifluridine and tipiracil tablets – Taiho Oncology)

REVIEW DATE: 02/15/2023

OVERVIEW

Lonsurf, a combination of trifluridine, a nucleoside metabolic inhibitor, and tipiracil, a thymidine phosphorylase inhibitor, is indicated for the following uses:[1]

- **Colorectal cancer**, metastatic, in adults who have been previously treated with oxaliplatin-, fluoropyrimidine-, and irinotecan-based chemotherapy, an anti-vascular endothelial growth factor (VEGF) biological therapy, and if *RAS* wild-type, an anti-epidermal growth factor receptor (EGFR) therapy.
- **Gastric or gastroesophageal junction adenocarcinoma**, metastatic, in adults previously treated with at least two lines of chemotherapy that included a fluoropyrimidine, a platinum, either a taxane or irinotecan, and if appropriate, human epidermal growth factor receptor 2 (HER2)/neu-targeted therapy.

Guidelines

Lonsurf is addressed in National Comprehensive Cancer Network guidelines:

- **Colon cancer** (version 3.2022 – January 25, 2023) and **rectal cancer** (version 4.2022 – January 25, 2023) guidelines recommend Lonsurf as subsequent therapy as a single agent or in combination with bevacizumab for advanced or metastatic disease not previously treated with Lonsurf. This recommendation is for patients who have progressed through all available regimens, besides Lonsurf or Stivarga® (regorafenib tablets) with or without bevacizumab.[2,3,6]
- **Gastric cancer** (version 2.2022 – January 11, 2022), and **esophageal and esophagogastric cancer** (version 5.2022 – December 5, 2022) guidelines recommend Lonsurf as a single agent for third line or subsequent therapy for locoregional disease in patients who are not surgical candidates or have unresectable locally advanced, recurrent, or metastatic gastric and esophagogastric junction adenocarcinoma and Karnofsky performance score ≥ 60% or Eastern Cooperative Oncology Group performance status of ≤ 2 (category 1).[4-6]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lonsurf. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lonsurf is recommended in those who meet one of the following criteria:

FDA-Approved Indications

17. Colon, Rectal, or Appendiceal Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):

A) Patient has been previously treated with a fluoropyrimidine (e.g., capecitabine, 5-fluorouracil [5-FU]); AND
B) Patient has been previously treated with oxaliplatin; AND
C) Patient has been previously treated with irinotecan; AND
D) If the patient's tumor or metastases are wild-type *RAS* (*KRAS* wild-type and *NRAS* wild-type) [that is, the tumors or metastases are *KRAS* and *NRAS* mutation negative], Erbitux (cetuximab intravenous infusion) or Vectibix (panitumumab intravenous infusion) has been tried.

2. **Gastric or Gastroesophageal Junction Adenocarcinoma.** Approve for 1 year if the patient has been previously treated with at least two chemotherapy regimens for gastric or gastroesophageal junction adenocarcinoma (e.g., regimens containing one or more of the following agents: capecitabine, 5-fluorouracil [5-FU], oxaliplatin, paclitaxel, docetaxel, and irinotecan).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lonsurf is not recommended in the following situations:

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lorbrena Prior Authorization Policy
- Lorbrena® (lorlatinib tablets – Pfizer)

REVIEW DATE: 11/29/2023

OVERVIEW

Lorbrena, a kinase inhibitor, is indicated for the treatment of metastatic **non-small cell lung cancer** (NSCLC) in adults whose tumors are anaplastic lymphoma kinase (*ALK*)-positive as detected by an FDA-approved test.[1]

GUIDELINES

Lorbrena is addressed in National Comprehensive Cancer Network (NCCN) guidelines:[2-5]

- **Histiocytic Neoplasms:** Guidelines (version 1.2023 – August 11, 2023) recommend Lorbrena as a "useful in certain circumstances" treatment option for *ALK*-positive Erdheim-Chester disease (category 2A).[3]
- **NSCLC:** Guidelines (version 5.2023 – November 8, 2023) recommend testing for biomarkers (e.g., *ALK* rearrangement, *ROS* proto-oncogene 1 (*ROS1)* gene rearrangement) in eligible patients with NSCLC.[4]
  - *ALK*-rearrangement-positive NSCLC: If *ALK* rearrangement is discovered prior to first-line systemic therapy, Lorbrena is a preferred first-line treatment option (category 1). If *ALK* rearrangement is discovered during first-line systemic therapy, options are to complete the planned systemic therapy (including maintenance therapy) or to interrupt the systemic therapy and treat with Lorbrena (preferred, category 2A) or another ALK inhibitor. Lorbrena is also recommended for patients who progress on other *ALK* inhibitors (category 2A).
  - *ROS* proto-oncogene 1 *(ROS1)* rearrangement-positive NSCLC: Lorbrena is a recommended subsequent therapy (category 2A) for patients who progress on Zykadia® (ceritinib capsules and tablets), Xalkori® (crizotinib capsules), or Rozlytrek™ (entrectinib capsules). Lorbrena is not a recommended first-line treatment option for *ROS1* rearrangement-positive NSCLC.
- **Inflammatory Myofibroblastic Tumor (IMT):** NCCN Soft Tissue Sarcoma guidelines (version 2.2023 – April 25, 2023) and NCCN Uterine Neoplasms guidelines (version 1.2023 – December 22, 2022) recommend Lorbrena as a treatment option for IMT with *ALK* translocation.[5,6]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lorbrena. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lorbrena is recommended in those who meet one of the following criteria:

FDA-Approved Indication

1. **Non-Small Cell Lung Cancer – Anaplastic Lymphoma Kinase (*ALK*)-Positive.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has advanced or metastatic disease; AND
   - **C)** Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND
   - **D)** The mutation was detected by an approved test.

Other uses With Supportive Evidence

2. **Erdheim-Chester Disease**. Approve for 1 year if the patient meets the following (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has anaplastic lymphoma kinase (*ALK*) rearrangement/fusion-positive disease.

3. **Inflammatory Myofibroblastic Tumor.** Approve for 1 year if the patients meets the following (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND.
   - **C)** Patient meets one of the following criteria (i or ii):
     - **i.** Patient has advanced, recurrent, or metastatic disease; OR
     - **ii.** The tumor is inoperable.

4. **Non-Small Cell Lung Cancer – *ROS1* Rearrangement-Positive.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has advanced or metastatic disease; AND
   - **C)** Patient has *ROS1* rearrangement-positive disease; AND
   - **D)** Patient has tried at least one of Xalkori (crizotinib capsules), Zykadia (ceritinib capsules or tablets), or Rozlytrek (entrectinib capsules).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lorbrena is not recommended in the following situations:

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lumakras Prior Authorization Policy
- Lumakras™ (sotorasib tablets – Amgen)

REVIEW DATE: 06/14/2023

OVERVIEW

Lumakras, a kirsten rat sarcoma (KRAS) inhibitor, is indicated for the treatment of adults with ***KRAS G12C*-mutated locally advanced or metastatic non-small cell lung cancer (NSCLC)**, as determined by an FDA-approved test, who have received at least one prior systemic therapy.[1]

This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trial(s).

Mutations in the *KRAS* gene most commonly occur at codon 12.[2] Data suggest that approximately 25% of patients with adenocarcinomas in a North American population have *KRAS* mutations. The prognosis of survival of patients with tumors with *KRAS* mutation is poorer compared with that of patients with tumors without *KRAS* mutation.

Guidelines

Lumakras is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Non-Small Cell Lung Cancer:** NCCN guidelines (version 3.2023 – April 13, 2023) recommend Lumakras as a subsequent therapy for patients with metastatic NSCLC with the *KRAS G12C* mutation (category 2A) who have been previously treated with combination chemotherapy regimens (± immunotherapy).[2]
- **Pancreatic Adenocarcinoma:** NCCN guidelines (version 1.2023 – May 4, 2023) recommend Lumakras as a subsequent therapy (category 2A) under "useful in certain circumstances" for locally advanced or metastatic disease. It is also recommended therapy for local recurrence in the pancreatic operative bed after resection (category 2A).[3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lumakras. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lumakras is recommended in those who meet the following criteria:

FDA-Approved Indication

4. **Non-Small Cell Lung Cancer (NSCLC).** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   D) Patient is ≥ 18 years of age; AND
   E) Patient has *KRAS G12C*-mutated locally advanced or metastatic NSCLC, as determined by an approved test; AND
   F) Patient has been previously treated with at least one systemic regimen.
   Note: Examples of systemic regimens include those containing one or more of the following products: Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion), Tecentriq (atezolizumab intravenous infusion), Alimta (pemetrexed intravenous infusion), Yervoy (ipilimumab intravenous infusion), Abraxane (albumin-bound paclitaxel intravenous infusion), bevacizumab, cisplatin, carboplatin, docetaxel, gemcitabine, paclitaxel, vinorelbine.

Other Uses with Supportive Evidence

5. **Pancreatic Adenocarcinoma.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has *KRAS G12C*-mutated disease, as determined by an approved test; AND
   C) Patient meets one of the following (i or ii):
      i. Patient meets both of the following (a and b):
         a) Patient has locally advanced or metastatic disease; AND
         b) Patient has been previously treated with at least one systemic regimen; OR
         Note: Examples of systemic regimens include one or more of the following: gemcitabine, albumin-bound paclitaxel, capecitabine, Keytruda (pembrolizumab intravenous infusion), FOLFIRINOX (5-fluoruracil + leucovorin + irinotecan + oxaliplatin).
      ii. Patient has recurrent disease after resection.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lumakras is not recommended in the following situations:

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lynparza Prior Authorization Policy
- Lynparza® (olaparib tablets – AstraZeneca)

REVIEW DATE: 02/22/2023; selected revision 06/07/2023

OVERVIEW

Lynparza, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicated for the following uses:[1]

- **Breast cancer**, with deleterious or suspected deleterious germline BReast Cancer (g*BRCA*) mutated, human epidermal growth factor 2 (HER2)-negative metastatic disease, in adults who have been treated with chemotherapy in the neoadjuvant, adjuvant, or metastatic setting. Patients with hormone receptor-positive (HR+) breast cancer should have been treated with a prior endocrine therapy or be considered inappropriate for endocrine therapy.
- **Breast cancer**, for the adjuvant treatment of deleterious or suspected deleterious g*BRCA* mutated HER2-negative high-risk early breast cancer in adults who have been treated with neoadjuvant or adjuvant chemotherapy.
- **Ovarian cancer, maintenance** treatment of deleterious or suspected deleterious germline or somatic *BRCA* mutated recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer, in adults who are in a complete or partial response to platinum-based chemotherapy.
- **Ovarian cancer, maintenance** treatment of deleterious or suspected deleterious *gBRCA* or somatic *BRCA*-mutated advanced epithelial ovarian, fallopian tube, or primary peritoneal cancer in adults who are in complete or partial response to first-line platinum-based chemotherapy.
- **Ovarian cancer, maintenance treatment in combination** with bevacizumab for advanced epithelial ovarian, fallopian tube or primary peritoneal cancer in adults who are in complete or partial response to first-line platinum-based chemotherapy and whose cancer is associated with homologous recombination deficiency (HRD)-positive status defined by either: a deleterious or suspected deleterious *BRCA* mutation, and/or genomic instability.
- **Pancreatic adenocarcinoma,** maintenance treatment of deleterious or suspected deleterious g*BRCA* mutated metastatic disease, in adults whose disease has not progressed on at least 16 weeks of a first-line platinum-based chemotherapy regimen.
- **Prostate cancer**, for the treatment of deleterious or suspected deleterious germline or somatic homologous recombination repair (HRR) gene-mutated metastatic castration resistant prostate cancer (mCRPC) in adults who have progressed following prior treatment with Xtandi® (enzalutamide tablets) or abiraterone.
- **Prostate cancer,** for the treatment of deleterious or suspected deleterious *BRCA*-mutated (*BRCA*m) mCRPC, in combination with abiraterone and prednisone or prednisolone in adults.

Guidelines

Lynparza is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):[7]

- **Breast Cancer:** NCCN guidelines (version 2.2023 – February 7, 2023) list single-agent Lynparza as a "Preferred Regimen" for first-line therapy for patients with a germline *BRCA 1/2* mutation for recurrent, unresectable, or stage IV HR-positive, HER2-negative disease, with visceral crisis or that is endocrine therapy-refractory (category 1).[2] For triple negative breast cancer with germline *BRCA*1/2 mutation, Lynparza is listed as a "Preferred Regimen" as first-line and second-line therapy for patients with programmed cell death ligand 1 combined positive score (PD-L1 CPS) < 10 (category 1). There is a footnote which states PARP inhibitors can be considered for a later line for those with *BRCA*1/2 mutation (category 2A); however, available evidence suggests it is more

effective if used earlier. Lynparza is also recommended as a single-agent for recurrent, unresectable, or stage IV HER2-positive disease with a *BRCA*1/2 mutation (category 2A). It is noted that although Lynparza is FDA-approved for HER2-negative disease, the NCCN panel supports use in any breast cancer subtype with a *BRCA1* or *BRCA2* mutation. The guidelines also state that addition of 1 year of adjuvant Lynparza is an option for select patients with germline *BRCA*1/2 mutation after completion of adjuvant chemotherapy for the following scenarios: triple negative disease if patient has ≥ primary tumor (pT2) or ≥ pathologic lymph nodes (pN1) disease after adjuvant chemotherapy or patient has residual disease after preoperative chemotherapy (category 1); HR+, HER2-negative tumors if 1) ≥ 4 positive lymph nodes after adjuvant chemotherapy (category 2A) or 2) residual disease after preoperative therapy and a clinical stage, pathologic stage, estrogen receptor status, and tumor grade (CPS+EG) score ≥ 3 (category 2A). The guidelines state that adjuvant Lynparza therapy can be given with endocrine therapy.

- **Ovarian Cancer**: NCCN guidelines (version 1.2023 – December 22, 2022) recommend Lynparza for maintenance therapy after primary treatment in patients who have had a complete or partial response in the following situations: single-agent Lynparza for *BRCA*1/2 mutations (category 1 if bevacizumab was not used during primary therapy and category 2A if bevacizumab was used during primary therapy); Lynparza + bevacizumab if bevacizumab was used as part of primary therapy (*BRCA*1/2 wild-type or unknown and homologous recombination deficient [category 1]; germline/somatic *BRCA*1/2 mutation [category 1]).[3] The guidelines recommend use of Zejula® (niraparib capsules), Rubraca® (rucaparib tablets), or Lynparza as single-agent maintenance therapy options in patients with platinum-sensitive persistent or recurrent disease who have completed two or more lines of platinum-based therapy and are in complete or partial response for BRCA mutation ("Preferred"; category 1); Lynparza can be used in this setting without a BRCA mutation (category 2A). The guidelines recommend Lynparza as single-agent targeted therapy for treatment of patients with deleterious germline *BRCA* mutated advanced (persistent disease or recurrence) ovarian cancer following two or more lines of chemotherapy (category 3).
- **Pancreatic Cancer:** NCCN guidelines (version 2.2022 – December 6, 2022) recommend Lynparza as a "Preferred Regimen" maintenance therapy for metastatic disease after the patient has tried first-line platinum-based chemotherapy.[4] It is specifically recommended in patients who have germline *BRCA1/2* mutations and who have not had disease progression after at least 4 to 6 months of chemotherapy (category 2A).
- **Prostate Cancer:** NCCN guidelines (version 1.2023 – September 16, 2022) recommend Lynparza as "Useful in Certain Circumstances" for mCRPC with germline or somatic HRR mutation for patients who have received prior novel hormone therapy (i.e. abiraterone, Xtandi® [enzalutamide capsule or tablet], Nubeqa® [darolutamide tablet], or Erleada® [apalutamide tablet]) [category 1; category 2B if the patient has visceral metastases and has tried docetaxel].[5] A footnote notes that Lynparza is a treatment option for patients with mCRPC and a pathogenic mutation (germline and/or somatic) in a HRR gene (*BRCA1*, *BRCA2*, *ATM*, *BARD1*, *BRIP1*, *CDK12*, *CHEK1*, *CHEK2*, *FANCL*, *PALB2*, *RAD51B*, *RAD51C*, *RAD51D*, or *RAD54L)*, who have been previously treated with androgen receptor-directed therapy. However, efficacy appears to be driven by the cohort of patients with at least one alteration in *BRCA2*, *BRCA1*, or *ATM*, and in particular by patients with *BRCA2* or *BRCA1* mutations based on exploratory gene-by-gene analysis. There may be heterogeneity of response to Lynparza for non-*BRCA* mutations based on the specific gene mutation.
- **Uterine Neoplasms:** NCCN guidelines (version 1.2023 – December 22, 2022) state that Lynparza may be considered as a single-agent second-line therapy as "Useful in Certain Circumstances", for *BRCA2*-altered uterine leiomyosarcoma (category 2A).[6]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lynparza. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lynparza is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Breast Cancer – Adjuvant Therapy.** Approve for 1 year (total) if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has germline *BRCA* mutation-positive breast cancer; AND
   - **C)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
   - **D)** Patient has tried neoadjuvant or adjuvant therapy.

2. **Breast Cancer – Recurrent or Metastatic Disease.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has recurrent or metastatic disease; AND
   - **C)** Patient has germline *BRCA* mutation-positive breast cancer.

3. **Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Maintenance, Monotherapy.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient meets ONE of the following criteria (i or ii):
     - **i.** Patient meets both of the following criteria for first-line maintenance therapy (a and b):
       - **a)** Patient has a germline or somatic *BRCA* mutation-positive disease as confirmed by an approved test; AND
       - **b)** Patient is in complete or partial response to first-line platinum-based chemotherapy regimen; OR
         Note: Examples are carboplatin with paclitaxel, carboplatin with doxorubicin, docetaxel with carboplatin.
     - **ii.** Patient is in complete or partial response after at least two platinum-based chemotherapy regimens.
       Note: Examples of platinum-based chemotherapy are carboplatin with gemcitabine, carboplatin with paclitaxel, cisplatin with gemcitabine.

4. **Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Maintenance, Combination Therapy.** Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** The medication is used in combination with bevacizumab; AND
   - **C)** Patient has homologous recombination deficiency (HRD)-positive disease as confirmed by an approved test; AND
     Note: HRD-positive disease includes patients with *BRCA* mutation-positive disease.
   - **D)** Patient is in complete or partial response to first-line platinum-based chemotherapy regimen.
     Note: Examples of chemotherapy regimens are carboplatin with paclitaxel, carboplatin with doxorubicin, docetaxel with carboplatin.

5. **Pancreatic Cancer – Maintenance Therapy.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has a germline *BRCA* mutation-positive metastatic disease; AND
   C) The disease has not progressed on at least 16 weeks of treatment with a first-line platinum-based chemotherapy regimen.

6. **Prostate Cancer.** Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has metastatic castration resistant prostate cancer; AND
   C) Patient meets one of the following criteria (i or ii):
      i. The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog; OR
      Note: Examples are leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), Orgovyx (relugolix tablets).
      ii. Patient has had a bilateral orchiectomy; AND
   D) Patient meets the following criteria (i or ii):
      i. Patient meets the following criteria (a and b):
         a) Patient has germline or somatic homologous recombination repair (HRR) gene-mutated disease, as confirmed by an approved test; AND
         Note: HRR gene mutations include *BRCA1*, *BRCA2*, *ATM*, *BARD1*, *BRIP1*, *CDK12*, *CHEK1*, *CHEK2*, *FANCL*, *PALB2*, *RAD51B*, *RAD51C*, *RAD51D*, or *RAD54L*.
         b) Patient has been previously treated with at least one androgen receptor-directed therapy; OR
         Note: Androgen-receptor-directed therapy includes: abiraterone, Xtandi (enzalutamide capsules and tablets), Nubeqa (darolutamide tablets), or Erleada (apalutamide tablets).
      ii. Patient meets the following criteria (a and b):
         a) Patient has a *BRCA* mutation; AND
         b) The medication is used in combination with abiraterone plus one of prednisone or prednisolone.

Other Uses With Supportive Evidence:

7. **Ovarian Cancer – Treatment.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   Note: This also includes fallopian tube, or primary peritoneal cancer.
   A) Patient is ≥ 18 years of age; AND
   B) Patient has a germline *BRCA*-mutation as confirmed by an approved test; AND
   C) Patient has progressed on two or more prior lines of chemotherapy.

8. **Uterine Leiomyosarcoma**. Approve for 1 year if the patient meets the following criteria (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has *BRCA2*-altered disease; AND
   C) Patient has tried one systemic regimen.

Note: Examples of a systemic regimen include one or more of the following products: dacarbazine, docetaxel, doxorubicin, epirubicin, gemcitabine, ifosfamide Yondelis (trabectedin intravenous infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lynparza is not recommended in the following situations:

8. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lytgobi Prior Authorization Policy
- Lytgobi® (futibatinib tablets – Taiho Oncology)

REVIEW DATE: 11/08/2023

OVERVIEW

Lytgobi, a fibroblast growth factor receptor 2 (*FGFR2*) inhibitor, is indicated for the treatment of adults with previously treated, unresectable, locally advanced or metastatic intrahepatic **cholangiocarcinoma** harboring *FGFR2* gene fusions or other rearrangements.

Guidelines

Lytgobi is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **Biliary Tract Cancers:** NCCN guidelines (version 2.2023 – May 10, 2023) recommend Lytgobi for disease progression on or following systemic therapy for patients with unresectable or metastatic intrahepatic or extrahepatic cholangiocarcinoma with *FGFR2* fusions or rearrangements.[2,3] NCCN guidelines also recommend Pemazyre® (pemigatinib tablets) for the same indication.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lytgobi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lytgobi is recommended in those who meet the following criteria:

FDA-Approved Indication

18. Cholangiocarcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has unresectable locally advanced or metastatic disease; AND
- **C)** Tumor has fibroblast growth factor receptor 2 (*FGFR2*) gene fusions or other rearrangements, as detected by an approved test; AND
- **D)** Patient has been previously treated with at least one systemic regimen.
  Note: Examples of systemic regimens include gemcitabine + cisplatin, 5-fluorouracil + oxaliplatin or cisplatin, capecitabine + cisplatin or oxaliplatin, gemcitabine + Abraxane (albumin-bound paclitaxel) or capecitabine or oxaliplatin, and gemcitabine + cisplatin + Abraxane.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lytgobi is not recommended in the following situations:

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Mekinist Prior Authorization Policy
- Mekinist® (trametinib tablets and oral solution – Novartis)

REVIEW DATE: 04/05/2023; selected revision 09/13/2023

OVERVIEW

Mekinist, a kinase inhibitor, is indicated for the treatment of patients with the following conditions:[1]

- **Low-grade glioma,** in combination with Tafinlar, for the treatment of pediatric patients ≥ 1 year of age with a *BRAF V600E* mutation who require systemic therapy.
- **Melanoma**, in the following situations:
  - As a single agent for unresectable or metastatic disease with a *BRAF V600E* or *V600K* mutation as detected by an FDA-approved test.
  - In combination with Tafinlar® (dabrafenib capsules and tablets for oral suspension), for unresectable or metastatic disease with a *BRAF V600E* or *V600K* mutation as detected by an FDA-approved test.
  - In combination with Tafinlar, as adjuvant treatment of *BRAF V600E* or *V600K* mutation-positive disease as detected by an FDA-approved test, with involvement of lymph nodes, following complete resection.
- **Non-small cell lung cancer**, in combination with Tafinlar, for disease that has the *BRAF V600E* mutation as detected by an FDA-approved test.
- **Solid tumors – unresectable or metastatic**, in combination with Tafinlar, for *BRAF V600E* mutation-positive disease, as determined by an FDA-approved test, in patients ≥ 1 year of age who have no satisfactory alternative treatment options.
- **Thyroid cancer**, in combination with Tafinlar, for locally advanced or metastatic anaplastic disease with *BRAF V600E* mutation and with no satisfactory locoregional treatment options.

Limitations of Use: Mekinist is not indicated for treatment of patients with colorectal cancer because of known intrinsic resistance to BRAF inhibition.

Dosing: For the tablet dosage form, Mekinist has dosing for patients who are adults and for patients who are between 6 and 17 years of age and weigh ≥ 26 kg. The oral solution dosage form also has weight-based dosing for patients ≥ 8 kg.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of Mekinist in multiple cancers.

- **Central Nervous System Cancers**: Guidelines (version 1.2023 – March 24, 2023) recommend a BRAF/MEK inhibitor combination (i.e., Tafinlar/Mekinist or Zelboraf® [vemurafenib tablets]/Cotellic® [cobimetinib tablets]) for treatment of *BRAF V600E* activation mutations in adults in the following situations: adjuvant treatment of pilocytic astrocytoma, pleomorphic xanthoastrocytoma, or ganglioglioma; recurrent or progressive low-grade glioma, oliogdenroglioma, or isocitrate dehydrogenase-2 (*IDH2*)-mutant astrocytoma; and recurrent glioblastoma.[7] BRAF/MEK combination therapy is also recommended for melanoma with brain metastases. Guidelines for pediatric central nervous system (CNS) cancers (version 2.2023 – October 31, 2022) include targeted therapy with Tafinlar + Mekinist as adjuvant therapy or for recurrent or progressive disease, if the cancer has a *BRAF V600E* mutation.[9]

- **Histiocytic Neoplasms:** Guidelines (version 1.2022 – May 20, 2022) recommend Cotellic as "preferred" or Mekinist as "other recommended regimen" for histiocytic neoplasms (if there is a MAP kinase pathway mutation, or no detectable mutation, or testing is not available) for the following types: Langerhans cell histiocytosis (including multisystem, pulmonary or central nervous system lesions), Erdheim-Chester disease, and Rosai-Dorfman disease.[6]
- **Melanoma, Cutaneous:** Guidelines (version 2.2023 – March 10, 2023) recommend BRAF/MEK inhibitor combinations among the "preferred" therapies for first-line and subsequent treatment of metastatic or unresectable melanoma with a *V600*-activating mutation.[2] While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor is an option. Tafinlar + Mekinist is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafinlar/Mekinist, other BRAF/MEK combinations can be considered.
- **Non-Small Cell Lung Cancer:** Guidelines (version 2.2023 – February 17, 2023) list Tafinlar + Mekinist among the first-line therapy and subsequent therapy options for tumors with a *BRAF* mutation.[3] NCCN also notes that monotherapy with a BRAF inhibitor (Tafinlar or Zelboraf) is a treatment option when combination therapy is not tolerated.

The NCCN Compendium[8] recommends use of Mekinist, in combination with Tafinlar, for the following *BRAF V600* positive tumors (all category 2A): High-grade gliomas, ampullary adenocarcinoma, neuroendocrine tumors, pancreatic adenocarcinoma, salivary gland tumors, esophageal and esophagogastric junction cancers, gastric cancer, biliary tract cancers, gastrointestinal stromal tumors, brain metastases due to melanoma, ovarian cancer, and differentiated thyroid carcinoma. NCCN Compendium also recommends use of Tafinlar as monotherapy for low-grade serous ovarian cancer.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Mekinist. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mekinist is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Low Grade Glioma.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   - **A)** Patient is ≥ 1 year of age; AND
   - **B)** Patient has *BRAF V600* mutation-positive disease; AND
   - **C)** The medication will be taken in combination with Tafinlar (dabrafenib capsules or tablets for oral suspension); AND
   - **D)** Patient requires systemic therapy.

2. **Melanoma.** Approve for 1 year if the patient meets the following (A, B, and C):
   - **A)** Patient is ≥ 6 years of age; AND
   - **B)** Patient has unresectable, advanced (including Stage III or Stage IV disease), or metastatic melanoma; AND

Note: This includes adjuvant treatment in patients with Stage III disease with no evidence of disease post-surgery.

C) Patient has *BRAF V600* mutation-positive disease.

3. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets the following (A, B, and C):
   A) Patient is ≥ 6 years of age; AND
   B) Patient has *BRAF V600* mutation-positive disease; AND
   C) The medication is prescribed in combination with Tafinlar (dabrafenib capsules or tablets for oral suspension).

4. **Solid Tumors – Unresectable or Metastatic.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   Note: Examples of solid tumors are: biliary tract cancer, brain metastases due to melanoma, high-grade gliomas, differentiated thyroid carcinoma, gastrointestinal stromal tumors, gastric cancer, esophageal and esophagogastric junction cancers, salivary gland tumors, pancreatic adenocarcinoma, neuroendocrine tumors, and ampullary adenocarcinoma.
   A) Patient is ≥ 1 year of age; AND
   B) Patient has *BRAF V600* mutation-positive disease; AND
   C) The medication will be taken in combination with Tafinlar (dabrafenib capsules or tablets for oral suspension); AND
   D) According to the prescriber, the patient has no satisfactory alternative treatment options.

5. **Thyroid Carcinoma, Anaplastic.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   A) Patient is ≥ 6 years of age; AND
   B) Patient has locally advanced or metastatic anaplastic disease; AND
   C) Patient has *BRAF V600* mutation-positive disease; AND
   D) The medication is prescribed in combination with Tafinlar (dabrafenib capsules or tablets for oral suspension), unless intolerant.

Other Uses with Supportive Evidence

6. **Histiocytic Neoplasm.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient is ≥ 6 years of age; AND
   B) Patient meets one of the following (i, ii, or iii):
      i. Patient has Langerhans cell histiocytosis and one of the following (a, b, or c):
         a) Multisystem disease; OR
         b) Pulmonary disease; OR
         c) Central nervous system lesions; OR
      ii. Patient has Erdheim-Chester disease; OR
      iii. Patient has Rosai-Dorfman disease.

7. **Ovarian, Fallopian Tube, or Primary Peritoneal Cancer**. Approve for 1 year if the patient meets the following (A, B, and C):
   - **A)** Patient is ≥ 6 years of age; AND
   - **B)** Patient has recurrent disease; AND
   - **C)** Patient meets ONE of the following (i or ii):
     - **i.** The medication is used for low-grade serous carcinoma; OR
     - **ii.** The patient meets both of the following (a and b):
       - **a)** Patient has *BRAF V600* mutation-positive disease; AND
       - **b)** The medication will be taken in combination with Tafinlar (dabrafenib capsules or tablets for oral suspension).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mekinist is not recommended in the following situations:

1. **Colon or Rectal Cancer.** Mekinist is not indicated for treatment of patients with colorectal cancer because of known intrinsic resistance to BRAF inhibition.[1]

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Mektovi Prior Authorization Policy
- Mektovi® (binimetinib tablets – Array BioPharma)

REVIEW DATE: 07/19/2023; selected revision 10/18/2023

OVERVIEW

Mektovi, a kinase inhibitor, is indicated for the following uses:[1]

- **Melanoma,** in combination with Braftovi® (encorafenib capsules) for the treatment of patients with unresectable or metastatic disease with a *BRAF V600E* or *V600K* mutation as detected by an FDA-approved test.
- **Non-small cell lung cancer (NSCLC),** in combination with Braftovi, for the treatment of adult patients with metastatic NSCLC with a *BRAF V600E* mutation, as detected by an FDA-approved test.

Guidelines

National Comprehensive Cancer Network guidelines support use of Mektovi in the following cancers.

- **Histiocytic Neoplasms:** Guidelines (version 1.2022 – May 20, 2022) recommend Cotellic® (cobimetinib tablets) "preferred" or Mektovi as "other recommended regimen" for histiocytic neoplasms (if there is a MAP kinase pathway mutation, or no detectable mutation, or testing is not available) for the following types: Langerhans cell histiocytosis (including multisystem, pulmonary, or central nervous system lesions).[3]
- **Melanoma, Cutaneous:** Guidelines (version 2.2023 – March 10, 2023) recommend BRAF/MEK inhibitor combinations among the "preferred" therapies for first-line and subsequent treatment of metastatic or unresectable melanoma with a *V600* activating mutation.[2] This combination is also recommended for adjuvant treatment (category 2B). Mektovi as a single agent is a category 2B recommendation for NRAS-mutated tumors (for progression following immune checkpoint inhibitor therapy). While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor is an option, especially in patients who are not appropriate candidates for checkpoint immunotherapy.
- **Non-Small Cell Lung Cancer:** Guidelines (version 3.2023 – April 13, 2023) recommend Tafinlar® (dabrafenib capsules) + Mekinist® (trametinib tablets) for first-line "preferred" and subsequent therapy (both category 2A) for *BRAF V600E* mutation-positive disease.[4] Zelboraf® (vemurafenib tablets) or Tafinlar monotherapy is also recommended under "useful in certain circumstances" (both category 2A). Braftovi + Mektovi combination is not yet addressed in the guidelines.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Mektovi. All approvals are provided the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mektovi is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Melanoma.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   - **D)** Patient is ≥ 18 years of age; AND
   - **E)** Patient has unresectable, advanced, or metastatic melanoma; AND
   - **F)** Patient has *BRAF V600* mutation-positive disease; AND
   - **G)** The medication will be used in combination with Braftovi (encorafenib capsules).

2. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets the following (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has *BRAF V600E* mutation-positive metastatic disease; AND
   - **C)** The medication will be taken in combination with Braftovi (encorafenib capsules).

Other Uses with Supportive Evidence

3. **Histiocytic Neoplasm.** Approve for 1 year if the patient meets the following (A and B):
   - **C)** Patient is ≥ 18 years of age; AND
   - **D)** Patient has Langerhans cell histiocytosis and one of the following (i, ii, or iii):
     - **ii.** Multisystem disease; OR
     - **iii.** Pulmonary disease; OR
     - **iv.** Central nervous system lesions.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mektovi is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Nerlynx Prior Authorization Policy
- Nerlynx® (neratinib tablets – Puma)

REVIEW DATE: 10/18/2023

OVERVIEW

Nerlynx, a kinase inhibitor, is indicated in adults for the following uses:[1]
- Early-stage human epidermal growth factor receptor 2 (HER2)-positive **breast cancer**, as a single agent for extended adjuvant therapy to follow adjuvant trastuzumab-based therapy.
- Advanced or metastatic HER2-positive **breast cancer**, in combination with capecitabine, for patients who have received two or more prior anti-HER2-based regimens in the metastatic setting.

Guidelines

Nerlynx is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):
- **Breast cancer:** Guidelines (version 4.2023 – March 23, 2023) note that Nerlynx can be considered as extended adjuvant therapy following adjuvant trastuzumab-containing therapy in patients with hormone receptor (HR)-positive, HER2-positive disease with a perceived high risk of recurrence (category 2A).[2] The benefits or toxicities associated with extended Nerlynx in patients who have received Perjeta® (pertuzumab intravenous infusion) or Kadcyla® (ado-trastuzumab emtansine intravenous infusion) are unknown. For the treatment of recurrent unresectable (local or regional) or Stage IV or metastatic HER2 positive disease, Nerlynx + capecitabine is recommended for fourth-line and beyond setting (category 2A).
- **Central nervous system cancers**: Guidelines (version 1.2023 – March 24, 2023) list Nerlynx + capecitabine (category 2A) and Nerlynx + paclitaxel (category 2B) for brain metastases for patients with HER2 positive breast cancer.[3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nerlynx. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nerlynx is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Breast Cancer – Adjuvant Therapy.** Approve for 1 year (total) if the patient meets the following (A, B, C, and D):
   A) Patient is ≥ 18 years of age; AND
   B) Patient will not be using this medication in combination with human epidermal growth factor 2 (HER2) antagonists.
   Note: Examples of HER2 antagonists are trastuzumab and Perjeta (pertuzumab intravenous infusion).

C) Patient has HER2-positive breast cancer; AND
D) Patient meets ONE of the following (i or ii):
  i. The medication is requested for extended adjuvant therapy after the patient has completed 1 year of adjuvant therapy with a trastuzumab intravenous product; OR
  ii. Patient has tried adjuvant therapy with a trastuzumab intravenous product and could not tolerate 1 year of therapy, according to the prescriber.

2. Breast Cancer – Recurrent or Metastatic Disease. Approve for 1 year if the patient meets the following (A, B, C, and D):
A) Patient is ≥ 18 years of age; AND
B) Patient has human epidermal growth factor receptor 2 (HER2)-positive breast cancer; AND
C) The medication is used in combination with capecitabine; AND
D) Patient has tried at least two prior anti-HER2 based regimens.
Note: Examples include Perjeta (pertuzumab intravenous infusion) + trastuzumab + docetaxel, Perjeta + trastuzumab + paclitaxel; Enhertu (fam-trastuzumab deruxtecan-nxki intravenous infusion), Kadcyla (ado-trastuzumab emtansine intravenous infusion), Tukysa (tucatinib tablets) + trastuzumab + capecitabine, trastuzumab + capecitabine, lapatinib + capecitabine, trastuzumab + lapatinib.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nerlynx is not recommended in the following situations:

10. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Nilutamide Prior Authorization Policy
- Nilandron® (nilutamide tablets – Concordia, generic)

REVIEW DATE: 01/18/2023

OVERVIEW

Nilutamide, in combination with surgical castration, is indicated for the treatment of **metastatic prostate cancer (Stage D_2)**.[1] For maximum benefit, nilutamide treatment must begin on the same day as or on the day after surgical castration.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for **prostate cancer** (version 1.2023 – September 16, 2022) recommend nilutamide in combination with luteinizing hormone-releasing hormone agonists [Lupron® (leuprolide subcutaneous injection), Lupron Depot® (leuprolide acetate intramuscular injection), Trelstar® (triptorelin pamoate intramuscular injection), Zoladex® (goserelin acetate subcutaneous implant), Vantas® (histrelin acetate subcutaneous implant)] with or without external beam radiation therapy for androgen deprivation therapy.[2,3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of nilutamide. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of nilutamide is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Prostate Cancer.** Approve for 1 year if nilutamide is used concurrently with a luteinizing hormone-releasing hormone (LHRH) agonist.
   Note: Examples are Lupron (leuprolide subcutaneous injection), Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of nilutamide is not recommended in the following situations:

11. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ninlaro Prior Authorization Policy
- Ninlaro® (ixazomib capsules – Takeda)

REVIEW DATE: 04/12/2023

OVERVIEW

Ninlaro, an oral proteasome inhibitor, is indicated in combination with lenalidomide and dexamethasone for treatment of patients with **multiple myeloma** who have received at least one prior therapy.[1]

Limitations of Use: Ninlaro is not recommended for use in the maintenance setting or in newly diagnosed multiple myeloma in combination with lenalidomide and dexamethasone outside of controlled clinical trials. Ninlaro should be taken once a week on the same day and at approximately the same time for the first 3 weeks of a 4-week cycle. There are dose modification guidelines which are recommended to manage treatment-related adverse events, including platelet count, absolute neutrophil count (ANC), and other toxicities (e.g., rash, peripheral neuropathy). Treatment should be continued until disease progression or unacceptable toxicity. Safety and efficacy are not established in patients < 18 years of age.

Guidelines

Ninlaro is discussed in various guidelines from the National Comprehensive Cancer Network (NCCN).

- **Multiple Myeloma:** NCCN guidelines (version 3.2023 – December 8, 2022) list multiple therapeutic regimens that may be used for primary therapy and previously treated multiple myeloma.[2] For primary therapy, in transplant candidates, Ninlaro/cyclophosphamide/dexamethasone (category 2A) and Ninlaro/lenalidomide/dexamethasone (category 2B) are listed under "Useful in certain circumstances". Ninlaro/lenalidomide/dexamethasone is a category 2A recommendation for non-transplant candidates under "Other recommended regimens". Maintenance with Ninlaro is also listed among the alternatives for transplant and non-transplant candidates (category 2B for both settings). For previously treated disease, multiple regimens are listed, including Ninlaro/lenalidomide/dexamethasone (preferred, category 1), Ninlaro/Pomalyst (pomalidomide capsules)/dexamethasone (preferred for "Bortezomib-refractory" group), and Ninlaro/cyclophosphamide/dexamethasone under "Other recommended regimens for early relapses (1-3 prior therapies).
- **Systemic Light Chain Amyloidosis:** NCCN guidelines (version 2.2022 – November 28, 2022) list Ninlaro ± dexamethasone and Ninlaro/lenalidomide/dexamethasone among the treatment options for patients with previously treated disease (both category 2A).[3]
- **Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma:** NCCN guidelines (version 1.2023 – July 6, 2022) list Ninlaro/rituximab/dexamethasone (category 2A) among the treatment options for primary therapy and for previously treated disease.[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ninlaro. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ninlaro is recommended in those who meet the following criteria:

FDA-Approved Indication

2. Multiple Myeloma. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **B)** Patient is ≥ 18 years of age; AND
- **C)** Patient meets one of the following (i, ii, or iii):
  - **i.** Ninlaro will be taken in combination with lenalidomide or cyclophosphamide and dexamethasone; OR
  - **ii.** Patient has received at least ONE prior regimen for multiple myeloma; OR
    Note: Examples include regimens containing bortezomib, cyclophosphamide, Kyprolis (carfilzomib intravenous infusion), lenalidomide, Darzalex (daratumumab intravenous infusion).
  - **iii.** The medication will be used following autologous stem cell transplantation (ASCT).

Other Uses with Supportive Evidence

3. Systemic Light Chain Amyloidosis. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has tried at least one other regimen for this condition.
  Note: Examples of agents used in other regimens include bortezomib, lenalidomide, cyclophosphamide, and melphalan.

4. Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The medication is used in combination with a rituximab product and dexamethasone.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ninlaro is not recommended in the following situations:

12. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Nubeqa Prior Authorization Policy
- Nubeqa® (darolutamide tablets – Bayer)

REVIEW DATE: 07/19/2023

OVERVIEW

Nubeqa, an androgen receptor inhibitor, is indicated for the treatment of adults for the following uses:[1]
- **Prostate cancer, metastatic, hormone-sensitive**, in combination with docetaxel.
- **Prostate cancer, non-metastatic, castration-resistant**.

Guidelines

According to the National Comprehensive Cancer Network guidelines for **prostate cancer** (version 1.2023 – September 16, 2022), for non-metastatic, castration-resistant prostate cancer, androgen deprivation therapy is continued to maintain castrate serum levels of testosterone (< 50 ng/dL).[2] Nubeqa, Erleada™ (apalutamide tablets) and Xtandi® (enzalutamide tablets and capsules) are all category 1 preferred regimens if the prostate specific antigen doubling time is ≤ 10 months. For metastatic castration naïve prostate cancer, the guidelines recommend abiraterone, Xtandi, Erleada, and docetaxel as preferred agents (category 1).

Dosing

For patients with hormone-sensitive metastatic prostate cancer, treated with Nubeqa in combination with docetaxel, the first of the 6 cycles of docetaxel should be administered within 6 weeks after the start of Nubeqa.[1] Treatment with Nubeqa may be continued until disease progression or unacceptable toxicity, even if a cycle of docetaxel is delayed, interrupted, or discontinued. Patients receiving Nubeqa should also receive a gonadotropin-releasing hormone (GnRH) analog concurrently or have had a bilateral orchiectomy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nubeqa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nubeqa is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Prostate Cancer – Metastatic, Castration-Sensitive.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient meets one of the following (i or ii):
     - **i.** The medication is used concurrently with docetaxel; OR
     - **ii.** Patient has completed docetaxel therapy; AND
   - **C)** Patient meets ONE of the following (i, ii, or iii):

i. The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) agonist; OR

Note: Examples of GnRH agonists include: leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant).

ii. The medication is used concurrently with Firmagon (degarelix subcutaneous injection); OR

iii. Patient has had a bilateral orchiectomy.

2. Prostate Cancer – Non-Metastatic, Castration-Resistant. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets one of the following (i, ii, or iii):

i. The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) agonist; OR

Note: Examples of GnRH agonists include: leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant).

ii. The medication is used concurrently with Firmagon (degarelix subcutaneous injection); OR

iii. Patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nubeqa is not recommended in the following situations:

13. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Odomzo Prior Authorization Policy
- Odomzo® (sonidegib capsules – Novartis)

REVIEW DATE: 12/21/2022

OVERVIEW

Odomzo, a hedgehog pathway inhibitor, is indicated for the treatment of adults with locally advanced **basal cell carcinoma** that has recurred following surgery or radiation therapy, or those who are not candidates for surgery or radiation therapy.[1]

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for basal cell carcinoma (version 2.2022 – March 24, 2022) note that surgical approaches offer the most effective and efficient means for accomplishing a cure; radiation therapy may be chosen as the primary treatment in order to achieve optimal overall results.[2] For locally advanced disease in which curative radiation therapy and curative surgery are not feasible, a hedgehog pathway inhibitor such as Odomzo is among the treatment options (category 2A). For primary or recurrent nodal metastases, Odomzo (category 2B) is among the alternatives when surgery is not feasible.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Odomzo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Odomzo is recommended in those who meet one of the following criteria:

FDA-Approved Indication

5. Basal Cell Carcinoma, Locally Advanced. Approve for 1 year if the patients meets ONE of the following conditions (A or B):

D) Initial Therapy. Approve if the patient meets BOTH of the following (i and ii):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Patient meets one of the following (a or b):
  - ~~(1)~~ Patient has recurrent basal cell carcinoma following surgery or radiation therapy; OR
  - ~~(2)~~ Patient meets BOTH of the following [(1) and (2)]:
    - **(1)** Patient is not a candidate for surgery; AND
    - **(2)** According to the prescriber, the patient is not a candidate for radiation therapy.

E) Patient is Currently Receiving Odomzo. Approve.

Other Uses with Supportive Evidence

6. **Basal Cell Carcinoma, Metastatic.** Approve for 1 year if the patient meets both of the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Disease is limited to nodal metastases.
   Note: This includes primary or recurrent nodal metastases. A patient with distant metastasis does not meet this requirement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Odomzo is not recommended in the following situations:

14. **Basal Cell Carcinoma (Locally Advanced or Metastatic), in a Patient with Disease Progression While on Erivedge (vismodegib capsules).** Note: This does not apply to a patient already started on Odomzo. Refer to criteria for Basal Cell Carcinoma, Locally Advanced for a Patient Currently Receiving Odomzo. Results from an open-label study (n = 9) showed resistance to Odomzo in patients with advanced basal cell carcinoma who had progressed while taking Erivedge.[6] There are no data to support the use of Odomzo in patients who have experienced disease progression on Erivedge. Previous use of a hedgehog inhibitor was not allowed in the pivotal study for Odomzo.[3] Patients who develop resistance to one of the hedgehog pathway inhibitors are not expected to respond to another hedgehog pathway inhibitor.

15. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ogsiveo Prior Authorization Policy
- Ogsiveo™ (nirogacestat tablets – SpringWorks Therapeutics)

REVIEW DATE: 11/29/2023

OVERVIEW

Ogsiveo, a gamma secretase inhibitor, is indicated for **progressing desmoid tumors** that require systemic treatment in adults.[1]

Disease Overview

Desmoid tumors, or aggressive fibromatosis, are rare soft-tissue tumors.[2] These types of tumors are locally aggressive and invasive, leading to morbidity, but rarely mortality. Desmoid tumors are not metastatic tumors. The enlarged size of some of the tumors can lead to compression of vital structures, resulting in severe pain, functional impairment, nerve damage, and bowel obstruction or perforation. Pain is associated with disease progression and can lead to opioid dependence or suboptimal pain management due to the concern for opioid dependence. Surgery used to be the mainstay of treatment; however, due to high morbidity and postsurgical recurrence rates of up to 50% to 88%, it is used less frequently. Other treatments include cytotoxic chemotherapy, tyrosine kinase inhibitors, local ablation, or radiation therapy.

Clinical Efficacy

The efficacy of Ogsiveo was assessed in a Phase III, double-blind, randomized, placebo-controlled trial in adults with progressing desmoid tumors not amenable to surgery.[1,3] Eligible patients (n = 142) were ≥ 18 years of age with a histologically confirmed diagnosis of progressing desmoid tumors, defined as ≥ 20% progression (according to Response Evaluation Criteria in Solid Tumors [RECIST], version 1.1) within 12 months before screening. Patients were randomized to receive Ogsiveo 150 mg or placebo orally twice daily until disease progression or unacceptable toxicity. Patients treated with Ogsiveo had a significant progression-free survival benefit over placebo. In the Ogsiveo group, 17% of patients had a progression event compared with 51% of patients in the placebo group (hazard ratio 0.29; 95% confidence interval: 0.15, 0.55; $P < 0.001$). The objective response rate was also significantly better in the Ogsiveo group compared with placebo: 41% vs. 8%, respectively ($P < 0.001$).

Guidelines

Ogsiveo is not addressed in the National Comprehensive Cancer Network (NCCN) soft tissue sarcoma guidelines (version 2.2023 – April 25, 2023). Guidelines recommend the following therapies as "preferred" regimens for desmoid tumors (aggressive fibromatosis):[4] sorafenib (category 1), methotrexate and vinorelbine, methotrexate and vinblastine, imatinib, pazopanib, doxorubicin ± dacarbazine, and Doxil® (liposomal doxorubicin for intravenous injection) [except for sorafenib, all other agents listed are category 2A recommendation]. Sulindac or other nonsteroidal anti-inflammatory drugs, including celecoxib are recommended for pain under "useful in certain circumstances" (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ogsiveo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ogsiveo is recommended in those who meet the following criteria:

FDA-Approved Indication

3. **Desmoid Tumors (Aggressive Fibromatosis).** Approve for 1 year if the patient meets the following (A, B, C, and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** According to the prescriber, the patient has progressing desmoid tumors; AND
     Note: Progressing desmoid tumors are defined as ≥ 20% progression within 12 months.
   - **C)** The desmoid tumors are not amenable to surgery; AND
   - **D)** According to the prescriber, the patient requires systemic treatment.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ogsiveo is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ojjaara Prior Authorization Policy
- Ojjaara™ (momelotinib tablets – GlaxoSmithKline)

REVIEW DATE: 09/20/2023; selected revision 11/08/2023

OVERVIEW

Ojjaara, a Janus Kinase (JAK1/JAK2) inhibitor and activin A receptor type 1 (ACVR1) inhibitor (also known as activin receptor like kinase 2 [ALK2]), is indicated for the treatment of intermediate or high-risk myelofibrosis (MF), including primary MF or secondary MF (post-polycythemia vera and post-essential thrombocythemia), in adults with anemia.[1]

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for myeloproliferative neoplasms (version 3.2023 – October 25, 2023) have recommendations for MF.[2] Ojjaara is a "preferred" regimen for the management of MF-associated anemia in patients with serum erythropoietin ≥ 500 mU/mL (category 2A). For patients with higher-risk MF with platelet count ≥ 50 x 10^9/L who are not transplant candidates, Jakafi® (ruxolitinib tablets) [category 1], Inrebic® (fedratinib capsules) [category 1], Ojjaara (category 2A), or Vonjo ® (pacritinib capsules) [category 2B] are recommended; for patients who had no response or loss of response to initial therapy, Jakafi, Inrebic, Ojjaara (all category 2A), or Vonjo (category 2B) are recommended if they were not previously used. For patients with higher-risk MF with platelet count < 50 x 10^9/L who are not candidates for transplant, NCCN recommends Vonjo as a "preferred" therapy (category 1) and Ojjaara as "other recommended regimens" (category 2B). For lower-risk symptomatic patients with MF, Jakafi (category 2A) and Ojjaara (category 2B) are considered "useful in certain circumstances" for first-line therapy; for patients who had no response or loss of response to first-line therapy, Jakafi (category 2A), Ojjaara (category 2B), and Vonjo [for patients with platelets < 50 x 10^9/L] {category 2A} can be used.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ojjaara. All approvals are provided for the duration noted below.

Automation: none

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ojjaara is recommended in those who meet the following criteria:

FDA-Approved Indication

7. Myelofibrosis. Approve for 1 year if the patient meets the following (A, B, and C):
Note: Examples of myelofibrosis include primary myelofibrosis, post-polycythemia vera myelofibrosis, and post-essential thrombocythemia myelofibrosis.
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has intermediate-risk or high-risk disease; AND
- **C)** Patient meets one of the following (i or ii):
  - **i.** Patient has anemia and meets both of the following (a and b):

a) Patient has hemoglobin < 10 g/dL AND
b) Patient has serum erythropoietin level ≥ 500 mU/mL; OR

ii. Patient has platelet count ≥ 50 X 10^9/L.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ojjaara is not recommended in the following situations:

16. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Onureg Prior Authorization Policy
- Onureg® (azacitidine tablets – Celgene)

REVIEW DATE: 09/13/2023

OVERVIEW

Onureg, a nucleoside metabolic inhibitor, is indicated for the continued treatment of **acute myeloid leukemia** (AML) in adults who achieve first complete remission or complete remission with incomplete blood count recovery following intensive induction chemotherapy and are unable to complete intensive curative therapy.[1]

Guidelines

The National Comprehensive Cancer Network AML guidelines (version 4.2023 – July 11, 2023) recommend Onureg for the post-remission maintenance treatment of AML in patients with intermediate- or adverse-risk disease, who completed no consolidation, some consolidation, or are recommended to receive a course of consolidation; and with no allogeneic stem cell transplantation planned (category 1).[2,3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Onureg. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Onureg is recommended in those who meet the following criteria:

FDA-Approved Indication

4. Acute Myeloid Leukemia. Approve for 1 year if the patient meets the following (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The medication is used for post-remission maintenance therapy; AND
- **C)** Patient has intermediate- or poor-risk cytogenetics; AND
  Note: Examples of intermediate- and poor-risk cytogenetics include the following genetic alterations: wild-type *NPM1* without *FLT3-ITD* or with *FLT3-ITD^{low}*, *MLLT3-KMT2A*, *DEK-NUP214*, and *KMT2A* rearranged.
- **D)** According to the prescriber, allogeneic hematopoietic stem cell transplant is not planned.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Onureg is not recommended in the following situations:

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Orgovyx Prior Authorization Policy
- Orgovyx® (relugolix tablets – Myovant Sciences/Pfizer)

REVIEW DATE: 01/25/2023

OVERVIEW
Orgovyx, a gonadotropin-releasing hormone (GnRH) receptor antagonist, is indicated for the treatment of **advanced prostate cancer** in adults.[1]

Guidelines
The National Comprehensive Cancer Network (NCCN) prostate cancer guidelines (version 1.2023 – September 16, 2022) recommend the use of androgen deprivation therapy (ADT) for various stages of prostate cancer. Orgovyx is listed as an option for ADT for clinically localized (regional node 0 [N0], distant metastases 0 [M0]), regional (N1, M0) disease, or M0 or M1 castration-naïve disease (category 2A).[2,3] The guidelines note that Orgovyx has not been adequately studied in combination with potent androgen receptor inhibitors, such as abiraterone acetate, Xtandi® (enzalutamide capsules and tablets), Erleada® (apalutamide tablets), Nubeqa® (darolutamide tablets), nor has it be studied in combination with docetaxel or cabazitaxel chemotherapy.[2]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Orgovyx. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Orgovyx is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Prostate Cancer.** Approve for 1 year if the patient is ≥ 18 years of age.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Orgovyx is not recommended in the following situations:

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Orserdu Prior Authorization Policy
- Orserdu™ (elacestrant tablets – Stemline/Menarini)

REVIEW DATE: 02/08/2023; selected revision 02/15/2023

OVERVIEW

Orserdu, an estrogen receptor antagonist, is indicated for the treatment of postmenopausal women or adult men with estrogen receptor-positive (ER+), human epidermal growth factor receptor 2 (HER2)-negative, estrogen receptor 1 gene (*ESR1)*-mutated advanced or metastatic breast cancer with disease progression following at least one line of endocrine therapy.[1]

Guidelines

National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 2.2023 – February 7, 2023) recommend Orserdu for ER+, HER2-negative, *ESR1*-mutated recurrent, unresectable or metastatic breast cancer after progression on one or two prior lines of endocrine therapy, including one line containing a cyclin-dependent kinase (CDK)4/6 inhibitor as other recommended regimens (category 2A). Preferred regimens for second-and subsequent-line therapy include fulvestrant + CDK4/6 inhibitor (Kisqali® [ribociclib tablets], Ibrance® [palbociclib tablets or capsules], or Verzenio® [abemaciclib tablets]) if CDK4/6 inhibitor was not previously used (category 1), Piqray® (alpelisib tablets) + fulvestrant for phosphatidylinositol-3-kinase (*PIK3CA*)-mutated tumors (category 1), and everolimus + endocrine therapy (exemestane, fulvestrant, or tamoxifen) [category 2A]. Other recommended regimens for subsequent-line therapy include selective ER down-regulator (fulvestrant, category 1) + non-steroidal aromatase inhibitor (anastrozole, letrozole) [category 1]; single agent therapy with fulvestrant, anastrozole, letrozole, tamoxifen, or exemestane (category 2A). There are also other agents recommended that are useful in certain circumstances for subsequent-line therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Orserdu. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; a man is defined as an individual with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Orserdu is recommended in those who meet the following criteria:

FDA-Approved Indication

5. **Breast Cancer in Postmenopausal Women or Men***. Approve for 1 year if the patient meets the following criteria (A, B, C, D, E, and F):
   - **F)** Patient is ≥ 18 years of age; AND
   - **G)** Patient has recurrent or metastatic disease; AND

H) Patient has estrogen receptor positive (ER+) disease; AND
I) Patient has human epidermal growth factor receptor 2 (HER2)-negative disease; AND
J) Patient has estrogen receptor 1 gene (*ESR1)*-mutated disease; AND
K) Patient has tried at least one endocrine therapy.
Note: Examples of endocrine therapy include fulvestrant, anastrozole, exemestane, letrozole, and tamoxifen.

***** Refer to the Policy Statement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Orserdu is not recommended in the following situations:

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Pemazyre Prior Authorization Policy
- Pemazyre® (pemigatinib tablets – Incyte)

REVIEW DATE: 05/10/2023

OVERVIEW

Pemazyre, a kinase inhibitor, is indicated in adults for the following uses:[1]
- Previously treated, unresectable locally advanced or metastatic **cholangiocarcinoma** with a fibroblast growth factor receptor 2 (*FGFR2*) fusion or other rearrangement as detected by an FDA-approved test.
- Relapsed or refractory **myeloid/lymphoid neoplasms** with fibroblast growth factor receptor 1 (*FGFR1*) rearrangement.

Guidelines

Pemazyre is addressed in National Comprehensive Cancer Network (NCCN) guidelines:[2]
- **Biliary tract cancers**: Guidelines (version 1.2023 – March 10, 2023) recommend Pemazyre for disease progression on or following systemic treatment for patients with unresectable or metastatic cholangiocarcinoma with *FGFR2* fusion or rearrangement, as a single agent (category 2A).[3]
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Fusion Genes**: Guidelines (version 2.2022 – October 18, 2022) recommend Pemazyre for the treatment of myeloid/lymphoid neoplasms with eosinophilia and *FGFR1* rearrangement in chronic phase or blast phase (category 2A).[2,4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Pemazyre. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Pemazyre is recommended in those who meet one of the following criteria:

FDA-Approved Indications

6. Cholangiocarcinoma. Approve for 1 year if the patient meets ALL of the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has unresectable locally advanced or metastatic disease; AND
- **C)** Tumor has fibroblast growth factor receptor 2 (*FGFR2*) fusion or other rearrangement, as detected by an approved test; AND
- **D)** Patient has been previously treated with at least one systemic regimen.
  Note: Examples of systemic regimens are gemcitabine + cisplatin, 5-fluorouracil + oxaliplatin or cisplatin, capecitabine + cisplatin or oxaliplatin, gemcitabine + Abraxane (albumin-bound paclitaxel) or capecitabine or oxaliplatin, gemcitabine + Abraxane + cisplatin, FOLFOX (5-

fluorouracil, leucovorin, and oxaliplatin), FOLFIRI (5-fluorouracil, leucovorin, irinotecan), Stivarga (regorafenib tablets).

7. **Myeloid/Lymphoid Neoplasms.** Approve for 1 year if the patient meets ALL of the following criteria (A, B, C, and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has eosinophilia; AND
   - **C)** The cancer has fibroblast growth factor receptor 1 (*FGFR1*) rearrangement, as detected by an approved test; AND
   - **D)** The cancer is in chronic phase or blast phase.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Pemazyre is not recommended in the following situations:

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Piqray Prior Authorization Policy
- Piqray® (alpelisib tablets – Novartis)

REVIEW DATE: 07/12/2023

OVERVIEW

Piqray, a kinase inhibitor, is indicated in combination with fulvestrant injection for the treatment of postmenopausal women and men with hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative, phosphatidylinositol-3-kinase (*PIK3CA*)-mutated, **advanced or metastatic breast cancer** as detected by an FDA-approved test following progression on or after an endocrine-based regimen.[1]

Patients treated with Piqray should have one or more *PIK3CA* mutations in tumor tissue or plasma specimens. If no mutation is detected in a plasma specimen, tumor tissue should be tested. Information on FDA-approved tests for the detection of *PIK3CA* mutations in breast cancer is available on the FDA website.[2]

Guidelines

Piqray is discussed in the guidelines from National Comprehensive Cancer Network (NCCN).[3,4] NCCN breast cancer guidelines (version 4.2023 – March 23, 2023) recommend Piqray, in combination with fulvestrant, as a preferred second-line regimen or subsequent-line therapy for *PIK3CA*-activating mutation in postmenopausal or premenopausal patients (receiving ovarian ablation or suppression, if premenopausal) with HR+/HER2-negative, recurrent unresectable (local or regional) or Stage IV disease (category 1).[3] It is noted that the safety of Piqray in patients with type 1 or uncontrolled type 2 diabetes has not been established. Preferred first-line regimens for HR+/HER2-negative disease include the following: aromatase inhibitor (i.e., letrozole, anastrozole, exemestane) + CDK4/6 inhibitor (i.e., Ibrance® [palbociclib capsules], Kisqali® [ribociclib tablets], Verzenio® [abemaciclib tablets]) or fulvestrant + CDK4/6 inhibitor. Of note, men with breast cancer are treated similarly to postmenopausal women.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Piqray. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Piqray is recommended in those who meet the following criteria:

FDA-Approved Indication

8. Breast Cancer. Approve for 1 year if the patient meets the following (A, B, C, D, E, F, and G):

A) Patient is ≥ 18 years of age; AND

B) Patient meets one of the following (i or ii):

i. Patient is a postmenopausal female* or a male*; OR

ii. Patient is pre/perimenopausal and meets one of the following (a or b):

a) Patient is receiving ovarian suppression with a gonadotropin-releasing hormone (GnRH) agonist; OR

Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous injection).

b) Patient has had surgical bilateral oophorectomy or ovarian irradiation; AND

C) Patient has advanced or metastatic hormone receptor (HR)-positive disease; AND

D) Patient has human epidermal growth factor receptor 2 (HER2)-negative disease; AND

E) Patient has *PIK3CA*-mutated breast cancer as detected by an approved test; AND

F) Patient has progressed on or after at least one prior endocrine-based regimen; AND

Note: Examples of an endocrine-based regimen contains one of the following products: anastrozole, letrozole, exemestane, tamoxifen, toremifene, or fulvestrant.

G) Piqray will be used in combination with fulvestrant injection.

* Refer to Policy Statement

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Piqray is not recommended in the following situations:

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Pomalyst Prior Authorization Policy
- Pomalyst® (pomalidomide capsules – Celgene)

REVIEW DATE: 05/10/2023

OVERVIEW

Pomalyst, a thalidomide analog, is indicated for the following uses:[1]

- **Kaposi sarcoma,** adults with Acquired Immune Deficiency Syndrome (AIDS)-related Kaposi sarcoma after failure of highly active antiretroviral therapy (HAART) or in adults with Kaposi sarcoma who are human immunodeficiency virus (HIV)-negative.
- **Multiple myeloma**, in combination with dexamethasone, in adults who have received at least two prior therapies including lenalidomide capsules and a proteasome inhibitor and have demonstrated disease progression on or within 60 days of completion of the last therapy.

Guidelines

Pomalyst is addressed in guidelines from National Comprehensive Cancer Network (NCCN):[3,5-7]

- **Central Nervous System (CNS) Cancers:** The NCCN has guidelines regarding CNS cancers (version 1.2023 – March 24, 2023).[5] Pomalyst is listed as a recommended regimen for patients with relapsed or refractory disease for primary CNS lymphoma.
- **Kaposi Sarcoma:** The NCCN has guidelines regarding Kaposi sarcoma (version 1.2023 – December 20, 2022).[3] Pomalyst is cited as the preferred subsequent system therapy option given alone (in patients without HIV) or with antiretroviral therapy for patients with HIV for relapsed/refractory advanced cutaneous, oral, visceral, or nodal disease that has not progressed on or not responded for first-line systemic therapy and progressed on alternate first-line systemic therapy. First-line systemic therapy options include liposomal doxorubicin (preferred) and paclitaxel.
- **Multiple Myeloma:** The NCCN guidelines for multiple myeloma (version 3.2023 – December 8, 2022) include Pomalyst.[6] Pomalyst is recommended in various clinical regimens after use of previous therapies in varying scenarios and with different agents among patients with multiple myeloma that has been previously treated (including as a category 1 and category 2A recommendation). It can be used as a monotherapy for patients who are steroid intolerant. Pomalyst is also indicated for treatment in combination with dexamethasone for the management of POEMS (polyneuropathy, organomegaly, endocrinopathy, monoclonal protein, skin changes) syndrome as induction therapy for transplant eligible patients and for transplant ineligible patients.
- **Systemic Light Chain Amyloidosis:** The NCCN has guidelines for systemic light chain amyloidosis (version 2.2023 – November 28, 2022).[7] The guidelines list Pomalyst plus dexamethasone as one of several treatment options for patients with previously treated disease (category 2A). Many other regimens are cited as primary therapy for transplant candidates and non-transplant candidates.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Pomalyst. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Pomalyst is recommended in those who meet one of the following criteria:

FDA-Approved Indications

8. **Kaposi Sarcoma.** Approve for 1 year if the patient meets the following (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient meets one of the following (i or ii):
     - **i.** Patient is Human Immunodeficiency Virus (HIV)-negative; OR
     - **ii.** Patient meets both of the following (a and b):
       - **a)** Patient is HIV-positive; AND
       - **b)** Patient continues to receive highly active antiretroviral therapy.

9. **Multiple Myeloma.** Approve for 1 year if the patient meets the following (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has received at least one other lenalidomide containing regimen.

Other Uses with Supportive Evidence

10. **Central Nervous System Lymphoma.** Approve for 1 year if the patient has relapsed or refractory disease.

11. **POEMS (polyneuropathy, organomegaly, endocrinopathy, monoclonal protein, skin changes) Syndrome.** Approve for 1 year if the patient meets and following (A and B):
    - **C)** Patient is ≥ 18 years of age; AND
    - **D)** Use of Pomalyst is in combination with dexamethasone.

12. **Systemic Light Chain Amyloidosis.** Approve for 1 year if the patient meets the following (A, B, and C):
    - **A)** Patient is ≥ 18 years of age; AND
    - **B)** Use of Pomalyst is in combination with dexamethasone; AND
    - **C)** Patient has tried at least one other regimen.
      Note: Examples of regimens include lenalidomide plus dexamethasone; bortezomib, lenalidomide, cyclophosphamide, and dexamethasone; bortezomib with or without dexamethasone; bortezomib, lenalidomide, and dexamethasone; melphalan and dexamethasone; bortezomib, cyclophosphamide, and dexamethasone; and Darzalex (daratumumab intravenous infusion)/Darzalex Faspro (daratumumab and hyaluronidase-fihj subcutaneous injection).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Pomalyst is not recommended in the following situations:

17. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Qinlock Prior Authorization Policy
- Qinlock® (ripretinib tablets – Deciphera Pharmaceuticals)

REVIEW DATE: 04/19/2023

OVERVIEW

Qinlock, a kinase inhibitor, is indicated for the treatment of advanced **gastrointestinal stromal tumor** in adults who have received prior treatment with three or more kinase inhibitors, including imatinib.[1]

Guidelines

Qinlock is discussed in the guidelines from the National Comprehensive Cancer Network (NCCN):

- **Gastrointestinal Stromal Tumor**: NCCN guidelines (version 1.2023 – March 13, 2023) recommend Qinlock for unresectable or metastatic disease in the following situations: Qinlock 150 mg daily for second-line therapy for patients who are intolerant of second-line sunitinib as a "Preferred Regimen" (category 2A); Qinlock 150 mg daily as fourth-line therapy after therapy with imatinib, sunitinib, and Stivarga® (regorafenib tablets) as a "Preferred Regimen" (category 1); Qinlock dose escalation to 150 mg twice daily if patient has previously progressed on Qinlock 150 mg daily as additional options after progression on approved therapies as "useful in certain circumstances"(category 2A); and Qinlock 150 mg daily or Qinlock 150 mg twice daily (if previously progressed with 150 mg daily) after progression with Ayvakit® (avapritinib tablets) and Sprycel® (dasatinib tablets).[2,3]
- **Melanoma: Cutaneous**: NCCN guidelines (version 2.2023 – March 10, 2023) recommend Qinlock as "useful in certain circumstances" for metastatic or unresectable disease with an activating *KIT* mutation as second-line or subsequent therapy for disease progression, intolerance, and/or projected risk of progression with *BRAF*-targeted therapy.[2,4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Qinlock. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Qinlock is recommended in those who meet the following criteria:

FDA-Approved Indication

9. Gastrointestinal Stromal Tumor. Approve for 1 year if the patient meets the following criteria (A, B and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has tried imatinib or Ayvakit (avapritinib tablets); AND
- **C)** Patient meets one of the following criteria (i, ii, or iii):
  - **i.** Patient has tried sunitinib and Stivarga (regorafenib tablets); OR
  - **ii.** Patient has tried Sprycel (dasatinib tablets); OR

iii. Patient is intolerant of sunitinib.

Other Uses with Supportive Evidence

10. Melanoma, Cutaneous. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has metastatic or unresectable disease; AND
- **C)** Patient has an activating *KIT* mutation; AND
- **D)** Patient has tried at least one systemic regimen.

  Note: Examples of a systemic regimen include: Opdivo (nivolumab intravenous infusion) + Yervoy (ipilimumab intravenous infusion), Opdivo + Opdualag (nivolumab/relatlimab-rmbw intravenous infusion), Keytruda (pembrolizumab intravenous infusion), Opdivo, Tafinlar (dabrafenib capsules) + Mekinist (trametinib tablets), Zelboraf (vemurafenib tablets) + Cotellic (cobimetinib tablets), Braftovi (encorafenib capsules) + Mektovi (binimetinib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Qinlock is not recommended in the following situations:

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Retevmo Prior Authorization Policy
- Retevmo® (selpercatinib capsules – Eli Lilly)

REVIEW DATE: 06/14/2023

OVERVIEW

Retevmo, a kinase inhibitor, is indicated for the following uses:[1]

- **Non-small cell lung cancer**, locally advanced or metastatic with a rearranged during transfection (*RET*) gene fusion, as detected by an FDA-approved test in adults.
- **Solid tumors,** locally advanced or metastatic solid tumors with a *RET* gene fusion in patients who have progressed on or following prior systemic treatment or who have no satisfactory alternative treatment options.
- **Thyroid cancer**, advanced or metastatic *RET*-mutant medullary, in patients ≥ 12 years of age who require systemic therapy.
- **Thyroid cancer**, advanced or metastatic *RET* fusion-positive, in patients ≥ 12 years of age who require systemic therapy and who are radioactive iodine-refractory (if radioactive iodine is appropriate), as detected by an FDA-approved test.

All of the indications above except non-small cell lung cancer were accelerated approvals based on overall response rate and duration of response. Continued approval of these indications may be contingent upon verification and description of clinical benefit in confirmatory trials.

Guidelines

Retevmo is addressed in the National Comprehensive Cancer Network (NCCN) compendium for an variety of solid tumors.[2] Retevmo is addressed in NCCN guidelines:

- **Histiocytic Neoplasms:** NCCN guidelines (version 1.2022 – May 20, 2022) recommend Retevmo as an agent that may be useful as the first- or subsequent-line treatment for the following types of histiocytic neoplasm with *RET* fusion: Langerhans cell histiocytosis, Erdheim-Chester disease, and Rosai-Dorfman disease (category 2A).[3]
- **Non-Small Cell Lung Cancer:** NCCN guidelines (version 3.2023 – April 13, 2023) recommend Retevmo as a preferred option for first-line and subsequent treatment of patients with *RET* rearrangement-positive recurrent, advanced, or metastatic non-small cell lung cancer (category 2A).[2,4]
- **Thyroid Carcinoma:** NCCN guidelines (version 2.2023 – May 18, 2023) recommend Retevmo and Gavreto® (pralsetinib capsules) as "preferred regimens" for the treatment of *RET* mutation-positive recurrent or persistent locoregional or metastatic medullary carcinoma (category 2A).[5] Retevmo is also recommended for the treatment of locally recurrent, advanced, and/or metastatic *RET*-fusion positive thyroid carcinoma that is not amenable to radioactive iodine therapy as "useful in certain circumstances" (category 2A). Additionally NCCN recommends Retevmo for *RET*-fusion positive anaplastic thyroid carcinoma for locoregional disease and metastatic disease (category 2A).[5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Retevmo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Retevmo is recommended in those who meet one of the following criteria:

FDA-Approved Indications

11. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has recurrent, advanced, or metastatic disease; AND
- **C)** The tumor is rearranged during transfection (*RET)* fusion-positive.

12. Thyroid Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 12 years of age; AND
- **B)** Patient has rearranged during transfection (*RET)* fusion-positive or *RET* mutation-positive disease; AND
- **C)** Patient meets ONE of the following criteria (i or ii):
  - **i.** Patient has anaplastic thyroid cancer; OR
  - **ii.** The disease requires treatment with systemic therapy and patient meets ONE of the following criteria (a or b):
    - **a)** The patient has medullary thyroid cancer; OR
    - **b)** The disease is radioactive iodine-refractory.

13. Solid Tumors. Approve for 1 year if the patient meets the following criteria (A, B, and C):
Note: Examples of solid tumors include breast cancer, cervical cancer, cholangiocarcinoma, colorectal cancer, esophageal cancer, gastric cancer, ovarian cancer, pancreatic adenocarcinoma, salivary gland tumors, soft tissue sarcoma, small bowel adenocarcinoma, and unknown primary cancer.
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has recurrent, advanced, or metastatic disease; AND
- **C)** The tumor is rearranged during transfection (*RET)* fusion-positive.

Other Uses with Supportive Evidence

14. Histiocytic Neoplasm. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **E)** Patient is ≥ 18 years of age; AND
- **F)** Patient meets one of the following (i, ii, or iii):
  - **i.** Patient has Langerhans cell histiocytosis; OR
  - **ii.** Patient has Erdheim-Chester disease; OR
  - **iii.** Patient has Rosai-Dorfman disease; AND
- **G)** Patient has a rearranged during transfection (*RET)* fusion.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Retevmo is not recommended in the following situations:

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Rezlidhia Prior Authorization Policy
- Rezlidhia™ (olutasidenib capsules – Rigel)

REVIEW DATE: 12/13/2023

OVERVIEW
Rezlidhia, an isocitrate dehydrogenase-1 (*IDH1*) inhibitor, is indicated for the treatment of relapsed or refractory **acute myeloid leukemia** with a susceptible *IDH1* mutation as detected by an FDA-approved test in adults.

Guidelines
The National Comprehensive Cancer Network (NCCN) acute myeloid leukemia guidelines (version 6.2023 – October 24, 2023) recommend Rezlidhia or Tibsovo® (ivosidenib tablets) for patients with relapsed or refractory AML with an *IDH1* mutation (both category 2A).

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Rezlidhia. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Rezlidhia is recommended in those who meet the following criteria:

FDA-Approved Indication

13. Acute Myeloid Leukemia. Approve for 1 year if the patient meets the following (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has relapsed or refractory disease; AND
- **C)** Patient has isocitrate dehydrogenase-1 (*IDH1*) mutation positive disease as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Rezlidhia is not recommended in the following situations:

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Rozlytrek Prior Authorization Policy
- Rozlytrek® (entrectinib capsules and oral pellets – Genentech)

REVIEW DATE: 09/27/2023; selected revision 11/22/2023

OVERVIEW

Rozlytrek, a kinase inhibitor, is indicated for the following uses:[1]

- **Non-small cell lung cancer (NSCLC)**, with *ROS1*-positive metastatic disease, as detected by an FDA-approved test, in adults.
- **Solid tumors**, in adult and pediatric patients ≥ 1 month of age that:
  - Have a neurotrophic tyrosine receptor kinase (*NTRK*) gene fusion, as detected by an FDA-approved test without a known acquired resistance mutation; AND
  - Are metastatic or surgical resection of the tumor is likely to result in severe morbidity; AND
  - Have either progressed following treatment or there are no satisfactory alternative therapies.

Guidelines

Rozlytrek is addressed in guidelines by the National Comprehensive Cancer Network (NCCN):[2,3]

- **NSCLC.** Guidelines (version 3.2023 – April 13, 2023) recommend Rozlytrek as a preferred first-line treatment option for patients with *ROS1* rearrangement-positive NSCLC (category 2A).[2] Rozlytrek is also recommended as a preferred first-line treatment option for patients with *NTRK* gene fusion-positive NSCLC (category 2A).
- **Solid tumors.** The NCCN Drugs and Biologics Compendium notes the use of Rozlytrek for *NTRK* gene fusion-positive tumors associated with the following cancers: ampullary adenocarcinoma, breast cancer, central nervous system cancers (e.g., glioma, glioblastoma, brain metastases), cervical cancer, colon cancer, esophageal and esophagogastric junction cancers, gastric cancer, gastrointestinal stromal tumors, head and neck cancers (e.g., salivary gland tumors), hepatobiliary cancers, histiocytic neoplasms, melanoma (cutaneous), non-small cell lung cancer, ovarian cancer/fallopian tube cancer/primary peritoneal cancer, pancreatic cancer, rectal cancer, small bowel adenocarcinoma, soft tissue sarcomas, thyroid carcinoma, uterine neoplasms, and vulvar cancer.[3] Rozlytrek is a category 2A recommendation for most of these cancers. Rozlytrek is recommended for use as a first-line and/or second-line treatment option for these cancers.
- **Pediatric Central Nervous System Cancers.** Guidelines (version 2.2023 – October 31, 2022) recommend Rozlytrek as adjuvant therapy and for recurrent or progressive disease (category 2A for both), for *TRK* fusion-positive pediatric diffuse high-grade gliomas.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rozlytrek. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rozlytrek is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   Note: If the patient has non-small cell lung cancer with neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion, see **Solid Tumors** indication.
   A) Patient is ≥ 18 years of age; AND
   B) Patient has metastatic disease; AND
   C) Patient has *ROS1*-positive disease; AND
   D) The mutation was detected by an approved test.

2. **Solid Tumors.** Approve for 1 year if the patient meets the following (A, B, and C):
   Note: Examples of solid tumors include breast cancer, colorectal cancer, head/neck cancer, hepatocellular carcinoma, biliary cancer, histiocytic neoplasm, non-small cell lung cancer (*NTRK* gene fusion-positive), ovarian cancer, pancreatic cancer, salivary gland tumors, sarcoma, thyroid cancer, adult glioma.
   A) Patient is ≥ 1 month of age; AND
   B) The tumor is positive for neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion; AND
   C) Patient meets one of the following (i or ii):
      i. The tumor is metastatic; OR
      ii. Surgical resection of tumor will likely result in severe morbidity.

Other Uses with Supportive Evidence

3. **Pediatric Diffuse High-Grade Gliomas.** Approve for 1 year if the patient meets the following (A, B, and C):
   A) Patient is < 18 years of age; AND
   B) The tumor is positive for neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion; AND
   C) Patient meets one of the following (i or ii):
      i. The medication is used as adjuvant therapy; OR
      ii. The medication is used for recurrent or progressive disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rozlytrek is not recommended in the following situations:

18. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Rubraca Prior Authorization Policy
- Rubraca® (rucaparib tablets – Clovis Oncology)

REVIEW DATE: 01/11/2023

OVERVIEW

Rubraca, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicated for the following uses:[1]

- **Ovarian, fallopian tube, or primary peritoneal cancer, maintenance treatment** of adults with a deleterious *BRCA* mutation (germline and/or somatic)-associated recurrent epithelial disease who are in a complete or partial response to platinum-based chemotherapy.
- **Prostate cancer**, metastatic castration-resistant (mCRPC), treatment of adults with a deleterious *BRCA* mutation (germline and/or somatic)-associated disease who have been treated with androgen receptor-directed therapy and a taxane-based chemotherapy.

Guidelines

Rubraca is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Ovarian Cancer:** NCCN guidelines (version 1.2023 – December 22, 2022) recommend single-agent Rubraca as maintenance therapy if the patient has had a complete or partial response to primary treatment in the following situations: no bevacizumab was used during primary therapy (category 2A) or bevacizumab was used during primary therapy and the patient has a germline or somatic *BRCA* mutation (category 2A).[2] In patients with platinum-sensitive disease who have completed two or more lines of platinum-based therapy and are in a partial or complete response, bevacizumab can be continued as maintenance therapy or Rubraca can be considered as maintenance therapy option if patient has a *BRCA* mutation and patient has not previously received a PARP inhibitor (category 1). Rubraca is also recommended as a preferred recurrence therapy for patients with platinum-sensitive or platinum-resistant ovarian cancer that has been treated with two or more lines of chemotherapy and have *BRCA* mutations (category 3).
- **Prostate Cancer:** NCCN guidelines (version 1.2023 – September 16, 2022) recommend Rubraca for *BRCA1* or *BRCA2* mutation (germline and/or somatic) for patients who have been treated with androgen receptor-directed therapy and a taxane-based chemotherapy in mCRPC, either as second-line or subsequent therapy (category 2A). It is listed under "useful in certain circumstances". The guidelines note that if the patient is not fit for chemotherapy, Rubraca can be considered even if taxane-based therapy has not been given.[3]
- **Uterine Neoplasms:** NCCN guidelines (version 1.2023 – December 22, 2022) state that Rubraca may be considered as a single-agent second-line therapy, useful in certain circumstances, for *BRCA2*-altered uterine leiomyosarcoma (category 2A).[4,5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rubraca. All approvals are provided for the duration note below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rubraca is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Ovarian, Fallopian Tube, or Primary Peritoneal Cancer –Maintenance Therapy.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient is in complete or partial response after a platinum-based chemotherapy regimen; AND
     Note: Examples are carboplatin with gemcitabine, carboplatin with paclitaxel, cisplatin with gemcitabine.
   - **C)** Patient meets one of the following criteria (i or ii):
     - **i.** Patient meets both of the following criteria (a and b):
       - **a**) Patient has recurrent disease; AND
       - **b**) Patient has a *BRCA* mutation; OR
     - **ii.** Patient is in complete or partial response to first-line primary treatment.

2. **Prostate Cancer.** Approve for 1 year if the patient meets the following criteria (A, B, C, D, E, and F):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has metastatic castration resistant prostate cancer AND
   - **C)** Patient has *BRCA* mutation-positive (germline and/or somatic) disease; AND
   - **D)** Patient meets one of the following criteria (i or ii):
     - **i.** The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog; OR
       Note: Examples are leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection),), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix subcutaneous injection), Orgovyx (relugolix tablets).
     - **ii.** Patient has had a bilateral orchiectomy; AND
   - **E)** Patient has been previously treated with at least one androgen receptor-directed therapy; AND
     Note: Androgen receptor-directed therapy includes abiraterone, Xtandi (enzalutamide tablets), Nubeqa (darulutamide tablets), or Erleada (apalutamide tablets).
   - **F)** Patient meets one of the following criteria (i or ii):
     - **i.** Patient has been previously treated with at least one taxane-based chemotherapy; OR
       Note: Examples are docetaxel, cabazitaxel.
     - **ii.** Patient is not a candidate or is intolerant to taxane-based chemotherapy, according to the prescriber.

Other Uses with Supportive Evidence:

3. **Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Treatment.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has a *BRCA* mutation (germline or somatic) as confirmed by an approved test; AND
   - **C)** Patient has progressed on two or more prior lines of chemotherapy.

4. **Uterine Leiomyosarcoma**. Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **D)** Patient is ≥ 18 years of age; AND
   - **E)** Patient has *BRCA2*-altered disease; AND
   - **F)** Patient has tried one systemic regimen.
     Note: Examples of a systemic regimen include one or more of the following products: dacarbazine, docetaxel, doxorubicin, epirubicin, gemcitabine, ifosfamide, vinorelbine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rubraca is not recommended in the following situations:

19. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Rydapt Prior Authorization Policy
- Rydapt® (midostaurin capsules – Novartis)

REVIEW DATE: 03/08/2023

OVERVIEW

Rydapt, a tyrosine kinase inhibitor, is indicated in adults for the following uses:[1]

- **Acute myeloid leukemia, newly diagnosed, that is FMS-like tyrosine kinase 3 (*FLT3*) mutation-positive** as detected by an FDA-approved test, in combination with standard cytarabine and daunorubicin induction and cytarabine consolidation. Limitations of use: Rydapt is not indicated as a single-agent induction therapy for treatment of patients with acute myeloid leukemia.
- **Aggressive systemic mastocytosis, systemic mastocytosis with associated hematological neoplasm, or mast cell leukemia**.

Guidelines

Rydapt is discussed in the National Comprehensive Cancer Network (NCCN) guidelines:[2]

- **Acute Myeloid Leukemia:** NCCN guidelines (version 1.2023 – March 3, 2023) recommend Rydapt + standard dose cytarabine and daunorubicin among the treatment options for induction, re-induction, consolidation, and post-induction therapy and for relapsed/refractory disease for patients with *FLT3-ITD/TKD* mutation (category 2A).[3] It was noted that while Rydapt was not FDA-approved for maintenance therapy, the pivotal trial was designed for consolidation and maintenance for a total of 12 months.
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Fusion Genes:** NCCN guidelines (version 2.2022 – October 18, 2022) recommend Rydapt for patients with *FGFR1* or *FLT3* rearrangements in chronic phase or blast phase (category 2A).[4] Rydapt is also recommended for treatment in combination with induction chemotherapy followed by allogeneic hematopoietic cell transplantation (if eligible) for lymphoid, myeloid or mixed lineage neoplasms with eosinophilia and *FGFR1* or *FLT3* rearrangements in blast phase (category 2A).
- **Systemic Mastocytosis:** NCCN guidelines (version 2.2022 – October 18, 2022) recommend Rydapt for the treatment of aggressive systemic mastocytosis, systemic mastocytosis with an associated hematologic neoplasm, and mast cell leukemia (all category 2A).[5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rydapt. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rydapt is recommended in those who meet one of the following criteria:

FDA-Approved Indications

14. **Acute Myeloid Leukemia.** Approve for 1 year if the patient meets the following criteria (A and B):
    A) Patient is ≥ 18 years of age; AND
    B) Patient has *FLT3* mutation-positive disease as detected by an approved test.

15. **Aggressive Systemic Mastocytosis.** Approve for 1 year if the patient is ≥ 18 years of age.

16. **Systemic Mastocytosis Associated with Acute Hematologic Neoplasm.** Approve for 1 year if the patient is ≥ 18 years of age.

17. **Mast Cell Leukemia.** Approve for 1 year if the patient is ≥ 18 years of age.

Other Uses With Supportive Evidence

18. **Myeloid or Lymphoid Neoplasms.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
    - Patient is ≥ 18 years of age; AND
    - Patient has eosinophilia; AND
    - Patient meets one of the following (i or ii):
      - Patient has an *FGFR1* rearrangement; OR
      - Patient has an *FLT3* rearrangement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rydapt is not recommended in the following situations:

20. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Scemblix Prior Authorization Policy
- Scemblix® (asciminib tablets – Novartis)

REVIEW DATE: 05/31/2023

OVERVIEW

Scemblix, a kinase inhibitor, is indicated for the following uses in adults:[1]

- **Chronic myeloid leukemia** (CML), Philadelphia chromosome positive (Ph+), chronic phase, previously treated with two or more tyrosine kinase inhibitors. This indication is approved under accelerated approval based on major molecular response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial(s).
- **CML**, Ph+, chronic phase with the T315I mutation.

Guidelines

Scemblix is discussed in guidelines from National Comprehensive Cancer Network (NCCN):

- **CML:** NCCN guidelines (version 2.2023 – April 13, 2023) state that for patients with chronic phase CML with a low risk score, the primary treatment recommended includes a first-generation TKI (imatinib), or a second-generation TKI (Bosulif® [bosutinib tablets], Sprycel® [dasatinib tablets], or Tasigna® [nilotinib capsules] {all category 1}).[2] For patients with chronic phase CML with an intermediate or high risk score, a second-generation TKI is preferred (Bosulif [category 1], Sprycel [category 1], or Tasigna [category 1]). A first-generation TKI (imatinib) is an alternative (category 2A). Iclusig® (ponatanib tablets) is an option for patients with a T315I mutation and/or chronic phase CML with resistance or intolerance to at least two prior TKIs or for patients with accelerated-phase CML or blast-phase CML for whom no other TKI is indicated (category 2A). Scemblix® (asciminib tablets) is a treatment option for chronic phase CML (Ph+or BCR-ABL1 positive) in patients with the T315I mutation and/or chronic phase CML with resistance or intolerance to at least two prior TKIs (category 2A). Scemblix is contraindicated for use in patients with the following mutations: A337T and P465S.
- **Myeloid/Lympoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions:** NCCN guidelines (version 1.2023 – May 19, 2023) recommend Scemblix as "other recommended regimens" for *ALB1* rearrangements in chronic phase or blast phase (category 2A). It is also recommended as treatment in combination with acute lymphoblastic leukemia or acute myeloid leukemia-type induction chemotherapy followed by allogeneic hematopoietic stem cell transplantation (HSCT) [if eligible] for lymphoid, myeloid, or mixed lineage neoplasms with eosinophilia and *ABL1* rearrangement in blast phase (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Scemblix. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Scemblix is recommended in those who meet the following criteria:

FDA-Approved Indication

19. Chronic Myeloid Leukemia. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has Philadelphia chromosome-positive chronic myeloid leukemia; AND
- **C)** Patient meets one of the following (i or ii):
  - **i.** The chronic myeloid leukemia is T315I-positive, OR
  - **ii.** Patient has tried at least two other tyrosine kinase inhibitors indicated for use in Philadelphia chromosome-positive chronic myeloid leukemia.
    Note: Examples of tyrosine kinase inhibitors include imatinib tablets, Bosulif (bosutinib tablets), Iclusig (ponatinib tablets), Sprycel (dasatinib tablets), and Tasigna (nilotinib capsules).

Other Uses with Supportive Evidence

2. Myeloid/Lymphoid Neoplasms with Eosinophilia. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The tumor has an *ABL1* rearrangement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Scemblix is not recommended in the following situations:

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Sorafenib Prior Authorization Policy
- Nexavar® (sorafenib tablets – Bayer/Onyx, generic)

REVIEW DATE: 06/07/2023

OVERVIEW

Sorafenib, a kinase inhibitor, is indicated for the treatment of the following uses:[1]
- **Differentiated thyroid carcinoma**, locally recurrent or metastatic, progressive disease that is refractory to radioactive iodine treatment.
- **Hepatocellular carcinoma** that is unresectable.
- **Renal cell carcinoma** that is advanced.

Guidelines

Sorafenib is discussed in the guidelines from the National Comprehensive Cancer Network (NCCN):[2]
- **Acute Myeloid Leukemia**: NCCN guidelines (version 3.2023 – April 5, 2023) recommend sorafenib + hypomethylating agents (azacitidine or decitabine) for *FLT3*-ITD positive disease for treatment induction or post-induction therapy for patients ≥ 60 years of age and for relapsed/refractory disease (category 2A).[3] Single-agent sorafenib is recommended as maintenance therapy for patients who are post-allogeneic stem cell transplantation, in remission, and have a *FLT3*-ITD mutation (category 2A).
- **Bone Cancer**: NCCN guidelines (version 3.2023 – April 4, 2023) recommend sorafenib as a systemic therapy agent, "useful in certain circumstances", for recurrent chordoma (category 2A).[4] It also recommends sorafenib for osteosarcoma as a second-line therapy for relapsed/refractory or metastatic disease as a "preferred regimen" (category 2A) and as "other recommended regimens" in combination with everolimus [category 2B].
- **Gastrointestinal Stromal Tumor**: NCCN guidelines (version 1.2023 – March 13, 2023) recommend sorafenib (category 2A) as an additional option, "useful in certain circumstances", after failure on approved therapies.[5] The first-line preferred therapies are imatinib or Ayvakit™ (avapritinib tablets; for patients with *PDGFRA* exon 18 mutation, including the *PDGFRA* D842V mutation); second-line therapy is sunitinib or Sprycel® (dasatinib tablets) [for patients with *PDGFRA* exon 18 mutation that are insensitive to imatinib (including the *PDGFRA* D842V mutation); third-line therapy is Stivarga® (regorafenib tablets); fourth-line therapy is Qinlock® (ripretinib tablets).
- **Hepatocellular Carcinoma**: NCCN guidelines (version 1.2023 – March 10, 2023) recommend sorafenib as a first-line systemic therapy option as "other recommended regimens" for Child-Pugh Class A (category 1) or Child Pugh Class B7 (category 2A) and as a subsequent-line therapy if disease progression for Child Pugh Class A or B7 (category 2A) for unresectable, inoperable, or metastatic hepatocellular carcinoma.[6] The guidelines note that there is limited safety data available for Child-Pugh Class B or C patients, and the dosing is uncertain; this drug should be used with extreme caution in patients with elevated bilirubin levels. The impact of sorafenib on patients potentially eligible for transplant is unknown.
- **Kidney Cancer**: NCCN guidelines (version 4.2023 – January 18, 2023) have removed sorafenib as a treatment option for kidney cancer.[7]
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions**: NCCN guidelines (version 1.2023 – May 19, 2023) recommend sorafenib for myeloid/lymphoid neoplasms with *FLT3* rearrangements (category 2A).[8]

- **Ovarian Cancer Including Fallopian Tube Cancer and Primary Peritoneal Cancer**: NCCN guidelines (version 2.2023 – June 2, 2023) recommend sorafenib + topotecan (category 2A) as other recommended regimen option as recurrence therapy for platinum-resistant disease.[9]
- **Soft Tissue Sarcoma**: NCCN guidelines (version 2.2023 – April 25, 2023) recommend sorafenib as single-agent therapy under "useful in certain circumstances" for angiosarcoma (category 2A); sorafenib as a "preferred" single-agent regimen for desmoid tumors (aggressive fibromatosis) (category 1) and for solitary fibrous tumor (category 2A).[10]
- **Thyroid Carcinoma**: NCCN guidelines (version 2.2023 – May 18, 2023) for differentiated thyroid carcinoma recommend sorafenib as "other recommended regimens" for progressive and/or symptomatic disease for locally recurrent, advanced, and/or metastatic disease not amenable to radioactive iodine therapy (category 1).[11] Sorafenib can be considered for treatment of progressive or symptomatic medullary thyroid disease if clinical trials or preferred systemic therapy options are not available or appropriate, or if there is progression on preferred systemic therapy options.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of sorafenib. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of sorafenib is recommended in those who meet one of the following criteria:

FDA-Approved Indications

20. Hepatocellular Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has unresectable or metastatic disease.

21. Renal Cell Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has relapsed or advanced disease; AND
- **C)** Patient has clear cell histology AND
- **D)** Patient has tried at least one systemic therapy.
  Note: Examples of systemic therapy include Inlyta (axitinib tablets), Votrient (pazopanib tablets), sunitinib, Cabometyx (cabozantinib tablets).

22. Thyroid Carcinoma, Differentiated. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has differentiated thyroid carcinoma; AND
  Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).
- **C)** The disease is refractory to radioactive iodine therapy.

Other Uses with Supportive Evidence

~~23.~~ Acute Myeloid Leukemia. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient is ≥ 18 years of age; AND
B) Patient has *FLT3*-ITD mutation-positive disease as detected by an approved test; AND
C) Patient meets one of the following criteria (i or ii):
i. This medication is used in combination with azacitidine or decitabine; OR
ii. Patient has had an allogeneic stem cell transplant and is in remission.

5. **Bone Cancer.** Approve for 1 year if the patient meets the following criteria (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient meets ONE of the following criteria (i or ii):
i. Patient has recurrent chordoma; OR
ii. Patient meets both of the following criteria (a and b):
a) Patient has osteosarcoma; AND
b) Patient has tried one systemic chemotherapy regimen.
Note: Examples of a systemic chemotherapy regimen contain one of more of the following products: cisplastin, doxorubicin, methotrexate, or ifosfamide.

6. **Gastrointestinal Stromal Tumor.** Approve for 1 year if the patient meets the following criteria (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient has previously tried each of the following (i, ii, iii, and iv):
i. One of imatinib or Ayvakit (avapritinib tablets); AND
ii. One of sunitinib or Sprycel (dasatinib tablets); AND
iii. Stivarga (regorafenib tablets); AND
iv. Qinlock (ripretinib tablets).

7. **Myeloid/Lymphoid Neoplasms with Eosinophilia.** Approve for 1 year if the patient meets the following criteria (A and B):
C) Patient is ≥ 18 years of age; AND
D) The tumor has an *FLT3* rearrangement.

8. **Ovarian, Fallopian Tube, Primary Peritoneal Cancer**. Approve for 1 year if the patient meets the following criteria (A, B, and C):
A) Patient is ≥ 18 years of age; AND
B) Patient has platinum-resistant disease; AND
C) Sorafenib is used in combination with topotecan.

9. **Soft Tissue Sarcoma.** Approve for 1 year if the patient meets the following criteria (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient has ONE of the following diagnoses (i, ii, or iii):
i. Angiosarcoma; OR
ii. Desmoid tumors (aggressive fibromatosis); OR
iii. Solitary Fibrous Tumor/Hemangiopericytoma.

10. **Thyroid Carcinoma, Medullary.** Approve for 1 year if the patient meets the following criteria (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient has tried at least one systemic therapy.
Note: Examples of systemic therapy include: Caprelsa (vandetanib tablets), Cometriq (cabozantinib capsules), Retevmo (selpercatinib capsules), and Gavreto (pralsetinib capsules).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nexavar is not recommended in the following situations:

21. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Sprycel Prior Authorization Policy
- Sprycel® (dasatinib tablets – Bristol-Myers Squibb)

REVIEW DATE: 05/31/2023

OVERVIEW

Sprycel, a tyrosine kinase inhibitor (TKI), is indicated for the following uses:[1]

- **Philadelphia chromosome positive (Ph+) acute lymphoblastic leukemia (ALL)**:
  - In adults with resistance or intolerance to prior therapy.
  - In newly diagnosed pediatric patients ≥ 1 year of age in combination with chemotherapy.
- **Ph+ chronic myeloid leukemia (CML)**:
  - Chronic phase in newly diagnosed adults.
  - Chronic phase, accelerated, or myeloid or lymphoid blast phase, in adults with resistance or intolerance to prior therapy that included imatinib.
  - Chronic phase, in pediatric patients ≥ 1 year of age.

Guidelines

Sprycel is addressed in guidelines from National Comprehensive Cancer Network (NCCN):

- **ALL:** NCCN guidelines for adults and adolescents (version 1.2022 – April 4, 2022) recommend Sprycel for Ph+ disease in many different clinical circumstances (e.g., induction, consolidation therapy, maintenance, or relapsed or refractory disease) [category 2A].[2] TKIs in combination with other agents (e.g., chemotherapy or corticosteroids) are recommended for induction therapy for Ph+ ALL. TKIs have also been incorporated into consolidation and maintenance therapy, as well as in the relapsed/refractory setting (category 2A). TKI options include: Bosulif® (bosutinib tablets), Sprycel, imatinib, Tasigna (nilotinib capsules), or Iclusig® (ponatinib tablets) [category 2A]. NCCN panel notes that not all TKIs have been directly studied within the context of each specific regimen and there are limited data for Bosulif in Ph+ ALL. Use of a specific TKI should account for anticipated/prior TKI intolerance and disease-related features. For adults and adolescents, Iclusig has activity against T315I mutations and/or in whom no other TKI is indicated (category 2A). NCCN guidelines for pediatric ALL (version 2.2023 – March 10, 2023) feature Sprycel prominently in a variety of clinical scenarios (mainly category 2A recommendations).[3]
- **Bone Cancer:** NCCN guidelines (version 3.2023 – April 4, 2023) recommend Sprycel for patients with chondrosarcoma as "other recommended regimens" for a patient with metastatic and widespread disease (category 2A).[4] Sprycel is also recommended for chordoma as "other recommended regimens" (category 2A).
- **CML:** NCCN guidelines (version 2.2023 – April 13, 2023) recommend Sprycel as a preferred primary treatment for newly diagnosed chronic phase Ph+ CML with a low-, intermediate-, or high-risk score (category 1).[5] Sprycel is also recommended as an alternative TKI treatment (after primary treatment with imatinib, Bosulif® [bosutinib tablets], or Tasigna® [nilotinib capsules]) for BCR::ABL1 transcript levels (category 2A). Sprycel is also recommended in a variety of other situations, including post-allogeneic hematopoietic stem cell transplant (category 2A).
- **Gastrointestinal Stromal Tumor:** NCCN guidelines (version 1.2023 – March 13, 2023) recommend Sprycel as a second-line therapy as "other recommended regimens" for unresectable, progressive or metastatic disease in patients with platelet-derived growth factor receptor alpha *[PDGFRA]* exon 18 mutations that are insensitive to imatinib (including the PDGFRA D842V mutation).[6]

- **Melanoma: Cutaneous**: NCCN guidelines (version 2.2023 – March 10, 2023) recommend Sprycel as "useful in certain circumstances" for metastatic or unresectable disease with an activating *KIT* mutation as second-line or subsequent therapy for disease progression, intolerance, and/or projected risk of progression with *BRAF*-targeted therapy.[7]
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions:** NCCN guidelines (version 1.2023 –May 19, 2023) list Sprycel as a preferred therapy under "other recommended regimens" for chronic phase or blast phase disease with an *ABL1* rearrangement (category 2A).[8,9]. It is also recommended as treatment in combination with ALL- or acute myeloid leukemia-type induction chemotherapy followed by allogeneic hematopoietic stem cell transplantation (HCT) (if eligible) for lymphoid, myeloid or mixed lineage neoplasms with eosinophilia and *ABL1* rearrangement in blast phase (category 2A).[9]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Sprycel. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Sprycel is recommended in those who meet one of the following criteria:

FDA-Approved Indications

3. **Acute Lymphoblastic Leukemia.** Approve for 1 year if the patient has Philadelphia chromosome-positive acute lymphoblastic leukemia.

4. **Chronic Myeloid Leukemia.** Approve for 1 year if the patient has Philadelphia chromosome-positive chronic myeloid leukemia.

Other Uses with Supportive Evidence

3. **Bone Cancer.** Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has chondrosarcoma or chordoma.

4. **Gastrointestinal Stromal Tumor.** Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has tried imatinib or Ayvakit (avapritinib tablets).

5. **Melanoma, Cutaneous.** Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
   E) Patient is ≥ 18 years of age; AND
   F) Patient has metastatic or unresectable disease; AND
   G) Patient has an activating *KIT* mutation; AND
   H) Patient has tried at least one systemic regimen.
   Note: Examples of a systemic regimen include: Opdivo (nivolumab intravenous infusion) + Yervoy (ipilimumab intravenous infusion), Opdivo + Opdualag (nivolumab/relatlimab-rmbw

intravenous infusion), Keytruda (pembrolizumab intravenous infusion), Opdivo, Tafinlar (dabrafenib capsules) + Mekinist (trametinib tablets), Zelboraf (vemurafenib tablets) + Cotellic (cobimetinib tablets), Braftovi (encorafenib capsules) + Mektovi (binimetinib tablets).

6. Myeloid/Lymphoid Neoplasms with Eosinophilia. Approve for 1 year if the patient meets the following criteria (A and B):
A) Patient is ≥ 18 years of age; AND
B) The tumor has an *ABL1* rearrangement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sprycel is not recommended in the following situations:

22. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Stivarga Prior Authorization Policy
- Stivarga® (regorafenib tablets – Bayer)

REVIEW DATE: 03/08/2023

OVERVIEW

Stivarga, a kinase inhibitor, is indicated for the following uses:[1]

- **Colorectal cancer**, metastatic, in patients who have been previously treated with fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapy, an anti-vascular endothelial growth factor (VEGF) therapy, and, if *RAS* wild-type, an anti-epidermal growth factor receptor (EGFR) therapy.
- **Gastrointestinal stromal tumor**, locally advanced, unresectable, or metastatic in patients who have been previously treated with imatinib and sunitinib.
- **Hepatocellular carcinoma**, in patients who have been previously treated with sorafenib.

Guidelines

Stivarga is discussed in National Comprehensive Cancer Network (NCCN) guidelines:[2]

- **Bone Cancer**: NCCN guidelines (version 2.2023 – September 28, 2022) recommend Stivarga as a single agent "Preferred Regimen" for second-line therapy for relapsed/refractory or metastatic disease for patients with osteosarcoma (category 1).[3]
- **Central Nervous System Cancers**: NCCN guidelines (version 2.2022 – September 29, 2022) recommend Stivarga as a single agent "Preferred Regimen" for the treatment of recurrent glioblastoma (category 2A).[4]
- **Colon Cancer and Rectal Cancer**: NCCN guidelines (colon cancer [version 3.2022 – January 25, 2023] and rectal cancer [version 4.2022 – January 25, 2023]) recommend Stivarga as subsequent therapy as a single agent for advanced or metastatic disease not previously treated with Stivarga in patients who have progressed through all available regimens except Stivarga or Lonsurf® (trifluridine and tipiracil tablets) with or without bevacizumab.[5,6] Stivarga may be given before or after Lonsurf. Appendiceal adenocarcinoma are treated similarly to colon cancer.
- **Gastrointestinal Stromal Tumors**: NCCN guidelines (version 2.2022 – September 1, 2022) recommend Stivarga as a "Preferred Regimen" for treatment of unresectable, recurrent, or metastatic disease with widespread, systemic progression after single-agent therapy with imatinib and sunitinib or Sprycel (dasatinib tablets) [category 1].[7] Stivarga in combination with everolimus tablets is recommended as "Useful in Certain Circumstances" for unresectable, recurrent, or metastatic disease after failure on approved therapies. Stivarga is also recommended as a special consideration for unresectable, *succinate dehydrogenase*-deficient disease.[7]
- **Hepatobiliary Cancers**: NCCN guidelines (version 5.2022 – January 13, 2023) recommend Stivarga for subsequent treatment as a single agent for patients with hepatocellular carcinoma (adenocarcinoma) [Child-Pugh Class A only] and disease progression for the following uses (all are category 1): in patients who are not transplant candidates with unresectable disease; in patients who have liver-confined disease, inoperable by performance status or comorbidity or with minimal or uncertain extrahepatic disease; or in patients who have extensive liver tumor burden or metastatic disease.[8] Stivarga is also recommended as subsequent treatment as a single agent for progression on or after systemic treatment for unresectable or metastatic disease (category 2B).[8]
- **Soft Tissue Sarcoma**: NCCN guidelines (version 2.2022 – May 17, 2022) recommend Stivarga as a single-agent subsequent therapy for patients with non-adipocytic sarcoma with

advanced/metastatic disease, advanced/metastatic pleomorphic rhabdomyosarcoma, or angiosarcoma (all category 2A).[9]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Stivarga. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Stivarga is recommended in those who meet one of the following criteria:

FDA-Approved Indications

24. Colon, Rectal and Appendiceal Cancer. Approve for 1 year if the patient meets all of the following criteria (A, B, C, D, E, and F):
- **L)** Patient is ≥ 18 years of age; AND
- **M)** Patient has advanced or metastatic disease; AND
- **N)** Patient has been previously treated with a fluoropyrimidine (e.g., capecitabine, 5-fluorouracil [5-FU]); AND
- **O)** Patient has been previously treated with oxaliplatin; AND
- **P)** Patient has been previously treated with irinotecan; AND
- **Q)** Patient meets one of the following criteria (i or ii):
  - **i.** Patient's tumor or metastases are wild-type *RAS* (*KRAS* wild-type and *NRAS* wild-type) and the patient meets one of the following criteria (a or b):
    Note: This includes tumors or metastases that are *KRAS* and *NRAS* mutation-negative.
    - **a)** The patient has tried Erbitux (cetuximab intravenous infusion) or Vectibix (panitumumab intravenous infusion); OR
    - **b)** The patient's tumor did not originate on the left side of the colon (from the splenic fixture to rectum); OR
  - **ii.** The patient's tumor has or metastases have a *RAS* mutation (either *KRAS* mutation or *NRAS* mutation).

2. Gastrointestinal Stromal Tumor. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has tried both of the following (i and ii):
  - **i.** Imatinib or Ayvakit (avapritinib tablets); AND
  - **ii.** Sunitinib or Sprycel (dasatinib tablets).

3. Hepatocellular Carcinoma. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has been previously treated with one systemic regimen.
  Note: Examples of a systemic regimen include: Tecentriq (atezolizumab intravenous infusion), bevacizumab, sorafenib, Lenvima (lenvatinib capsules), Opdivo (nivolumab intravenous infusion), Imjudo (tremelimumab-actl intravenous infusion), Imfinzi (durvalumab intravenous infusion).

Other Uses with Supportive Evidence

4. **Glioblastoma.** Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has recurrent disease.

5. **Osteosarcoma.** Approve for 1 year if the patient meets all of the following criteria (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has relapsed/refractory or metastatic disease; AND
   C) Patient has tried one systemic chemotherapy regimen.
   Note: Examples of a systemic chemotherapy regimen contain one of more of the following products: cisplastin, doxorubicin, methotrexate, or ifosfamide.

6. **Soft Tissue Sarcoma.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has advanced or metastatic disease; AND
   C) Patient has one of the following (i, ii, or iii):
      i. Non-adipocytic sarcoma; OR
      ii. Pleomorphic rhabdomyosarcoma; OR
      iii. Angiosarcoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Stivarga is not recommended in the following situations:

23. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Sunitinib Prior Authorization Policy
- Sutent® (sunitinib malate capsules – Pfizer; generic)

REVIEW DATE: 06/28/2023

OVERVIEW

Sunitinib, a kinase inhibitor, is indicated in adults for the following uses:[1]

- **Gastrointestinal stromal tumor (GIST)**, after disease progression on or intolerance to imatinib mesylate tablets.
- **Pancreatic neuroendocrine tumors**, that is progressive and well-differentiated in patients with unresectable locally advanced or metastatic disease.
- **Renal cell carcinoma,** advanced, and for the adjuvant treatment of adult patients at high risk of recurrent renal cell carcinoma following nephrectomy.

Guidelines

Sunitinib is discussed in the guidelines from the National Comprehensive Cancer Network (NCCN):[2]

- **Bone Cancer**: NCCN guidelines (version 3.2023 – April 4, 2023) recommend sunitinib as a systemic therapy agent for recurrent chordoma (category 2A).[3]
- **Central Nervous System Cancers**: NCCN guidelines (version 1.2023 – March 24, 2023) recommend sunitinib for meningioma for surgically inaccessible recurrent or progressive disease when radiation is not possible (category 2B).[4]
- **Gastrointestinal Stromal Tumor**: NCCN guidelines (version 1.2023 – March 13, 2023) recommend sunitinib as preferred second-line therapy for unresectable, progressive, or metastatic disease (category 1).[5] The first line therapies include imatinib or Ayvakit™ (avapritinib tablets; for GIST with *PDGFRA* exon 18 mutation that are insensitive to imatinib, including the *PDGFRA* D842V mutation).[5] The guidelines also state in a footnote that for unresectable disease, sunitinib, Stivarga® (regorafenib tablets) and Votrient® (pazopanib tablets) are special considerations for succinate dehydrogenase (SDH)-deficient GIST (category 2A). Sunitinib is also recommended in combination with everolimus as "useful in certain circumstances" for unresectable, recurrent/progressive, or metastatic disease after progression on approved therapies (category 2A).
- **Kidney Cancer**: NCCN guidelines (version 4.2023 – January 18, 2023) recommend single-agent sunitinib as adjuvant treatment following nephrectomy for stage 3 disease with clear cell histology (category 3).[6] NCCN guidelines also recommend single-agent sunitinib for relapse or stage IV disease as a first-line and subsequent therapy option for clear cell histology and as a "preferred" systemic therapy option for non-clear cell histology (category 2A).[6]
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Fusion Genes**: NCCN guidelines (version 1.2023 – May 19, 2023) recommend sunitinib for myeloid/lymphoid neoplasms with *FLT3* rearrangements (category 2A).[7]
- **Neuroendocrine and Adrenal Tumors**: NCCN guidelines (version 2.2022 – December 21, 2022) recommend sunitinib as a "preferred" single-agent for the management of recurrent, locoregional advanced disease and/or distant metastatic disease (category 1 for progressive disease; category 2A for all others).[8] NCCN guidelines also recommend for treatment (pancreas only) for unresectable locally advanced/metastatic disease with favorable biology (e.g. relatively low Ki-67 [<55%], positive SSR-based PET imaging) that has clinically significant tumor burden or evidence of progression (category 2A). Sunitinib is also recommended as a single-agent for locally unresectable or distant metastatic pheochromocytoma and paraganglioma.[8]

- **Soft Tissue Sarcoma**: NCCN guidelines (version 2.2023 – April 25, 2023) recommend sunitinib as single-agent therapy as "useful in certain circumstances" for angiosarcoma (category 2A).[9] The guidelines also recommend sunitinib as a preferred single-agent therapy for alveolar soft part sarcoma and for solitary fibrous tumor (both category 2A).[9]
- **Thymomas and Thymic Carcinomas**: NCCN guidelines (version 1.2023 – December 15, 2022) recommend single agent sunitinib as second-line systemic therapy for thymic carcinoma (category 2A).[10]
- **Thyroid Carcinoma**: NCCN guidelines (version 2.2023 – May 18, 2023) recommend sunitinib as one of the kinase inhibitors to be considered if clinical trials or other systemic therapies are not available or appropriate for the treatment of progressive and/or symptomatic iodine refractory thyroid cancer.[11] This recommendation is for follicular, oncocytic (formerly Hürthle cell carcinoma), and papillary cancer subtypes (all category 2A). Sunitinib can be considered for treatment of progressive or symptomatic medullary thyroid disease if clinical trials or preferred systemic therapy options are not available or appropriate, or if there is progression on preferred systemic therapy options (category 2A).[11]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of sunitinib. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sunitinib is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Gastrointestinal Stromal Tumor.** Approve for 1 year if the patient meets the following (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient meets one of the following criteria (i or ii):
   - **i.** Patient has tried imatinib or Ayvakit (avapritinib tablets); OR
   - **ii.** Patient has succinate dehydrogenase (SDH)-deficient gastrointestinal stromal tumor.

2. **Neuroendocrine Tumors of the Pancreas.** Approve for 1 year if the patient meets the following (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has advanced or metastatic disease.

3. **Renal Cell Cancer.** Approve for 1 year if the patient meets the following (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has relapsed or advanced disease.

Other Uses with Supportive Evidence

4. **Bone Cancer.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has recurrent chordoma.

5. **Meningioma.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has recurrent or progressive disease.

6. **Myeloid/Lymphoid Neoplasms.** Approve for 1 year if the patient meets the following (A, B, and C):
   E) Patient is ≥ 18 years of age; AND
   F) Patient has eosinophilia; AND
   G) The tumor has an *FLT3* rearrangement.

7. **Pheochromocytoma/Paraganglioma.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has unresectable or metastatic disease.

8. **Soft Tissue Sarcoma.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has one of the following diagnosis (i, ii, or iii):
      i. Alveolar soft part sarcoma; OR
      ii. Angiosarcoma; OR
      iii. Solitary fibrous tumor/Hemangiopericytoma.

9. **Thymic Carcinoma.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has tried at least one systemic chemotherapy regimen.
   Note: Examples of a systemic chemotherapy regimen include one or more of the following products: carboplatin, paclitaxel, cisplatin, doxorubicin, cyclophosphamide, or etoposide.

10. **Thyroid Carcinoma, Differentiated.** Approve for 1 year if the patient meets the following (A, B, and C):
    A) Patient is ≥ 18 years of age; AND
    B) Patient has differentiated thyroid carcinoma; AND
    Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).
    C) Patient is refractory to radioactive iodine therapy.

11. **Thyroid Carcinoma, Medullary.** Approve for 1 year if the patient meets the following (A and B):
    A) Patient is ≥ 18 years of age; AND
    B) Patient has tried at least one systemic therapy.
    Note: Examples of systemic therapy include: Caprelsa (vandetanib tablets), Cometriq (cabozantinib capsules), Retevmo (selpercatinib capsules), and Gavreto (pralsetinib capsules).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of sunitinib is not recommended in the following situations:

24. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tabrecta Prior Authorization Policy
- Tabrecta® (capmatinib tablets – Novartis)

REVIEW DATE: 02/01/2023

OVERVIEW

Tabrecta, a kinase inhibitor, is indicated for the treatment of adults with metastatic **non-small cell lung cancer (NSCLC)** whose tumors have a mutation that leads to mesenchymal-epithelial transition (*MET*) exon 14 skipping as detected by an FDA-approved test.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 1.2023 – December 22, 2022) recommend Tabrecta as a first-line or subsequent line treatment option for patients with advanced or metastatic NSCLC who are positive for *MET* exon 14 skipping mutations or high-level *MET* amplification.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tabrecta. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tabrecta is recommended in those who meet the following criteria:

FDA-Approved Indication

5. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has advanced or metastatic disease; AND
- **C)** Patient meets one of the following criteria (i or ii):
  - **i.** Patient has mesenchymal epithelial transition (*MET*) exon 14 skipping mutations as detected by an approved test; OR
  - **ii.** Patient has high-level *MET* amplification as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tabrecta is not recommended in the following situations:

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tafinlar Prior Authorization Policy
- Tafinlar® (dabrafenib capsules and tablets for oral suspension – Novartis)

REVIEW DATE: 04/05/2023; selected revision 09/13/2023

OVERVIEW

Tafinlar, a BRAF inhibitor, is indicated for the following uses:[1]

- **Low-grade glioma,** in combination with Mekinist, for the treatment of pediatric patients ≥ 1 year of age with a BRAF V600E mutation who require systemic therapy.
- **Melanoma**, in the following situations:[1]
  - As a single agent for unresectable or metastatic disease with *BRAF V600E* mutation as detected by an FDA-approved test.
  - In combination with Mekinist® (trametinib tablets and oral solution), for unresectable or metastatic disease with a *BRAF V600E* or *V600K* mutation, as detected by an FDA-approved test.
  - In combination with Mekinist, as adjuvant treatment of *BRAF V600E* or *V600K* mutation-positive disease as detected by an FDA-approved test, with involvement of the lymph node(s), following complete resection.
- **Non-small cell lung cancer**, in combination with Mekinist for disease that has the *BRAF V600E* mutation as detected by an FDA-approved test.
- **Solid tumors - unresectable or metastatic**, in combination with Mekinist, for *BRAF V600E* mutation-positive disease, as determined by an FDA-approved test, in patients ≥ 1 year of age who have no satisfactory alternative treatment options.
- **Thyroid cancer**, in combination with Mekinist, for locally advanced or metastatic anaplastic disease with *BRAF V600E* mutation and with no satisfactory locoregional treatment options.

Limitations of Use**:** Tafinlar is not indicated for treatment of patients with colorectal cancer because of the known intrinsic resistance to BRAF inhibition. Tafinlar is not indicated for treatment of patients with wild-type BRAF solid tumors.

Dosing: For the tablet dosage form, Tafinlar has dosing for patients who are adults and for patients who are between 6 and 17 years of age and weigh ≥ 26 kg. The oral solution dosage form also has weight-based dosing for patients ≥ 8 kg.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use in multiple cancers.

- **Central Nervous System Cancers:** Guidelines (version 1.2023 – March 24, 2023) recommend a BRAF/MEK inhibitor combination (i.e., Tafinlar/Mekinist or Zelboraf® [vemurafenib tablets]/Cotellic® [cobimetinib tablets]) for treatment of *BRAF V600E* activation mutations in adults in the following situations: adjuvant treatment of pilocytic astrocytoma, pleomorphic xanthoastrocytoma, or ganglioglioma; recurrent or progressive low-grade glioma, oligodenroglioma, or isocitrate dehydrogenase-2 (*IDH2*)-mutant astrocytoma; and recurrent glioblastoma. BRAF/MEK combination therapy is also recommended for melanoma with brain metastases.[6] Guidelines for pediatric central nervous system (CNS) cancers (version 2.2023 – October 31, 2022) include targeted therapy with Tafinlar + Mekinist as adjuvant therapy or for recurrent or progressive disease, if the cancer has a *BRAF V600E* mutation.[9]

- **Histiocytic Neoplasms:** Guidelines (version 1.2022 – May 20, 2022) recommend Zelboraf as "preferred" or Tafinlar as "other recommended regimen" for *BRAF V600E*-mutated Erdheim-Chester disease, and for multisystem, pulmonary, or CNS Langerhans cell histiocytosis.[5]
- **Melanoma, Cutaneous:** Guidelines (version 2.2023 – March 10, 2023) recommend BRAF/MEK inhibitor combinations among the preferred therapies for first-line and subsequent treatment of metastatic or unresectable melanoma with a *V600*-activating mutation.[2] While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor is an option. Tafinlar + Mekinist is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafinlar/Mekinist, other BRAF/MEK combinations can be considered.
- **Non-Small Cell Lung Cancer:** Guidelines (version 2.2023 – February 17, 2023) list Tafinlar + Mekinist among the first-line therapy and subsequent therapy options for tumors with a *BRAF* mutation.[3] NCCN also notes that monotherapy with a BRAF inhibitor (Tafinlar or Zelboraf) is a treatment option when combination therapy is not tolerated.

The NCCN Compendium[7] recommends use of Tafinlar, in combination with Mekinist, for the following *BRAF V600* positive tumors (all category 2A): High-grade gliomas, ampullary adenocarcinoma, neuroendocrine tumors, pancreatic adenocarcinoma, salivary gland tumors, ovarian/fallopian tube/primary peritoneal cancer, esophageal and esophagogastric junction cancers, gastric cancer, biliary tract cancers, gastrointestinal stromal tumors, brain metastases due to melanoma, and differentiated thyroid carcinoma.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tafinlar. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tafinlar is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Low Grade Glioma.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   - **A)** Patient is ≥ 1 year of age; AND
   - **B)** Patient has *BRAF V600* mutation-positive disease; AND
   - **C)** The medication will be taken in combination with Mekinist (trametinib tablets or oral solution); AND
   - **D)** Patient requires systemic therapy.

2. **Melanoma.** Approve for 1 year if the patient meets the following (A, B, and C):
   - **A)** Patient is ≥ 6 years of age; AND
   - **B)** Patient has unresectable, advanced (including Stage III or Stage IV disease), or metastatic melanoma; AND
     Note: This includes adjuvant treatment in patients with Stage III disease with no evidence of disease post-surgery.
   - **C)** Patient has *BRAF V600* mutation-positive disease.

3. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets the following (A and B)
   A) Patient is ≥ 6 years of age; AND
   B) Patient has *BRAF V600* mutation-positive disease.

4. **Solid Tumors – Unresectable or Metastatic.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   Note: Examples of solid tumors are: biliary tract cancer, brain metastases due to melanoma, high-grade gliomas, ovarian/fallopian tube/primary peritoneal cancer, differentiated thyroid carcinoma, gastrointestinal stromal tumors, gastric cancer, esophageal and esophagogastric junction cancers, salivary gland tumors, pancreatic adenocarcinoma, neuroendocrine tumors, and ampullary adenocarcinoma.
   E) Patient is ≥ 1 year of age; AND
   F) Patient has *BRAF V600* mutation-positive disease; AND
   G) The medication will be taken in combination with Mekinist (trametinib tablets or oral solution); AND
   H) According to the prescriber, the patient has no satisfactory alternative treatment options.

5. **Thyroid Carcinoma, Anaplastic.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   E) Patient is ≥ 6 years of age; AND
   F) Patient has locally advanced or metastatic anaplastic disease; AND
   G) Patient has *BRAF V600* mutation-positive disease; AND
   H) The medication will be taken in combination with Mekinist (trametinib tablets or oral solution), unless intolerant.

Other Uses with Supportive Evidence

6. **Histiocytic Neoplasm.** Approve for 1 year if the patient meets the following (A, B, and C):
   A) Patient is ≥ 6 years of age; AND
   B) Patient meets one of the following (i or ii):
      i. Patient has Langerhans cell histiocytosis AND one of the following (a, b, or c):
         a) Multisystem disease; OR
         b) Pulmonary disease; OR
         c) Central nervous system lesions; OR
      ii. Patient has Erdheim-Chester disease; AND
   C) Patient has *BRAF V600*-mutation positive disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tafinlar is not recommended in the following situations:

1. **Colon or Rectal Cancer.** Tafinlar is not indicated for treatment of patients with colorectal cancer because of known intrinsic resistance to BRAF inhibition.[1]

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tagrisso Prior Authorization Policy
- Tagrisso® (osimertinib tablets – AstraZeneca)

REVIEW DATE: 01/11/2023

OVERVIEW

Tagrisso, a tyrosine kinase inhibitor, is indicated for the following uses:[1]

- **Non-Small Cell Lung Cancer (NSCLC) – Epidermal growth factor rector (*EGFR*) Mutation-Positive:** First-line treatment of adults with metastatic NSCLC whose tumors have *EGFR* exon 19 deletions or exon 21 L858R mutations, as detected by an FDA-approved test.
- **NSCLC – *EGFR* T790M Mutation-Positive:** Treatment of adults with metastatic *EGFR* T790M mutation-positive NSCLC, as detected by an FDA-approved test, whose disease has progressed on or after *EGFR* tyrosine kinase inhibitor (TKI) therapy.
- **NSCLC – *EGFR* Mutation-Positive, Post Tumor Resection:** Adjuvant therapy after tumor resection in adults with NSCLC whose tumors have *EGFR* exon 19 deletions or exon 21 L858R mutations, as detected by an FDA-approved test.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 1.2023 – December 22, 2022) recommend testing for sensitizing *EGFR* mutations in patients with metastatic disease.[2] The most common *EGFR* mutations are exon 19 deletions and exon 21 (L858R) substitution mutations. Other less common mutations that are also sensitive to *EGFR* tyrosine kinase inhibitors (TKIs) include L861Q, G719X, and S768I. NCCN recommends the *EGFR* TKIs as first-line treatment for patients with advanced or metastatic NSCLC with *EGFR* exon 19 deletions, exon 21 (L858R) substitution mutations, L861Q, G719X, and S768I. Tagrisso is a preferred first-line *EGFR* TKI and is also recommended as subsequent treatment for these patients. The panel recommends T790M (a secondary mutation in *EGFR*) testing in patients who progress on erlotinib tablets, Gilotrif® (afatinib tablets), Iressa® (gefitinib tablets), or Vizimpro® (dacomitinib tablets). If the patient has *EGFR* T790M-positive metastatic NSCLC, Tagrisso may be considered for second-line and beyond (subsequent) therapy. If the disease is *EGFR* T790M-negative, the patient can be continued on the current TKI (i.e., erlotinib, Gilotrif, Iressa, or Vizimpro). Tagrisso is also recommended for use in patients with completely resected stage IB-IIIA *EGFR* (exon 19 deletion, L858R) NSCLC who received previous adjuvant chemotherapy or are ineligible to receive platinum-based chemotherapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tagrisso. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tagrisso is recommended in those who meet one of the following criteria:

FDA-Approved Indications

4. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following criteria (A, B and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has advanced or metastatic disease; AND
- **C)** Patient meets one of the following criteria (i or ii):
  - **i.** Patient has sensitizing epidermal growth factor receptor (*EGFR)* mutation-positive disease as detected by an approved test; OR
    Note: Examples of sensitizing *EGFR* mutation-positive non-small cell lung cancer include the following: exon 19 deletions, exon 21 (L858R) substitution mutations, L861Q, G719X, and S768I.
  - **ii.** Patient meets the following criteria (a and b):
    - **a)** Patient has epidermal growth factor receptor (*EGFR*) T790M mutation-positive disease as detected by an approved test; AND
    - **b)** Patient has progressed on treatment with at least one of the *EGFR* tyrosine kinase inhibitors.
      Note: *EGFR* tyrosine kinase inhibitors are erlotinib, Iressa (gefitinib tablets), Vizimpro (dacomitinib tablets), Gilotrif (afatinib tablets).

2. Non-Small Cell Lung Cancer – Post Tumor Resection. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has completely resected disease; AND
- **C)** Patient has *EGFR* exon 19 deletion or exon 21 (L858R) substitution mutation as detected by an approved test; AND
- **D)** Patient meets one of the following criteria (i or ii):
  - **i.** Patient received previous adjuvant chemotherapy; OR
  - **ii.** Patient is ineligible to receive platinum-based chemotherapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tagrisso is not recommended in the following situations:

25. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

41. Tagrisso™ tablets [prescribing information]. Wilmington, DE: AstraZeneca; December 2020.
42. The NCCN Non-Small Cell Lung Cancer Clinical Practice Guidelines in Oncology (version 1.2023 – December 22, 2022). © 2022 National Comprehensive Cancer Network. Available at: http://www.nccn.org. Accessed on January 9, 2022.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Talzenna Prior Authorization Policy
- Talzenna® (talazoparib capsules – Pfizer)

REVIEW DATE: 12/13/2023

OVERVIEW

Talzenna, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicated for the following uses:[1]

- **Breast cancer**, for the treatment of deleterious or suspected deleterious germline BReast CAncer susceptibility gene (BRCA)-mutated human epidermal growth factor receptor 2 (HER2)-negative locally-advanced or metastatic breast cancer in adults.
- **Prostate cancer**, for the treatment of homologous recombination repair (HRR) gene-mutated metastatic castration-resistant prostate cancer (mCRPC) in combination with Xtandi® (enzalutamide capsules or tablets) in adults.

GUIDELINES

Talzenna is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Breast Cancer**: NCCN guidelines (version 5.2023 – December 5, 2023) recommend Talzenna for patients with recurrent unresectable (local or regional) or Stage IV disease breast cancer with hormone receptor-positive, HER2-negative disease with visceral crisis or endocrine-refractory, germline *BRCA1/2* mutation as a "Preferred Regimen" (category 1).[2] Lynparza® (olaparib tablets) is another "Preferred Regimen" in this setting (category 1). There is a footnote which states PARP inhibitors can be considered for a later line for those with *BRCA*1/2 mutation, however, available evidence suggests it is more effective if used earlier. Talzenna is also recommended as a single-agent for recurrent, unresectable, or stage IV HER2-positive disease with a *BRCA1/2* mutation (category 2A). The guidelines note that although Talzenna and Lynparza are FDA-approved for HER2-negative disease, the NCCN Panel supports use of these agents in any subtype associated with a germline *BRCA1/2* mutation. For triple negative breast cancer with germline *BRCA*1/2 mutation, Talzenna and Lynparza are listed as a "Preferred Regimens" in the first-line setting for patients with programmed cell death ligand 1 combined positive score (PD-L1 CPS) < 10 (category 1), and also in the second-line setting (category 1).
- **Prostate Cancer:** NCCN guidelines (version 4.2023 – September 7, 2023) recommend Talzenna + Xtandi for HRR mutation (category 1) as "Useful in Certain Circumstances" in the first-line setting for mCRPC. For patients who have received prior novel hormone therapy and no prior docetaxel therapy, Talzenna + Xtandi is recommended for HRR mutation (category 2B) as "Useful in Certain Circumstances". For patients who have received prior docetaxel therapy and no prior novel hormone therapy, Talzenna + Xtandi is recommended for HRR mutation (category 2A) as "Useful in Certain Circumstances".

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Talzenna. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Talzenna is recommended in those who meet one of the following criteria:

FDA-Approved Indication

1. **Breast Cancer.** Approve for 1 year if the patient meets the following (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has recurrent or metastatic breast cancer; AND
   - **C)** Patients has germline *BRCA* mutation-positive disease.

2. **Prostate Cancer.** Approve for 1 year if the patient meets the following (A, B, C, D, and E):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has metastatic castration resistant prostate cancer; AND
   - **C)** Patient meets one of the following criteria (i or ii):
     - **i.** The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog; OR
       Note: Examples are leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), Orgovyx (relugolix tablets).
     - **ii.** Patient has had a bilateral orchiectomy; AND
   - **D)** Patient has homologous recombination repair (HRR) gene-mutated disease; AND
     Note: HRR gene mutations include *ATM, ATR, BRCA1, BRCA2, CDK12, CHEK2, FANCA, MLH1, MRE11A, NBN, PALB2, or RAD51C*
   - **E)** The medication is used in combination with Xtandi (enzalutamide capsules and tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Talzenna is not recommended in the following situations:

26. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

45. The NCCN Prostate Cancer Clinical Practice Guidelines in Oncology (version 4.2023 – September 7, 2023). © 2023National Comprehensive Cancer Network. Available at: http://www.nccn.org. Accessed December 1, 2023.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tasigna Prior Authorization Policy
- Tasigna® (nilotinib capsules – Novartis)

REVIEW DATE: 05/31/2023

OVERVIEW

Tasigna, a tyrosine kinase inhibitor (TKI), is indicated for the following uses:[1]

- **Chronic myeloid leukemia (CML)**, chronic phase, newly diagnosed and Philadelphia chromosome positive (Ph+), in adult and pediatric patients ≥ 1 year of age.
- **CML**, Ph+, chronic phase and accelerated phase, in adults with resistance or intolerance to prior therapy that included imatinib.
- **CML**, Ph+, chronic phase and accelerated phase, in pediatric patients ≥ 1 year of age with resistance or intolerance to prior TKI therapy.

Guidelines

Tasigna is addressed in guidelines from National Comprehensive Cancer Network (NCCN):

- **Acute Lymphoblastic Leukemia (ALL):** NCCN guidelines for adults and adolescents (version 1.2022 – April 4, 2022) recommend Tasigna for Ph+ disease in many different clinical circumstances (e.g., induction, consolidation therapy, maintenance, or relapsed or refractory disease) [category 2A].[2,8] TKIs in combination with other agents (e.g., chemotherapy or corticosteroids) are recommended for induction therapy for Ph+ ALL. TKIs have also been incorporated into consolidation and maintenance therapy, as well as in the relapsed/refractory setting (category 2A). TKI options include: Bosulif® (bosutinib tablets), Sprycel® (dasatinib tablets), imatinib, Tasigna, or Iclusig® (ponatinib tablets) [category 2A]. NCCN panel notes that not all TKIs have been directly studied within the context of each specific regimen and there are limited data for Bosulif in Ph+ ALL. Use of a specific TKI should account for anticipated/prior TKI intolerance and disease-related features. For adults and adolescents, Iclusig has activity against T315I mutations and/or in whom no other TKI is indicated (category 2A).
- **CML:** NCCN guidelines (version 2.2023 – April 13, 2023) recommend Tasigna as a preferred primary treatment for newly diagnosed chronic phase Ph+ CML patients with a low-, intermediate-, or high-risk score (category 1).[3,8] Tasigna is also recommended as an alternative TKI treatment (after primary treatment with imatinib, Bosulif® [bosutinib tablets], or Sprycel® [dasatinib tablets]) for BCR-ABL1 transcript levels (category 2A). Tasigna is also recommended in a variety of other situations, including post-allogeneic hematopoietic stem cell transplant (category 2A).
- **Gastrointestinal Stromal Tumor (GIST):** NCCN guidelines (version 1.2023 – March 13, 2023) recommend Tasigna as "useful in certain circumstances" after failure on approved therapies (category 2A).[4] Imatinib is a preferred regimen for first-line therapy (category 1) for sensitive mutations (excluding platelet-derived growth factor receptor alpha (*PDGFRA*) exon 18 mutations that are insensitive to imatinib including D842V mutation). Ayvakit® (avapritinib tablets) is also a preferred regimen (category 2A) for GIST with *PDGFRA* exon 18 mutations that are insensitive to imatinib, including the *PDGFRA* D842V mutation. Second-line therapies include sunitinib as "preferred" (category 1) and Sprycel as "other recommended regimen" (category 2A). Stivarga® (regorafenib tablets) is a "preferred" third-line therapy (category 1). Qinlock™ (ripretinib tablets) is a "preferred" fourth-line therapy (category 1).
- **Melanoma: Cutaneous**: NCCN guidelines (version 2.2023 – March 10, 2023) recommend Sprycel as "useful in certain circumstances" for metastatic or unresectable disease with an

activating *KIT* mutation as second-line or subsequent therapy for disease progression, intolerance, and/or projected risk of progression with *BRAF*-targeted therapy.[5]

- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions:** NCCN guidelines (version 1.2023 – May 19, 2023) recommend Tasigna as a preferred agent as "other recommended regimens" for *ABL1* rearrangements (category 2A).[6] It is also recommended as treatment in combination with ALL- or acute myeloid leukemia-type induction chemotherapy followed by allogeneic hematopoietic stem cell transplantation (HSCT) [if eligible] for lymphoid, myeloid or mixed lineage neoplasms with eosinophilia and *ABL1* rearrangement in blast phase (category 2A).[8]
- **Soft Tissue Sarcomas:** NCCN guidelines (version 2.2023 – April 25, 2023) recommend Tasigna as "useful in certain circumstances" as single-agent therapy for the treatment of pigmented villonodular synovitis/tenosynovial giant cell tumor (category 2A).[7] Turalio® (pexidartinib capsules) is the preferred regimen (category 1) and imatinib is also cited as "useful in certain circumstances" (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tasigna. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tasigna is recommended in those who meet one of the following criteria:

FDA-Approved Indication

6. **Chronic Myeloid Leukemia.** Approve for 1 year if the patient has Philadelphia chromosome-positive chronic myeloid leukemia.

Other Uses with Supportive Evidence

7. **Acute Lymphoblastic Leukemia.** Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has Philadelphia chromosome-positive acute lymphoblastic leukemia.

8. **Gastrointestinal Stromal Tumor.** Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has tried each of the following (i, ii, iii, and iv):
      i. Imatinib or Ayvakit (avapritinib tablets); AND
      ii. Sunitinib or Sprycel (dasatinib tablets); AND
      iii. Stivarga (regorafenib tablets); AND
      iv. Qinlock (ripretinib tablets).

9. **Melanoma, Cutaneous.** Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
   I) Patient is ≥ 18 years of age; AND

J) Patient has metastatic or unresectable disease; AND
K) Patient has an activating *KIT* mutation; AND
L) Patient has tried at least one systemic regimen.
Note: Examples of a systemic regimen include: Opdivo (nivolumab intravenous infusion) + Yervoy (ipilimumab intravenous infusion), Opdivo + Opdualag (nivolumab/relatlimab-rmbw intravenous infusion), Keytruda (pembrolizumab intravenous infusion), Opdivo, Tafinlar (dabrafenib capsules) + Mekinist (trametinib tablets), Zelboraf (vemurafenib tablets) + Cotellic (cobimetinib tablets), Braftovi (encorafenib capsules) + Mektovi (binimetinib tablets).

10. Myeloid/Lymphoid Neoplasms with Eosinophilia. Approve for 1 year if the patient meets the following criteria (A and B):
H) Patient is ≥ 18 years of age; AND
I) The tumor has an *ABL1* rearrangement.

~~11.~~ Pigmented Villonodular Synovitis/Tenosynovial Giant Cell Tumor. Approve for 1 year if the patient meets one of the following criteria (A or B):
A) Patient has tried Turalio (pexidartinib capsules); OR
B) Patient cannot take Turalio, according to the prescriber.
Note: Examples of reasons for not being able to take Turalio include patients with elevated liver enzymes or concomitant use of medications that are associated with hepatotoxicity.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tasigna is not recommended in the following situations:

27. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tazverik Prior Authorization Policy
- Tazverik® (tazemetostat tablets – Epizyme)

REVIEW DATE: 03/01/2023

OVERVIEW

Tazverik, an EZH2 inhibitor, is approved in the following conditions:[1]

- **Epithelioid sarcoma**, in patients ≥ 16 years of age with metastatic or locally advanced disease not eligible for complete resection.
- **Follicular lymphoma**, in the following situations:
  - Relapsed or refractory disease, in adults whose tumors are positive for an EZH2 mutation as detected by an approved test and who have received at least two prior systemic therapies.
  - Relapsed or refractory disease, in adults who have no satisfactory alternative treatment options.

These indications are approved under accelerated approval based on overall response rate and duration of response. Continued approval may be contingent upon verification and description of clinical benefit in confirmatory trial(s).

Guidelines

Tazverik is addressed in the following guidelines from the National Comprehensive Cancer Network:

- **Epithelioid Sarcoma:** Guidelines for soft tissue sarcoma (version 2.2022 – May 17, 2022) recommend Tazverik as a "Preferred" therapy for treatment of metastatic or locally advanced epithelioid sarcoma not eligible for complete resection.[2] No other therapies are listed for this specific subtype of soft tissue sarcoma.
- **Follicular Lymphoma:** Guidelines for B-cell lymphomas (version 2.2023 – February 8, 2023) recommend Tazverik as a third-line and subsequent therapy for follicular lymphoma, irrespective of EZH2 mutation status.[3] Tazverik is an "Other Recommended" regimen in the second-line setting for a patient who is elderly or infirm, and if none of the other therapies are expected to be tolerable in the opinion of the treating physician.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tazverik. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tazverik is recommended in those who meet one of the following criteria:

FDA-Approved Indications

6. **Epithelioid Sarcoma.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is ≥ 16 years of age; AND
   - **B)** Patient has metastatic or locally advanced disease; AND
   - **C)** Patient is not eligible for complete resection.

7. **Follicular Lymphoma.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has relapsed or refractory disease; AND
   - **C)** Patient meets ONE of the following (i or ii):
     - **i.** Patient has tried at least two prior systemic therapies; OR
     - **ii.** According to the prescriber, there are no appropriate alternative therapies.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tazverik is not recommended in the following situations:

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Temozolomide Capsules Prior Authorization Policy
- Temodar® (temozolomide capsules – Merck, generic)

REVIEW DATE: 10/11/2023

OVERVIEW

Temozolomide, an alkylating agent, is indicated in adults for the following uses:[1]

- **Anaplastic astrocytoma,**
  - Newly diagnosed as adjuvant treatment
  - Refractory
- **Glioblastoma**, newly diagnosed, concomitantly used with radiotherapy and then as maintenance therapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium recommends use of temozolomide for the indications listed in the FDA-Approved Indications and Other Uses with Supportive Evidence sections.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of temozolomide capsules. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of temozolomide capsules is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Anaplastic Astrocytoma.** Approve for 1 year.

2. **Glioblastoma Multiforme.** Approve for 1 year.
   Note: This includes glioblastoma and grade IV astrocytoma.

Other Uses with Supportive Evidence

3. **Bone Cancer.** Approve for 1 year if the patient meets the following (A and B):
   - **A)** Patient has tried one chemotherapy regimen; AND
     Note: Examples of a chemotherapy regimen include one or more of the following products: vincristine, doxorubicin, cyclophosphamide, ifosfamide, etoposide.
   - **B)** Patient has ONE of the following (i or ii):
     - **i.** Ewing sarcoma; OR
     - **ii.** Mesenchymal chondrosarcoma.

4. **Brain Metastases from Solid Tumors.** Approve for 1 year.

5. **Ependymoma, Intracranial or Spinal.** Approve for 1 year.

6. **Glioma, Other Types.** Approve for 1 year.
   Note: Examples of other types of gliomas include pediatric diffuse high-grade glioma, oligodendroglioma, low-grade glioma, and circumscribed glioma. For anaplastic astrocytoma and glioblastoma multiforme, refer to the respective criteria under the FDA-approved indications.

7. **Gliosarcoma.** Approve for 1 year.

8. **Medulloblastoma.** Approve for 1 year if the patient has tried one chemotherapy regimen.
   Note: Examples of a chemotherapy regimen include one or more of the following products: cisplatin, cyclophosphamide, vincristine, lomustine.

9. **Melanoma.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient has unresectable or metastatic melanoma; AND
   B) Patient has tried one systemic regimen.
      Note: Examples of a systemic regimen include one or more of the following medications: Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion), Yervoy (ipilimumab intravenous infusion), Tafinlar (dabrafenib capsule), Mekinist (trametinib tablet), Zelboraf (vemurafenib tablet), Cotellic (cobimetinib tablet), Braftovi (encorafenib capsule), Mektovi (binimetinib tablet).

10. **Mycosis Fungoides/Sézary Syndrome.** Approve for 1 year if the patient meets the following (A and B):
    A) Patient has tried one prior therapy; AND
       Note: Examples of a prior therapy include topical carmustine, topical corticosteroids, topical imiquimod, topical retinoids, Adcetris (brentuximab vedotin intravenous infusion), gemcitabine.
    B) Patient has central nervous system (CNS) involvement.

11. **Neuroendocrine Tumors.** Approve for 1 year if the patient meets ONE of the following (A, B, C, D, E, or F):
    A) Patient has carcinoid tumors or neuroendocrine tumor of gastrointestinal tract, lung or thymus; OR
    B) Patient has islet cell tumors or pancreatic neuroendocrine tumors; OR
    C) Patient has extrapulmonary poorly differentiated neuroendocrine carcinoma; OR
    D) Patient has large or small cell carcinoma; OR
    E) Patient has mixed neuroendocrine-non-neuroendocrine neoplasm; OR
    F) Patient has well differentiated grade 3 neuroendocrine tumor.

12. **Pheochromocytoma or Paragangliomas.** Approve for 1 year in patients with unresectable or metastatic disease.

13. **Primary Central Nervous System Lymphoma.** Approve for 1 year.

14. **Small Cell Lung Cancer.** Approve for 1 year if the patient has tried one systemic regimen.
    Note: Examples of systemic regimen include one or more of the following products: cisplatin, etoposide, carboplatin, Tecentriq (atezolizumab intravenous infusion), Imfinzi (durvalumab intravenous infusion), irinotecan.

15. **Soft Tissue Sarcomas.** Approve for 1 year if the patient meets ONE of the following (A or B):
    - **A)** Patient has advanced or metastatic disease; OR
    - **B)** Patient has ONE of the following diagnoses (i or ii):
        - **i.** Non-pleomorphic rhabdomyosarcoma; OR
        - **ii.** Solitary fibrous tumor.

16. **Uterine Sarcomas**. Approve for 1 year if the patient has tried a chemotherapy regimen.
    Note: Examples of a chemotherapy regimen include one or more of the following products: doxorubicin, docetaxel, epirubicin, gemcitabine, ifosfamine, dacarbazine, vinorelbine.

17. **Uveal Melanoma.** Approve for 1 year if the patient has unresectable or metastatic disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of temozolomide capsules is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tepmetko Prior Authorization Policy
- Tepmetko® (tepotinib tablets – EMD Serono)

REVIEW DATE: 02/01/2023

OVERVIEW

Tepmetko, a kinase inhibitor, is indicated for the treatment of adults with metastatic **non-small cell lung cancer (NSCLC)** harboring mesenchymal-epithelial transition (*MET*) exon 14 skipping alterations.[1] This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

Guidelines

The National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 1.2023 – December 22, 2022) recommend Tepmetko as a first-line or subsequent line treatment option for patients with advanced or metastatic NSCLC who are positive for *MET* exon 14 skipping mutations or high-level *MET* amplification.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tepmetko. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tepmetko is recommended in those who meet the following criteria:

FDA-Approved Indication

12. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has advanced or metastatic disease; AND
- **C)** Patient meets one of the following criteria (i or ii):
- **i.** Patient has mesenchymal epithelial transition (*MET*) exon 14 skipping mutations as detected by an approved test; OR
- **ii.** Patient has high-level *MET* amplification as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tepmetko is not recommended in the following situations:

8. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Thalomid Prior Authorization Policy
- Thalomid® (thalidomide capsules – Celgene)

REVIEW DATE: 05/10/2023

OVERVIEW

Thalomid, an immunomodulatory agent, is indicated for the following uses:[1]

- **Erythema nodosum leprosum (ENL)**, acute treatment of cutaneous manifestations in moderate to severe disease. Thalomid is not indicated as monotherapy for such ENL treatment in the presence of moderate to severe neuritis.
- **ENL**, maintenance therapy for prevention and suppression of the cutaneous manifestations of ENL recurrence.
- **Multiple myeloma**, newly diagnosed, in combination with dexamethasone.

Other Uses with Supportive Evidence

Discoid Lupus Erythematosus or Cutaneous Lupus Erythematosus

Thalomid has been used for discoid lupus erythematosus and cutaneous lupus erythematosus. Patients usually had refractory disease after trial of other therapies and good responses were achieved for many patients given Thalomid.[2-12] A retrospective medical review was done that involved 29 patients with refractory cutaneous manifestations of cutaneous lupus erythematosus who received Thalomid. Of the 23 patients who took Thalomid for 1 month, 74% of patients (n = 17/23) had complete resolution of the cutaneous manifestations and 13% of patients (n = 3/23) had a 75% or greater partial improvement.[3] Another report involving patients with discoid lupus (n = 18), subacute cutaneous lupus (n = 6), and systemic lupus erythematosus with skin involvement (n = 24) who had been resistant to at least two other treatments found a response rate of 81% (n = 39/48) with use of Thalomid with 60% of patients (n = 29/48) achieving a complete cutaneous remission.[4] Other therapies used for these conditions include antimalarial agents (e.g. hydroxychloroquine), corticosteroids (oral, topical, intralesional), methotrexate, azathioprine, cyclosporine, dapsone, mycophenolate mofetil, topical calcineurin inhibitors (e.g., Elidel® [pimecrolimus 1% cream], Protopic® [tacrolimus 0.03% and 0.1% ointment]), and Soriatane® (acitretin capsules).[2,7,12]

Prurigo Nodularis

Thalomid has been studied in patients with prurigo nodularis, most of whom were refractory to other treatments or with adverse events from the other therapies.[2,13-15] A retrospective review assessed the medical records of 42 patients with prurigo nodularis who were refractory to other therapy and who received Thalomid.[13] Patients received Thalomid for an average of 105 weeks. Previous therapies tried included topical steroids, intralesional steroids, systemic steroids, topical tar, macrolides, cyclosporine, azathioprine, methotrexate, calcineurnin inhibitors, antihistamines, dapsone, capsaicin, laser therapy, psoralen plus ultraviolet A therapy, ultraviolet B therapy, retinoids, hydroxyzine, and macrolides. With Thalomid, improvement was noted in approximately one-third of patients.

Aphthous Ulcers or Aphthous Stomatitis

Recurrent aphthous ulcers and recurrent aphthous stomatitis are associated with frequent and recurring symptoms that are painful and can lead to difficulty in speaking, eating, and swallowing.[16-27] Ulcers are larger and may persist for weeks to months. The conditions are noted in certain disease states such as in patients who are human immunodeficiency virus (HIV)-positive and Bechet's disease. In general, few adequately powered trials have assessed the efficacy of therapeutic agents for aphthous ulcers or aphthous

stomatitis. Although the data are older and limited, Thalomid has led to rapid resolution of symptoms in patients with recurrent aphthous ulcers or aphthous stomatitis.[16-27] A double-blind, randomized, placebo-controlled study assessed Thalomid as a therapy for oral aphthous ulcers in patients infected with HIV. In total, 55% of patients (n = 16/29) given Thalomid had complete healing of their aphthous ulcers after 4 weeks compared with only 7% of patients (n = 2/28) who received placebo. Patients given Thalomid had symptom improvements in regards to discomfort that occurred while eating.[21] A retrospective cohort study involving patients with recurrent aphthous stomatitis found that Thalomid was rapidly effective as 85% of patients (n = 78/92) achieved a complete remission of the condition within 14 days.[25] Many other agents have been used for recurrent aphthous ulcers or stomatitis including topical or intralesional corticosteroids, systemic corticosteroids, topical anesthetics/analgesics (lidocaine 2% viscous solution, benzocaine lozenges), antimicrobial mouth washes (tetracycline, chlorhexidine), topical sucralfate, acyclovir, pentoxifylline, dapsone, colchicine, and azathioprine.[16-27] Due to toxicities, use of Thalomid is generally reserved for patients who have not obtained satisfactory results with other agents.[26,27]

Guidelines

Thalomid is addressed in guidelines from National Comprehensive Cancer Network (NCCN):

- **Castleman's Disease:** The NCCN guidelines for B-cell lymphomas (version 2.2023 – February 8, 2023) recommend use of Thalomid, with or without rituximab, for patients with Castleman's disease for those who have relapsed/refractory or progressive disease (category 2A).[28] Thalomid is cited as an "other recommended therapy" (when given with cyclophosphamide and prednisone) for patients with multi-centric Castleman's disease who are negative for HIV and human herpesvirus-8 (HHV-8) [category 2A].
- **Histiocytic Neoplasms:** The NCCN guidelines for histiocytic neoplasms (version 1.2022 – May 20, 2022) recommend Thalomid in a few clinical scenarios.[29] For Langerhans cell histiocytosis, Thalomid is recommended as first-line or as subsequent therapy for single system multifocal skin disease (including mucosa) and for relapsed/refractory disease (category 2A). Thalomid is also recommended as first-line or subsequent therapy for cutaneous skin disease associated with Rosai-Dorfman disease under "useful in certain circumstances" (category 2A) [e.g., those with relapsed/refractory disease, symptomatic multifocal disease, symptomatic unresectable unifocal disease].
- **Kaposi Sarcoma:** The NCCN guidelines for Kaposi sarcoma (version 1.2023 – December 20, 2022) recommended Thalomid as an agent "useful under certain conditions" for subsequent systemic therapy options for relapsed/refractory therapy (category 2A) [for patients with corticosteroid-refractory immune reconstitution inflammatory syndrome].[30] This includes use when given alone (in patients without HIV) or with antiretroviral therapy for patients with HIV. First-line systemic therapy options include liposomal doxorubicin (preferred), and paclitaxel. Other subsequent systemic therapy options for relapsed/refractory therapy are also cited (e.g., Pomalyst® [pomalidomide capsules] {preferred}, lenalidomide, imatinib).
- **Multiple Myeloma:** The NCCN guidelines for multiple myeloma (version 3.2023 – December 8, 2022) recommend use of Thalomid in various scenarios (category 1 for use with bortezomib and dexamethasone; category 2A for others).[31] It is considered "useful in certain circumstances" among patients with previously treated multiple myeloma, as well as for primary therapy for transplant candidates. Thalomid is always recommended to be used with at least two other therapies to comprise the regimen.
- **Myelofibrosis:** The NCCN has guidelines regarding myeloproliferative neoplasms (version 3.2022 – August 11, 2022) discuss myelofibrosis.[32] Thalomid is recommended in the management of anemia associated with myelofibrosis "useful in certain circumstances", with or without prednisone, for a variety of clinical scenarios (category 2A) including patients with erythropoietin levels ≥ 500 mU/mL and with erythropoietin levels < 500 mU/mL and no response or loss of response to erythropoietic stimulating agents.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Thalomid. All approvals are provided for the duration noted below.

Automation: None.

Recommended Authorization Criteria
Coverage of Thalomid is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Erythema Nodosum Leprosum.** Approve for 1 year.

2. **Multiple Myeloma.** Approve for 1 year if the patient meets the following (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Thalomid is being taken in combination with at least two other medications.
     Note: Examples of medications include bortezomib, dexamethasone, cisplatin, doxorubicin, cyclophosphamide, etoposide, and Kyprolis (carfilzomib intravenous infusion).

Other Uses with Supportive Evidence

3. **Castleman's Disease.** Approve for 1 year if the patient meets one of the following (A or B):
   - **A)** Patient has relapsed/refractory or progressive disease; OR
   - **B)** Patient meets the following criteria (i and ii):
     - **i.** Patient has multi-centric Castleman's disease; AND
     - **ii.** Patient is negative for the human immunodeficiency virus and human herpesvirus-8.

4. **Discoid Lupus Erythematosus or Cutaneous Lupus Erythematosus.** Approve for 1 year if the patient has tried at least two other medications.
   Note: Examples of medications include corticosteroids (oral, topical, intralesional), antimalarial agents (e.g., hydroxychloroquine), topical calcineurin inhibitors (e.g., Protopic [tacrolimus ointment], Elidel [pimecrolimus cream]), azathioprine, cyclosporine, mycophenolate mofetil, methotrexate, dapsone, and Soriatane (acitretin capsules).

5. **Kaposi Sarcoma.** Approve for 1 year if the patient meets the following (A and B):
   - **A)** Patient has tried at least one medication; AND
     Note: Examples include liposomal doxorubicin, paclitaxel, Pomalyst (pomalidomide capsules), lenalidomide, and imatinib.
   - **B)** Patient has relapsed or refractory disease.

6. **Langerhans Cell Histiocytosis.** Approve for 1 year if the patient has multifocal skin disease.

7. **Myelofibrosis.** Approve for 1 year if the patient meets one of the following (A or B):
   - **C)** Patient meets the following criteria (i, ii, and iii):
     - **iv.** Patient is ≥ 18 years of age; AND
     - **v.** According to the prescriber the patient has anemia; AND
     - **vi.** Patient has serum erythropoietin levels ≥ 500 mU/mL; OR

D) Patient meets the following criteria (i, ii, iii, and iv):
- **v.** Patient is ≥ 18 years of age; AND
- **vi.** According to the prescriber the patient has anemia; AND
- **vii.** Patient has serum erythropoietin levels < 500 mU/mL; AND
- **viii.** Patient has experienced no response or loss of response to an erythropoiesis-stimulating agent.

8. **Prurigo Nodularis.** Approve for 1 year if the patient has tried at least two other medications.
   Note: Examples of medications include topical steroids, intralesional steroids, systemic steroids, topical tar, cyclosporine, macrolides, azathioprine, methotrexate, topical calcineurin inhibitors (Elidel [pimecrolimus cream], Protopic [tacrolimus ointment]), retinoids, antihistamines, hydroxyzine, dapsone, capsaicin, psoralen plus ultraviolet A therapy, and ultraviolet B therapy.

9. **Recurrent Aphthous Ulcers or Aphthous Stomatitis.** Approve for 1 year if the patient has tried at least two other medications.
   Note: Examples of medications include topical or intralesional corticosteroids, systemic corticosteroids, topical anesthetics/analgesics (e.g., lidocaine 2% viscous solution, benzocaine lozenges), antimicrobial mouthwashes (e.g., tetracycline, chlorhexidine), topical sucralfate, acyclovir, pentoxifylline, dapsone, colchicine, and azathioprine.

10. **Rosai-Dorfman Disease.** Approve for 1 year if the patient has cutaneous disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Thalomid is not recommend in the following situations:

28. **Cancer Cachexia.** Several small studies are available that have investigated Thalomid in the management of cancer cachexia related to various cancers.[33-37] A single center double-blind, controlled trial randomized patients with pancreatic cancer who had lost at least 10% of their body weight to receive Thalomid or placebo for 24 weeks (n = 50).[34] Of the 33 patients evaluable at 4 weeks, patients given Thalomid had gained an average of 0.37 kg compared with a loss of 2.21 kg in the patients given placebo.[34] A published review of data regarding use of Thalomid for the management of cancer cachexia concluded that there is inadequate evidence to recommend Thalomid in clinical practice.[37]

29. **Crohn's Disease.** Several publications report use of Thalomid in patients with Crohn's disease.[38-54] Thalomid was used as an adjunctive therapy, or in those refractory to other therapy, and usually involved children. The data were not of high quality and primarily consisted of open-label designs or retrospective reviews, without a placebo control, and involved very few patients.[38-54] Guidelines from the American College of Gastroenterology (2018) for the management of Crohn's disease in adults do not mention Thalomid as a therapeutic alternative.[49] Also, guidelines from the American Gastroenterological Association (2021) do not mention Thalomid in the guidelines for the medical management of moderate to severe luminal and perianal fistulizing Crohn's Disease.[55] Although some improvements were noted in published data with Thalomid, more definite data from randomized, controlled trials are required before this is a recommended therapy.[49] Consensus guidelines of the European Crohn's and Colitis Organization and the European society of Pediatric Gastroenterology, Hepatology and Nutrition (2014) state that even though some data are available that suggest efficacy of Thalomid in refractory pediatric Crohn's disease, there are insufficient data to recommended Thalomid therapy at this juncture.[54] Many other therapies are available for the management of Crohn's disease.

30. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tibsovo Prior Authorization Policy
- Tibsovo® (ivosidenib tablets –Servier/Les)

REVIEW DATE: 03/08/2023; selected revision 04/19/2023 and 11/01/2023

OVERVIEW

Tibsovo, an isocitrate dehydrogenase-1 (IDH1) inhibitor, is indicated for the treatment of cancers with a susceptible *IDH1* mutation as detected by an FDA-approved test:[1]

- **Acute myeloid leukemia, newly diagnosed disease, in combination with azacitidine or as monotherapy,** in patients who are ≥ 75 years of age or who have comorbidities that preclude use of intensive induction chemotherapy.
- **Acute myeloid leukemia, relapsed or refractory disease**, in adults.
- **Cholangiocarcinoma, locally advanced or metastatic**, in adults who have been previously treated.
- **Myelodysplastic syndrome, relapsed or refractory disease**, in adults.

Guidelines

Tibsovo is discussed in the National Comprehensive Cancer Network (NCCN) guidelines:[2]

- **Acute Myeloid Leukemia:** NCCN guidelines (version 1.2023 – March 3, 2023) recommend Tibsovo as a single-agent (category 2A) or in combination with azacitidine (category 1) as "Preferred" therapy for treatment induction for patients with an *IDH1* mutation who are not candidates for intensive induction therapy; and it is also used for follow-up after induction therapy, and consolidation therapy for patients with an *IDH1* mutation. Tibsovo is also recommended for relapsed or refractory disease with *IDH1* mutation (category 2A).[3]
- **Bone Cancer:** NCCN guidelines (version 2.2023 – September 28, 2022) recommend Tibsovo for conventional (grades 1 to 3) and dedifferentiated chondrosarcoma in patients with susceptible *IDH1* mutations as "Useful in Certain Circumstances" (category 2A).[5]
- **Central Nervous System Cancers:** NCCN guidelines (version 1.2023 – March 24, 2023) recommend Tibsovo for recurrent or progressive *IDH-1* mutant oligodendroglioma World Health Organization (WHO) grade 2 as "other recommend regimens" and WHO grade 3 as "useful in certain circumstances" (both category 2A) and *IDH-1* mutant astrocytoma WHO grade 2 as "other recommend regimens" (category 2A) and WHO grade 3 or 4 as "useful in certain circumstances" (category 2B).[6]
- **Cholangiocarcinoma:** NCCN guidelines for hepatobiliary cancers (version 5.2022 – January 13, 2023) cite Tibsovo as "Useful in Certain Circumstances" for patients with cholangiocarcinoma with *IDH1* mutations as subsequent-line therapy if there is disease progression (category 2A).[4]
- **Myelodysplastic Syndromes:** NCCN guidelines (version 2.2023 – October 17, 2023) state that emerging data are demonstrating effectiveness of Tibsovo and Idhifa® (enasidenib) for patients with myelodysplastic syndrome with *IDH* 1 or *IDH* 2 mutations.[7]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tibsovo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tibsovo is recommended in those who meet one of the following criteria:

FDA-Approved Indications

5. **Acute Myeloid Leukemia.** Approve for 1 year if the patient meets the following (A and B):
   - **D)** Patient is ≥ 18 years of age; AND
   - **E)** Patient has isocitrate dehydrogenase-1 (*IDH1*) mutation-positive disease as detected by an approved test.

6. **Cholangiocarcinoma.** Approve for 1 year if the patient meets the following (A, B and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has isocitrate dehydrogenase-1 (*IDH1*) mutation-positive disease; AND
   - **C)** Patient has been previously treated with at least one chemotherapy regimen.
     Note: Examples are gemcitabine + cisplatin; Imfinzi (durvalumab intravenous infusion) + gemcitabine + cisplatin, 5-fluorouracil + oxaliplatin or cisplatin; capecitabine + oxaliplatin or cisplatin; gemcitabine + Abraxane (paclitaxel protein-bound particles intravenous infusion) or capecitabine or oxaliplatin; and FOLFOX (5-fluorouracil, leucovorin, and oxaliplatin).

7. **Myelodysplastic Syndrome.** Approve for 1 year if the patient meets the following (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has isocitrate dehydrogenase-1 (*IDH1*) mutation-positive disease; AND
   - **C)** Patient has relapsed or refractory disease.

Other Uses with Supportive Evidence

8. **Bone Cancer.** Approve for 1 year if the patient meets the following (A and B):
   - **A)** Patient has chondrosarcoma; AND
   - **B)** Patient has isocitrate dehydrogenase-1 (*IDH1*) mutation-positive disease.

9. **Central Nervous System Cancer**. Approve for 1 year if the patient meets the following (A, B and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has recurrent or progressive disease; AND
   - **C)** Patient has meets one of the following (i or ii):
     - **i.** Patient has World Health Organization (WHO) grade 2 or 3 oligodendroglioma; OR
     - **ii.** Patient has WHO grade 2 astrocytoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tibsovo is not recommended in the following situations:

31. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Truqap Prior Authorization Policy
- Truqap™ (capivasertib tablets – AstraZeneca)

REVIEW DATE: 11/29/2023; selected revision 01/03/2024

OVERVIEW

Truqap, a kinase inhibitor, is indicated in combination with fulvestrant for the treatment of hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative, locally advanced or metastatic breast cancer with one or more phosphatidylinositol 3-kinase (*PIK3CA*)/ serine/threonine protein kinase 1 (*AKT1*)/ phosphatase and tensin homolog (*PTEN*)-alterations as detected by an FDA-approved test following progression on at least one endocrine-based regimen in the metastatic setting or recurrence on or within 12 months of completing adjuvant therapy in adults.[1]

Guidelines

National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 5.2023 – December 5, 2023) state that for patients with HR+/HER2-negative tumors with *PIK3CA/AKT1/PTEN*-activating mutations, Truqap + fulvestrant is a "Preferred Regimen" for second or subsequent-line therapy in selected patients (category 1).[2] This would include adults with *PIK3CA/AKT1/PTEN*-activating mutations after disease progression or recurrence after one or more prior lines of endocrine therapy, including one line containing a cyclin-dependent kinase (CDK) 4/6 inhibitor. In this setting, for patients with PIK3CA-mutated tumors, Piqray® (alpelisib tablets) + fulvestrant is recommended (category 1). In the first-line setting for all patients, aromatase inhibitor or fulvestrant is recommended in combination with a CDK4/6 inhibitor (category 1 or category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Truqap. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Truqap is recommended in those who meet the following criteria:

FDA-Approved Indication

8. Breast Cancer. Approve for 1 year if the patient meets the following (A, B, C, D, E, and F):
- **R)** Patient is ≥ 18 years of age; AND
- **S)** Patient has locally advanced or metastatic disease; AND
- **T)** Patient has hormone receptor-positive (HR+) disease; AND
- **U)** Patient has human epidermal growth factor receptor 2 (*HER2*)-negative disease; AND
- **V)** Patient has at least one phosphatidylinositol 3-kinase (*PIK3CA*), serine/threonine protein kinase (*AKT1*), or phosphatase and tensin homolog (*PTEN*)-alteration; AND
- **W)** Patient meets one of the following (i or ii):
  - **i.** Patient meets both of the following (a and b):

a) Patient has had progression with at least one endocrine-based regimen in the metastatic setting; AND
Note: Examples of endocrine-based therapy include anastrozole, exemestane, and letrozole.

b) Patient has had progression with at least one cyclin-dependent kinase (CDK) 4/6 inhibitor in the metastatic setting; OR
Note: Examples of CDK4/6 inhibitor include: Ibrance (palbociclib tablets or capsules), Verzenio (abemaciclib tablets), Kisqali (ribociclib tablets), Kisqali Femara Co-Pack (ribociclib and letrozole tablets).

ii. Patient has recurrence on or within 12 months of completing adjuvant endocrine therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Truqap is not recommended in the following situations:

8. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Truseltiq Prior Authorization Policy
- Truseltiq™ (infigratinib capsules – QED Therapeutics)

REVIEW DATE: 06/14/2023

OVERVIEW

Truseltiq, a kinase inhibitor, is indicated for the treatment of adults with previously treated, unresectable locally advanced or metastatic **cholangiocarcinoma** with a fibroblast growth factor 2 (FGFR2) fusion or other rearrangement as detected by an FDA-approved test.[1] This indication was approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

In October 2022, Helsinn, the manufacturer, announced the discontinuation of distribution of Truseltiq on March 31, 2023.[4] Helsinn stated that this was not for safety reason and they recommend that no new patients be started on Truseltiq.

Guidelines

The National Comprehensive Cancer Network Hepatobiliary Cancers (version 2.2023 – May 10, 2023) clinical practice guidelines no longer recommend Truseltiq for the subsequent treatment of unresectable or metastatic cholangiocarcinoma with FGFR2 fusions or rearrangements, as a single agent for progression on or after systemic treatment.[2,3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Truseltiq. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Truseltiq is recommended in those who meet the following criteria:

FDA-Approved Indication

9. Cholangiocarcinoma. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
- **A)** Patient is currently receiving Truseltiq; AND
- **B)** Patient is ≥ 18 years of age; AND
- **C)** Patient has unresectable locally advanced or metastatic disease; AND
- **D)** Patient has fibroblast growth factor receptor 2 (FGFR2) fusion or other rearrangement, as detected by an approved test; AND
- **E)** Truseltiq is used as subsequent therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Truseltiq is not recommended in the following situations:

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tukysa Prior Authorization Policy
- Tukysa® (tucatinib tablets –Seagan)

REVIEW DATE: 06/07/2023

OVERVIEW

Tukysa, a kinase inhibitor, is indicated for the following uses:[1]

- **Breast cancer**, in combination with trastuzumab and capecitabine, for the treatment of advanced unresectable or metastatic human epidermal growth factor receptor 2 (HER2)-positive disease, including patients with brain metastases, who have received one or more prior anti-HER2-based regimens in the metastatic setting in adults.
- **Colorectal cancer**, in combination with trastuzumab, for the treatment of RAS wild-type HER2-positive unresectable or metastatic disease that has progressed following treatment with fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapy in adults.
  This indication is approved under accelerated approval based on tumor response rate and durability of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

Guidelines

Tukysa is discussed in the guidelines from the National Comprehensive Cancer Network (NCCN):

- **Breast Cancer:** NCCN guidelines (version 4.2023 – March 23, 2023) recommend Tukysa + trastuzumab + capecitabine in the third-line and beyond setting as a "preferred regimen" (category 1) for the treatment of recurrent unresectable (local or regional) or Stage IV HER2-positive disease in patients with both systemic and central nervous system (CNS) progression.[2] There is a footnote that states it may be given in the second-line setting. Perjeta® (pertuzumab intravenous infusion) + trastuzumab + docetaxel (category 1) and Perjeta + trastuzumab + paclitaxel (category 2A) are recommended first-line regimens. Enhertu® (fam-trastuzumab deruxtecan-nxki intravenous infusion) [category 1] is a recommended second-line agent.
- **Colon Cancer and Rectal Cancer:** NCCN colon cancer guidelines (version 2.2023 – April 25, 2023) and NCCN rectal cancer guidelines (version 3.2023 – May 26, 2023) recommend Tukysa in combination with trastuzumab as a primary or subsequent treatment option for advanced or metastatic HER2-amplified, *RAS* and *BRAF* wild type disease (category 2A) in a variety of different clinical scenarios.[3,4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tukysa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tukysa is recommended in those who meet one of the following criteria:

FDA-Approved Indications

13. Breast Cancer. Approve for 1 year if the patient meets ALL of the criteria (A, B, C, D, and E):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has recurrent or metastatic breast cancer; AND
- **C)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **D)** Patient has received at least one prior anti-HER2-based regimen in the metastatic setting; AND
  Note: Examples of anti-HER2-based regimens include Perjeta (pertuzumab intravenous infusion) + trastuzumab + docetaxel, Perjeta + trastuzumab + paclitaxel; Kadcyla (ado-trastuzumab emtansine intravenous infusion), capecitabine + trastuzumab or lapatinib tablets, trastuzumab + lapatinib tablets, Enhertu (fam-trastuzumab deruxtecan-nxki intravenous infusion), trastuzumab + docetaxel or vinorelbine, Nerlynx (neratinib tablets) + capecitabine, and Margenza (margetuximab-cmkb intravenous infusion) + chemotherapy (capecitabine, Halaven [eribulin intravenous infusion], gemcitabine, or vinorelbine).
- **E)** The medication is used in combination with trastuzumab and capecitabine.

14. Colon and Rectal Cancer. Approve for 1 year if the patient meets ALL of the criteria (A, B, C, D, and E):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has unresectable or metastatic disease; AND
- **C)** Patient has human epidermal growth factor receptor 2 (HER2)-amplified disease; AND
- **D)** Patient's tumor or metastases are wild-type *RAS* (*KRAS* wild-type and *NRAS* wild-type); AND
- **E)** The medication is used in combination with trastuzumab.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tukysa is not recommended in the following situations:

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Turalio Prior Authorization Policy
- Turalio® (pexidartinib capsules – Daiichi Sankyo)

REVIEW DATE: 08/30/2023

OVERVIEW

Turalio, a kinase inhibitor, is indicated for the treatment of **symptomatic tenosynovial giant cell tumor** associated with severe morbidity or functional limitations and not amenable to improvement with surgery in adults.[1]

Guidelines

Turalio is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Histiocytic Neoplasms**: NCCN guidelines (version 1.2023 – August 11, 2023) recommend Turalio as first-line or subsequent therapy for *CSF1R* mutation target as "Useful in Certain Circumstances", for Langerhans cell histiocytosis, Erdheim-Chester disease, and Rosai-Dorfman disease in various settings (category 2A).[2-3]
- **Soft Tissue Sarcoma:** NCCN guidelines (version 2.2023 – April 25, 2023), indicate that Turalio is the "preferred" single-agent therapy for the treatment of pigmented villonodular synovitis/tenosynovial giant cell tumor (category 1).[3-4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Turalio. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Turalio is recommended in those who meet one of the following criteria:

FDA-Approved Indication

1) **Tenosynovial Giant Cell Tumor (Pigmented Villonodular Synovitis).** Approve for 1 year if the patient meets the following (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** According to the prescriber, the tumor is not amenable to improvement with surgery.

Other Uses with Supportive Evidence

2) **Histiocytic Neoplasms.** Approve for 1 year if the patient meets the following (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has a colony stimulating factor 1 receptor (*CSF1R*) mutation; AND
   - **C)** Patient has one of the following (i, ii, or iii):

i. Langerhans cell histiocytosis; OR
ii. Erdheim-Chester disease; OR
iii. Rosai-Dorfman disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Turalio is not recommended in the following situations:

32. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Valchlor Prior Authorization Policy
- Valchlor® (mechlorethamine topical gel – Helsinn)

REVIEW DATE: 12/13/2023

OVERVIEW

Valchlor, a nitrogen mustard, is indicated for the topical treatment of Stage IA and IB **mycosis fungoides-type cutaneous T-cell lymphoma** in patients who have received prior skin-directed therapy.[1]

Guidelines

Valchlor is addressed in National Comprehensive Cancer Network guidelines:

- **Histiocytic neoplasms:** Guidelines (version 1.2023 – August 11, 2023) recommend Valchlor for the topical treatment of unifocal Langerhans cell histiocytosis with isolated skin disease.[2,5]
- **Primary cutaneous lymphomas:** Guidelines (version 1.2023 – January 5, 2023) recommend Valchlor for the topical treatment of primary cutaneous B-cell lymphoma, mycosis fungoides/Sezary syndrome, and primary cutaneous CD30+ T-cell lymphoproliferative disorders.[2,3]
- **T-cell lymphomas:** Guidelines (version 1.2023 – January 5, 2023) recommend Valchlor for the topical treatment of adult T-cell leukemia/lymphoma – chronic/smoldering subtype.[2,4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Valchlor. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Valchlor is recommended in those who meet one of the following criteria:

FDA-Approved Indication

10. **Cutaneous Lymphomas**. Approve for 1 year if the patient is ≥ 18 years of age.
    Note: Includes mycosis fungoides/Sezary syndrome, primary cutaneous B-cell lymphoma, primary cutaneous CD30+ T-cell lymphoproliferative disorders.

Other Uses with Supportive Evidence

11. **Adult T-Cell Leukemia/Lymphoma**. Approve for 1 year if the patient has chronic/smoldering subtype of adult T-cell leukemia/lymphoma.

12. **Langerhans Cell Histiocytosis**. Approve for 1 year if, according to the prescriber, patient has unifocal Langerhans cell histiocytosis with isolated skin disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Valchlor is not recommended in the following situations:

10. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vanflyta Prior Authorization Policy
- Vanflyta® (quizartinib tablets – Daiichi Sankyo)

REVIEW DATE: 08/02/2023; selected revision 08/09/2023

OVERVIEW

Vanflyta, a kinase inhibitor, is indicated in combination with standard cytarabine and anthracycline induction and cytarabine consolidation, and as maintenance monotherapy following consolidation chemotherapy, for the treatment of **newly diagnosed acute myeloid leukemia (AML)** that is FMS-like tyrosine kinase 3 internal tandem duplication (**FLT3-ITD)-positive** as detected by an FDA-approved test in adults.[1]

Limitation of use: Vanflyta is not indicated as maintenance monotherapy following allogeneic hematopoietic stem cell transplantation (HSCT) and improvement in overall survival with Vanflyta in this setting has not been demonstrated.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for AML (version 4.2023 – July 11, 2023) do not address Vanflyta.[2] The guidelines recommend Rydapt® (midostaurin capsules) in several settings in adults with *FLT3*-mutated AML. Rydapt + chemotherapy is recommended for induction for newly diagnosed *FLT3-ITD/TKD* mutation-positive AML and for consolidation therapy (category 2A). Other consolidation therapies include hematopoietic cell transplantation (HCT), high dose cytarabine, or other chemotherapy. For maintenance therapy in patients with *FLT3-ITD* mutation who are in remission, sorafenib (category 2A), Rydapt (category 2B), and Xospata® (gilteritinib tablets) [category 2B] are recommended. For relapsed or refractory AML, Xospata is recommended for patients with *FLT3-ITD/TKD* mutations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vanflyta. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vanflyta is recommended in those who meet the following criteria:

FDA-Approved Indication

10. Acute Myeloid Leukemia. Approve for 1 year if the patient meets the following (A, B and C):
- **C)** Patient is ≥ 18 years of age; AND
- **D)** Patient has *FLT3-ITD* mutation-positive disease as detected by an approved test; AND
- **E)** This medication is being used for induction, consolidation, or maintenance treatment.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vanflyta is not recommended in the following situations:

33. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

28. Vanflyta® tablets [prescribing information]. Basking Ridge, NJ: Daiichi Sankyo, July 2023.
29. The NCCN Acute Myeloid Leukemia Clinical Practice Guidelines in Oncology (version 4.2023 – July 11, 2023). © 2023 National Comprehensive Cancer Network. Available at: http://www.nccn.org. Accessed on July 28, 2023.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Venclexta Prior Authorization Policy
- Venclexta® (venetoclax tablets – AbbVie and Genentech)

REVIEW DATE: 07/19/2023

OVERVIEW

Venclexta, a B-cell lymphoma-2 inhibitor, is indicated in adults for the following uses:[1]

- **Acute myeloid leukemia (AML)**, in combination with azacitidine or decitabine or low-dose cytarabine for newly diagnosed AML in patients ≥ 75 years of age or who have comorbidities that preclude use of intensive induction chemotherapy.
- **Chronic lymphocytic leukemia (CLL)**.
- **Small lymphocytic lymphoma (SLL)**.

Guidelines

Venclexta is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **AML**: NCCN guidelines (version 4.2023 – July 11, 2023) recommend Venclexta (in combination with decitabine, azacitidine or low-dose cytarabine) in a variety of clinical scenarios, such as induction therapy, post induction therapy, and relapsed or refractory disease. The guidelines recommend Venclexta (in combination with decitabine, azacitidine, or low-dose cytarabine) (category 2A) for Blastic Plasmacytoid Dendritic Cell Neoplasm (BPDCN) for systemic disease treated with palliative intent (patients with low performance and/or nutritional status) or relapsed/refractory disease.
- **B-Cell Lymphomas**: NCCN guidelines (version 5.2023 – July 7, 2023) address mantle cell lymphoma.[3] The guidelines cite Venclexta (continuous) ± rituximab (category 2A), Venclexta + Imbruvica® (ibrutinib tablets, capsules, and oral solution) [category 2A] as second-line therapy regimens as "useful in certain circumstances".
- **CLL/SLL**: NCCN guidelines (version 3.2023 – June 12, 2023) cite Venclexta in several scenarios.[4] For patients without 17p deletion/TP53 mutation, Venclexta + Gazyva® (obinutuzumab intravenous infusion) is listed as a "preferred" first-line therapy (category 1); Venclexta + rituximab is listed as a "preferred regimen" (category 1) and single-agent Venclexta is listed as "other recommended regimen" (category 2A) for second-line or third-line therapy.[3] For patients with 17p deletion/TP53 mutation, Venclexta + Gazyva is recommended as a "preferred regimen" first-line (category 2A); Venclexta + rituximab (category 1) and single-agent Venclexta (category 2A) are preferred second-line and subsequent therapy in this population. Many other first-line options are recommended. CLL and SLL are different manifestations of the same disease which are managed similarly.
- **Multiple Myeloma:** NCCN guidelines (version 3.2023 – December 8, 2022) recommend Venclexta + dexamethasone for previously treated multiple myeloma for relapse or progressive disease for patients with t (11;14) translocation as "useful in certain circumstances for early relapses (1-3 prior therapies) [category 2A].[5]
- **Systemic Light Chain Amyloidosis:** NCCN guidelines (version 2.2023 – November 28, 2022) list Venclexta ± dexamethasone as a therapy for previously treated disease for patients with t (11;14) translocation as "useful in certain circumstances" (category 2A).[6]
- **Waldenström Macroglobulinemia/Lymphoplasmacytic Lymphoma:** NCCN guidelines (version 1.2023 – July 6, 2022) recommend single-agent Venclexta as "other recommended regimen" for previously treated disease (category 2A).[4-5]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Venclexta. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Venclexta is recommended in those who meet one of the following criteria:

FDA-Approved Indications

11. Acute Myeloid Leukemia. Approve for 1 year if the patient meets the following (A and B):
Note: Acute Myeloid Leukemia includes Blastic Plasmacytoid Dendritic Cell Neoplasm (BPDCN).
A) Patient is ≥ 18 years of age; AND
B) Venclexta is used in combination with either azacitidine, decitabine, or cytarabine.

12. Chronic Lymphocytic Leukemia. Approve for 1 year if the patient is ≥ 18 years of age.

13. Small Lymphocytic Lymphoma. Approve for 1 year if the patient is ≥ 18 years of age.

Other Uses with Supportive Evidence

14. Mantle Cell Lymphoma. Approve for 1 year if the patient meets the following (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient has tried at least one systemic regimen.
Note: Examples of systemic regimens include those containing one or more of the following products: Imbruvica (ibrutinib tablets, capsules, and oral solution), rituximab, Calquence (acalabrutinib tablets), lenalidomide, dexamethasone, cytarabine, cisplatin, cyclophosphamide, doxorubicin, vincristine, high-dose methotrexate, cytarabine, or Treanda (bendamustine intravenous infusion).

15. Multiple Myeloma. Approve for 1 year if the patient meets the following (A, B, C, and D):
A) Patient is ≥ 18 years of age; AND
B) Patient has t (11;14) translocation; AND
C) Patient has tried at least one systemic regimen for multiple myeloma; AND
Note: Examples of systemic regimens include those containing one or more of the following products: bortezomib, Kyprolis (carfilzomib intravenous injection), lenalidomide, cyclophosphamide, or Ninlaro (ixazomib capsules).
D) Venclexta is used in combination with dexamethasone.

16. Systemic Light Chain Amyloidosis. Approve for 1 year if the patient meets the following (A, B, and C):
A) Patient is ≥ 18 years of age; AND
B) Patient has t (11;14) translocation; AND
C) Patient has tried at least one systemic regimen.
Note: Examples of systemic regimens include those containing one or more of the following products: bortezomib, lenalidomide, cyclophosphamide, and melphalan.

17. Waldenström Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if the patient meets the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one systemic regimen.

Note: Examples of a systemic regimen contain one or more of the following products: Brukinsa (zanubrutinib capsules), Imbruvica (ibrutinib tablets, capsules, and oral solution), rituximab, bendamustine, cyclophosphamide, dexamethasone, bortezomib, fludarabine, or cladribine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Venclexta is not recommended in the following situations:

34. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Verzenio Prior Authorization Policy
- Verzenio® (abemaciclib tablets – Eli Lilly)

REVIEW DATE: 02/22/2023

OVERVIEW

Verzenio, a cyclin-dependent kinase (CDK) 4/6 inhibitor, is indicated for the treatment of hormone receptor-positive (HR+), human epidermal growth factor receptor 2 (HER2)-negative **breast cancer** in adults in the following settings:[1]

- **Early breast cancer**, in combination with endocrine therapy (tamoxifen or an aromatase inhibitor [AI]) for adjuvant treatment for node-positive disease at high risk of recurrence.
- **Advanced or metastatic breast cancer:**
  - In combination with an AI as initial endocrine-based therapy.
  - In combination with fulvestrant for disease progression following endocrine therapy.
  - As monotherapy for disease progression following endocrine therapy and prior chemotherapy in the metastatic setting.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on **breast cancer** (version 2.2023 – February 7, 2023) recommend Verzenio with AI (category 2A) or fulvestrant (category 1) as a first-line "Preferred Regimen" for recurrent unresectable (local or regional) or Stage IV HR+ and HER2-negative disease in postmenopausal women or premenopausal patient receiving ovarian ablation or suppression.[2,3] The guidelines state in a footnote that in phase III randomized controlled trials, Kisqali® (ribociclib tablets) + endocrine therapy has shown overall survival benefit in the first-line setting. CDK4/6 inhibitor + fulvestrant is recommended for second- and subsequent-line therapy, if CDK4/6 inhibitor was not previously used (category 1) in this setting, which is a "Preferred Regimen". The guidelines state in a footnote that in phase III randomized controlled trials, fulvestrant in combination with a CDK4/6 inhibitor has shown overall survival benefit in the second-line setting. In this setting, single-agent Verzenio is recommended as a "Useful In Certain Circumstances" therapy (for subsequent treatment) if there is progression on prior endocrine therapy and prior chemotherapy in the metastatic setting (category 2A). For men with breast cancer, the compendium recommends they be treated similarly to postmenopausal women, except that the use of an aromatase inhibitor is ineffective without concomitant suppression of testicular steroidogenesis.[3] The guidelines also recommend Verzenio for 2 years as adjuvant therapy in combination with endocrine therapy in patients with HR+, HER2-negative, high risk (i.e., ≥4 positive lymph nodes, or 1-3 positive lymph nodes with one or more of the following: grade 3 disease, tumor size ≥5 cm, or a Ki-67 score of ≥20%) disease (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Verzenio. All approvals are provided for duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Verzenio is recommended in those who meet one of the following criteria:

FDA-Approved Indications

18. Breast Cancer - Early. Approve for 2 years if the patient meets the following criteria (A, B, C, D, and E):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
- **C)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- **D)** Patient has node-positive disease at high risk of recurrence; AND
  Note: High risk includes patients with ≥4 positive lymph nodes, or 1-3 positive lymph nodes with one or more of the following: grade 3 disease, tumor size ≥5 cm, or a Ki-67 score of ≥20%.
- **E)** Patient meets ONE of the following criteria (i or ii):
  - **i.** Verzenio will be used in combination with anastrozole, exemestane, or letrozole AND patient meets one of the following (a ,b, or c):
    - **a)** Patient is a postmenopausal woman*; OR
    - **b)** Patient is a pre/perimenopausual woman* and meets one of the following [(1) or (2)]:
      - **(1)** Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR
        Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous injection).
      - **(2)** Patient has had surgical bilateral oophorectomy or ovarian irradiation; OR
    - **c)** Patient is a man* and patient is receiving a gonadotropin-releasing hormone (GnRH) analog; OR
      Note: Examples of a GnRH analog include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous injection), Firmagon (degarelix acetate subcutaneous injection), Orgovyx (relugolix tablet).
  - **ii.** Verzenio will be used in combination with tamoxifen AND patient meets one of the following (a or b):
    - **a)** Patient is a postmenopausal woman* or man*; OR
    - **b)** Patient is a pre/perimenopausual woman* and meets one of the following [(1) or (2)]:
      - **(1)** Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR
        Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous injection).
      - **(2)** Patient has had surgical bilateral oophorectomy or ovarian irradiation.

***** Refer to the Policy Statement.

19. Breast Cancer – Recurrent or Metastatic in Women*. Approve for 1 year if the patient meets the following criteria (A, B, C, D, E, and F):
- **X)** Patient is ≥ 18 years of age; AND

Y) Patient has recurrent or metastatic breast cancer; AND

Z) Patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND

AA) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND

BB) Patient meets ONE of the following criteria (i or ii):

- **i.** Patient is postmenopausal OR
- **ii.** Patient is pre/perimenopausal and meets one of the following (a or b):
  - **a)** Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR
    Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant).
  - **b)** Patient has had surgical bilateral oophorectomy or ovarian irradiation; AND

CC) Patient meets ONE of the following criteria (i, ii, or iii):

- **i.** Verzenio will be used in combination with anastrozole, exemestane, or letrozole; OR
- **ii.** Verzenio will be used in combination with fulvestrant; OR
- **iii.** Patient meets the following conditions (a, b, and c):
  - **a)** Verzenio will be used as monotherapy; AND
  - **b)** Patient's breast cancer has progressed on at least one prior endocrine therapy; AND
    Note: Examples of prior endocrine therapy include anastrozole, exemestane, letrozole, tamoxifen, toremifene, exemestane plus everolimus, fulvestrant, everolimus plus fulvestrant or tamoxifen, megestrol acetate, fluoxymesterone, ethinyl estradiol.
  - **c)** Patient has tried chemotherapy for metastatic breast cancer.

***** Refer to the Policy Statement.

3. Breast Cancer - Recurrent or Metastatic in Men*. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

A) Patient is ≥ 18 years of age; AND

B) Patient has recurrent or metastatic breast cancer; AND

C) Patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}]disease; AND

D) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND

E) Patient meets ONE of the following criteria (i, ii, or iii):

- **i.** Patient meets BOTH of the following conditions (a and b):

a) Patient is receiving a gonadotropin-releasing hormone (GnRH) analog; AND
Note: Examples of a GnRH analog include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), Orgovyx (relugolix tablet).

b) Verzenio will be used in combination with anastrozole, exemestane, or letrozole; OR

- **ii.** Verzenio will be used in combination with fulvestrant; OR
- **iii.** Patient meets the following conditions (a, b, and c):
  - **a)** Verzenio will be used as monotherapy; AND
  - **b)** Patient's breast cancer has progressed on at least one prior endocrine therapy; AND
    Note: Examples are anastrozole, exemestane, letrozole, tamoxifen, toremifene, exemestane plus everolimus, fulvestrant, everolimus plus fulvestrant or tamoxifen, megestrol acetate, fluoxymesterone, ethinyl estradiol.
  - **c)** Patient has tried chemotherapy for metastatic breast cancer.

***** Refer to the Policy Statement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Verzenio is not recommended in the following situations:

35. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

GnRH – Gonadotropin-releasing hormone.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vistogard Prior Authorization Policy
- Vistogard® (uridine triacetate oral granules – Wellstat Therapeutics)

REVIEW DATE: 07/12/2023

OVERVIEW

Vistogard, a pyrimidine analog, is indicated for the emergency treatment of adult and pediatric patients for the following uses:[1]

- **Fluorouracil or capecitabine overdose**, regardless of the presence of symptoms.
- **Early-onset, severe or life-threatening toxicity** affecting the cardiac or central nervous system, and/or early-onset, unusually severe adverse reactions (e.g., gastrointestinal toxicity, neutropenia) within 96 hours following the end of fluorouracil or capecitabine administration.

As a limitation of use, Vistogard is not recommended for the non-emergent treatment of adverse events associated with fluorouracil or capecitabine because it may diminish the efficacy of these drugs.[1] The safety and efficacy of Vistogard initiated more than 96 hours following the end of fluorouracil or capecitabine administration have not been established.

Disease Overview

Fluorouracil and capecitabine (a fluorouracil prodrug) are widely used chemotherapeutic agents with potential for significant toxicity. Exaggerated sensitivity to capecitabine or fluorouracil may occur due to genetic variations in certain enzymes, renal impairment, or other causes.[2] Toxicity results in tissue damage, often manifesting as ulcerative mucositis with neutropenia leading to sepsis, shock, and organ failure. Additionally, central neurotoxicity and cardiac toxicity may occur without any identifiable predisposing factors. Exogenous uridine competes with the toxic metabolite fluorouridine triphosphate for incorporation into RNA in normal tissues, thereby protecting the tissues from toxicity.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vistogard. All approvals are provided for the duration noted below.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vistogard is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Capecitabine or Fluorouracil Overdose.** Approve for 7 days.

2. **Capecitabine or Fluorouracil Toxicity, Severe or Life-Threatening.** Approve for 7 days.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vistogard is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vitrakvi Prior Authorization Policy
- Vitrakvi® (larotrectinib capsules and oral solution – Bayer)

REVIEW DATE: 01/25/2023

OVERVIEW

Vitrakvi, a kinase inhibitor, is indicated in adult and pediatric patients for treatment of **solid tumors** that: have a **neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion** without a known acquired resistance mutation; are metastatic or where surgical resection is likely to result in severe morbidity; and have no satisfactory alternative treatments or that have progressed following treatment.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium notes Vitrakvi as an option for the treatment of the following cancers with *NTRK* gene fusion-positive tumors as category 2A recommendations: ampullary adenocarcinoma, breast cancer, central nervous system cancers, cervical cancer, cholangiocarcinoma (intrahepatic and extrahepatic), colon cancer, cutaneous melanoma, endometrial carcinoma, epithelial ovarian cancer/fallopian tube cancer/primary peritoneal cancer, Erdheim-Chester disease, esophageal and esophagogastric cancer, gallbladder cancer, gastric cancer, gastrointestinal stromal tumors, hepatocellular carcinoma, Langerhans Cell histiocytosis, neuroendocrine and adrenal tumors, non-small cell lung cancer, pancreatic cancer, rectal cancer, Rosai-Dorfman disease, salivary gland tumors, small bowel adenocarcinoma, soft tissue sarcoma, thyroid carcinoma, uterine sarcoma, and vulvar cancer.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vitrakvi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vitrakvi is recommended in those who meet the following criteria:

FDA-Approved Indication

4. Solid Tumors. Approve for 1 year if the patient meets the following criteria (A and B):
Note: Examples of solid tumors include breast cancer, colon cancer, hepatobiliary cancer, histiocytic neoplasm, ovarian cancer, pancreatic cancer, salivary gland tumors, thyroid cancer, and rectal cancer.
- **A)** The tumor is positive for neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion; AND
- **B)** Patient meets one of the following criteria (i or ii):
  - **i.** The tumor is metastatic; OR
  - **ii.** Surgical resection of tumor will likely result in severe morbidity.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vitrakvi is not recommended in the following situations:

36. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vizimpro Prior Authorization Policy
- Vizimpro® (dacomitinib tablets – Pfizer)

REVIEW DATE: 11/29/2023

OVERVIEW

Vizimpro, a tyrosine kinase inhibitor, is indicated for the first-line treatment of patients with metastatic **non-small cell lung cancer (NSCLC)** with epidermal growth factor receptor (*EGFR*) exon 19 deletion or exon 21 L858R substitution mutations as detected by an FDA-approved test.[1]

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 5.2023 – November 8, 2023) recommend testing for sensitizing *EGFR* mutations in patients with metastatic disease.[2] Patients with sensitizing *EGFR* mutations have a significantly better response to the *EGFR* tyrosine kinase inhibitors (TKIs) [erlotinib, Gilotrif®, Iressa®, Tagrisso®, and Vizimpro]. The most common *EGFR* mutations are exon 19 deletions and exon 21 (L858R) substitution mutations. Other less common mutations that are also sensitive to *EGFR* TKIs include L861Q, G719X, and S768I; these mutations cumulatively account for approximately 10% of all *EGFR* mutations. NCCN recommends the *EGFR* TKIs as first-line treatment for patients with advanced or metastatic NSCLC with *EGFR* exon 19 deletions, exon 21 (L858R) substitution mutations, L861Q, G719X, and S768I.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vizimpro. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vizimpro is recommended in those who meet the following criteria:

FDA-Approved Indication

20. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following (A, B, and C):
- **DD)** Patient is ≥ 18 years of age; AND
- **EE)** Patient has advanced or metastatic disease; AND
- **FF)** Patient has sensitizing *EGFR* mutation-positive non-small cell lung cancer as detected by an approved test.

  Note: Examples of sensitizing *EGFR* mutation-positive non-small cell lung cancer include the following: exon 19 deletions, exon 21 (L858R) substitution mutations, L861Q, G719X, and S768I.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vizimpro is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vonjo Prior Authorization Policy
- Vonjo™ (pacritinib capsules – CTI BioPharma)

REVIEW DATE: 03/22/2023

OVERVIEW

Vonjo, an inhibitor of Janus Associated Kinase (JAK)2 and FMS-like tyrosine kinase, is indicated for the treatment of intermediate- or high-risk primary or secondary (post-polycythemia vera or post-essential thrombocythemia) myelofibrosis with a platelet count below 50×10^9/L in adults.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for myeloproliferative neoplasms (version 3.2022 – August 11, 2022) classify risk stratification into two groupings: lower-risk disease and higher-risk disease.[2] NCCN guidelines recommend Vonjo for symptomatic lower-risk myelofibrosis if platelet count is $< 50 \times 10^9$/L with no response or loss of response to Jakafi® (ruxolitinib tablets), Pegasys® (peginterferon alfa-2a subcutaneous injection), or hydroxyurea. Vonjo is recommended for higher-risk myelofibrosis if the patient is not a transplant candidate and platelet count is $< 50 \times 10^9$/L; and if platelet count is $\geq 50 \times 10^9$/L in situations where the patient did not respond to or lost response to one prior JAK inhibitor (Jakafi or Inrebic® [fedratinib capsules]).[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vonjo. All approvals are provided for the duration noted below.

Automation: none

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vonjo is recommended in those who meet the following criteria:

FDA-Approved Indication

21. Myelofibrosis, including Primary Myelofibrosis, Post-Polycythemia Vera Myelofibrosis, and Post-Essential Thrombocythemia Myelofibrosis. Approve for 1 year if the patient meets the following criteria (A and B):

D) Patient is ≥ 18 years of age; AND

E) Patient meets one of the following criteria (i or ii):

a) Patient has a platelet count of less than 50×10^9/L (< 50,000/mcL) and meets one of the following criteria (a or b):

a) Patient meets both of the following criteria (1 and 2):

(1) Patient has intermediate-risk or high-risk disease; AND

(2) Patient is not a candidate for transplant; OR

b) Patient meets both of the following criteria (1 and 2):

(1) Patient has lower-risk disease; AND

(2) Patient has tried at least one prior therapy; OR

Note: Examples of prior therapy include: Jakafi (ruxolitinib tablets), Pegasys (peginterferon alfa-2a subcutaneous injection), and hydroxyurea.

b) Patient has a platelet count of greater than or equal to 50×10^9/L ($\geq$ 50,000/mcL) and meets all of the following criteria (a, b, and c):
- **a)** Patient has high-risk disease; AND
- **b)** Patient is not a candidate for transplant; AND
- **c)** Patient has tried Jakafi (ruxolitinib tablets) or Inrebic (fedratinib capsules).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vonjo is not recommended in the following situations:

37. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Votrient Prior Authorization Policy
- Votrient® (pazopanib tablets – GlaxoSmithKline)

REVIEW DATE: 06/14/2023

OVERVIEW

Votrient, a multi-tyrosine kinase inhibitor, is indicated in adults for the following uses:[1]
- **Renal cell carcinoma,** advanced.
- **Soft tissue sarcoma**, advanced, for patients who have received prior chemotherapy.

Guidelines

Votrient is discussed in guidelines from the National Comprehensive Cancer Network (NCCN)[2]:
- **Bone Cancer**: NCCN guidelines (version 3.2023 – April 4, 2023) recommend Votrient as a systemic therapy agent as "other recommended" regimens for chondrosarcoma for metastatic and widespread disease (category 2A).[3]
- **Gastrointestinal Stromal Tumor**: NCCN guidelines (version 1.2023 – March 13, 2023) recommend Votrient as an additional option after failure on approved therapies as "useful in certain circumstances" (category 2A).[4] The first line therapies are imatinib or Ayvakit™ (avapritinib tablets; for patients with *PDGFRA* exon 18 mutation, including the *PDGFRA* D842V mutation); second-line therapy is sunitinib or Sprycel® (dasatinib tablets; for *PDGFRA* exon 18 mutations that are insensitive to imatinib [including the *PDGFRA D842V* mutation]); third-line therapy is Stivarga® (regorafenib tablets); fourth-line therapy is Qinlock® (ripretinib tablets). The guidelines also state in a footnote that for unresectable disease, sunitinib, Stivarga, and Votrient are special considerations for succinate dehydrogenase (SDH)-deficient GIST (category 2A).[4]
- **Kidney Cancer**: NCCN guidelines (version 4.2023 – January 18, 2023) recommend Votrient as first-line and subsequent therapy for relapsed or stage IV disease for clear cell histology and as systemic therapy for non-clear cell histology as "useful in certain circumstances" (category 2A).[5] Votrient is also recommended as a single-agent therapy for von Hippel-Lindau-associated renal cell carcinoma as useful in certain circumstances (category 2A).
- **Ovarian Cancer Including Fallopian Tube Cancer and Primary Peritoneal Cancer**: NCCN guidelines (version 2.2023 – June 2, 2023) recommend Votrient (category 2B) as single-agent therapy for persistent disease or recurrence.[6]
- **Soft Tissue Sarcoma**: NCCN guidelines (version 2.2023 – April 25, 2023) recommend Votrient as single agent therapy for alveolar soft part sarcoma, angiosarcoma, desmoid tumors (aggressive fibromatosis), and solitary fibrous tumor/hemangiopericytoma.[7] Votrient is also recommended for dermatofibrosarcoma protuberans with fibrosarcomatous transformation for patients who are ineligible for intravenous systemic therapy or patients who are not candidates for anthracyclines-based regimens. For soft tissue sarcoma subtypes with non-specific histology, the guidelines recommend Votrient as first-line therapy for advanced and metastatic for patients who are ineligible for intravenous systemic therapy or patients who are not candidates for anthracyclines-based regimens and as a subsequent line of therapy for advanced or metastatic disease as palliative therapy as a single-agent (category 2A) or in combination with gemcitabine (category 2B).
- **Thyroid Carcinoma**: NCCN guidelines (version 2.2023 – May 18, 2023) for differentiated thyroid carcinoma recommend Votrient (category 2A) for progressive and/or symptomatic disease for unresectable locoregional recurrent or persistent disease not amenable to radioactive iodine therapy or distant metastatic disease not amendable to radioactive iodine therapy.[8] For differentiated

thyroid cancer subtypes, the guidelines have changed the naming of Hürthle cell neoplasm to oncocytic carcinoma. Votrient can be considered for treatment of progressive or symptomatic medullary thyroid disease if clinical trials or preferred systemic therapy options are not available or appropriate, or if there is progression on preferred systemic therapy options.

- **Uterine Neoplasms**: NCCN guidelines (version 2.2023 – April 28, 2023) recommend Votrient for as a systemic therapy option for uterine sarcoma as other recommended regimen for patients with recurrent or metastatic disease that have progressed on prior cytotoxic chemotherapy (category 2A).[9]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Votrient. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Votrient is recommended in those who meet one of the following criteria:

FDA-Approved Indications

22. Renal Cell Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient meets one of the following criteria (i or ii):
  - **i.** Patient has relapsed or advanced disease; OR
  - **ii.** Patient has von Hippel-Lindau disease.

2. Soft Tissue Sarcoma. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient does not have gastrointestinal stromal tumor; AND
  Note: If patient has gastrointestinal stromal tumor, see criteria 4 for gastrointestinal stromal tumor.
- **C)** Patient has advanced or metastatic disease; AND
- **D)** Patient has ONE of the following criteria (i, ii, iii, iv, v, vi, or vii):
  - **i.** Alveolar soft part sarcoma; OR
  - **ii.** Angiosarcoma; OR
  - **iii.** Desmoid tumors (aggressive fibromatosis); OR
  - **iv.** Dermatofibrosarcoma protuberans with fibrosarcomatous transformation; OR
  - **v.** Non-adipocytic sarcoma; OR
  - **vi.** Pleomorphic rhabdomyosarcoma; OR
  - **vii.** Solitary fibrous tumor/hemangiopericytoma.

Other Uses with Supportive Evidence

3. Bone Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has chondrosarcoma; AND
- **C)** Patient meets the following criteria (i and ii):
  - **i.** Patient has metastatic disease; AND
  - **ii.** According to the prescriber, patient has widespread disease.

4. **Gastrointestinal Stromal Tumor.** Approve for 1 year if the patient meets the following criteria (A and B):
   C) Patient is ≥ 18 years of age; AND
   D) Patient meets one of the following criteria (i or ii):
      i. Patient has succinate dehydrogenase (SDH)-deficient gastrointestinal stromal tumor; OR
      ii. Patient has tried each of the following (a, b, c, and d):
         a) One of imatinib or Ayvakit (avapritinib tablets); AND
         b) One of sunitinib or Sprycel (dasatinib tablets); AND
         c) Stivarga (regorafenib tablets); AND
         d) Qinlock (ripretinib tablets).

5. **Ovarian Cancer, Fallopian Tube, or Primary Peritoneal Cancer.** Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has persistent or recurrent disease.

6. **Thyroid Carcinoma, Differentiated.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has differentiated thyroid carcinoma; AND
   Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).
   C) Patient is refractory to radioactive iodine therapy.

7. **Thyroid Carcinoma, Medullary.** Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has tried at least one systemic therapy.
   Note: Examples of systemic therapy include Caprelsa (vandetanib tablets), Cometriq (cabozantinib capsules), Retevmo (selpercatinib capsules), and Gavreto (pralsetinib capsules).

8. **Uterine Sarcoma.** Approve for 1 year if the patient meets the following (A, B, and C):
   Note: Examples of uterine sarcoma include endometrial stromal sarcoma, undifferentiated uterine sarcoma, or uterine leiomyosarcomas.
   A) Patient is ≥ 18 years of age; AND
   B) Patient has recurrent or metastatic disease; AND
   C) Patient has tried at least one systemic regimen.
   Note: Examples of a systemic regimen include one or more of the following: doxorubicin, docetaxel, gemcitabine, ifosfamide, dacarbazine, epirubicin, or vinorelbine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Votrient is not recommended in the following situations:

38. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Welireg Prior Authorization Policy
- Welireg™ (belzutifan tablets – Merck)

REVIEW DATE: 09/13/2023; selected revision 12/20/2023

OVERVIEW

Welireg, a hypoxia-inducible factor inhibitor, is indicated for the treatment of:

- **Renal cell carcinoma**, **advanced** following a programmed death receptor-1 (PD-1) or programmed death-ligand 1 (PD-L1) inhibitor and a vascular endothelial growth factor tyrosine kinase inhibitor (VEGF-TKI) in adults.
- **von Hippel-Lindau (VHL) disease,** in adults who require therapy for associated renal cell carcinoma, central nervous system (CNS) hemangioblastomas, or pancreatic neuroendocrine tumors, not requiring immediate surgery.[1]

The pivotal trial for VHL disease included patients with VHL disease-associated renal cell carcinoma, CNS hemangioblastomas, pancreatic neuroendocrine tumor, and retinal hemangioblastoma.[2]

Guidelines

Welireg is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **CNS Cancers:** Guidelines (version 1.2023 – March 24, 2023) recommend Welireg for VHL-associated CNS hemangioblastoma not requiring immediate surgery as "useful in certain circumstances" (category 2A).[3]
- **Kidney Cancer:** Guidelines (version 1.2024 – June 21, 2023) recommend Welireg as a "preferred" regimen for VHL-associated renal cell carcinoma (category 2A) and single-agent therapy for relapse or stage IV disease as subsequent therapy for clear cell histology as "useful in certain circumstances" (category 2B)[4]
- **Neuroendocrine and Adrenal Tumors:** Guidelines (version 1.2023 – August 2, 2023) list VHL disease as a hereditary endocrine neoplasia. Welireg is recommended in a variety of settings for pancreatic neuroendocrine tumors with germline VHL alteration (category 2A).[5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Welireg. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Welireg is recommended in those who meet the following criteria:

FDA-Approved Indications

23. Renal Cell Carcinoma. Approved for 1 year if the patient meets the following (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has advanced disease; AND

C) Patient has tried at least one programmed death receptor-1 (PD-1) or programmed death-ligand 1 (PD-L1) inhibitor; AND

Note: Examples of PD-1 inhibitor or PD-L1 inhibitor include: Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion), and Bavencio (avelumab intravenous infusion).

D) Patient has tried at least one vascular endothelial growth factor tyrosine kinase inhibitor (VEGF-TKI).

Note: Examples of VEGF-TKI include Cabometyx (cabozantinib tablets), Lenvima (lenvatinib capsules), Inlyta (axitinib tablets), Fotivda (tivozanib capsules), pazopanib, sunitinib, and sorafenib

24. Von Hippel-Lindau Disease. Approve for 1 year if the patient meets the following (A, B, C and D):

A) Patient is ≥ 18 years of age; AND

B) Patient has a von Hippel-Lindau (VHL) germline alteration as detected by genetic testing; AND

C) Patient does not require immediate surgery; AND

D) Patient requires therapy for ONE of the following conditions (i, ii, iii, or iv):

i. Central nervous system hemangioblastomas; OR

ii. Pancreatic neuroendocrine tumors; OR

iii. Renal cell carcinoma; OR

iv. Retinal hemangioblastoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Welireg is not recommended in the following situations:

39. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xalkori Prior Authorization Policy
- Xalkori® (crizotinib capsules and oral pellets – Pfizer)

REVIEW DATE: 01/11/2023; selected revision 11/22/2023

OVERVIEW

Xalkori, an oral kinase inhibitor, is indicated for the following uses:[1]

- **Anaplastic large cell lymphoma (ALCL)**, treatment of relapsed or refractory, systemic ALCL that is anaplastic lymphoma kinase (*ALK)*-positive in pediatric patients ≥ 1 year of age and young adults.
- **Inflammatory Myofibroblastic tumor (IMT),** treatment of unresectable, recurrent, or refractory inflammatory myofibrobastic tumor that is *ALK*-positive in patients ≥ 1 year of age.
- **Non-small cell lung cancer (NSCLC)**, metastatic, whose tumors are *ALK*-positive or *ROS* proto-oncogene 1 (*ROS1)*-positive as detected by an FDA-approved test in adults.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines address the use of Xalkori:[5-8]

- **Histiocytic Neoplasms:** Guidelines (version 1.2022 – May 20, 2022) recommend Xalkori as a "useful in certain circumstances" treatment option for the following types of histiocytic neoplasm with *ALK* rearrangement/fusion: Langerhans cell histiocytosis, Erdheim-Chester disease, and Rosai-Dorfman disease (category 2A).[3]
- **Inflammatory Myofibroblastic Tumor (IMT):** NCCN Soft Tissue Sarcoma guidelines (version 2.2022 – May 17, 2022) and NCCN Uterine Neoplasms guidelines (version 1.2023 – December 22, 2022) recommend Xalkori as a treatment option for IMT with *ALK* translocation.[4,5]
- **Melanoma: Cutaneous:** Guidelines (version 1.2023 – December 22, 2022) recommend Xalkori as a treatment option for cutaneous melanoma with *ALK* or *ROS1* fusions.[6]
- **NSCLC:** Guidelines (version 1.2023 – December 23, 2022) recommend Xalkori as a treatment option for *ALK* rearrangement-positive NSCLC and as a treatment option for NSCLC with mesenchymal-epithelial transition (*MET*) exon 14 skipping mutation or high-level *MET* amplification.[7]
- **T-Cell Lymphoma:** Guidelines (version 1.2023 – January 5, 2023) recommend Xalkori as a treatment option for relapsed or refractory *ALK*-positive ALCL.[7] NCCN notes that Xalkori also demonstrated activity in adults with relapsed or refractory *ALK*-positive ALCL, after at least one line of prior cytotoxic therapy.[8]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xalkori. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Xalkori is recommended in those who meet one of the following criteria:

FDA-Approved Indications

2. **Anaplastic Large Cell Lymphoma.** Approve for 1 year if the patient meets the following (A, B, and C):
   A) Patient is ≥ 1 year of age; AND
   B) Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND
   C) Patient meets one of the following (i or ii):
      i. Patient has relapsed disease; OR
      ii. Patient has refractory disease.

3. **Inflammatory Myofibroblastic Tumor.** Approve for 1 year if the patient meets the following (A, B, and C):
   A) Patient is ≥ 1 year of age; AND
   B) Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND
   C) Patient meets one of the following (i or ii):
      i. Patient has advanced, recurrent, or metastatic disease; OR
      ii. The tumor is inoperable.

4. **Non-Small Cell Lung Cancer – Anaplastic Lymphoma Kinase (*ALK*)-Positive.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has advanced or metastatic disease; AND
   C) Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND
   D) The mutation was detected by an approved test.

5. **Non-Small Cell Lung Cancer – *ROS1* Rearrangement-Positive.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has advanced or metastatic disease; AND
   C) Patient has *ROS1* rearrangement-positive disease; AND
   D) The mutation was detected by an approved test.

Other Uses with Supportive Evidence

5. **Histiocytic Neoplasm.** Approve for 1 year if patient meets one of the following (A, B, and C).
   A) Patient is ≥ 18 years of age; AND
   B) Patient has anaplastic lymphoma kinase (*ALK*) rearrangement/fusion-positive disease; AND
   C) Patient meets one of the following (i, ii, or iii):
      i. Patient has Langerhans cell histiocytosis; OR
      ii. Patient had Erdheim-Chester disease; OR
      iii. Patient has Rosai-Dorfman disease.

6. **Melanoma, Cutaneous.** Approve for 1 year if patient meets the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient meets one of the following (i or ii):
      i. Patient has anaplastic lymphoma kinase (*ALK*) fusion disease; OR
      ii. Patient has *ROS1* fusion disease.

7. **Non-Small Cell Lung Cancer with Mesenchymal Epithelial Transition (*MET*) Mutation.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient meets one of the following (i or ii):
      i. Patient has non-small cell lung cancer with high level *MET* amplification; OR
      ii. Patient has non-small cell lung cancer with *MET* exon 14 skipping mutation.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xalkori is not recommended in the following situations:

40. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xermelo Prior Authorization Policy
- Xermelo™ (telotristat ethyl tablets – Lexicon)

REVIEW DATE: 06/14/2023

OVERVIEW

Xermelo, an inhibitor of tryptophan hydroxylase, is indicated for the treatment of **carcinoid syndrome diarrhea** in combination with somatostatin analog therapy in adults inadequately controlled by somatostatin analog therapy.[1]

The efficacy of Xermelo was evaluated in patients with metastatic neuroendocrine tumor and carcinoid syndrome diarrhea who were having between 4 to 12 daily bowel movements despite the use of somatostatin analog therapy at a stable dose for at least 3 months.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for treatment of neuroendocrine and adrenal tumors (version 2.2022 – December 21, 2022) state that Xermelo can be considered in combination with Sandostatin® LAR Depot (octreotide subcutaneous injection) or Somatuline® Depot (lanreotide subcutaneous injection) for persistent diarrhea due to poorly controlled carcinoid syndrome.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xermelo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xermelo is recommended in those who meet the following criteria:

FDA-Approved Indication

25. Carcinoid Syndrome Diarrhea. Approve for 1 year if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve if the patient meets all of the following criteria (i, ii, and iii):
- **i.** Patient has been on a long-acting somatostatin analog therapy for at least 3 consecutive months; AND
  Note: Examples of long-acting somatostatin analog therapy are Somatuline Depot (lanreotide subcutaneous injection) and Sandostatin LAR Depot (octreotide subcutaneous injection).
- **ii.** While on a long-acting somatostatin analog therapy (prior to starting Xermelo), the patient continues to have at least four bowel movements per day; AND
- **iii.** Xermelo will be used concomitantly with a long-acting somatostatin analog therapy.

B) Patient is Currently Receiving Xermelo. Approve if the patient is continuing to take Xermelo concomitantly with a long-acting somatostatin analog therapy for carcinoid syndrome diarrhea.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xermelo is not recommended in the following situations:

41. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xospata Prior Authorization Policy
- Xospata® (gilteritinib tablets – Astellas)

REVIEW DATE: 01/04/2023

OVERVIEW

Xospata, an inhibitor of tyrosine kinases including FMS-like tyrosine kinase 3 (*FLT3*), is indicated for the treatment of relapsed or refractory **acute myeloid leukemia** in adults with an *FLT3* mutation as detected by an FDA-approved test.[1]

Guidelines

Xospata is discussed in the National Comprehensive Cancer Network (NCCN) guidelines:

- **Acute Myeloid Leukemia:** NCCN guidelines (version 2.2022 – June 14, 2022) recommend Xospata in patients with relapsed or refractory disease and *FLT3*-internal tandem duplication (*FLT3-ITD*) or *FLT3*-tyrosine kinase domain (*FLT3-TKD*) mutation (category 1 for both).[2]
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Fusion Genes:** NCCN guidelines (version 2.2022 – October 18, 2022) recommend Xospata for the treatment of myeloid/lymphoid neoplasms with eosinophilia and *FLT3* rearrangement in chronic phase or blast phase (category 2A). Xospata is also recommended in combination with acute lymphocytic leukemia- or acute myeloid leukemia-type induction chemotherapy followed by allogeneic hematopoietic cell transplantation (if eligible) for lymphoid, myeloid, or mixed lineage neoplasms with eosinophilia and *FLT3* rearrangement in blast phase (category 2A).[3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xospata. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xospata is recommended in those who meet one of the following criteria:

FDA-Approved Indications

13. Acute Myeloid Leukemia. Approve for 1 year if the patient meets the following criteria (A, B, and C).
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has relapsed or refractory disease; AND
- **C)** Disease is *FLT3*-mutation positive as detected by an approved test.

Other Uses with Supportive Evidence

14. Myeloid/Lymphoid Neoplasms. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient is ≥ 18 years of age; AND
B) Patient has eosinophilia; AND
C) Disease is *FLT3*-mutation positive as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xospata is not recommended in the following situations:

11. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available Condition.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xpovio Prior Authorization Policy
- Xpovio® (selinexor tablets – Karyopharm Therapeutics)

REVIEW DATE: 03/01/2023

OVERVIEW

Xpovio, a nuclear export inhibitor, is indicated for treatment of the following conditions:[1]

- **Diffuse large B-cell lymphoma** (DLBCL), not otherwise specified (including DLBCL arising from follicular lymphoma), for treatment of relapsed or refractory disease in adults, after at least two lines of systemic therapy.
- **Multiple myeloma**:
  - In combination with dexamethasone for treatment of relapsed or refractory disease in adults who have received at least four prior therapies and whose disease is refractory to at least two proteasome inhibitors, at least two immunomodulatory agents, and an anti-CD38 monoclonal antibody.
  - In combination with bortezomib and dexamethasone, in adults who have received at least one prior therapy.

For DLBCL, Xpovio was approved under accelerated approval based on response rate. Continued approval may be contingent upon verification in a confirmatory trial(s).

Guidelines

Xpovio is addressed in the following guidelines from the National Comprehensive Cancer Network (NCCN):

- **B-Cell Lymphoma:** NCCN guidelines (version 2.2023 – February 8, 2023) recommend Xpovio as third-line and subsequent therapy of DLBCL (including for histologic transformation of indolent lymphomas to DLBCL), after at least two lines of systemic therapy.[3] This includes patients with disease progression after transplant or chimeric antigen receptor T-cell therapy.
- **Multiple Myeloma:** NCCN guidelines (version 3.2023 – December 8, 2022) recommend various regimens as primary therapy (transplant eligible and non-transplant candidates), maintenance therapy, and for previously treated multiple myeloma.[2] Xpovio/bortezomib/dexamethasone (once weekly) is among the "Other Recommended" regimens for previously treated disease following one to three previous therapies. Xpovio/dexamethasone after at least four prior therapies and whose disease is refractory to at least two proteasome inhibitors, at least two immunomodulatory agents, and an anti-CD38 monoclonal antibody, is recommended for patients with late relapses (> three prior therapies). Xpovio/Darzalex® (daratumumab injection)/dexamethasone, Xpovio/Kyprolis® (carfilzomib intravenous infusion)/dexamethasone, and Xpovio/Pomalyst® (pomalidomide capsules)/dexamethasone are among the regimens considered "Useful in Certain Circumstances" for previously treated multiple myeloma, for early relapses (one to three prior therapies).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xpovio. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xpovio is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Diffuse Large B-Cell Lymphoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
   Note: This includes patients with histologic transformation of indolent lymphomas to diffuse large B-cell lymphoma.
   A) Patient is ≥ 18 years of age; AND
   B) Patient has been treated with at least two prior systemic therapies.

2. **Multiple Myeloma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) The medication will be taken in combination with dexamethasone; AND
   C) Patient meets one of the following (i, ii, or iii):
   i. Patient has tried at least four prior regimens for multiple myeloma; OR
   ii. Patient meets both of the following (a and b):
   a) Patient has tried at least one prior regimen for multiple myeloma; AND
   b) The medication will be taken in combination with bortezomib; OR
   iii. Patient meets both of the following (a and b):
   a) Patient has tried at least one prior regimen for multiple myeloma; AND
   Note: Examples of prior regimens include bortezomib/Revlimid (lenalidomide capsules)/dexamethasone, Kyprolis (carfilzomib intravenous infusion)/Revlimid/dexamethasone, Darzalex (daratumumab intravenous infusion)/bortezomib or Kyprolis/dexamethasone, or other regimens containing a proteasome inhibitor, immunomodulatory drug, and/or anti-CD38 monoclonal antibody.
   b) The medication will be taken in combination with Darzalex (daratumumab intravenous infusion), Darzalex Faspro (daratumumab and hyaluronidase-fihj subcutaneous injection), Kyprolis (carfilzomib intravenous infusion), or Pomalyst (pomalidomide capsules).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xpovio is not recommended in the following situations:

12. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xtandi Prior Authorization Policy
- Xtandi® (enzalutamide capsules and tablets – Astellas/Pfizer)

REVIEW DATE: 04/05/2023; selected revision 11/29/2023

OVERVIEW

Xtandi is an androgen receptor inhibitor indicated for the treatment of patients with **castration-resistant prostate cancer (CRPC), metastatic castration-sensitive prostate cancer (mCSPC)**, and **non-metastatic castration-sensitive prostate cancer (nmCSPC)** with biochemical recurrence at high risk for metastasis (high-risk biochemical recurrence [high-risk BCR]).[1] For CRPC and mCSPC, patients should receive Xtandi with a concurrent gonadotropin-releasing hormone (GnRH) analog or should have had a bilateral orchiectomy. Patients with nmCSPC with high-risk BCR may be treated with or without a GnRH analog.

Guidelines

According to the National Comprehensive Cancer Network (NCCN) guidelines on prostate cancer (version 1.2023 – September 16, 2022), all patients with metastatic CRPC should continue androgen deprivation therapy to maintain castrate levels of serum testosterone (< 50 ng/dL).

- For patients with non-metastatic CRPC, if the prostate specific antigen doubling time is ≤ 10 months, Xtandi, Erleada® (apalutamide tablets), and Nubeqa® (darolutamide tablets) are all preferred category 1 recommended options.
- For patients with mCRPC adenocarcinoma, therapies are based on prior docetaxel or prior novel hormone therapy use.
    - No prior docetaxel and no prior novel hormone therapy: the preferred regimens are Xtandi (category 1), abiraterone (category 1 only if no visceral metastases), and docetaxel (category 1).
    - Prior docetaxel, but no prior novel hormone therapy: the preferred regimens include Xtandi or abiraterone (both category 1), and Jevtana® (cabazitaxel intravenous infusion) [category 2A].
    - Prior novel hormone therapy but no prior docetaxel: Xtandi, abiraterone, and abiraterone + dexamethasone are "other recommended regimens" (both category 2A).
    - Prior docetaxel and prior novel hormone therapy: All systemic therapies are category 2B if visceral metastases are present. Preferred regimens are Jevtana (category 1) and docetaxel rechallenge. Xtandi, abiraterone, and other secondary hormone therapy are "other recommended regimens" (all category 2A).
- For mCSPC androgen deprivation therapy in combination with Xtandi, abiraterone + steroid, Erleada, and docetaxel are all category 1 recommended preferred options. Yonsa® (abiraterone acetate) with methylprednisolone is a category 2B recommendation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xtandi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xtandi is recommended in those who meet one of the following criteria:

FDA-Approved Indications

26. Prostate Cancer – Castration-Resistant (Metastatic or Non-Metastatic). Approve for 1 year if the patient meets the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient meets ONE of the following (i, ii, or iii):
  - **i.** The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) agonist; OR
    Note: Examples of GnRH agonists include: leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant).
  - **ii.** The medication is concurrently used with Firmagon (degarelix subcutaneous injection); OR
  - **iii.** Patient has had a bilateral orchiectomy.

2. Prostate Cancer – Metastatic, Castration-Sensitive. Approve for 1 year if the patient meets the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient meets ONE of the following (i, ii, or iii):
  - **i.** The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) agonist; OR
    Note: Examples of GnRH agonists include: leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant).
  - **ii.** The medication is concurrently used with Firmagon (degarelix subcutaneous injection); OR
  - **iii.** Patient has had a bilateral orchiectomy.

3. Prostate Cancer – Non-Metastatic, Castration-Sensitive. Approve for 1 year if the patient meets the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has biochemical recurrence and is at high risk for metastasis.
  Note: High-risk biochemical recurrence is defined as prostate-specific antigen (PSA) doubling time ≤ 9 months.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xtandi is not recommended in the following situations:

42. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

15. Xtandi® capsules and tablets [prescribing information]. Northbrook, IL: Astellas/Pfizer; November 2023.
2. The NCCN Prostate Cancer Clinical Practice Guidelines in Oncology (version 1.2023 – September 16, 2022). © 2022 National Comprehensive Cancer Network. Available at: http://www.nccn.org. Accessed April 2, 2023.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Yonsa Prior Authorization Policy
- Yonsa® (abiraterone acetate tablets – Sun Pharmaceutical)

REVIEW DATE: 07/12/2023

OVERVIEW

Yonsa, an androgen biosynthesis inhibitor, is indicated in combination with methylprednisolone for the treatment of patients with **metastatic castration-resistant prostate cancer (CRPC)**.[1]

Guidelines

The National Comprehensive Cancer Network guidelines on prostate cancer (version 1.2023 – September 16, 2022) recommend Yonsa for the following uses:[2]

- At initial diagnosis, for patients classified in the regional risk group (metastases in regional nodes [N1] with no distant metastases [M0]) and with a > 5 year expected patient survival, external beam radiation therapy (EBRT) + androgen deprivation therapy (ADT) [category 1] + Zytiga® (abiraterone acetate tablets) and prednisone (category 2A) or Yonsa and methylprednisolone (category 2B) are recommended options. ADT (without EBRT) ± Zytiga and prednisone is a category 2A recommended option in this setting; ADT + Yonsa and methylprednisolone is a category 2B recommendation.
- If patients are positive for distant metastasis (M1) and have castration-naïve disease, ADT + Zytiga and prednisone and ADT + docetaxel are both category 1 recommended options. ADT + Yonsa and methylprednisolone is a category 2B recommendation in this setting.
- For patients with metastatic CRPC and who have not received prior docetaxel or prior novel hormone therapy, Zytiga + prednisone (category 1 without visceral metastases and category 2A with visceral metastases) and Yonsa + methylprednisolone (category 2A) is recommended.
- For patients with metastatic CRPC who have received prior novel hormone therapy but no prior docetaxel, Zytiga + prednisone or Yonsa + methylprednisolone is recommended (category 2A); Zytiga + dexamethasone or Yonsa + dexamethasone is recommended in this setting if patients have had disease progression on either formulation of abiraterone (category 2A). If docetaxel was used previously but no prior hormone therapy, Zytiga + prednisone (category 1) or Yonsa + methylprednisolone (category 2A) is recommended. If docetaxel and prior novel hormone therapy were used, Zytiga + prednisone or Yonsa + methylprednisolone are recommended (category 2A without visceral metastases; category 2B with visceral metastases).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Yonsa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Yonsa is recommended in those who meet the following criteria:

FDA-Approved Indication

3. **Prostate Cancer – Metastatic, Castration-Resistant.** Approve for 1 year if the patient meets the following (A and B):
   - **A)** The medication is used in combination with methylprednisolone or dexamethasone; AND
   - **B)** Patient meets ONE of the following (i, ii, or iii):
     - **i.** The medication is concurrently used with a gonadotropin-releasing hormone agonist; OR
       Note: Examples of GnRH agonists include: leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), or Vantas (histrelin acetate subcutaneous implant).
     - **ii.** The medication is concurrently used with Firmagon (degarelix subcutaneous injection); OR
     - **iii.** Patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Yonsa is not recommended in the following situations:

13. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zejula Prior Authorization Policy
- Zejula™ (niraparib capsules and tablets – GlaxoSmithKline)

REVIEW DATE: 01/11/2023; selected revision 05/10/2023

OVERVIEW

Zejula, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicated for **ovarian, fallopian tube, or primary peritoneal cancer** for the following uses:[1,2]

- Maintenance treatment of adults with advanced epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in a complete or partial response to first-line platinum-based chemotherapy.
- Maintenance treatment of adults with deleterious or suspected deleterious germline BReast CAncer gene (*BRCA)*-mutated recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in a complete or partial response to platinum-based chemotherapy.

Guidelines

Zejula is discussed in the National Comprehensive Cancer Network (NCCN) guidelines:

- **Ovarian cancer:** NCCN guidelines (version 1.2023 – December 22, 2022) recommend Zejula for treatment of recurrent disease and for maintenance treatment.[2] For treatment of recurrent disease, monotherapy with Lynparza® (olaparib capsules), Rubraca® (rucaparib tablets), and Zejula are listed under other recommended regimens for both platinum-sensitive and platinum-resistant disease (all category 3).[3] Zejula is recommended following three or more lines of prior chemotherapy in patients whose cancer is associated with homologous recombination deficiency (HRD) defined by either a deleterious or suspected deleterious *BRCA* mutation or genomic instability and progression > 6 months after response to the last platinum-based chemotherapy. Zejula + bevacizumab (category 2B) is also listed under other recommended targeted therapy regimen for platinum-sensitive disease.[2] Maintenance recommendations following primary treatment apply to Stage II, III, or IV ovarian cancer after primary treatment if the patient is in complete or partial response. If bevacizumab was not used during primary therapy, Zejula is recommended (category 1 for *BRCA* mutation; category 2A for *BRCA* wild-type of unknown). There is a footnote for Zejula that states in the absence of a *BRCA* mutation, HRD status may provide information on the magnitude of benefit of PARP inhibitor therapy. If bevacizumab was used during primary therapy, Zejula is only recommended for patients with a *BRCA* mutation (category 2A). In patients with platinum-sensitive disease who have completed at least two lines of platinum-based therapy and have achieved a complete or partial response, Zejula, Rubraca, or Lynparza can be considered for maintenance therapy if PARP therapy has not previously been used.[2] There is a footnote that states Zejula is limited to those with a deleterious or suspected deleterious germline *BRCA* mutation (category 1).
- **Uterine Neoplasms:** NCCN guidelines (version 1.2023 – December 22, 2022) recommend Zejula, Lynparza, and Rubraca as single-agent second-line or subsequent therapies for *BRCA2*-altered uterine leiomyosarcoma, useful in certain circumstances (category 2A).[4]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Zejula. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Zejula is recommended in those who meet one of the following criteria:

FDA-Approved Indication

27. Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Maintenance Therapy. Approve for 1 year if the patient meets the following (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient is in complete or partial response after a platinum-based chemotherapy regimen; AND
  Note: Examples of chemotherapy regimens are carboplatin with gemcitabine, carboplatin with paclitaxel, cisplatin with gemcitabine.
- **C)** Patient meets one of the following criteria (i or ii):
  - **i.** Patient meets both of the following criteria (a and b):
    - **a)** Patient has recurrent disease; AND
    - **b)** Patient has a *BRCA* mutation; OR
  - **ii.** Patient is in complete or partial response to first-line primary treatment.

Other Uses with Supportive Evidence

2. Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Treatment. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has tried at least three prior chemotherapy regimens; AND
  Note: Examples of chemotherapy regimens are carboplatin/gemcitabine, carboplatin/liposomal doxorubicin, carboplatin/paclitaxel, cisplatin/gemcitabine, capecitabine, irinotecan.
- **C)** Patient has homologous recombination deficiency (HRD)-positive disease as confirmed by an approved test.
  Note: HRD-positive disease includes patients with *BRCA* mutation-positive disease.

3. Uterine Leiomyosarcoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has a *BRCA2* mutation; AND
- **C)** Patient has tried one systemic regimen.
  Note: Examples of a systemic regimen include one or more of the following products: dacarbazine, docetaxel, doxorubicin, epirubicin, gemcitabine, ifosfamide, vinorelbine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Zejula is not recommended in the following situations:

43. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

- Zelboraf® (vemurafenib tablets – Genentech/Daiichi Sankyo)

REVIEW DATE: 07/19/2023

OVERVIEW

Zelboraf, a BRAF inhibitor, is indicated in adults for the following indications:[1]
- **Erdheim-Chester disease**, for treatment of patients with the *BRAF V600* mutation.
- **Melanoma**, for treatment of unresectable or metastatic disease with *BRAF V600E* mutation as detected by an FDA-approved test.

Of note, Cotellic® (cobimetinib tablets) is a MEK inhibitor that is indicated to be given in combination with Zelboraf in a similar patient population with melanoma. Zelboraf is not recommended for use in patients with wild-type BRAF melanoma.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use in multiple cancers.
- **Central Nervous System Cancers**: Guidelines (version 1.2023 – March 24, 2023) recommend a BRAF/MEK inhibitor combination (i.e., Tafinlar® [dabrafenib capsules]/Mekinist® [trametinib tablets] or Zelboraf/Cotellic) for treatment of *BRAF V600E* activation mutation in the following situations: adjuvant treatment of pilocytic astrocytoma, pleomorphic xanthoastrocytoma, or ganglioglioma; recurrent or progressive low-grade glioma; oligodendroglioma or isocitrate dehydrogenase-2 (*IDH2*)-mutant astrocytoma; and recurrent glioblastoma.[7] BRAF/MEK combination therapy is also recommended for melanoma with brain metastases. Guidelines for pediatric central nervous system (CNS) cancers (version 2.2023 – October 31, 2022) include targeted therapy with Zelboraf as adjuvant therapy or for recurrent or progressive disease, if the cancer has a *BRAF V600E* mutation (both category 2A).[8] In the adjuvant setting, Zelboraf is recommended under "other recommended regimens" for age < 3 years with BRAF V600E mutated disease.
- **Hairy Cell Leukemia:** Guidelines (version 1.2023 – August 30, 2022) for hairy cell leukemia list Zelboraf ± rituximab among the treatment options for relapsed or refractory disease and for progressive disease after relapsed/refractory therapy.[3] For initial therapy, Zelboraf + Gazyva (obinutuzumab intravenous infusion) has been added as a category 2A recommendation under "useful in certain circumstances" with a qualifier that it can be considered for patients who are unable to tolerate purine analogs including frail patients and those with active infection.
- **Histiocytic Neoplasms**: Guidelines (version 1.2022 – May 20, 2022) recommend Zelboraf (preferred) or Tafinlar (other recommended regimen) for *BRAF V600E*-mutated Erdheim-Chester disease and for multisystem, pulmonary, or CNS Langerhans cell histocytosis.[6]
- **Melanoma, Cutaneous:** Guidelines (version 2.2023 – March 10, 2023) for cutaneous disease recommend BRAF/MEK inhibitor combinations among the preferred therapies for first-line and subsequent treatment of metastatic or unresectable melanoma with a *V600*-activating mutation.[2] This combination is also recommended for adjuvant treatment (category 2B). While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor is an option, especially in patients who are not appropriate candidates for checkpoint immunotherapy. Zelboraf + Cotellic + Tecentriq (atezolizumab intravenous infusion) is a recommended combination that is "useful in certain circumstances" (category 2A).

- **Non-Small Cell Lung Cancer:** Guidelines (version 3.2023 – April 13, 2023) list Zelboraf among the first-line options for tumors with a *BRAF* mutation, particularly if combination therapy with Tafinlar + Mekinist is not tolerated.[4]
- **Thyroid Carcinoma:** Guidelines (version 2.2023 – May 18, 2023) list Zelboraf as a treatment option (category 2B) if cancer is not amenable to radioiodine treatment, for differentiated thyroid cancer (follicular, oncocytic, and papillary cancer subtypes) with a *BRAF V600* mutation.[5]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Zelboraf. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Zelboraf is recommended in those who meet one of the following criteria:

FDA-Approved Indications

7. **Erdheim-Chester Disease.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has *BRAF V600* mutation-positive disease.

8. **Melanoma.** Approve for 1 year if the patient meets the following (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has unresectable, advanced, or metastatic melanoma; AND
   C) Patient has *BRAF V600* mutation-positive disease.

Other Uses with Supportive Evidence

9. **Central Nervous System Cancer.** Approve for 1 year if the patient meets the following (A, B, and C):
   A) The medication is being used for one of the following (i, ii, or iii):
      i. Adjuvant treatment of one of the following (a, b, or c):
         a) Pilocytic astrocytoma; OR
         b) Pleomorphic xanthoastrocytoma; OR
         c) Ganglioglioma; OR
      ii. Recurrent or progressive disease for one of the following (a, b, c, or d):
         a) Glioma; OR
         b) Isocitrate dehydrogenase-2 (*IDH2*)-mutant astrocytoma; OR
         c) Oligodendroglioma; OR
         d) Glioblastoma; OR
      iii. Brain metastases due to melanoma; AND
   B) Patient has *BRAF V600* mutation-positive disease; AND
   C) The medication is prescribed in combination with Cotellic (cobimetinib tablets).

10. **Hairy Cell Leukemia.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient meets one of the following (i or ii):

i. Patient has tried at least one other systemic therapy for hairy cell leukemia; OR
Note: Examples of other systemic therapies include cladribine, Nipent (pentostatin injection), rituximab, Intron A (interferon alpha-2b injection).

ii. Patient meets both of the following (a and b):

i. Patient is unable to tolerate purine analogs (i.e., active infection, frail patients); AND
Note: Examples of purine analogs are cladribine, Nipent (pentostatin injection).

ii. Zelboraf is used in combination with Gazyva (obinutuzumab intravenous infusion) as initial therapy.

11. Histiocytic Neoplasm. Approve for 1 year if the patient meets the following (A, B, and C):
Note: For Erdheim-Chester disease, refer to FDA-approved indication.

D) Patient is ≥ 18 years of age; AND

E) Patient has Langerhans cell histiocytosis and one of the following (i, ii, or iii):

i. Multisystem disease; OR

ii. Pulmonary disease; OR

iii. Central nervous system lesions; AND

F) Patient has *BRAF V600* mutation-positive disease.

12. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has *BRAF V600E* mutation-positive disease.

13. Thyroid Carcinoma, Differentiated. Approve for 1 year if the patient meets the following (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Patient has differentiated thyroid carcinoma; AND
Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).

C) Patient has disease that is refractory to radioactive iodine therapy; AND

D) Patient has *BRAF* mutation-positive disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zelboraf is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zolinza Prior Authorization Policy
- Zolinza® (vorinostat capsules – Merck)

REVIEW DATE: 08/02/2023

OVERVIEW
Zolinza, a histone deacetylase inhibitor, is indicated for the treatment of cutaneous manifestations of **cutaneous T-cell lymphoma** in patients who have progressive, persistent or recurrent disease on or following two systemic therapies.[1]

Guidelines
The National Comprehensive Cancer Network (NCCN) clinical practice guidelines for **primary cutaneous lymphomas** (version 1.2023 – January 5, 2023) recommend Zolinza as a systemic therapy for mycosis fungoides/Sezary syndrome.[2,3] Zolinza can be used for primary treatment or for relapsed, persistent, or refractory disease.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Zolinza. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Zolinza is recommended in those who meet the following criteria:

FDA-Approved Indication

15. Cutaneous T-Cell Lymphoma including Mycosis Fungoides/Sezary Syndrome. Approve for 1 year.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Zolinza is not recommended in the following situations:

14. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zydelig Prior Authorization Policy
- Zydelig® (idelalisib tablets – Gilead)

REVIEW DATE: 06/28/2023

OVERVIEW

Zydelig, a phosphatidylinositol 3-kinase (PI3K) inhibitor, is indicated for relapsed **chronic lymphocytic leukemia (CLL)** in combination with rituximab, in patients for whom rituximab alone would be considered appropriate therapy due to other comorbidities.[1]

Limitations of use: Zydelig is not indicated and is not recommended for first-line treatment of any patient, including patients with CLL, small lymphocytic lymphoma (SLL), follicular lymphoma (FL), and other indolent non-Hodgkin lymphomas. Zydelig is not indicated and is not recommended in combination with bendamustine and rituximab, or in combination with rituximab for the treatment of patients with FL, SLL, and other indolent non-Hodgkin lymphomas.[1]

Guidelines

Zydelig is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **CLL/SLL:** NCCN guidelines (version 3.2023 – June 12, 2023) recommend Zydelig with or without rituximab as "other recommended regimens" for relapsed or refractory disease after prior Bruton tyrosine kinase inhibitor and venetoclax-based regimens for patients without del(17p)/TP53 mutations and as second-line or third-line therapy for patients with del(17p)TP53 mutation (category 2A).[3] Many other agents have a more prominent role in the first-line management of CLL. The guidelines note that CLL and SLL are different manifestations of the same condition and are treated similarly.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zydelig. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zydelig is recommended in those who meet one of the following:

FDA-Approved Indication

28. Chronic Lymphocytic Leukemia. Approve for 1 year if the patient meets the following (A and B):

C) Patient is ≥ 18 years of age; AND

D) Patient has tried at least one systemic regimen.

Note: Examples of systemic regimens contain one or more of the following products: Imbruvica (ibrutinib capsules, tablets, and oral solution), Brukinsa (zanubrutinib capsules), Calquence (acalabrutinib tablets), Venclexta (venetoclax tablets), chlorambucil, Gazyva (obinutuzumab intravenous infusion), rituximab, fludarabine, cyclophosphamide, bendamustine, high-dose methylprednisolone, Campath (alemtuzumab intravenous infusion), or Arzerra (ofatumumab intravenous infusion).

Other Uses with Supportive Evidence

29. Small Lymphocytic Lymphoma. Approve for 1 year if the patient meets the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one systemic regimen.

Note: Examples of systemic regimens contain one or more of the following products: Imbruvica (ibrutinib capsules, tablets, or oral solution), Brukinsa (zanubrutinib capsules), Calquence (acalabrutinib tablets), Venclexta (venetoclax tablets), chlorambucil, Gazyva (obinutuzumab intravenous infusion), rituximab, fludarabine, cyclophosphamide, bendamustine, high-dose methylprednisolone, Campath (alemtuzumab intravenous infusion), or Arzerra (ofatumumab intravenous infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zydelig is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

24. Zydelig® tablets [prescribing information]. Foster City, CA: Gilead Sciences; February 2022.
25. The NCCN Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma Clinical Practice Guidelines in Oncology (version 3.2023 – June 12, 2023). © 2023 National Comprehensive Cancer Network. Available at: http://www.nccn.org. Accessed on June 21, 2023.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zykadia Prior Authorization Policy
- Zykadia® (ceritinib capsules and tablets – Novartis)

REVIEW DATE: 07/12/2023

OVERVIEW

Zykadia, a kinase inhibitor, is indicated for the treatment of adults with metastatic **non-small cell lung cancer** (NSCLC) whose tumors are anaplastic lymphoma kinase (*ALK*)-positive as detected by an FDA-approved test.[1]

GUIDELINES

Zykadia is addressed in National Comprehensive Cancer Network (NCCN) guidelines:[2-5]

- **Histiocytic Neoplasms:** Guidelines (version 1.2022 – May 20, 2022) recommend Zykadia as a "useful in certain circumstances" treatment option for *ALK*-positive Erdheim-Chester Disease (category 2A).[3]
- **Inflammatory Myofibroblastic Tumor (IMT):** NCCN Soft Tissue Sarcoma guidelines (version 2.2023 – April 25, 2023) and NCCN Uterine Neoplasms guidelines (version 2.2023 – April 28, 2023) recommend Zykadia as a treatment option for IMT with *ALK* translocation.[5,6]
- **NSCLC:** Guidelines (version 3.2023 – April 13, 2023) recommend testing for biomarkers (e.g., *ALK* rearrangement, *ROS* proto-oncogene 1 (*ROS1)* gene rearrangement) in eligible patients with NSCLC.[4]
  - *ALK* rearrangement-positive NSCLC: If *ALK* rearrangement is discovered prior to first-line systemic therapy, Zykadia is an "other recommended therapy" (category 1). If *ALK* rearrangement is discovered during first-line systemic therapy, options are to complete the planned systemic therapy (including maintenance therapy) or to interrupt the systemic therapy and treat with Zykadia (category 2A) or another *ALK* inhibitor. NCCN recommendations for patients with disease progression often include continuing the first-line targeted therapy, depending on type of progression.
  - *ROS1* rearrangement-positive NSCLC: If *ROS1* rearrangement is discovered prior to first-line systemic therapy, Zykadia is an "other recommended" first-line treatment option (category 2A). If *ROS1* rearrangement is discovered during first-line systemic therapy, options are to complete the planned systemic therapy (including maintenance therapy) or interrupt and treat with Zykadia (category 2A). For patients who progress on treatment, if they are asymptomatic, they may continue to receive the treatment they were previously receiving (including Zykadia) or switch to Lorbrena® (lorlatinib tablets). There are different recommendations for patients who are symptomatic, depending on type of progression.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zykadia. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zykadia is recommended in those who meet one of the following criteria:

FDA-Approved Indication

1. **Non-Small Cell Lung Cancer (NSCLC) – Anaplastic Lymphoma Kinase (*ALK*)-Positive.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has advanced or metastatic disease; AND
   - **C)** Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND
   - **D)** The mutation is detected by an approved test.

Other Uses with Supportive Evidence

2. **Erdheim-Chester Disease.** Approve for 1 year if the patient meets the following (A and B):
   - **E)** Patient is ≥ 18 years of age; AND
   - **F)** Patient has anaplastic lymphoma kinase (*ALK*) rearrangement/fusion-positive disease.

3. **Inflammatory Myofibroblastic Tumor.** Approve for 1 year if the patients meets the following (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND
   - **C)** Patient meets one of the following (i or ii):
   - **i.** Patient has advanced, recurrent, or metastatic disease; OR
   - **ii.** The tumor is inoperable.

4. **Non-Small Cell Lung Cancer with *ROS1* Rearrangement.** Approve for 1 year if the patient meets the following (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has advanced or metastatic disease; AND
   - **C)** Patient has *ROS1* rearrangement-positive disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zykadia is not recommended in the following situations:

44. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmic – Glaucoma – Prostaglandins Prior Authorization Policy

- Bimatoprost 0.03% ophthalmic solution – generic only
- Lumigan® (bimatoprost 0.01% ophthalmic solution – Allergan)
- Rocklatan™ (netarsudil 0.02%/latanoprost 0.005% ophthalmic solution – Aerie)
- Travatan® Z (travoprost 0.004% ophthalmic solution [benzalkonium chloride-free] – Novartis, generic)
- Vyzulta™ (latanoprostene bunod 0.024% ophthalmic solution – Bausch + Lomb)
- Xalatan® (latanoprost 0.005% ophthalmic solution – Pfizer, generic)
- Xelpros™ (latanoprost 0.005% ophthalmic emulsion – Sun)
- Zioptan® (tafluprost 0.0015% ophthalmic solution – Akorn, generic)

REVIEW DATE: 04/26/2023

OVERVIEW

The various ophthalmic prostaglandin products are indicated for the reduction of elevated intraocular pressure (IOP) in patients with **open-angle glaucoma** or **ocular hypertension**.[1-8] All of these are single-entity products, except Rocklatan, which is a combination product containing a rho kinase inhibitor (netarsudil) and a prostaglandin analog (latanoprost). Bimatoprost 0.03% ophthalmic solution is also marketed as Latisse®, indicated to treat hypotrichosis of the eyelashes by increasing their growth including length, thickness, and darkness.[9] Of note, Latisse is not included in this policy.

Glaucoma, a disease that damages the eye's optic nerve, is the leading cause of blindness in people > 60 years old.[10] Reduction of IOP, regardless of the pretreatment IOP, reduces the risk of disease progression.[11] In addition, IOP reduction may prevent the onset to early glaucoma in patients with ocular hypertension.

Normal-tension glaucoma is a form of open-angle glaucoma characterized by glaucomatous optic neuropathy in patients with IOP measurements consistently < 21 mmHg.[12] According to the Glaucoma Research Foundation, normal-tension glaucoma is also referred to as low-tension glaucoma or normal-pressure glaucoma.[13] Additionally, the American Academy of Ophthalmology guidelines on primary open-angle glaucoma include normal-tension glaucoma in the recommendations for care, stating that lowering IOP reduces the risk of developing primary open-angle glaucoma and slows the progression of primary open-angle glaucoma, including normal-tension open-angle glaucoma.[11]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of ophthalmic prostaglandins for patients < 60 years of age. This age edit (for patients < 60 years of age) is used to monitor for appropriate use and to screen for cosmetic use. Prescription benefit coverage of these products for cosmetic conditions is not recommended. All approvals are provided for the duration noted below. For patients ≥ 60 years of age, coverage will be approved at the point of service. Prior Authorization and prescription benefit coverage is not recommended for Latisse.

Automation: If the patient is < 60 years of age and does not have a of one ophthalmic glaucoma agent (e.g., beta blockers, alpha adrenergic agonists, carbonic anhydrase inhibitors) within the 720-day look-back period, coverage will be determined by Prior Authorization criteria.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of ophthalmic prostaglandins is recommended in those who meet one of the following criteria:

FDA-Approved Indications

15. Ocular Hypertension. Approve for 1 year.

16. Open-Angle Glaucoma. Approve for 1 year.
Note: Open-angle glaucoma includes normal-tension glaucoma, which is also referred to as low-tension glaucoma or normal-pressure glaucoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of an ophthalmic prostaglandin is not recommended in the following situations:

45. Cosmetic Conditions (e.g., eyelash growth). Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.

46. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Dry Eye Disease – Cyclosporine Products Prior Authorization Policy
- Cequa™ (cyclosporine 0.09% ophthalmic solution – Sun Pharmaceuticals)
- Restasis® (cyclosporine 0.05% ophthalmic emulsion – Allergan, generic)
- Restasis Multidose™ (cyclosporine 0.05% ophthalmic emulsion – Allergan)
- Vevye™ (cyclosporine 0.1% ophthalmic solution – Novaliq)

REVIEW DATE: 07/12/2023; selected revision 10/11/2023

OVERVIEW

Ophthalmic cyclosporine products are indicated for the treatment of signs and symptoms of dry eye disease.[1-4] Specifically, ophthalmic cyclosporine emulsion products are indicated to increase tear production in patients whose tear production is presumed to be suppressed due to **ocular inflammation associated with keratoconjunctivitis sicca**.[1,2] Cequa is indicated to increase tear production in patients with keratoconjunctivitis sicca (dry eye).[3] Vevye is indicated for the treatment of the signs and symptoms of dry eye disease.[4]

Dry eye disease refers to a group of disorders of the tear film that are due to reduced tear production or tear instability and are associated with ocular discomfort and inflammatory disease of the ocular surface.[5] Dry eye disease is also known as dry eye syndrome and keratoconjunctivitis sicca.

The safety and efficacy of Restasis have not been established in pediatric patients < 16 years of age.[1,2] Although both Cequa and Vevye are approved for use in patients ≥ 18 years of age per product labeling, these products have the same chemical moiety as Restasis.[1-4]

Guidelines

The American Academy of Ophthalmology (AAO) published a Preferred Practice Pattern® guidelines (2018) for dry eye syndrome.[5] The AAO notes that dry eye disease may develop as a result of systemic inflammatory diseases (e.g., Sjögren syndrome, autoimmune thyroid disease, or rheumatoid arthritis) and ocular surface disease (e.g., herpes simplex virus keratitis). The AAO classifies dry eye as mild, moderate, or severe, based on signs and symptoms of the disease. Treatment recommendations of dry eye disease are listed in a four-step progression but specific therapies may be chosen from any category, regardless of the level of disease severity, depending on provider experience and patient preference. Topical non-glucocorticoid immunomodulatory drugs (such as cyclosporine) are staged as a Step 2 recommendation within the guidelines. The AAO recommends the use of topical cyclosporine as one of the treatment options for dry eye disease related to Sjögren syndrome.

The AAO Preferred Practice Pattern® guidelines for blepharitis (2018) note that blepharitis is a chronic ocular inflammation that may be associated with abnormalities with the Meibomian gland.[6] Treatment of blepharitis includes use of warm compresses, eyelid cleansing/eyelid massages, topical and/or systemic antibiotics, and ophthalmic anti-inflammatory agents (e.g., corticosteroids, cyclosporine).

The AAO Preferred Practice Pattern® guidelines for conjunctivitis (2018) note that dry eye and blepharitis are the most frequent causes of conjunctival inflammation.[7] Ophthalmic cyclosporine can be used to treat dry eye syndrome associated with GVHD and different types of conjunctivitis.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of ophthalmic cyclosporine products. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of ophthalmic cyclosporine products is recommended in those who meet one of the following criteria:

FDA-Approved Indication

1. **Dry Eye Disease.** Approve for 1 year if the patient is ≥ 16 years of age.
   Note: Examples of dry eye disease include dry eye syndrome and keratoconjunctivitis sicca.

Other Uses with Supportive Evidence

2. **Dry Eye Conditions due to Systemic Inflammatory Diseases.** Approve for 1 year if the patient is ≥ 16 years of age.
   Note: Examples of systemic inflammatory diseases that could result in dry eye conditions include Sjögren syndrome, autoimmune thyroid disease, rheumatoid arthritis.

3. **Dry Eye Conditions due to Ocular Surface Diseases.** Approve for 1 year if the patient is ≥ 16 years of age.
   Note: Examples of ocular surface diseases that could result in dry eye conditions include blepharitis, conjunctivitis, herpes simplex keratitis, ocular graft-versus-host disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of cyclosporine ophthalmic products is not recommended in the following situations:

15. **Concomitant Use with Another Ophthalmic Cyclosporine Product, Miebo (perfluorohexyloctane ophthalmic solution), Tyrvaya (varenicline nasal solution), or Xiidra (lifitegrast ophthalmic solution).** There are no data to support the concomitant use of two (or three) ophthalmic cyclosporine products or the concomitant use of an ophthalmic cyclosporine product with Miebo, Tyrvaya, or Xiidra.
    Note: Ophthalmic cyclosporine products are Cequa, Restasis, and Vevye.

16. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Dry Eye Disease – Eysuvis Prior Authorization Policy
- Eysuvis® (loteprednol etabonate 0.25% ophthalmic suspension – Kala)

REVIEW DATE: 12/06/2023

OVERVIEW
Eysuvis, an ophthalmic corticosteroid, is indicated for the **short-term (up to 2 weeks) treatment of the signs and symptoms of dry eye disease**.[1]

Guidelines
Eysuvis is not addressed in guidelines. The American Academy of Ophthalmology published a Preferred Practice Pattern® (2018) for the treatment of dry eye syndrome.[3] For mild dry eyes, education and environmental modifications, artificial tear solutions, and eyelid therapy (warm compresses and eyelid scrubs) are listed as some of the treatment options. The guidelines note commercially available loteprednol etabonate 0.5% was used in a prospective, randomized study for a 2-week period. The study found a favorable effect in patients' dry eye symptoms and conjunctival hyperemia findings.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Eysuvis. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Eysuvis is recommended in those who meet the following criteria:

FDA-Approved Indication

16. Dry Eye Disease (Short-Term Treatment). Approve for 1 month if the patient has tried artificial tears.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Eysuvis is not recommended in the following situations:

17. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Dry Eye Disease – Lacrisert Prior Authorization Policy
- Lacrisert® (hydroxypropyl cellulose ophthalmic insert – Bausch & Lomb)

REVIEW DATE: 12/06/2023

OVERVIEW

Lacrisert, an ophthalmic insert made of hydroxypropyl cellulose, is indicated for moderate to severe dry eye syndromes, including keratoconjunctivitis sicca.[1] Lacrisert is indicated especially in patients who remain symptomatic after an adequate trial of therapy with artificial tear solutions. Lacrisert is also indicated for patients with: exposure keratitis, decreased corneal sensitivity, and recurrent corneal erosions.

Guidelines

The American Academy of Ophthalmology (AAO) published Preferred Practice Pattern® (2018) for the treatment of dry eye syndrome.[2] The AAO classifies dry eye as mild, moderate, or severe, based on signs and symptoms of the disease. Treatment recommendations of dry eye disease are listed in a four-step progression, but specific therapies may be chosen from any category regardless of the level of disease severity, depending on provider experience and patient preference. Slow-release hydroxypropyl cellulose inserts are recommended within the guidelines for moderate dry eye as occasionally helpful for patients who are unable to apply artificial tears.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lacrisert. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lacrisert is recommended in those who meet the following criteria:

FDA-Approved Indication

17. Ocular Conditions Associated with Moderate to Severe Dry Eye. Approve for 1 year if the patient has tried artificial tears.
Note: Examples of ocular conditions include decreased corneal sensitivity, dry eye syndrome, exposure keratitis, keratoconjunctivitis sicca, recurrent corneal erosions.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lacrisert is not recommended in the following situations:

18. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

45. Lacrisert® ophthalmic insert [prescribing information]. Bridgewater, NJ: Bausch & Lomb; October 2019.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Dry Eye Disease – Miebo Prior Authorization Policy
- Miebo™ (perfluorohexyloctane ophthalmic solution – Bausch & Lomb)

REVIEW DATE: 06/14/2023

OVERVIEW

Miebo, a semifluorinated alkane, is indicated for the treatment of the signs and symptoms of **dry eye disease** (DED).[1] The safety and effectiveness of Miebo in pediatric patients < 18 years of age have not been established.

There are no data to support concomitant use of Miebo with other ophthalmic medications for DED (e.g., cyclosporine [Cequa™, Restasis®, Vevye™), Tyrvaya® (varencilcine nasal solution), Xiidra® (lifitegrast ophthalmic solution).

Guidelines

The American Academy of Ophthalmology (AAO) published a Preferred Practice Pattern for the treatment of dry eye syndrome (used interchangeably with DED) in 2018.[2] The AAO classifies dry eye as mild, moderate, or severe, based on signs and symptoms of the disease. Treatment recommendations for DED are listed in a four-step progression but specific therapies may be chosen from any category, regardless of the level of disease severity, depending on provider experience and patient preference.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Miebo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Miebo is recommended in those who meet the following criteria:

FDA-Approved Indication

30. Dry Eye Disease. Approve for 1 year if the patient is ≥ 18 years of age.
Note: Examples of dry eye disease include dry eye syndrome.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Miebo is not recommended in the following situations:

19. Concomitant use with an ophthalmic cyclosporine product (Cequa, Restasis, Vevye), Tyrvaya (varenicline nasal solution), or Xiidra (lifitegrast ophthalmic solution). There are no data to support the concomitant use of Miebo with Cequa/Restasis/Vevye, Tyrvaya, or Xiidra.

20. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

39. Miebo™ ophthalmic solution [prescribing information]. Bridgewater, NJ: Bausch & Lomb; May 2023.
40. Akpek E, Amescua G, Farid M, et al. American Academy of Ophthalmology Preferred Practice Pattern Cornea and External Disease Panel. Dry Eye Syndrome Preferred Practice Pattern®. *Ophthalmology*. 2019 Jan;126(1):286-334.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Dry Eye Disease – Tyrvaya Prior Authorization Policy
- Tyrvaya™ (varenicline nasal solution – Oyster Point)

REVIEW DATE: 09/20/2023

OVERVIEW

Tyrvaya, a cholinergic agonist, is indicated for the treatment of the signs and symptoms of **dry eye disease**.[1] The safety and efficacy of Tyrvaya in pediatric patients have not been established.

Guidelines

The American Academy of Ophthalmology (AAO) published a Preferred Practice Pattern (2018) for the treatment of dry eye syndrome.[2] Tyrvaya is not addressed in these guidelines. The AAO classifies dry eye as mild, moderate, or severe, based on signs and symptoms of the disease. Treatment recommendations for dry eye disease are listed in a four-step progression; however, specific therapies may be chosen from any category, regardless of the level of disease severity, depending on provider experience and patient preference. For mild dry eyes, education and environmental modifications, artificial tear solutions, and eyelid therapy (warm compresses and eyelid scrubs) are listed as some of the treatment options. Medications such as an ophthalmic cyclosporine product (Restasis®, Cequa™) or Xiidra® (lifitegrast ophthalmic solution) are recommended in moderate dry eye disease.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tyrvaya. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tyrvaya is recommended in those who meet the following criteria:

FDA-Approved Indication

31. Dry Eye Disease. Approve for 1 year if the patient meets the ALL of the following (A, B, and C):
Note: Examples of dry eye disease include dry eye syndrome.
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has tried artificial tears; AND
- **C)** The medication is prescribed by or in consultation with an ophthalmologist or optometrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tyrvaya is not recommended in the following situations:

21. **Concomitant Use With An Ophthalmic Cyclosporine Product, Miebo (perfluorohexyloctane ophthalmic solution), or Xiidra® (lifitegrast ophthalmic solution).** There are no data to support the concomitant use of Tyrvaya with an ophthalmic cyclosporine product, Miebo, or Xiidra.
    Note: Ophthalmic cyclosporine products are Cequa, Restasis, and Vevye.

22. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

42. Akpek E, Amescua G, Farid M, et al. American Academy of Ophthalmology Preferred Practice Pattern Cornea and External Disease Panel. Dry Eye Syndrome Preferred Practice Pattern®. *Ophthalmology*. 2019 Jan;126(1):286-334.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Dry Eye Disease – Xiidra Prior Authorization Policy
- Xiidra® (lifitegrast ophthalmic solution – Novartis)

REVIEW DATE: 09/20/2023

OVERVIEW

Xiidra, a lymphocyte function-associated antigen-1 (LFA-1) antagonist, is indicated for the treatment of the signs and symptoms of **dry eye disease**.[1] The safety and efficacy of Xiidra in pediatric patients have not been established.

Guidelines

The American Academy of Ophthalmology (AAO) published Preferred Practice Pattern (2018) for the treatment of dry eye syndrome.[2] The AAO classifies dry eye as mild, moderate, or severe, based on signs and symptoms of the disease. Treatment recommendations of dry eye disease are listed in a four-step progression but specific therapies may be chosen from any category, regardless of the level of disease severity, depending on provider experience and patient preference. Topical LFA-1 antagonist drugs (such as Xiidra) are staged as a Step 2 recommendation within the guidelines.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xiidra. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xiidra is recommended in those who meet the following criteria:

FDA-Approved Indication

32. Dry Eye Disease. Approve for 1 year if the patient is ≥ 18 years of age.
Note: Examples of dry eye disease include dry eye syndrome.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xiidra is not recommended in the following situations:

23. Concomitant Use with an Ophthalmic Cyclosporine Product, Miebo (perfluorohexyloctane ophthalmic solution), or Tyrvaya (varenicline nasal solution). There are no data to support the concomitant use of Xiidra with an ophthalmic cyclosporine product, Miebo, or Tyrvaya.
Note: Ophthalmic cyclosporine products are Cequa, Restasis, and Vevye.

24. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Durysta Prior Authorization Policy
- Durysta® (bimatoprost implant, for intracameral administration – Allergan)

REVIEW DATE: 04/19/2023

OVERVIEW

Durysta, a prostaglandin analog, is indicated for the reduction of intraocular pressure (IOP) in patients with **open-angle glaucoma** or **ocular hypertension**.[1]

Disease Overview

Glaucoma, a disease that damages the eye's optic nerve, is the leading cause of blindness in people > 60 years of age.[2] Reduction of IOP, regardless of the pretreatment IOP, reduces the risk of disease progression.[3] In addition, IOP reduction may prevent the onset of early glaucoma in patients with ocular hypertension.

Ophthalmic prostaglandins, beta-blockers, alpha-agonist (brimonidine), carbonic anhydrase inhibitors, rho kinase inhibitor (netarsudil), and fixed combination products are used to treat glaucoma.[3,4] The choice of product is influenced by potential cost, adverse event profile, dosing schedule, and the degree of pressure lowering needed.[3]

Dosing Considerations

Durysta, a biodegradable implant, is given as a single intracameral administration.[1] Durysta should not be re-administered to an eye that was previously treated with Durysta.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Durysta. All approvals are provided for one implant per treated eye (i.e., one implant per treated eye; maximum of two implants per patient). Note that a 1-month (30 days) approval duration is applied to allow for the one-time treatment of one or both eye(s). Because of the specialized skills required for evaluation and diagnosis of patients treated with Durysta as well as the monitoring required for adverse events and long-term efficacy, approval requires Durysta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Durysta is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Ocular Hypertension.** Approve for a one-time use in each treated eye (i.e., one implant per treated eye; a total of two implants per patient) if the patient meets ALL of the following criteria (A, B, C, D, and E):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient is not receiving re-treatment of eye(s) previously treated with Durysta; AND
   - **C)** Patient meets BOTH of the following criteria (i and ii):
     - **i.** Patient has tried at least two ophthalmic prostaglandins (either as monotherapy or as concomitant therapy) for the treatment of open-angle glaucoma or ocular hypertension; AND
       Note: Examples of ophthalmic prostaglandins include bimatoprost 0.03% ophthalmic solution, latanoprost 0.005% ophthalmic solution, travoprost 0.004% ophthalmic solution; Lumigan (bimatoprost 0.01% ophthalmic solution), Vyzulta (latanoprostene bunod 0.024% ophthalmic solution), Xelpros (latanoprost 0.005% ophthalmic emulsion), and tafluprost 0.0015% ophthalmic solution), Iyuzeh (latanoprost 0.005% ophthalmic solution), and Omlonti (omidenepag isopropyl 0.002% ophthalmic solution).
     - **ii.** Patient has tried at least two ophthalmic products (either as monotherapy or as concomitant therapy) from two different pharmacological classes for the treatment of open-angle glaucoma or ocular hypertension; AND
       Note: Examples of pharmacological classes of ophthalmic products for the treatment of open-angle glaucoma or ocular hypertension include beta-blockers, alpha-agonist (brimonidine), carbonic anhydrase inhibitors, and rho kinase inhibitor (netarsudil).
   - **D)** For each of the ophthalmic medications that were tried, the patient meets ONE of the following criteria (i or ii):
     - **i.** Patient has had inadequate efficacy to the previously tried ophthalmic products, according to the prescriber; OR
     - **ii.** Patient has experienced adverse event(s) severe enough to warrant discontinuation of the previously tried ophthalmic products, according to the prescriber; AND
   - **E)** The medication is prescribed by or in consultation with an ophthalmologist.

2. **Open-Angle Glaucoma.** Approve for a one-time use in each treated eye (i.e., one implant per treated eye; a total of two implants per patient) if the patient meets ALL of the following criteria (A, B, C, D, and E):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient is not receiving re-treatment of eye(s) previously treated with Durysta; AND
   - **C)** Patient meets BOTH of the following criteria (i and ii):
     - **i.** Patient has tried at least two ophthalmic prostaglandins (either as monotherapy or as concomitant therapy) for the treatment of open-angle glaucoma or ocular hypertension; AND
       Note: Examples of ophthalmic prostaglandins include bimatoprost 0.03% ophthalmic solution, latanoprost 0.005% ophthalmic solution, travoprost 0.004% ophthalmic solution; Lumigan (bimatoprost 0.01% ophthalmic solution), Vyzulta (latanoprostene bunod 0.024% ophthalmic solution), Xelpros (latanoprost 0.005% ophthalmic emulsion), tafluprost 0.0015% ophthalmic solution, Iyuzeh (latanoprost 0.005% ophthalmic solution), and Omlonti (omidenepag isopropyl 0.002% ophthalmic solution).
     - **ii.** Patient has tried at least two ophthalmic products (either as monotherapy or as concomitant therapy) from two different pharmacological classes for the treatment of open-angle glaucoma or ocular hypertension; AND
       Note: Examples of pharmacological classes of ophthalmic products for the treatment of open-angle glaucoma or ocular hypertension include beta-blockers, alpha-agonist (brimonidine), carbonic anhydrase inhibitors, and rho kinase inhibitor (netarsudil).

D) For each of the ophthalmic medications that were tried, the patient meets ONE of the following criteria (i or ii):
- **i.** Patient has had inadequate efficacy to the previously tried ophthalmic products, according to the prescriber; OR
- **ii.** Patient has experienced adverse event(s) severe enough to warrant discontinuation of the previously tried ophthalmic products, according to the prescriber; AND

E) The medication is prescribed by or in consultation with an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Durysta is not recommended in the following situations:

25. Re-Treatment of Previously-Treated Eye(s). Durysta is approved for a one-time use in each treated eye. Repeat administration in previously treated eye(s) is not approvable.

26. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Gene Therapy – Luxturna Prior Authorization Policy
- Luxturna® (voretigene neparvovec-rzyl subretinal injection – Spark Therapeutics)

REVIEW DATE: 02/22/2023

OVERVIEW

Luxturna, an adeno-associated virus vector-based gene therapy, is indicated for the treatment of patients with confirmed **biallelic human retinal pigment epithelial 65 kDa protein (RPE65) mutation-associated retinal dystrophy**.[1] Patients must have viable retinal cells as determined by the treating physician(s).

Luxturna is made up of a live, non-replicating adeno-associated virus serotype 2 which has been genetically modified to express the human RPE65 gene.[1] Luxturna is designed to deliver a normal copy of the gene encoding RPE65 to cells of the retina in patients with reduced or absent levels of biologically active RPE65. Treatment with Luxturna is not recommended for patients younger than 12 months of age, because the retinal cells are still undergoing cell proliferation, and Luxturna would potentially be diluted or lost during cell proliferation. The safety and effectiveness of Luxturna have not been established in geriatric patients. Clinical studies of Luxturna for this indication did not include patients ≥ 65 years of age.

Disease Overview

Inherited retinal dystrophies are a broad group of genetic retinal disorders that are associated with progressive visual dysfunction.[2] RPE65 mutation-associated retinal dystrophy is associated with numerous discrete gene mutations and affects 1,000 to 2,000 patients in the US. Mutations in the RPE65 gene lead to reduced or absent levels of RPE65 isomerohydrolase activity.[1] The absence of RPE65 leads to the accumulation of toxic precursors, damage to RPE-producing cells, and, over time, damage to photoreceptors, progressing to near total blindness in most patients.

Dosing Information

The recommended dose of Luxturna for each eye is 1.5×10^{11} vector genomes (vg) administered once per eye by subretinal injection.[1] After completing a vitrectomy (removal of the vitreous gel that fills the eye cavity) and under direct visualization, a small amount of Luxturna is injected slowly until an initial subretinal bleb is observed; the remaining volume is then injected slowly until the total 0.3 mL is delivered. Luxturna should be injected into each eye on separate days within a close interval, but no less than 6 days apart.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Luxturna. All approvals are provided for one injection per eye. Note: A 1-month (30 days) approval duration is applied to allow for the one-time treatment of both eyes. Because of the specialized skills required for evaluation and diagnosis of a patient treated with Luxturna as well as the specialized training required for administration of Luxturna, approval requires Luxturna to be administered by a retinal specialist. All reviews (approvals and denials) will be forwarded to the Medical Director for evaluation. Some clients have elected Embarc Benefit Protection. For these clients, the Medical Director will coordinate with eviCore to ensure the Embarc Benefit Protection portion of the review has been completed. If the Embarc Benefit Protection portion of

the review has not been completed, the Medical Director will route to Embarc@eviCore.com prior to completing the review.

Documentation: Documentation is required for use of Luxturna as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts, and/or other information.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Luxturna is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Biallelic Human Retinal Pigment Epithelial 65 kDa Protein (RPE65) Mutation-Associated Retinal Dystrophy.** Approve for a one-time treatment course (i.e., a total of two injections, one injection in each eye) if the patient meets the following criteria (A, B, C, D, and E):
   - **A)** Patient has a genetically confirmed diagnosis of biallelic RPE65 mutation-associated retinal dystrophy **[documentation required]**; AND
   - **B)** Patient is ≥ 12 months of age and < 65 years of age **[documentation required]**; AND
   - **C)** Luxturna is administered by a retinal specialist **[documentation required]**; AND
   - **D)** Patient must have viable retinal cells as determined by the treating physician **[documentation required]**; AND
   - **E)** Patient is not receiving retreatment of eye(s) previously treated with Luxturna **[documentation required]**.

   Dosing. Approve the following dosing regimen (A and B):
   - **A)** One 1.5 x 10^{11} vector genomes (vg) injection administered by subretinal injection into each eye; AND
   - **B)** The doses for the first eye and the second eye are separated by at least 6 days (i.e., injection of the second eye occurs 6 or more days after injection of the first eye).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Luxturna is not recommended in the following situations:

47. **Retreatment of previously treated eye(s)**. Luxturna is for one time use in each eye. Repeat dosing in previously treated eye(s) is not approvable.

48. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Izervay Prior Authorization Policy
- Izervay™ (avacincaptad pegol intravitreal injection – Iveric)

REVIEW DATE: 08/16/2023

OVERVIEW

Izervay, a complement C5 inhibitor, is indicated for the treatment of **geographic atrophy (GA) secondary to age-related macular degeneration (AMD)**.[1]

Disease Overview

AMD, a chronic, multifactorial, progressive central retinal disease, is the leading cause of irreversible blindness in the elderly population.[2-4] GA is a chronic progressive degeneration of the macula and is an advanced stage of AMD.[4,5] Approximately 20% of individuals with AMD will develop GA. GA is characterized by localized atrophy of the outer retinal tissue and irreversible loss of photoreceptors, retinal pigment epithelium, and choriocapillaris.[4-6] Initially, the GA lesions appear in the perifoveal macula but over time, the lesions often expand and coalesce to include the fovea. As the atrophic area expands, visual function and/or acuity decreases. In the clinical studies, patients had GA secondary to AMD with a best-corrected visual acuity (BCVA) between 20/25 and 20/320.[7,8]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Izervay. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Izervay as well as the monitoring required for adverse events and long-term efficacy, approval requires Izervay to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Izervay is recommended in those who meet the following criteria:

FDA-Approved Indication

18. Geographic Atrophy. Approve for 1 year if the patient meets the following (A, B, and C):
- **A)** Patient has geographic atrophy secondary to age-related macular degeneration; AND
- **B)** Patient has a best corrected visual acuity (BCVA) in the affected eye of between 20/25 and 20/320 letters; AND
- **C)** The medication is administered by or under the supervision of an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Izervay is not recommended in the following situations:

27. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Syfovre Prior Authorization Policy
- Syfovre™ (pegcetacoplan intravitreal injection – Apellis)

REVIEW DATE: 03/01/2023

OVERVIEW

Syfovre, a complement 3 inhibitor, is indicated for the treatment of **geographic atrophy (GA) secondary to age-related macular degeneration (AMD)**.[1]

Disease Overview

AMD, a chronic, multifactorial, progressive central retinal disease, is the leading cause of irreversible blindness in the elderly population.[2,3] There are two types of AMD: exudative or neovascular ("wet") and nonexudative or ("dry"). GA, a chronic progressive degeneration of the macula, is an advanced stage of dry AMD.[3,4] GA is characterized by localized atrophy of the outer retinal tissue and irreversible loss of photoreceptors, retinal pigment epithelium, and choriocapillaris.[3-5] Initially, the GA lesions appear in the perifoveal macula but over time, the lesions often expand and coalesce to include the fovea.[5,6] Area of the lesions is associated with a corresponding loss of visual function.[6]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Syfovre. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Syfovre as well as the monitoring required for adverse events and long-term efficacy, approval requires Syfovre to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Syfovre is recommended in those who meet the following criteria:

FDA-Approved Indication

19. Geographic Atrophy. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **D)** Patient has geographic atrophy secondary to age-related macular degeneration; AND
- **E)** Patient has a best corrected visual acuity (BCVA) of 24 letters or better using Early Treatment Diabetic Retinopathy Study (ETDRS) charts; AND

Note: BCVA of 24 letters or better is approximately 20/320 Snellen equivalent.
- **F)** The medication is administered by or under the supervision of an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Syfovre is not recommended in the following situations:

28. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Tepezza Prior Authorization Policy
- Tepezza™ (teprotumumab intravenous infusion – Horizon)

REVIEW DATE: 01/18/2023

OVERVIEW

Tepezza, an insulin-like growth factor-1 receptor (IGF-1R) antagonist, is indicated for the treatment of **thyroid eye disease**, regardless of thyroid eye disease activity or duration.[1]

The Tepezza labeling (indication) was revised in April 2023 to include "regardless of thyroid eye disease activity or duration".[1] This change was supported by data from a Phase IV study.[2,3] However, full analysis of the data is not yet available. Based on limited available data, criteria changes are not needed at this time.

Disease Overview

Thyroid eye disease is a progressive, vision-threatening autoimmune inflammatory disease of the eye and orbital tissues with predominant features of fibrosis and adipogenesis.[4] It is also recognized in literature as Graves' ophthalmopathy, Graves' orbitopathy, thyroid-associated ophthalmopathy, and thyroid orbitopathy. Thyroid eye disease is most commonly related to Graves' disease, it can also develop in patients with other thyroid diseases (e.g., Hashimoto's thyroiditis) and has a higher prevalence in women than men (16 per 100,000 vs. 3 per 100,000, respectively).[5] In active disease, orbital fibroblasts appear responsible for soft tissue enlargement by expressing potential pathogenic autoantigens, such as thyrotropin receptor and IGF-1R.[4] Activation of orbital fibroblasts leads to increased hyaluronic acid production, proinflammatory cytokine synthesis, and enhanced differentiation into either myofibroblasts or adipocytes. These processes result in inflammation, enlargement of extraocular muscles and expansion of orbital tissue and fat, which in turn cause forward displacement of the eye, resulting in proptosis and inflammation.[6] The degree of severity can be staged as mild, moderate-to-severe, or sight-threatening, following quantitative assessment of lid aperture width, proptosis measurement, diplopia score, degrees of abduction in eye muscle movement, examination of the cornea for evidence of exposure keratitis or ulceration, and assessment of optic nerve function.

Dosing Information

The recommended dose is 10 mg/kg administered by intravenous (IV) infusion for the initial dose, followed by 20 mg/kg administered intravenously once every 3 weeks for seven additional doses.[1]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tepezza. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tepezza as well as the monitoring required for adverse events and long-term efficacy, approval requires Tepezza to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tepezza is recommended in those who meet the following criteria:

FDA-Approved Indication

20. Thyroid Eye Disease. Approve for 6 months if the patient meets the following criteria (A, B, C, and D):
Note: Thyroid Eye Disease is also recognized as Graves' ophthalmopathy, Graves' orbitopathy, thyroid-associated ophthalmopathy, and thyroid orbitopathy.
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has been assessed as having active disease of at least moderate severity based on signs and symptoms, according to the prescriber; AND
  Note: Examples of active disease of at least moderate severity include the degree of inflammation, degree of proptosis, presentation of diplopia.
- **C)** Patient has not received 8 doses (total) of Tepezza; AND
  Note: The maximum recommended treatment is for 8 doses. For a patient who has started therapy but has not completed 8 doses, approve the number of doses required for the patient to receive a total of 8 doses.
- **D)** The medication is prescribed by or in consultation with an ophthalmologist, endocrinologist, or a physician who specializes in thyroid eye disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tepezza is not recommended in the following situations:

29. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Upneeq Prior Authorization Policy
- Upneeq® (oxymetazoline hydrochloride 0.1% ophthalmic solution –RVL Pharmaceuticals)

REVIEW DATE: 09/20/2023

OVERVIEW
Upneeq, an alpha-adrenergic agonist, is indicated for the treatment of **acquired blepharoptosis** in adults.[1]

Disease Overview and Clinical Efficacy
Blepharoptosis, also known as ptosis, is a common condition defined by abnormal drooping of one or both upper eyelids.[2,3] Overall incidence ranges from 4.7% to 13.5% in adults. Prevalence increases with age; a United Kingdom study reported that prevalence increased from 2.4% in patients 50 to 59 years of age to 20.8% in patients ≥ 70 years of age.[3] Blepharoptosis is either congenital or acquired (underlying etiology include involutional, neurogenic, myogenic, traumatic, or mechanical).[2,3] Transient ptosis can also occur following ocular procedures (e.g., cataract surgery). The most common cause of acquired ptosis is stretching, dehiscence, or disinsertion of the levator muscle complex related to aging. Ptosis can partially or completely affect vision and it can also affect patients' appearance, which can increase levels of anxiety and depression. Surgical interventions are the standard of care and are effective in improving the visual field. However, surgery may be associated with complications and risks of asymmetry, under- or over-correction which can require surgical revision, bleeding, and infection.

Guidelines
Upneeq is not addressed in guidelines. The American Academy of Ophthalmology issued a report (2011) detailing functional indications for upper eyelid ptosis and blepharoplasty surgery; various quantitative and qualitative criteria may be used to identify appropriate surgical candidates.[4] Surgical techniques vary and outcomes data are limited to low-level evidence (case series). Some studies have demonstrated median improvements of 13 points in the Leicester Peripheral Field Test (LPFT) score following surgical interventions.

POLICY STATEMENT
Due to insufficient clinical efficacy data, **approval of Upneeq is not recommended**. Current Upneeq efficacy information is insufficient to determine if the medication demonstrates any clinically meaningful benefits.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Upneeq is not recommended in the following situations:

30. **Blepharoptosis.** Due to insufficient clinical efficacy data, approval of Upneeq for treatment of blepharoptosis is not recommended. Upneeq was studied in two randomized, double-masked, placebo-controlled, multicenter Phase III studies (published) [n = 304].[1,2] Patients with acquired ptosis and superior visual field deficit in at least one eye at screening were randomized 2:1 to Upneeq or vehicle. Study medication was self-administered as a single drop per eye, once daily in the morning for 42 days (6 weeks). The primary endpoint was change from baseline in number of points seen in the top four rows on the Leicester Peripheral Field test (LPFT), which assesses superior visual field deficits due to ptosis on Day 1 (6 hours after instillation) and Day 14 (2 hours after instillation). The secondary endpoint was change from baseline in marginal reflex distance 1 (MRD1), which is the distance between the center of the papillary light reflex and the upper eyelid margin with the eye in primary gaze, on Days 1 and 14. Although Upneeq provided a statistically significant incremental benefit over vehicle in LPFT, the difference between the groups was small compared with what is typically observed following surgical interventions. Significantly greater, but numerically small, changes in MRD1 from baseline were observed in the Upneeq group vs. vehicle. It is unclear if these incremental changes (between Upneeq and vehicle) would correspond with clinically meaningful improvement. In addition, the studies were 6 weeks in duration (primary and secondary endpoints were assessed on Days 1 and 14); there are no long-term efficacy data for Upneeq for this condition. Upneeq's role in the management of patients with blepharoptosis is not established.

31. **Conjunctivitis.** Oxymetazoline solution 0.1% has not been evaluated for conjunctivitis.

32. **Cosmetic uses.** Coverage of Upneeq for cosmetic uses (i.e., blepharoptosis when functional limitation is absent) is not recommended as cosmetic uses are excluded from coverage in a typical pharmacy benefit.

33. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Beovu Prior Authorization Policy
- Beovu® (brolucizumab-dbll intravitreal injection – Novartis)

REVIEW DATE: 11/15/2023

OVERVIEW

Beovu, a vascular endothelial growth factor (VEGF) inhibitor, is indicated for the following uses:[1]
- **Diabetic macular edema**.
- **Neovascular (wet) age-related macular degeneration**.

Other Uses with Supportive Evidence

Overproduction of VEGF may lead to other eye conditions, including neovascular glaucoma, retinopathy of prematurity, and other retinal and choroidal neovascular conditions affecting the eye.[2,3] The VEGF inhibitors have the potential to be used off-label to reduce or slow visual impairment or vision loss associated with other eye conditions related to increased VEGF production.[2,4,5] The use of anti-VEGF agents have been shown to stop the angiogenic process and maintain visual acuity and improve vision in patients with certain neovascular ophthalmic conditions; therefore, research is rapidly evolving on the use of VEGF inhibitors in other neovascular ophthalmic conditions which threaten vision.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Beovu. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Beovu as well as the monitoring required for adverse events and long-term efficacy, approval requires Beovu to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Beovu is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Diabetic Macular Edema.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

2. **Neovascular (Wet) Age-Related Macular Degeneration.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

Other Uses with Supportive Evidence

3. Other Neovascular Diseases of the Eye. Approve for 1 year if administered by or under the supervision of an ophthalmologist.
Note: Examples of other neovascular diseases of the eye include neovascular glaucoma, retinopathy of prematurity, sickle cell neovascularization, choroidal neovascular conditions.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Beovu is not recommended in the following situations:

34. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Eylea and Eylea HD Prior Authorization Policy
- Eylea® (aflibercept intravitreal injection – Regeneron)
- Eylea® HD (aflibercept intravitreal injection – Regeneron)

REVIEW DATE: 11/15/2023

OVERVIEW

Eylea, a vascular endothelial growth factor (VEGF) inhibitor, is indicated for the following uses:[1]
- **Diabetic macular edema**.
- **Diabetic retinopathy**.
- **Macular edema following retinal vein occlusion**.
- **Neovascular (wet) age-related macular degeneration**.
- **Retinopathy of Prematurity**.

Eylea HD, a high dose VEGF inhibitor, is indicated for the following uses:[6]
- **Diabetic macular edema**.
- **Diabetic retinopathy**.
- **Neovascular (wet) age-related macular degeneration**.

Other Uses with Supportive Evidence for Eylea

Overproduction of VEGF may lead to other eye conditions, including neovascular glaucoma, retinopathy of prematurity, and other retinal and choroidal neovascular conditions affecting the eye.[2,3] The VEGF inhibitors have the potential to be used off-label to reduce or slow visual impairment or vision loss associated with other eye conditions related to increased VEGF production.[2,4,5] The use of anti-VEGF agents have been shown to stop the angiogenic process and maintain visual acuity and improve vision in patients with certain neovascular ophthalmic conditions; therefore, research is rapidly evolving on the use of VEGF inhibitors in other neovascular ophthalmic conditions which threaten vision.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Eylea and Eylea HD. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Eylea and Eylea HD as well as the monitoring required for adverse events and long-term efficacy, approval requires Eylea and Eylea HD to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Eylea is recommended in those who meet one of the following criteria:

FDA-Approved Indications

4. Diabetic Macular Edema. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

5. Diabetic Retinopathy. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

6. Macular Edema Following Retinal Vein Occlusion. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

7. Neovascular (Wet) Age-Related Macular Degeneration. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

8. Retinopathy of Prematurity. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

Other Uses with Supportive Evidence

9. Other Neovascular Diseases of the Eye. Approve for 1 year if administered by or under the supervision of an ophthalmologist.
Note: Examples of other neovascular diseases of the eye include neovascular glaucoma, sickle cell neovascularization, and choroidal neovascular conditions.

II. Coverage of Eylea HD is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Diabetic Macular Edema.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

35. Diabetic Retinopathy. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

36. Neovascular (Wet) Age-Related Macular Degeneration. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Eylea and Eylea HD is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Susvimo Prior Authorization Policy
- Susvimo™ (ranibizumab intravitreal injection via ocular implant – Genentech)

REVIEW DATE: 11/15/2023

OVERVIEW

Susvimo, a vascular endothelial growth factor (VEGF) inhibitor, is indicated for the treatment of patients with **neovascular** (wet) **age-related macular degeneration** (nAMD) who have previously responded to at least two intravitreal injections of a VEGF inhibitor.[1] In contrast to the other VEGF inhibitor products which are administered as intravitreal injections, Susvimo is an intravitreal implant.

Safety

Susvimo has a Boxed Warning regarding endophthalmitis, which occurred at a 3-fold higher rate with Susvimo vs. Lucentis (1.7% vs. 0.5% in active-controlled trials).[1] Additional Warnings associated with the implant and/or implant-related procedures unique to Susvimo include rhegmatogenous retinal detachment, implant dislocation, vitreous hemorrhage, conjunctival erosion or retraction, conjunctival bleb, postoperative decrease in visual acuity, air bubbles causing improper filling of the implant, and deflection of the implant. These Warnings/Precautions are unique to Susvimo (among the injectable VEGF inhibitor class) and in general, many of these Warnings/Precautions are associated with the Susvimo implant and/or other implant-related procedures.

POLICY STATEMENT

Due to the safety concerns, **approval is not recommended** for Susvimo. There are significant risks associated with use based on the Boxed Warning regarding endophthalmitis.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Susvimo is not recommended in the following situations:

38. Neovascular (Wet) Age-Related Macular Degeneration. Due to the safety data, approval is not recommended for Susvimo. In the pivotal trial, Susvimo demonstrated non-inferiority compared with Lucentis.[1-3] However, ocular adverse events were more frequent with Susvimo vs. Lucentis; patients treated with Susvimo require regular monitoring to evaluate for presence of these adverse events. Notably, Susvimo labeling includes a unique Boxed Warning regarding endophthalmitis, which was three times more frequent with Susvimo vs. Lucentis.

39. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Verkazia Prior Authorization Policy
- Verkazia® (cyclosporine 0.1% ophthalmic emulsion – Santen)

REVIEW DATE: 01/18/2023

OVERVIEW

Verkazia, a calcineurin inhibitor immunosuppressant, is indicated for the treatment of **vernal keratoconjunctivitis** in patients ≥ 4 years of age.[1]

Guidelines

Verkazia is not addressed in guidelines. However, ophthalmic cyclosporine products (in strengths of 0.05% and 2%) are discussed for the treatment of vernal keratoconjunctivitis in the American Academy of Ophthalmology Conjunctivitis Preferred Practice Pattern recommendations (2018).[2] Commercially available 0.05% ophthalmic cyclosporine has demonstrated efficacy with more frequent dosing for the treatment of vernal conjunctivitis. It has been shown to reduce signs and symptoms, prevent seasonal recurrences, and may reduce use of topical steroids. Besides cyclosporine, other medications recommended for maintenance of vernal keratoconjunctivitis include ocular lubricants, antihistamines (oral and ophthalmic), and ophthalmic mast-cell stabilizers. Ophthalmic corticosteroids are reserved for acute exacerbations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Verkazia. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Verkazia as well as the monitoring required for adverse events and long-term efficacy, approval requires Verkazia to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Verkazia is recommended in those who meet the following criteria:

FDA-Approved Indication

10. Vernal Keratoconjunctivitis. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 4 years of age; AND
- **B)** According to the prescriber, the patient has moderate to severe vernal keratoconjunctivitis; AND
- **C)** Patient meets one of the following (i or ii):
  - **i.** Patient has tried two single-action ophthalmic medications (i.e., ophthalmic mast-cell stabilizers or ophthalmic antihistamines) for the maintenance treatment of vernal keratoconjunctivitis; OR

Note: Examples of single-action ophthalmic medications for the maintenance treatment of vernal keratoconjunctivitis include ophthalmic mast-cell stabilizers (e.g., cromolyn ophthalmic solution, Alomide ophthalmic solution]) and ophthalmic antihistamines (e.g., Zerviate [cetirizine ophthalmic solution]).

ii. Patient has tried one dual-action ophthalmic mast-cell stabilizer/antihistamine product for the maintenance treatment of vernal keratoconjunctivitis; AND

Note: Examples of dual-action ophthalmic mast-cell stabilizer/antihistamine products include azelastine ophthalmic solution, beoptastine ophthalmic solution, epinastine ophthalmic solution, ketotifen ophthalmic solution, Lastacaft, and olopatadine ophthalmic solution.

Note: An exception to the requirement for a trial of two single-action ophthalmic medications (i.e., ophthalmic mast-cell stabilizers or ophthalmic antihistamines) or one dual-action ophthalmic mast-cell stabilizer/antihistamine product for the maintenance treatment of vernal keratoconjunctivitis can be made if the patient has already tried at least one ophthalmic cyclosporine product (e.g., Cequa [cyclosporine 0.09% ophthalmic solution], Restasis [cyclosporine 0.05% ophthalmic emulsion]) other than the requested medication.

D) The medication is prescribed by or in consultation with an optometrist or ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Verkazia is not recommended in the following situations:

40. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Oxervate Prior Authorization Policy
- Oxervate™ (cenegermin-bkbj ophthalmic solution – Dompé)

REVIEW DATE: 06/14/2023

OVERVIEW

Oxervate, a recombinant human nerve growth factor, is indicated for the treatment of **neurotrophic keratitis**.[1]

Duration of Treatment

The recommended dosing regimen is one drop six times a day (at 2 hour intervals) for 8 weeks.[1] In one of the pivotal studies, five patients who experienced a recurrence of neurotrophic keratitis after an 8-week course of Oxervate were re-treated with another 8 weeks of Oxervate.[2] Four of these patients achieved corneal healing, which was maintained through the end of the follow-up period.

Disease Overview

Neurotrophic keratitis, a rare degenerative disease, is characterized by corneal epithelium breakdown, impairment of corneal healing, and development of corneal ulceration, melting, and perforation.[3-6] Corneal epithelial cells release various neurotrophic growth factors, including nerve growth factors, which are important in maintaining the integrity and function of the ocular surface and in stimulating both epithelial and nerve fiber proliferation and survival.[7,8] When corneal sensory innervation is impaired, reduction of both protective reflexes and trophic neuromodulators essential for the vitality, metabolism, and wound healing of the ocular surface tissues results. *In vivo* studies have shown that increasing nerve growth factor concentration after injury can accelerate healing.[4,8]

Guidelines/Recommendations

Neurotrophic keratosis is classified into three stages: Stage 1 (mild), corneal epithelial changes; Stage 2 (moderate), corneal epithelial defect; Stage 3 (severe), corneal ulcer, perforation, melting.[6] Prior to the approval of Oxervate, there were no approved pharmacologic therapies for the treatment of neurotrophic keratitis.[3] If neurotrophic keratitis is left untreated, the condition can progress to anatomical loss of the eye; even with treatment, loss of vision is common.[6,7] Treatment should target corneal sensory innervation impairment to restore corneal integrity; treatment goals are to stop progression and promote epithelial healing.

There are no formal clinical guidelines, although there are expert opinion on the diagnosis and treatment of neurotrophic keratitis.[6] Optimal care requires identifying and treating the underlying causes of neurotrophic keratitis; for example, using antiviral medications for herpetic disease, correcting eyelid abnormalities, controlling hemoglobin A1c levels in patients with diabetes, and providing supportive therapy for limbal stem cell deficiency. For all stages, optimal care includes discontinuation of all preservative-containing ophthalmic medications to the extent possible and use of preservative-free tear substitutes or lubricants is recommended. For patients with Stage 2 disease, Oxervate, prophylactic ophthalmic preservative-free antibiotics, oral tetracyclines (e.g., doxycycline), corneal therapeutic contact lenses, and fresh-frozen self-retained amniotic membrane may be considered. For patients with Stage 3 disease, all of the listed options for Stage 2 disease as well as synthetic tissue adhesive, tarsorrhaphy, amniotic membrane transplant, and corneal neurotization are optimal treatments.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Oxervate. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Oxervate as well as the monitoring required for adverse events and long-term efficacy, approval requires Oxervate to be prescribed by a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Oxervate is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Neurotrophic Keratitis.** Approve if the patient meets the following criteria (A or B):
   Note: The initial course is 8 weeks of treatment with Oxervate in the affected eye. If the patient has not yet received a total of 8 weeks of treatment in the affected eye, review under Initial Course. If the patient has already received at least 8 weeks of treatment in the affected eye, review under Recurrence.
   A) Initial Course. Approve up to 8 weeks per affected eye(s) if the patient meets the following criteria (i and ii):
   Note: For example, if the patient has already received 2 weeks of treatment with Oxervate, an additional 6 weeks may be approved. This allows for a total of 8 weeks of treatment per affected eye(s).
      i. Patient has previously received < 8 weeks of treatment in the affected eye(s); AND
      ii. The medication is prescribed by an ophthalmologist or optometrist; OR
   B) Recurrence. Approve up to 8 weeks per affected eye(s) if the patient meets the following criteria (i and ii):
   Note: For example, if the patient has already received 8 weeks of treatment with Oxervate, an additional 8 weeks may be approved. This allows for a total of 16 weeks of treatment per affected eye(s).
      i. Patient has previously received at least 8 weeks but less than 16 weeks of treatment per affected eye(s); AND
      ii. The medication is prescribed by an ophthalmologist or optometrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Oxervate is not recommended in the following situations:

1. **Treatment Duration of > 16 Weeks Per Affected Eye(s).** Available data supports use of Oxervate for up to 16 weeks.[2,7]

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Vabysmo Prior Authorization Policy
- Vabysmo® (faricimab-svoa intravitreal injection – Genentech)

REVIEW DATE: 11/15/2023

OVERVIEW

Vabysmo, a vascular endothelial growth factor (VEGF) and angiopoietin-2 (Ang-2) inhibitor, is indicated for the following uses:[1]

- **Diabetic macular edema** (DME).
- **Macular edema following retinal vein occlusion (RVO).**
- **Neovascular (wet) age-related macular degeneration** (nAMD).

For the indication of macular edema following RVO, Vabysmo is recommended for use for 6 months.[1] The prescribing information does not note a duration of treatment for DME or nAMD.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vabysmo. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Vabysmo as well as the monitoring required for adverse events and long-term efficacy, approval requires Vabysmo to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vabysmo is recommended in those who meet one of the following criteria:

FDA-Approved Indications

6. Diabetic Macular Edema. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

7. Macular edema following retinal vein occlusion. Approve for 6 months if administered by or under the supervision of an ophthalmologist.

3. Neovascular (Wet) Age-Related Macular Degeneration. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vabysmo is not recommended in the following situations:

41. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

92. Vabysmo® intravitreal injection [prescribing information]. South San Francisco, CA: Genentech; October 2023.

PRIOR AUTHORIZATION POLICY

POLICY: Opioids – Fentanyl Transmucosal Drugs Prior Authorization Policy

- Abstral® (fentanyl sublingual tablet – Sentynl [obsolete as of 12/2016])
- Actiq® (oral transmucosal fentanyl citrate – Teva, generic)
- Fentora® (fentanyl buccal tablet – Teva, authorized generic)
- Lazanda® (fentanyl nasal spray – West Therapeutic Development [obsolete as of 12/30/2022])
- Subsys® (fentanyl sublingual spray – West Therapeutic Development)

REVIEW DATE: 11/15/2023

OVERVIEW

The transmucosal fentanyl drugs are indicated only for the management of **breakthrough pain in patients with cancer** who are already receiving and who are tolerant to opioid therapy for their underlying persistent cancer pain.[1-6]

Actiq (generic), Abstral (obsolete as of 12/2016), Fentora, and Subsys are immediate-release oral transmucosal formulations of fentanyl citrate.[1-5] Lazanda (obsolete as of 12/30/2022) is a nasal spray intended for intranasal transmucosal administration.[6] Patients considered opioid tolerant are those who are taking at least 60 mg of oral morphine daily, at least 25 mcg of transdermal fentanyl/hour, at least 30 mg of oxycodone daily, at least 8 mg oral hydromorphone daily, at least 25 mg oral oxymorphone daily, or an equianalgesic dose of another opioid for one week or longer. The appropriate dosing and safety of Actiq (generic) in opioid-tolerant children with breakthrough cancer pain have not been established in those below 16 years of age.[1,3] The safety and efficacy of Abstral, Fentora, Subsys, and Lazanda have not been established in pediatric patients below 18 years of age.[2,4-6]

The transmucosal fentanyl drugs are contraindicated in the management of acute or postoperative pain and in patients with known intolerance or hypersensitivity to any components or the drug fentanyl.[1-6] In addition, these products must not be used in patients who are not opioid tolerant (contraindicated). The transmucosal fentanyl drugs are approved for use only in the care of cancer patients and only by healthcare professionals[1-5] (oncologists and pain specialists)[2,3,6] who are knowledgeable of and skilled in the use of Schedule II opioids to treat cancer pain. Because of the risk of misuse, abuse, addition, and overdose, these products are available only through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called the Transmucosal Immediate-Release Fentanyl (TIRF) REMS ACCESS program. Under the TIRF REMS ACCESS program, outpatients, prescribers who prescribe to outpatients, pharmacies, and distributors must enroll in the program.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of fentanyl transmucosal drugs. All approvals are provided for the duration noted below.

Automation: If the patient has a prescription for a cancer medication (see Appendix A) within a 180-day period, the claim will adjudicate. When available, the ICD-10 codes for cancer will be used as part of automation to allow approval of the requested medication (see Appendix B).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of fentanyl transmucosal drugs is recommended for those who meet the following criteria:

FDA-Approved Indication

1. **Breakthrough Pain in a Patient with Cancer.** Approve for 1 year if the patient meets the following (A and B):
   - **A)** Patient meets ONE of the following conditions (i or ii):
   - **i.** Patient is unable to swallow, has dysphagia, esophagitis, mucositis, or uncontrollable nausea/vomiting; OR
   - **ii.** Patient is unable to take two other short-acting narcotics secondary to allergy or severe adverse events; AND

     Note: Examples of short-acting narcotics include immediate-release formulations of oxycodone, morphine sulfate, hydromorphone, etc.
   - **B)** Patient is on or will be on an oral or transdermal long-acting narcotic, or the patient is on an intravenous, subcutaneous, or spinal (intrathecal, epidural) narcotic.

   Note: Examples of long-acting narcotics include Duragesic (fentanyl transdermal system), OxyContin (oxycodone extended-release tablets), and morphine extended-release. Examples of intravenous, subcutaneous, or spinal narcotics include morphine sulfate, hydromorphone, and fentanyl citrate.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of fentanyl transmucosal drugs is not recommended in the following situations:

1. **Acute and/or Postoperative Pain.** This includes surgery/post-surgery, trauma/post-trauma, acute medical illness (acute abdominal pain, pelvic pain, muscle spasm). Actiq (generic), Abstral, Fentora, Lazanda, and Subsys are contraindicated for use in the management of acute or postoperative pain, including migraine headache pain.[1-6]

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX A

Note: This list is not inclusive. As new STCs become available, they will roll into this policy and the list will be updated periodically.

* Excluding topical products

APPENDIX B

*Indicates the inclusion of subheadings.

PRIOR AUTHORIZATION POLICY

POLICY: Opioids – Long-Acting Products Prior Authorization Policy

Note: This is not an inclusive list. As new products become available, they will roll into this policy and the list will be updated periodically.

- Buprenorphine (i.e., Belbuca® buccal film, Butrans® transdermal patch)
- Fentanyl transdermal patch (Duragesic®, generic)
- Hydrocodone extended-release capsules/tablets (e.g., Hysingla™ ER, Zohydro® ER)
- Hydromorphone extended-release tablets (e.g., generic to discontinued Exalgo®)
- Methadone dispersible tablets/oral solution/tablets (e.g., Diskets®, Dolophine®, Methadose™, generic)
- Morphine sulfate extended-release capsules/tablets (e.g., Arymo® ER, Kadian®, MS Contin®, generic)
- Oxycodone extended-release capsules/tablets (e.g., Xtampza® ER, OxyContin®)
- Oxymorphone extended-release tablets (e.g., generic [generic is not AB-rated to the discontinued Opana® ER formulation])
- Tapentadol extended-release tablets (e.g., Nucynta® ER)
- Tramadol extended-release capsules/tablets (e.g., Conzip®, Ultram® ER, generic)

REVIEW DATE: 02/01/2023

OVERVIEW

All of the long-acting (LA) opioids are indicated for the **management of pain severe enough to require daily, around-the-clock, long-term opioid treatment** and for which alternative treatment options are inadequate.[1-16] OxyContin is the only product specifically indicated in pediatric patients 11 years to 18 years of age.[6] Nucynta ER is the only product also indicated for the management of neuropathic pain associated with diabetic peripheral neuropathy in adults.[1] Methadone has additional indications for the treatment and maintenance treatment of opioid addiction (i.e., heroin or other morphine-like drugs).[16] Note that methadone products, when used for the treatment of opioid addiction in detoxification or maintenance programs, shall be dispensed only by opioid treatment programs (and agencies, practitioners, or institutions by formal agreement with the program sponsor) certified by the Substance Abuse and Mental Health Services Administration and approved by the designated state authority.

The currently available LA opioids are buprenorphine, fentanyl, hydrocodone, hydromorphone, methadone, morphine sulfate, oxycodone, oxymorphone, tapentadol, and tramadol.[1-16]

Guidelines

In 2022, the **Centers for Disease Control and Prevention (CDC)** published an updated guideline for prescribing opioids for pain.[17] Nonopioid therapies are at least as effective as opioids for many common types of acute pain, and nonopioid therapies are preferred for subacute and chronic pain. Clinicians should maximize the use of nonpharmacologic and nonopioid pharmacologic therapies as appropriate for the specific condition and patient and only consider initiating opioid therapy if expected benefits for pain and function are anticipated to outweigh risks to the patient. Multiple noninvasive nonpharmacologic interventions (e.g., aerobic, aquatic, or resistance exercises, weight loss, psychological therapy, spinal manipulation, low-level laser therapy, massage, mindfulness-based stress reduction, yoga, tai chi, qigong, acupuncture, cognitive behavioral therapy, and spinal manipulation) are associated with improvements in pain, function, or both, that are sustained after treatment and are not associated with serious harms. Non-opioid drugs (e.g., tricyclic antidepressants, serotonin and norepinephrine reuptake inhibitor [SNRI]

antidepressants, duloxetine, selected antiseizure medications (e.g., pregabalin, gabapentin, oxcarbazepine), capsaicin and lidocaine patches, and nonsteroidal anti-inflammatory drugs [NSAIDs]) are associated with small to moderate improvements in chronic pain and function for certain chronic pain conditions.

Before initiating opioid therapy for patients with pain, clinicians should discuss with patients the realistic benefits and known risks of opioid therapy.[17] Before starting ongoing opioid therapy for patients with subacute or chronic pain, clinicians should work with patients to establish treatment goals for pain and function and consider how opioid therapy will be discontinued if benefits do not outweigh risks. When opioids are initiated, clinicians should prescribe the lowest effective dosage of immediate-release opioids for no longer than needed for the expected duration of pain severe enough to require opioids. During ongoing opioid therapy, clinicians should collaborate with patients to evaluate and carefully weigh the benefits and risks of continuing opioid therapy and exercise care when increasing, continuing, or reducing opioid dosage. The guideline recommends that clinicians should not initiate opioid treatment with LA opioids for patients who are opioid-naïve and should not prescribe LA opioids for intermittent use. LA opioids should be reserved for severe, continuous pain. Before starting and periodically during continuation of opioid therapy, clinicians should evaluate the risk for opioid-related harms and should work with patients to incorporate relevant strategies to mitigate risk, including offering naloxone and reviewing potential interactions with any other prescribed medications or substances used. When prescribing initial opioid therapy and periodically during opioid therapy, clinicians should review the patient's history of controlled substance prescriptions using state prescription drug monitoring program (PDMP) data to determine whether the patient is receiving opioid dosages or combinations that put the patient at high risk for overdose. When prescribing opioids for subacute or chronic pain, clinicians should consider the benefits and risks of toxicology testing to assess for prescribed medications as well as other prescribed and nonprescribed controlled substances.

The 2020 **American Society of Hematology** guideline for the management of acute and chronic pain in patients with sickle cell disease states that pain causes significant morbidity for those living with sickle cell disease and manifests as acute intermittent pain, chronic daily pain, and acute-on-chronic pain.[18] For adults and children with chronic pain who are receiving chronic opioid therapy, are functioning well, and have perceived benefit, the guideline suggests shared decision making for continuation of chronic opioid therapy. For adults and children with chronic pain who are receiving chronic opioid therapy, are functioning poorly, or are at high risk for aberrant opioid use or toxicity, the guideline suggests against continuation of chronic opioid therapy.

A)

B)

POLICY STATEMENT

C) Prior Authorization is recommended for prescription benefit coverage of long-acting opioids. Long-acting opioids are controlled substances (CII with the exception of tramadol-containing products which are CIV) which can be misused and abused. Because of the specialized skills required for evaluation and diagnosis of patients with sickle cell disease as well as the monitoring required for adverse events and long-term efficacy, approval requires LA opioids to be prescribed by or in consultation with a hematologist for patients with this diagnosis. All approvals are provided for the duration noted below.

D) Note: This policy includes long-acting formulations of the medications listed on page 1; the list is not inclusive. As new products become available, they will roll into this policy and the list will be updated periodically.

Automation: A patient with a history of a long-acting opioid within the 130-day look-back period is excluded from Prior Authorization. If the patient has a prescription for a cancer medication (see Appendix A) within a 180-day period, the claim will adjudicate. When available, the ICD-10 codes for cancer will be used as part of automation to allow approval of the requested medication (see Appendix B).

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of long-acting opioids is recommended in those who meet the following criteria:

I. Coverage of all long-acting opioids, except fentanyl transdermal products, is recommended in those who meet one of the following criteria:

FDA-Approved Indications

GG) Pain Severe Enough to Require Daily, Around-the-Clock, Long-Term Opioid Treatment. Approve for 1 year if the patient meets ONE of the following criteria (A, B, C, or D):

A) Patient has a cancer diagnosis; OR
B) Patient is in a hospice program, end-of-life care, or palliative care; OR
C) Patient meets BOTH of the following criteria (i and ii):
  i) Patient has diagnosis of sickle cell disease; AND
  ii) Medication is prescribed by or in consultation with a hematologist; OR
D) Patient meets ALL of the following criteria (i, ii, iii, iv, v, vi, and vii):
  i. Patient is not opioid-naïve; AND
  ii. Non-opioid therapies have been optimized and are being used in conjunction with opioid therapy, according to the prescriber; AND
  Note: Examples of non-opioid therapies include non-opioid medications (e.g., nonsteroidal anti-inflammatory drugs, tricyclic antidepressants, serotonin and norepinephrine reuptake inhibitors, antiseizure medications), physical therapy, exercise therapy, weight loss, and cognitive behavioral therapy.
  iii. Patient's of controlled substance prescriptions has been checked using the state prescription drug monitoring program (PDMP), according to the prescriber; AND
  iv. Risks (e.g., addiction, overdose) and realistic benefits of opioid therapy have been discussed with the patient, according to the prescriber; AND
  v. Treatment plan (including goals for pain and function) is in place and reassessments (including pain levels and function) are scheduled at regular intervals, according to the prescriber.
  vi. Need for a naloxone prescription has been assessed and naloxone has been ordered, if necessary, according to the prescriber; AND
  vii. Need for periodic toxicology testing has been assessed and ordered, if necessary, according to the prescriber.

2. Opioid Addiction (Dependence) [methadone products only]. Approve methadone for 1 year if the patient meets ONE of the following criteria (A or B):
  A) Methadone is dispensed by an opioid treatment program certified by the Substance Abuse and Mental Health Services Administration and approved by the designated state authority; OR
  B) Methadone is being prescribed during an emergency period of ≤ 3 days while definitive care for the addiction is being sought in an appropriately licensed facility.

II. Coverage of fentanyl transdermal products is recommended in those who meet the following criteria:

FDA-Approved Indication

1. Pain Severe Enough to Require Daily, Around-the-Clock, Long-Term Opioid Treatment. Approve for 1 year if the patient has a cancer diagnosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of long-acting opioids is not recommended in the following situations:

49. Acute Pain. According to the CDC guideline for prescribing opioids for chronic pain, clinicians should not prescribe extended-release/long-acting opioids for the treatment of acute pain due to the longer half-lives and longer duration of effects (e.g., respiratory depression) with extended-release/long-acting opioids.[17]

50. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Opioids – Tramadol Extended-Release Products Prior Authorization Policy
- ConZip® (tramadol hydrochloride extended-release capsules – Vertical)
- Tramadol extended-release capsules – various (brand products)
- Tramadol hydrochloride extended-release tablets – generic to the discontinued product Ultram® ER
- Tramadol hydrochloride extended-release tablets – generic to the discontinued product Ryzolt™

REVIEW DATE: 02/01/2023; selected revision 11/15/2023

OVERVIEW

Tramadol extended-release tablets, tramadol extended-release capsules, and ConZip are indicated for the **management of pain severe enough to require daily, around-the-clock, long-term opioid treatment** and for which alternative treatment options are inadequate.[1-3]

Tramadol is a centrally acting synthetic opioid analgesic.[1-3] The extended-release tramadol products differ in their extended-release mechanism. ConZip contains a total dose of tramadol in a combination of immediate-release and extended-release components. However, ConZip is bioequivalent to a reference extended-release tramadol product under fasting conditions. Therefore, clinical efficacy was based on a reference extended-release tramadol product.

Guidelines

In 2022, the **Centers for Disease Control and Prevention (CDC)** published an updated guideline for prescribing opioids for pain.[4] Nonopioid therapies are at least as effective as opioids for many common types of acute pain, and nonopioid therapies are preferred for subacute and chronic pain. Clinicians should maximize the use of nonpharmacologic and nonopioid pharmacologic therapies as appropriate for the specific condition and patient and only consider initiating opioid therapy if expected benefits for pain and function are anticipated to outweigh risks to the patient. Multiple noninvasive nonpharmacologic interventions (e.g., aerobic, aquatic, or resistance exercises, weight loss, psychological therapy, spinal manipulation, low-level laser therapy, massage, mindfulness-based stress reduction, yoga, tai chi, qigong, acupuncture, cognitive behavioral therapy, and spinal manipulation) are associated with improvements in pain, function, or both, that are sustained after treatment and are not associated with serious harms. Non-opioid drugs (e.g., tricyclic antidepressants, serotonin and norepinephrine reuptake inhibitor [SNRI] antidepressants, duloxetine, selected antiseizure medications (e.g., pregabalin, gabapentin, oxcarbazepine), capsaicin and lidocaine patches, and nonsteroidal anti-inflammatory drugs [NSAIDs]) are associated with small to moderate improvements in chronic pain and function for certain chronic pain conditions.

Before initiating opioid therapy for patients with pain, clinicians should discuss with patients the realistic benefits and known risks of opioid therapy.[4] Before starting ongoing opioid therapy for patients with subacute or chronic pain, clinicians should work with patients to establish treatment goals for pain and function and consider how opioid therapy will be discontinued if benefits do not outweigh risks. When opioids are initiated, clinicians should prescribe the lowest effective dosage of immediate-release opioids for no longer than needed for the expected duration of pain severe enough to require opioids. During ongoing opioid therapy, clinicians should collaborate with patients to evaluate and carefully weigh the benefits and risks of continuing opioid therapy and exercise care when increasing, continuing, or reducing opioid dosage. The guideline recommends that clinicians should not initiate opioid treatment with long-

acting (LA) opioids for patients who are opioid-naïve and should not prescribe LA opioids for intermittent use. LA opioids should be reserved for severe, continuous pain. Before starting and periodically during continuation of opioid therapy, clinicians should evaluate the risk for opioid-related harms and should work with patients to incorporate relevant strategies to mitigate risk, including offering naloxone and reviewing potential interactions with any other prescribed medications or substances used. When prescribing initial opioid therapy and periodically during opioid therapy, clinicians should review the patient's history of controlled substance prescriptions using state prescription drug monitoring program (PDMP) data to determine whether the patient is receiving opioid dosages or combinations that put the patient at high risk for overdose. When prescribing opioids for subacute or chronic pain, clinicians should consider the benefits and risks of toxicology testing to assess for prescribed medications as well as other prescribed and nonprescribed controlled substances.

The 2020 **American Society of Hematology** guideline for the management of acute and chronic pain in patients with sickle cell disease states that pain causes significant morbidity for those living with sickle cell disease and manifests as acute intermittent pain, chronic daily pain, and acute-on-chronic pain.[5] For adults and children with chronic pain who are receiving chronic opioid therapy, are functioning well, and have perceived benefit, the guideline suggests shared decision making for continuation of chronic opioid therapy. For adults and children with chronic pain who are receiving chronic opioid therapy, are functioning poorly, or are at high risk for aberrant opioid use or toxicity, the guideline suggests against continuation of chronic opioid therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of tramadol extended-release products. Tramadol extended-release products are controlled substances (CIV) which can be misused and abused. Because of the specialized skills required for evaluation and diagnosis of patients with sickle cell disease as well as the monitoring required for adverse events and long-term efficacy, approval requires tramadol extended-release products to be prescribed by or in consultation with a hematologist for patients with this diagnosis. All approvals are provided for the duration noted below.

Automation: A patient with a history of a tramadol extended-release product within the 130-day look-back period is excluded from Prior Authorization. If a patient has a prescription for a cancer medication (see Appendix A) within a 180-day period, the claim will adjudicate. When available, the ICD-10 codes for cancer will be used as part of automation to allow approval of the requested medication (see Appendix B).

RECOMMENDED CRITERIA

Coverage of a tramadol extended-release product is recommended in those who meet the following criteria:

FDA-Approved Indication

HH) Pain Severe Enough to Require Daily, Around-the-Clock, Long-Term Opioid Treatment.
Approve for 1 year if the patient meets ONE of the following (A, B, C, or D):

- **ii.** Patient has a cancer diagnosis; OR
- **iii.** Patient is in hospice program, end-of-life care, or palliative care; OR
- **iv.** Patient meets BOTH of the following criteria (i and ii):
  - **i.** Patient has diagnosis of sickle cell disease; AND
  - **ii.** Medication is prescribed by or in consultation with a hematologist; OR
- **v.** Patient meets all of the following (i, ii, iii, iv, v, vi, and vii):

i. Patient is not opioid-naïve; AND

ii. Non-opioid therapies have been optimized and are being used in conjunction with opioid therapy according to the prescriber; AND

E) Note: Examples of non-opioid therapies include non-opioid medications (e.g., nonsteroidal anti-inflammatory drugs, tricyclic antidepressants, serotonin and norepinephrine reuptake inhibitors, antiseizure medications), physical therapy, exercise therapy, weight loss, and cognitive behavioral therapy.

iii. Patient's of controlled substance prescriptions has been checked using the state prescription drug monitoring program (PDMP), according to the prescriber; AND

iv. Risks (e.g., addiction, overdose) and realistic benefits of opioid therapy have been discussed with the patient, according to the prescriber; AND

v. Treatment plan (including goals for pain and function) is in place and reassessments (including pain levels and function) are scheduled at regular intervals, according to the prescriber; AND

vi. Need for a naloxone prescription has been assessed and naloxone has been ordered, if necessary, according to the prescriber; AND

vii. Need for periodic toxicology testing has been assessed and ordered, if necessary, according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of a tramadol extended-release product is not recommended in the following situations:

51. Acute Pain. According to the CDC guideline for prescribing opioids for chronic pain, clinicians should not prescribe extended-release/long-acting opioids for the treatment of acute pain due to the longer half-lives and longer duration of effects (e.g., respiratory depression) with extended-release/long-acting opioids.[4]

52. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Kynmobi Prior Authorization Policy
- Kynmobi™ (apomorphine sublingual film – Sunovion)

REVIEW DATE: 07/26/2023

OVERVIEW
Kynmobi, a non-ergoline dopamine agonist, is indicated for the acute, intermittent treatment of "off" episodes in patients with **Parkinson's disease**.[1]

Guidelines
The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).[2] Kynmobi is not addressed. The review categorically divides treatment recommendations by Parkinson's disease characteristics. Apomorphine subcutaneous is noted to be efficacious and clinically useful in treatment for motor fluctuations.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Kynmobi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kynmobi as well as the monitoring required for adverse events and long-term efficacy, approval requires Kynmobi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Kynmobi is recommended in those who meet the following criteria:

FDA-Approved Indication

11. Parkinson's Disease. Approve for 1 year if the patient meets all of the following (A, B, C, and D):
- **A)** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- **B)** Patient is currently receiving carbidopa/levodopa therapy; AND
- **C)** Patient has previously tried one other treatment for "off" episodes and meets ONE of the following criteria (i or ii):
  - **i.** Patient had significant intolerance, according to the prescriber; OR
  - **ii.** Patient had inadequate efficacy, according to the prescriber; AND

  Note: Examples of treatments for "off" episodes include entacapone, rasagiline, pramipexole, ropinirole, tolcapone, cabergoline, selegiline, Apokyn (apomorphine subcutaneous injection), Ongentys (opicapone capsules), or Xadago (safinamide tablets).
- **D)** The medication is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kynmobi is not recommended in the following situations:

42. Concurrent Use with a Serotonin 5-HT_3 Antagonist. Administration of Kynmobi in conjunction with a serotonin 5-HT_3 antagonist (e.g., ondansetron, granisetron, dolasetron, palonosetron, alosetron) can result in extreme lowering of blood pressure and loss of consciousness.[1]

43. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Ongentys Prior Authorization Policy
- Ongentys® (opicapone capsules – Neurocrine Biosciences)

REVIEW DATE: 07/26/2023

OVERVIEW

Ongentys, a peripheral, selective, and reversible catechol-o-methyltransferase (COMT) inhibitor, is indicated for adjunctive treatment to levodopa/carbidopa in patients with **Parkinson's disease** experiencing "off" episodes.[1]

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).[2] The review categorically divides treatment recommendations by Parkinson's disease characteristics. Ongentys is noted to be efficacious and clinically useful in treatment for motor fluctuations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ongentys. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ongentys as well as the monitoring required for adverse events and long-term efficacy, approval requires Ongentys to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ongentys is recommended in those who meet the following criteria:

FDA-Approved Indication

12. Parkinson's Disease. Approve for 1 year if the patient meets all of the following (A and B):
- **A)** Patient is currently receiving carbidopa/levodopa therapy; AND
- **B)** Ongentys is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ongentys is not recommended in the following situations:

44. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

95. Ongentys® capsules [prescribing information]. San Diego, CA: Neurocrine Biosciences; May 2020.
96. Fox SH, Katzenschlager R, Lim SY, et al. International Parkinson and movement disorder society evidence-based medicine review: Update on treatments for the motor symptoms of Parkinson's disease. *Mov Disord*. 2018;33(8):1248-1266.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Amantadine Extended-Release Drugs Prior Authorization with Step Therapy Policy
- Gocovri® (amantadine extended-release capsules – Adamas)
- Osmolex® ER (amantadine extended-release tablets – Adamas)

REVIEW DATE: 11/15/2023

OVERVIEW

Gocovri, an extended-release capsule formulation of amantadine, is indicated for patients with **Parkinson's disease** for the following uses:[1]
- **Dyskinesia**, in patients receiving levodopa-based therapy, with or without concomitant dopaminergic medications.
- **"Off" episodes**, as adjunctive treatment to levodopa/carbidopa.

Osmolex ER, an extended-release tablet formulation of amantadine, is indicated for the following uses:[2]
- **Drug-induced extrapyramidal reactions**, in adult patients.
- **Parkinson's disease**, in adult patients.

Amantadine hydrochloride is available as immediate-release capsules, tablets, and oral solution.[3-5] The amantadine immediate-release products are indicated for the prophylaxis and treatment of signs and symptoms of infection caused by various strains of influenza A virus; idiopathic Parkinson's disease (paralysis agitans), post-encephalitic parkinsonism, symptomatic parkinsonism which may follow injury to the nervous system by carbon monoxide intoxication, and in those elderly patients believed to develop parkinsonism in association with cerebral arteriosclerosis; and drug-induced extrapyramidal reactions.

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018). Amantadine is addressed; however, specific formulations are not. The review categorically divides treatment recommendations by Parkinson's disease characteristics. Amantadine was noted to be likely efficacious and possibly useful in treatment for symptomatic monotherapy and symptomatic adjunct therapy in early or stable Parkinson's disease. For treatment of dyskinesia, amantadine was identified to be efficacious and clinically useful.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of amantadine extended-release products. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with amantadine extended-release products as well as the monitoring required for adverse events and long-term efficacy, approval requires amantadine extended-release products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for use of Gocovri and Osmolex ER as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts, and/or other information. For patient cases in which documentation

is required, if this documentation has been previously received upon a prior coverage review, the documentation requirement is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Gocovri is recommended in those who meet the following criteria:

FDA-Approved Indication

33. Parkinson's Disease. Approve if patient meets ONE of the following (A or B):
- **A)** Initial Therapy. Approve for 3 months if the patient meets the following (i, ii, iii , and iv):
  - **i.** Patient meets ONE of the following (a or b):
    - **a)** Patient is experiencing dyskinesia; OR
    - **b)** Patient is experiencing "off" episodes; AND
      Note: Examples of "off" episodes include muscle stiffness, slow movements, or difficulty starting movements.
  - **ii.** Patient is currently receiving levodopa-based therapy (e.g., carbidopa/levodopa); AND
  - **iii.** Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following (a or b):
    - **a)** Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber **[documentation required]**; OR
    - **b)** Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber **[documentation required]**; AND
  - **iv.** The medication is prescribed by or in consultation with a neurologist.
- **B)** Patients is Currently Receiving Gocovri. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):
  - **i.** Patient is currently receiving levodopa-based therapy (e.g., carbidopa/levodopa); AND
  - **ii.** Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following (a or b):
    - **a)** Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber **[documentation required]**; OR
    - **b)** Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber **[documentation required]**; AND
  - **iii.** Patient has had a response to therapy (e.g., decrease in dyskinesia, decrease in "off" episodes), as determined by the prescriber; AND
    Note: Examples of "off" episodes include muscle stiffness, slow movements, or difficulty starting movements.
  - **iv.** The medication is prescribed by or in consultation with a neurologist.

II. Coverage of Osmolex ER is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. Drug-Induced Extrapyramidal Reactions. Approve if patient meets ONE of the following (A or B):
- **A)** Initial Therapy. Approve for 3 months if the patient meets the following (i and ii):

i. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following (a or b):
  a) Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber **[documentation required]**; OR
  b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber **[documentation required]**; AND
ii. The medication is prescribed by or in consultation with a neurologist.

B) Patient is Currently Receiving Osmolex ER. Approve for 1 year if the patient meets the following (i, ii, and iii):
i. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following (a or b):
  a) Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber **[documentation required]**; OR
  b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber **[documentation required]**; AND
ii. Patient has had a response to therapy (e.g., decrease in extrapyramidal reactions), as determined by the prescriber; AND
iii. The medication is prescribed by or in consultation with a neurologist.

2. Parkinson's Disease. Approve if patient meets ONE of the following (A or B):
A) Initial Therapy. Approve for 3 months if the patient meets the following (i and ii):
i. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following (a or b):
  a) Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber **[documentation required]**; OR
  b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber **[documentation required]**; AND
ii. The medication is prescribed by or in consultation with a neurologist.

B) Patient is Currently Receiving Osmolex ER. Approve for 1 year if the patient meets the following (i, ii, and iii):
i. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following (a or b):
  a) Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber **[documentation required]**; OR
  b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber **[documentation required]**; AND
ii. Patient has had a response to therapy (e.g., decrease in dyskinesia), as determined by the prescriber; AND
iii. The medication is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of amantadine extended-release products is not recommended in the following situations:

45. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Carbidopa Prior Authorization Policy
- Lodosyn® (carbidopa tablets – Bausch Health, generic)

REVIEW DATE: 09/20/2023

OVERVIEW

Carbidopa, an aromatic amino acid decarboxylation inhibitor, is indicated for use with carbidopa-levodopa or with levodopa for the following uses:[1]

- **Parkinson's disease,** idiopathic.
- **Postencephalitic parkinsonism**.
- **Symptomatic parkinsonism**, which may follow injury to the nervous system by carbon monoxide intoxication and/or manganese intoxication.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of carbidopa. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with carbidopa as well as the monitoring required for adverse events and long-term efficacy, approval requires carbidopa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of carbidopa is recommended in those who meet one of the following criteria:

FDA-Approved Indications

13. **Parkinson's Disease.** Approve for 1 year if the patient meets both of the following (A and B):
    A) Patient is currently receiving carbidopa/levodopa therapy; AND
    B) The medication is being prescribed by or in consultation with a neurologist.

14. **Postencephalitic Parkinsonism.** Approve for 1 year if the patient meets both of the following (A and B):
    A) Patient is currently receiving carbidopa/levodopa therapy; AND
    B) The medication is being prescribed by or in consultation with a neurologist.

15. **Symptomatic Parkinsonism.** Approve for 1 year if the patient meets both of the following (A and B):
    A) Patient is currently receiving carbidopa/levodopa therapy; AND
    B) The medication is being prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of carbidopa is not recommended in the following situations:

46. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Duopa Prior Authorization Policy
- Duopa® (carbidopa and levodopa enteral suspension – AbbVie)

REVIEW DATE: 9/20/2023

OVERVIEW
Duopa, a combination enteral suspension of carbidopa and levodopa, is indicated for the treatment of motor fluctuations in patients with advanced **Parkinson's disease**.[1]

Guidelines
The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).[2] The review categorically divides treatment recommendations by Parkinson's disease characteristics. Duopa is noted to be efficacious and clinically useful for treatment of motor fluctuations, along with likely efficacious and clinically useful for dyskinesia.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Duopa. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Duopa as well as the monitoring required for adverse events and long-term efficacy, approval requires Duopa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Duopa is recommended in those who meet the following criteria:

FDA-Approved Indication

16. Parkinson's Disease. Approve for 1 year if the patient meets the following (A, B, C, D, and E):
- **A)** Patient is diagnosed with advanced Parkinson's disease; AND
- **B)** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- **C)** Patient has tried an oral extended-release carbidopa/levodopa therapy and meets one of the following (i or ii):
  - **i.** Patient had significant intolerance, according to the prescriber; OR
  - **ii.** Patient had inadequate efficacy, according to the prescriber; AND
- **D)** Patient has previously tried THREE other treatments for "off" episodes; AND
  Note: Examples of treatment for "off" episodes include entacapone, rasagiline, pramipexole, ropinirole, tolcapone, cabergoline, selegiline, Kynmobi (apomorphine hydrochloride sublingual film), Ongentys (opicapone capsules), or Xadago (safinamide tablets).
- **E)** Duopa is being prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Duopa is not recommended in the following situations:

47. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

104. Duopa® enteral suspension [prescribing information] North Chicago, IL: AbbVie; March 2022.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Inbrija Prior Authorization Policy
- Inbrija® (levodopa inhalation powder – Acorda)

REVIEW DATE: 09/20/2023

OVERVIEW

Inbrija, an aromatic amino acid, is indicated for the intermittent treatment of "off" episodes in patients with **Parkinson's disease** treated with carbidopa-levodopa.[1]

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).[2] The review categorically divides treatment recommendations by Parkinson's disease characteristics. Inbrija is not specifically addressed. However, the rapid-onset levodopa drug class is noted to have insufficient evidence and considered investigational for treatment of motor fluctuations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Inbrija. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Inbrija as well as the monitoring required for adverse events and long-term efficacy, approval requires Inbrija to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inbrija is recommended in those who meet the following criteria:

FDA-Approved Indication

17. Parkinson's Disease. Approve for 1 year if the patient meets the following (A, B, C, D, and E):
- **A)** Patient is currently taking carbidopa-levodopa; AND
- **B)** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- **C)** Patient has previously tried one other treatment for "off" episodes and meets ONE of the following (i or ii):

  Note: Examples of treatments for "off" episodes are entacapone, rasagiline, pramipexole, ropinirole, tolcapone, Apokyn (apomorphine hydrochloride subcutaneous injection), cabergoline, selegiline, Kynmobi (apomorphine hydrochloride sublingual film), Ongentys (opicapone capsules), or Xadago (safinamide tablets).
  - **i.** Patient had significant intolerance, according to the prescriber; OR
  - **ii.** Patient had inadequate efficacy, according to the prescriber; AND

D) Patient does not have asthma, chronic obstructive pulmonary disease, or other chronic underlying lung disease; AND
E) Inbrija is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Inbrija is not recommended in the following situations:

48. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

106. Inbrija® inhalation powder [prescribing information]. Ardsley, NY: Acorda; February 2022.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Nourianz Prior Authorization Policy
- Nourianz® (istradefylline tablets – Kyowa Kirin)

REVIEW DATE: 09/20/2023

OVERVIEW

Nourianz, an adenosine receptor antagonist, is indicated as adjunctive treatment to carbidopa/levodopa in adults with **Parkinson's disease** experiencing "off" episodes.[1]

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).[2] The review categorically divides treatment recommendations by Parkinson's disease characteristics. Nourianz is noted to be likely efficacious and possibly useful for treatment of motor fluctuations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nourianz. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nourianz as well as the monitoring required for adverse events and long-term efficacy, approval requires Nourianz to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nourianz is recommended in those who meet the following criteria:

FDA-Approved Indication

18. Parkinson's Disease. Approve Nourianz for 1 year if patient meets the following (A, B, and C):
- **F)** Patient is currently taking carbidopa/levodopa; AND
- **G)** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- **H)** Nourianz is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nourianz is not recommended in the following situations:

49. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

108. Nourianz® tablets [prescribing information]. Bedminster, NJ: Kyowa Kirin; November 2020.
109. Fox SH, Katzenschlager R, Lim SY, et al. International Parkinson and movement disorder society evidence-based medicine review: Update on treatments for the motor symptoms of Parkinson's disease. *Mov Disord*. 2018;33(8):1248-1266.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Nuplazid Prior Authorization Policy
- Nuplazid® (pimavanserin capsules and tablets – Acadia)

REVIEW DATE: 09/20/2023

OVERVIEW

Nuplazid, a selective serotonin 5-HT_{2A} inverse agonist, is indicated for the treatment of hallucinations and delusions associated with **Parkinson's disease psychosis**.[1]

Safety

Nuplazid has a Boxed Warning regarding increased mortality in elderly patients with dementia-related psychosis.[1] Nuplazid is not approved for the treatment of patients with dementia-related psychosis unrelated to the hallucinations and delusions associated with Parkinson's disease psychosis.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nuplazid. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nuplazid as well as the monitoring required for adverse events and long-term efficacy, approval requires Nuplazid to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nuplazid is recommended in those who meet the following criteria:

FDA-Approved Indication

34. Parkinson's Disease Psychosis. Approve for 1 year if the patient meets all of the following (A, B, and C):
- **II)** Patient has hallucinations and delusions associated with Parkinson's disease psychosis; AND
- **JJ)** Patient does not have dementia-related psychosis unrelated to the hallucinations and delusions associated with Parkinson's disease psychosis; AND
- **KK)** Nuplazid is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nuplazid is not recommended in the following situations:

50. Dementia-Related Psychosis. Nuplazid prescribing information has a Boxed Warning regarding increased mortality in elderly patients with dementia-related psychosis.[1] Elderly patients with dementia-related psychosis treated with antipsychotic drugs are at an increased risk of death.

51. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Tolcapone Prior Authorization Policy
- Tasmar® (tolcapone tablets – Bausch Health, generic)

REVIEW DATE: 09/20/2023

OVERVIEW

Tolcapone, a catechol-O-methyltransferase (COMT) inhibitor, is used in the treatment of **Parkinson's disease** as an adjunct to carbidopa/levodopa therapy.[1]

Safety

Tolcapone has a Boxed Warning of the risk of potentially fatal, acute fulminant liver failure and should be reserved for patients who are experiencing symptom fluctuations and are not responding satisfactorily to or are not appropriate candidates for other adjunctive therapies.[1]

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).[2] The review categorically divides treatment recommendations by Parkinson's disease characteristics. Tolcapone and entacapone, another COMT inhibitor, are noted to be efficacious and possibly useful for treatment of motor fluctuations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of tolcapone. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with tolcapone as well as the monitoring required for adverse events and long-term efficacy, approval requires tolcapone to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of tolcapone is recommended in those who meet the following criteria:

FDA-Approved Indication

19. Parkinson's Disease. Approve for 1 year if the patient meets all of the following (A, B, and C):
- **A)** Patient is currently receiving carbidopa/levodopa therapy; AND
- **B)** Patient has tried an entacapone product and meets ONE of the following (i or ii):
  - **i.** Patient had significant intolerance, according to the prescriber; OR
  - **ii.** Patient had inadequate efficacy, according to the prescriber; AND
- **C)** Tolcapone is being prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of tolcapone is not recommended in the following situations:

52. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Zelapar Prior Authorization Policy
- Zelapar® (selegiline orally disintegrating tablets – Bausch Health)

REVIEW DATE: 09/20/2023

OVERVIEW

Zelapar, an irreversible inhibitor of monoamine oxidase, is indicated in patients with **Parkinson's disease** as an adjunct to levodopa/carbidopa among patients who exhibit deterioration in the quality of their response to this therapy.[1]

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).[2] The review categorically divides treatment recommendations by Parkinson's disease characteristics. Zelapar is noted to have insufficient evidence and be investigational for treatment of motor fluctuations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zelapar. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zelapar as well as the monitoring required for adverse events and long-term efficacy, approval requires Zelapar to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zelapar is recommended in those who meet the following criteria:

FDA-Approved Indication

20. Parkinson's Disease. Approve for 1 year if the patient meets all of the following (A, B, C, and D):
- **A)** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- **B)** Patient is currently receiving carbidopa/levodopa therapy; AND
- **C)** Patient has tried one of oral selegiline tablets, selegiline capsules, or rasagiline tablets and meets ONE of the following (i or ii):
  - **i.** Patient had significant intolerance, according to the prescriber; OR
  - **ii.** Patient has difficulty swallowing tablets or capsules; AND
- **D)** Zelapar is being prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zelapar is not recommended in the following situations:

53. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

113. Zelapar® orally disintegrating tablets [prescribing information] Bridgewater, NJ: Bausch Health; June 2021.
114. Fox SH, Katzenschlager R, Lim SY, et al. International Parkinson and movement disorder society evidence-based medicine review: Update on treatments for the motor symptoms of Parkinson's disease. *Mov Disord*. 2018;33(8):1248-1266.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease –Apomorphine Subcutaneous Prior Authorization Policy
- Apokyn® (apomorphine hydrochloride subcutaneous injection – US WorldMeds, generic)

REVIEW DATE: 07/26/2023

OVERVIEW

Apomorphine, a non-ergoline dopamine agonist, is indicated for the acute, intermittent treatment of hypomobility, "off" episodes ("end-of-dose wearing off" and unpredictable "on/off" episodes) associated with advanced **Parkinson's disease**.[1]

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).[2] The review categorically divides treatment recommendations by Parkinson's disease characteristics. Apomorphine subcutaneous is noted to be efficacious and clinically useful in treatment for motor fluctuations, particularly for OFF periods that require rapid reversal.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of apomorphine subcutaneous. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with apomorphine subcutaneous as well as the monitoring required for adverse events and long-term efficacy, approval requires apomorphine subcutaneous to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of apomorphine subcutaneous is recommended in those who meet the following criteria:

FDA-Approved Indication

LL) Parkinson's Disease. Approve for 1 year if the patient meets the following (A, B, C, and D):

i. Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND

ii. Patient is currently receiving carbidopa/levodopa therapy; AND

iii. Patient has previously tried one other treatment for "off" episodes and meets ONE of the following (i or ii):

(1) Patient had significant intolerance, according to the prescriber; OR

(2) Patient had inadequate efficacy, according to the prescriber; AND

Note: Examples of treatments for "off" episodes include entacapone, rasagiline, pramipexole, ropinirole, tolcapone, cabergoline, selegiline, Kynmobi (apomorphine hydrochloride sublingual film), Ongentys (opicapone capsules), or Xadago (safinamide tablets).

iv. The medication is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of apomorphine subcutaneous is not recommended in the following situations:

54. Concurrent Use with a Serotonin 5-HT_3 Antagonist. Administration of apomorphine subcutaneous in conjunction with a serotonin 5-HT_3 antagonist (e.g., ondansetron, granisetron, dolasetron, palonosetron, alosetron) can result in extreme lowering of blood pressure and loss of consciousness and is considered an absolute contraindication.[1]

55. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Phenylketonuria – Palynziq Prior Authorization Policy

- Palynziq® (pegvaliase-pqpz subcutaneous injection – BioMarin)

REVIEW DATE: 08/23/2023

OVERVIEW

Palynziq, a phenylalanine-metabolizing enzyme, is indicated to reduce blood phenylalanine concentrations in adult patients with **phenylketonuria (PKU)** who have uncontrolled blood phenylalanine concentrations greater than 600 micromol/L on existing management.[1]

Treatment with Palynziq should be managed by a healthcare provider experienced in the management of PKU. Baseline blood phenylalanine concentrations should be obtained before initiating treatment.

Dose Titration

The recommended initial induction dosage for Palynziq is 2.5 mg subcutaneously (SC) for 4 weeks.[1] This dose is then titrated over a period of at least 5 weeks to a maintenance dose of 20 mg SC once daily (QD). The maintenance dose should be individualized to achieve blood phenylalanine control (blood phenylalanine concentration ≤ 600 micromol/L). Maintain the Palynziq 20 mg QD dose for at least 24 weeks. Consider increasing the Palynziq dose to 40 mg QD in a patient who has been on 20 mg QD for at least 24 weeks without achieving blood phenylalanine control. Consider increasing the Palynziq dose to a maximum of 60 mg QD in a patient who has been on 40 mg QD for at least 16 weeks without achieving blood phenylalanine control. Discontinue Palynziq in a patient who has not achieved an adequate response after continuous treatment with the maximum dose of 60 mg QD for 16 weeks. A dose titration schedule is outlined in Table 1. Therapeutic response may not be achieved until the patient is titrated to an effective maintenance dose.

Table 1. Palynziq Dose Titration.[1]

* Additional time may be required prior to each dosage escalation based on patient tolerability; QD – Once daily.

Because of the risk of anaphylaxis Palynziq is available only through a restricted Risk Evaluation and Mitigation Strategy (REMS) program. It was unclear from the Palynziq clinical trials if all patients had tried and were non-responders to sapropterin.

Guidelines

Recommendations regarding use of Palynziq are not made in guidelines from the American College of Medical Genetics and Genomics (ACMG) [2014] or European guidelines (2017).[2,3] However, a consensus statement regarding use of Palynziq in adults with PKU was published in 2019.[4] Palynziq should be considered for all adults with PKU who have the ability to give informed consent and adhere to treatment. It is noted that some patients may show a response early on, whereas other may take 1 year or more from initiation of treatment before a reduction in blood phenylalanine concentration is observed. The definition of a "clinically meaningful" efficacy benefit should be determined by the treating clinician based on individual patient goals. Primarily, the efficacy benefit should be determined by a significant reduction in blood phenylalanine concentration from baseline.

Although ACMG and European guidelines do not offer recommendations specific to Palynziq, they do provide general principles for PKU management. ACMG guidelines suggest a target blood phenylalanine level of 120 to 360 micromol/L for all patients.[2] However, European guidelines state that patients ≥ 12

years of age with blood phenylalanine concentration < 600 micromol/L do not require treatment, and the target range for patients ≥ 12 years of age receiving treatment is 120 to 600 micromol/L.[3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Palynziq. Because of the specialized skills required for evaluation and diagnosis of patients treated with Palynziq as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Palynziq to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Palynziq is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Phenylketonuria.** Approve for the duration noted if the patient meets one of the following (A or B):
   - **A)** Initial Therapy. Approve for 1 year if the patient meets the following (i, ii, and iii):
     - **i.** Patient is ≥ 18 years of age; AND
     - **ii.** Patient has uncontrolled blood phenylalanine concentrations greater than 600 micromol/L on at least one existing treatment modality; AND
       F) Note: Examples of treatment modalities include restriction of dietary phenylalanine and protein intake and prior treatment with sapropterin (Kuvan, generic).
     - **iii.** The medication is prescribed by or in consultation with a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).
   - **B)** Patient is Currently Receiving Palynziq. Approve for 1 year if the patient meets the following (i, ii, and iii):

G) Note: A patient who has received < 1 year of therapy or who is restarting therapy with Palynziq should be considered under Initial Therapy criteria.

- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Patient meets one of the following (a or b):
  - **a)** Patient meets both of the following (1 and 2):
    - **(1)** Patient is continuing to titrate Palynziq to an effective maintenance dose, per the prescriber; AND
    - **(2)** If the patient is receiving a dose of Palynziq 60 mg once daily, the treatment duration at this dose has not exceeded 16 weeks; OR
  - **b)** Patient meets both of the following (1 and 2):
    - **(1)** Patient meets one of the following (a or b):
      - **(a)** Patient's blood phenylalanine concentration is ≤ 600 micromol/L; OR
      - **(b)** Patient has achieved a ≥ 20% reduction in blood phenylalanine concentration from pre-treatment baseline (i.e., blood phenylalanine concentration before starting Palynziq therapy); AND
    - **(2)** Patient is not receiving concomitant therapy with sapropterin (Kuvan, generic).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Palynziq is not recommended in the following situations:

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Phenylketonuria – Sapropterin Prior Authorization Policy
- Kuvan™ (sapropterin dihydrochloride tablets and powder for oral solution – BioMarin, generic)
- Javygtor™ (sapropterin dihydrochloride tablets and powder for oral solution – Dr. Reddy's Laboratories)

REVIEW DATE: 08/30/2023

OVERVIEW

Sapropterin (Kuvan, Javygtor, generic), a synthetic form of the cofactor for the enzyme phenylalanine hydroxylase, is indicated to reduce blood phenylalanine levels in patients one month of age and older with hyperphenylalaninemia due to tetrahydrobiopterin-responsive **phenylketonuria** (PKU).[1] The medication should be used with a phenylalanine-restricted diet. Of note, some patients do not show a biochemical response to sapropterin. Per the prescribing information, biochemical response cannot generally be predetermined by laboratory testing and should be determined through a therapeutic trial (evaluation) of sapropterin response.

Dose Titration

The initial starting dose of sapropterin is either 10 mg/kg per day or 20 mg/kg per day. If a 10 mg/kg per day starting dose is used, the dose should be increased to 20 mg/kg if the patient's blood phenylalanine does not decrease after 1 month of treatment. If blood phenylalanine does not decrease after 1 month of treatment on 20 mg/kg per day, sapropterin should be discontinued.

Guidelines/Recommendations

According to the European guidelines for PKU (2017), there is consensus in the literature that patients with blood phenylalanine concentration > 600 micromol/L should be treated.[8] There is also consensus that patients with blood phenylalanine concentration < 360 micromol/L can remain untreated, but should be monitored. Patients with blood phenylalanine concentration between 360 to 600 micromol/L should be treated until 12 years of age. Treatment for life is recommended for any patient with PKU; however, it is also noted that patients ≥ 12 years of age with blood phenylalanine concentration < 600 micromol/L do not require treatment. All adults with PKU should have lifelong systematic follow-ups in specialized metabolic centers, due to specific risks which may occur during adulthood. With regards to target phenylalanine levels, in treated PKU patients up to 12 years of age, the target levels should be 120 to 360 micromol/L; in treated PKU patients ≥ 12 years of age, the target levels should be 120 to 600 micromol/L.

The American College of Medical Genetics and Genomics (ACMG) published practice guidelines (2014) for the diagnosis and management of phenylalanine hydroxylase (PAH) deficiency.[9] The guidelines recommend initiating treatment as early as possible, preferably within the first week of life with a goal of having blood phenylalanine levels in the treatment range within the first 2 weeks. Dietary restriction of phenylalanine intake is the mainstay of therapy for PKU. Blood phenylalanine levels in all patients should be maintained in the range of 120 to 360 micromol/L. The guidelines state that approximately 25% to 50% of patients with PAH deficiency are responsive to sapropterin. A significant decline in blood phenylalanine level is expected in responders once treatment is initiated (with phenylalanine-restricted diet); however, patients in the lower end of the treatment range (≤ 180 micromol/L) rarely show a decrease in blood phenylalanine level even if they are responsive to sapropterin. In these patients, responsiveness is determined by adding phenylalanine to the diet in a stepwise method. An improvement in neuropsychiatric

symptoms or increase in phenylalanine tolerance without a decrease in blood phenylalanine levels is sufficient reasoning to continue therapy. According to the guidelines, there is strong evidence to support life-long treatment and maintenance of metabolic control in patients with PAH deficiency.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of sapropterin (Kuvan, Javygtor, generic). Because of the specialized skills required for evaluation and diagnosis of patients treated with sapropterin as well as the monitoring required for adverse events and long-term efficacy, initial approval requires sapropterin to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of sapropterin (Kuvan, Javygtor, generic) is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Phenylketonuria.** Approve for the duration noted if the patient meets the following (A or B):
   - **A)** Initial Therapy. Approve for 12 weeks if the patient meets the following (i and ii):
     - **i.** Sapropterin is prescribed in conjunction with a phenylalanine-restricted diet; AND
     - **ii.** The medication is prescribed by or in consultation with a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).
   - **B)** Patients is Currently Receiving Sapropterin (Kuvan, Javygtor, generic). Approve for 1 year if the patient meets the following (i and ii):

     Note: A patient who has received < 12 weeks of therapy or who is restarting therapy with sapropterin should be considered under Initial Therapy.
     - **i.** Patient meets one of the following (a, b, or c):
       - **a)** Patient has had a clinical response (e.g., cognitive and/or behavioral improvements) as determined by the prescriber; OR
       - **b)** Patient has achieved a ≥ 20% reduction in blood phenylalanine concentration from pre-treatment baseline (i.e., blood phenylalanine concentration before starting sapropterin therapy); OR
       - **c)** Treatment with sapropterin has resulted in an increase in dietary phenylalanine tolerance, according to the prescriber; AND
     - **ii.** Patient is not receiving concomitant Palynziq (pegvaliase-pqpz subcutaneous injection) at a stable maintenance dose.

       Note: Concomitant use with Palynziq is permitted during Palynziq dose titration.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of sapropterin (Kuvan, Javygtor, generic) is not recommended in the following situations:

Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pheochromocytoma – Metyrosine and Phenoxybenzamine (Oral) Prior Authorization Policy
- Demser® (metyrosine capsules – Bausch Health, generic)
- Dibenzyline® (phenoxybenzamine capsules – Concordia, generic)

REVIEW DATE: 09/20/2023

OVERVIEW

Metyrosine, a tyrosine hydroxylate inhibitor, is indicated for the treatment of patients with **pheochromocytoma** for the following uses:[1]
- Preoperative preparation of patients for surgery.
- Management of patients when surgery is contraindicated.
- Chronic treatment of patients with malignant pheochromocytoma.

Phenoxybenzamine, a long-acting, adrenergic, alpha-receptor blocking agent, is indicated for the treatment of **pheochromocytoma** to control episodes of hypertension and sweating. If tachycardia is excessive, it may be necessary to use a beta-blocking agent concomitantly.[2]

Guidelines

A clinical practice guideline was published in 2014 from the Endocrine Society regarding pheochromocytoma and paraganglioma.[3] The guidelines recommend a preoperative alpha$_1$-adrenergic receptor blocker as the first choice to control blood pressure and prevent a hypertensive crisis. Both selective and non-selective alpha-blockers have been used (e.g., phenoxybenzamine, doxazosin, prazosin, and terazosin). Calcium channel blockers are the most often used add-on drug class to further improve blood pressure control in patients already treated with alpha-adrenergic receptor blockers. Preoperative co-administration of a beta-adrenergic receptor blocker (e.g., atenolol, metoprolol, and propranolol) is utilized to control tachycardia after administration of an alpha-adrenergic receptor blocker. Metyrosine may be used in combination with an alpha-adrenergic receptor blocker for a short period before surgery to further stabilize blood pressure to reduce blood loss and volume depletion during surgery.

The National Comprehensive Cancer Network guidelines for neuroendocrine and adrenal tumors (version 1.2023 – August 02, 2023) address pheochromocytoma and paragangliomas.[4] Alpha blockade (e.g., terazosin, doxazosin, and prazosin) is recommended first-line for all hormone-secreting pheochromocytomas and paragangliomas. After alpha blockade, if additional blood pressure support is required, the additional of dihydropyridine calcium channel blockers can be considered. Metyrosine can be used in addition to alpha blockade to stabilize blood pressure.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of metyrosine and phenoxybenzamine. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with metyrosine and phenoxybenzamine as well as the monitoring required for adverse events and long-term efficacy, approval requires metyrosine and phenoxybenzamine to be prescribed by or

in consultation with a physician who specializes in the condition being treated.

Automation: None.

Documentation: Documentation will be required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, and prescription receipts.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of phenoxybenzamine is recommended in those who meet the following criteria:

FDA-Approved Indication

1. Pheochromocytoma. Approve for 1 year if the patient meets the following (A and B):
- **A)** If brand Dibenzyline is requested, patient meets both of the following (i and ii):
  - **i.** Patient has tried generic phenoxybenzamine; AND
  - **ii.** Patient cannot continue to use generic phenoxybenzamine due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product which, according to the prescriber, would result in a significant allergy or a serious adverse reaction **[documentation required]**; AND
- **B)** The medication is prescribed by or in consultation with an endocrinologist or a physician who specializes in the management of pheochromocytoma.

II. Coverage of metyrosine is recommended in those who meet the following criteria:

FDA-Approved Indication

1. Pheochromocytoma. Approve for the duration noted if the patient meets ONE of the following (A or B):
- **A)** Initial Therapy. Approve for 1 year if the patient meets all of the following (i, ii, and iii):
  - **i.** Patient has tried a selective alpha blocker (e.g., doxazosin, terazosin, or prazosin); AND
  - **ii.** Patient has tried phenoxybenzamine (brand or generic); AND
  - **iii.** The medication is prescribed by, or in consultation with, an endocrinologist or a physician who specializes in the management of pheochromocytoma.
- **B)** Patient is Currently Receiving Metyrosine. Approve for 1 year if prescribed by or in consultation with an endocrinologist or a physician who specializes in the management of pheochromocytoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of metyrosine and phenoxybenzamine is not recommended in the following situations:

56. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pompe Disease – Enzyme Replacement Therapy – Lumizyme Prior Authorization Policy
- Lumizyme® (alglucosidase intravenous infusion – Genzyme)

REVIEW DATE: 04/12/2023

OVERVIEW

Lumizyme, a human hydrolytic lysosomal glycogen-specific enzyme (acid α-glucosidase), is indicated for patients with **Pompe disease** (acid α-glucosidase deficiency).[1] It is produced in a Chinese hamster ovary cell line via recombinant DNA technology. After administration of Lumizyme, it is internalized into cells and transported to lysosomes where it catalyzes the breakdown of glycogen to glucose.

Disease Overview

Pompe disease (glycogen storage disease type II, or acid maltase deficiency), is a rare lysosomal storage disorder characterized by a deficiency in acid α-glucosidase activity leading to the accumulation of glycogen, particularly in muscle.[2,3] The onset, progression and severity of Pompe disease is variable. Infantile-onset Pompe disease usually manifests in the first few months of life and death often occurs in the first year of life, if left untreated.[2] Clinical manifestations of infantile-onset Pompe disease includes hypotonia, difficulty feeding, and cardiopulmonary failure.[4] Late-onset Pompe disease has more variable clinical course, can manifest any time after 12 months of age, and patients typically present with progressive muscle weakness which can progress to respiratory insufficiency.[3,4] The diagnosis of Pompe disease is established by demonstrating decreased acid α-glucosidase activity in blood, fibroblasts, or muscle tissue; or by genetic testing.[3,4] Definitive treatment of Pompe disease consists of enzyme replacement therapy with Lumizyme.[2-4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lumizyme. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Lumizyme as well as the monitoring required for adverse events and long-term efficacy, approval requires Lumizyme to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lumizyme is recommended in those who meet the following criteria:

FDA-Approved Indication

21. Acid Alpha-Glucosidase Deficiency (Pompe Disease). Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** The diagnosis is established by one of the following (i or ii):
  - **i.** Patient has a laboratory test demonstrating deficient acid alpha-glucosidase activity in blood, fibroblasts, or muscle tissue; OR
  - **ii.** Patient has a molecular genetic test demonstrating acid alpha-glucosidase gene mutation; AND
- **B)** Lumizyme is prescribed by or in consultation with a geneticist, neurologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lumizyme is not recommended in the following situations:

57. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pompe Disease – Enzyme Replacement Therapy – Nexviazyme Prior Authorization Policy
- Nexviazyme® (avalglucosidase alfa-ngpt intravenous infusion – Genzyme)

REVIEW DATE: 08/23/2023

OVERVIEW

Nexviazyme, a hydrolytic lysosomal glycogen-specific recombinant human α-glucosidase enzyme, is indicated for **late-onset Pompe disease** (lysosomal acid α-glucosidase deficiency) in patients ≥ 1 year of age.[1]

Disease Overview

Pompe disease (glycogen storage disease type II, or acid maltase deficiency), is a rare lysosomal storage disorder characterized by a deficiency in acid α-glucosidase activity leading to the accumulation of glycogen, particularly in muscle.[2,3] The onset, progression and severity of Pompe disease is variable. Infantile-onset Pompe disease usually manifests in the first few months of life and death often occurs in the first year of life, if left untreated.[2] Clinical manifestations of infantile-onset Pompe disease includes hypotonia, difficulty feeding, and cardiopulmonary failure.[4] Late-onset Pompe disease has a more variable clinical course and can manifest any time after 12 months of age.[3,4] Patients typically present with progressive muscle weakness which can progress to respiratory insufficiency. The diagnosis of Pompe disease is established by demonstrating decreased acid α-glucosidase activity in blood, fibroblasts, or muscle tissue, or by genetic testing.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nexviazyme. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nexviazyme as well as the monitoring required for adverse events and long-term efficacy, approval requires Nexviazyme to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nexviazyme is recommended in those who meet the following criteria:

FDA-Approved Indication

22. Acid Alpha-Glucosidase Deficiency (Pompe Disease). Approve for 1 year if the patient meets the following (A, B, C, and D):
- **A)** Patient is ≥ 1 year of age; AND
- **B)** Patient has late-onset acid alpha-glucosidase deficiency (late-onset Pompe disease); AND
- **C)** The diagnosis is established by one of the following (i or ii):
  - **i.** Patient has a laboratory test demonstrating deficient acid alpha-glucosidase activity in blood, fibroblasts, or muscle tissue; OR
  - **ii.** Patient has a molecular genetic test demonstrating acid alpha-glucosidase gene mutation; AND

D) The medication is prescribed by or in consultation with a geneticist, neurologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nexviazyme is not recommended in the following situations:

58. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pompe Disease – Enzyme Replacement Therapy – Pombiliti Prior Authorization Policy
- Pombiliti® (cipaglucosidase alfa-atga intravenous infusion – Amicus)

REVIEW DATE: 10/04/2023

OVERVIEW

Pombiliti, a hydrolytic lysosomal glycogen-specific recombinant human α-glucosidase enzyme, is indicated in combination with Opfolda® (miglustat capsules), an enzyme stabilizer, for **late-onset Pompe disease** (lysosomal acid α-glucosidase deficiency) in adults weighing ≥ 40 kg who are not improving on their current enzyme replacement therapy.[1]

Disease Overview

Pompe disease (glycogen storage disease type II, or acid maltase deficiency), is a rare lysosomal storage disorder characterized by a deficiency in acid α-glucosidase activity leading to the accumulation of glycogen, particularly in muscle.[2,3] The onset, progression, and severity of Pompe disease is variable. Infantile-onset Pompe disease usually manifests in the first few months of life and death often occurs in the first year of life, if left untreated.[2] Clinical manifestations of infantile-onset Pompe disease includes hypotonia, difficulty feeding, and cardiopulmonary failure.[4] Late-onset Pompe disease has a more variable clinical course and can manifest any time after 12 months of age.[3,4] Patients typically present with progressive muscle weakness which can progress to respiratory insufficiency. The diagnosis of Pompe disease is established by demonstrating decreased acid α-glucosidase activity in blood, fibroblasts, or muscle tissue, or by genetic testing.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Pombiliti. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Pombiliti as well as the monitoring required for adverse events and long-term efficacy, approval requires Pombiliti to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Pombiliti is recommended in those who meet the following criteria:

FDA-Approved Indication

23. Acid Alpha-Glucosidase Deficiency (Pompe Disease). Approve for 1 year if the patient meets the following (A, B, C, D, E, and F):
- **A)** Patient is ≥ 18 year of age; AND
- **B)** Patient weighs ≥ 40 kg; AND
- **C)** The medication will be used in combination with Opfolda; AND
- **D)** Patient has not demonstrated an improvement in objective measures after receiving one of the following for at least one year (i or ii):

Note: Examples of objective measures include forced vital capacity (FVC) and six-minute walk test (6MWT).

i. Lumizyme (alglucosidase alfa) intravenous infusion; OR

ii. Nexviazyme (avalglucosidase alfa-ngpt) intravenous infusion; AND

E) Patient has late-onset acid alpha-glucosidase deficiency (late-onset Pompe disease) with diagnosis established by one of the following (i or ii):

i. Patient has a laboratory test demonstrating deficient acid alpha-glucosidase activity in blood, fibroblasts, or muscle tissue; OR

ii. Patient has a molecular genetic test demonstrating acid alpha-glucosidase gene mutation; AND

F) The medication is prescribed by or in consultation with a geneticist, neurologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Pombiliti is not recommended in the following situations:

59. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pompe Disease – Enzyme Stabilization Therapy – Opfolda Prior Authorization Policy
- Opfolda® (miglustat capsules – Amicus)

REVIEW DATE: 10/04/2023

OVERVIEW

Opfolda, an enzyme stabilizer, is indicated in combination with Pombiliti® (cipaglucosidase alfa intravenous infusion), a hydrolytic lysosomal glycogen-specific recombinant human α-glucosidase enzyme, for **late-onset Pompe disease** (lysosomal acid α-glucosidase deficiency) in adults weighing ≥ 40 kg who are not improving on their current enzyme replacement therapy.[1] Opfolda binds with, stabilizes, and reduces inactivation of Pombiliti after infusion. Bound Opfolda dissociates from Pombiliti after it is internalized and transported into lysosomes. Opfolda as monotherapy has no pharmacological activity in Pompe disease.

Disease Overview

Pompe disease (glycogen storage disease type II, or acid maltase deficiency), is a rare lysosomal storage disorder characterized by a deficiency in acid α-glucosidase activity leading to the accumulation of glycogen, particularly in muscle.[2,3] The onset, progression, and severity of Pompe disease is variable. Infantile-onset Pompe disease usually manifests in the first few months of life and death often occurs in the first year of life, if left untreated.[2] Clinical manifestations of infantile-onset Pompe disease includes hypotonia, difficulty feeding, and cardiopulmonary failure.[4] Late-onset Pompe disease has a more variable clinical course and can manifest any time after 12 months of age.[3,4] Patients typically present with progressive muscle weakness which can progress to respiratory insufficiency. The diagnosis of Pompe disease is established by demonstrating decreased acid α-glucosidase activity in blood, fibroblasts, or muscle tissue, or by genetic testing.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Opfolda. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Opfolda as well as the monitoring required for adverse events and long-term efficacy, approval requires Opfolda to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Opfolda is recommended in those who meet the following criteria:

FDA-Approved Indication

24. Acid Alpha-Glucosidase Deficiency (Pompe Disease). Approve for 1 year if the patient meets the following (A, B, C, D, E, and F):
- **A)** Patient is ≥ 18 year of age; AND
- **B)** Patient weighs ≥ 40 kg; AND

C) The medication will be used in combination with Pombiliti; AND

D) Patient has not demonstrated an improvement in objective measures after receiving one of the following for at least one year (i or ii):
Note: Examples of objective measures include forced vital capacity (FVC) and six-minute walk test (6MWT)
- **i.** Lumizyme (alglucosidase alfa) intravenous infusion; OR
- **ii.** Nexviazyme (avalglucosidase alfa-ngpt) intravenous infusion; AND

E) Patient has late-onset acid alpha-glucosidase deficiency (late-onset Pompe disease) with diagnosis established by one of the following (i or ii):
- **i.** Patient has a laboratory test demonstrating deficient acid alpha-glucosidase activity in blood, fibroblasts, or muscle tissue; OR
- **ii.** Patient has a molecular genetic test demonstrating acid alpha-glucosidase gene mutation; AND

F) The medication is prescribed by or in consultation with a geneticist, neurologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Opfolda is not recommended in the following situations:

60. Gaucher Disease. An alternate dosage of miglustat is available for the treatment of Gaucher disease.[5]

61. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Proprotein Convertase Subtilisin Kexin Type 9 Inhibitors – Praluent Prior Authorization Policy
- Praluent® (alirocumab subcutaneous injection – Regeneron)

REVIEW DATE: 04/26/2023

OVERVIEW

Praluent, a proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitor antibody, is indicated for the following uses:[1]

- **Established cardiovascular (CV) disease**, in adults to reduce the risk of myocardial infarction (MI), stroke, and unstable angina requiring hospitalization.
- **Primary hyperlipidemia** (including **heterozygous familial hypercholesterolemia [HeFH]**), in adults as an adjunct to diet, alone or in combination with other lipid-lowering therapies (e.g., statins, ezetimibe) to reduce low-density lipoprotein cholesterol (LDL-C).
- **Homozygous familial hypercholesterolemia (HoFH)**, in adults as an adjunct to other LDL-C lowering therapies, to reduce LDL-C.

The safety and efficacy of Praluent in children have not been established.[1] Repatha® (evolocumab subcutaneous injection) is another PCSK9 inhibitor.[2] Leqvio® (inclisiran subcutaneous injection), a small interfering ribonucleic acid (RNA) directed to PCSK9 messenger RNA, is a similar product.[3]

Guidelines

Many guidelines are available regarding the treatment of patients with dyslipidemia.[4-10] For patients with elevated LDL-C, statins are the cornerstone of therapy and recommended first-line to be used at maximally tolerated doses due to the established benefits regarding the reduction of CV risks. Atorvastatin 40 mg to 80 mg once daily (QD) and rosuvastatin 20 mg to 40 mg QD are considered high-intensity statins as they achieve LDL-C lowering of ≥ 50%. Ezetimibe is usually the next therapy added.

- The **American College of Cardiology Expert Consensus Decision Pathway on the Role of Non-Statin Therapies** for LDL-Cholesterol Lowering in the Management of Atherosclerotic cardiovascular disease (ASCVD) Risk (2022) make several recommendations regarding PCSK9 inhibitors.[4] For adults with clinical ASCVD at very high risk (e.g., patients with major ASCVD events, HeFH, diabetes) who are on statin therapy for secondary prevention, the general goal is ≥ 50% LDL-C reduction and an LDL-C < 55 mg/dL with maximally tolerated statin therapy. If the above goals are not achieved, the initial non-statin agents recommended include ezetimibe and/or a PCSK9 monoclonal antibody (i.e., Repatha or Praluent). For adults without clinical ASCVD or diabetes or LDL-C ≥ 190 mg/dL who have undergone subclinical atherosclerosis imaging, if the coronary artery calcium score is ≥ 1,000 Agatston units, PCSK9 monoclonal antibodies (i.e., Repatha or Praluent) may be non-statin agents to consider following high-intensity statin therapy and ezetimibe to achieve the goal of a ≥ 50% LDL-C reduction (and LDL-C threshold < 70 mg/dL).
- The **American Heart Association/American College of Cardiology guidelines on the management of blood cholesterol** (updated 2018) defines ASCVD as an acute coronary syndrome, those with a history of MI, stable or unstable angina or coronary or other revascularizations, stroke, transient ischemic attack, or peripheral arterial disease.[5,6] Although LDL-C thresholds are not always recognized, in general, an LDL-C < 70 mg/dL is recommended for most patients with ASCVD to reduce CV risk. Use of a PCSK9 as an adjunct is justified if this goal is not met with maximally tolerated statins.[5,6] Additionally, guidelines and reviews have recognized that patients with an elevated coronary

artery calcium or calcification score (e.g., ≥ 300 Agatston units) are at an increased risk of CV events.[8,11-14]

- The **National Lipid Association** published guidelines for the screening, diagnosis, and management of pediatric and adult patients with familial hypercholesterolemia (2011).[9] Genetic testing can identify HoFH and HeFH in some cases. Also, HeFH can be diagnosed utilizing Simon Broome criteria or Dutch Lipid Clinical Network criteria. Patients with an untreated LDL-C ≥ 190 mg/dL suggest familial hypercholesterolemia. Statins are the initial treatment for all adults with familial hypercholesterolemia, usually at high-potency doses. Ezetimibe can also be added. In general, for patients with HeFH who have not yet manifested ASCVD, LDL-C levels ≤ 100 mg/dL are recommended.
- The **2014 HoFH position paper from the Consensus Panel on familial hypercholesterolemia of the European Atherosclerosis Society** states the diagnosis of HoFH is made based on genetic or clinical criteria.[15] A definitive diagnosis can be made by genetic confirmation of two mutant alleles at the low density lipoprotein receptor, apolipoprotein B, PCSK9, or low-density lipoprotein receptor adaptor protein 1 gene locus. However, in some patients genetic confirmation remains elusive. Historically, HoFH has been commonly diagnosed based on LDL-C levels such as an untreated LDL-C > 500 mg/dL, or a treated LDL-C ≥ 300 mg/dL. Also confirming the diagnosis is the presence of xanthomas (cutaneous or tendinous) before the age of 10 years or a family history of elevated LDL-C levels consistent with HeFH in both parents. Other clinical manifestations of HoFH include arcus cornea or xanthelasma. Initial therapy for HoFH is high-intensity statins.[15] Other guidelines note that ezetimibe and PCSK9 inhibitors can be added for patients with HoFH if further reductions are needed; Juxtapid® (lomitapide capsules) and Evkeeza® (evinacumab-dgnb intravenous infusion) can be considered.[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Praluent. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and monitoring, approval requires Praluent to be prescribed by or in consultation with a physician who specializes in the condition being treated. A patient who has previously met initial therapy criteria for Praluent for the requested indication under the Coverage Review Department and is currently receiving the requested therapy is only required to meet continuation of therapy criteria (i.e., currently receiving therapy). If past criteria have not been met under the Coverage Review Department and the patient is currently receiving Praluent, or is restarting Praluent, initial criteria must be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Praluent is recommended in those who meet the following criteria:

FDA-Approved Indications

35. Atherosclerotic Cardiovascular Disease.* Approve for 1 year if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve if the patient meets all of the following (i, ii, iii, and iv):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Patient has had one of the following conditions or diagnoses (a, b, c, d, or e):
  - **a)** A previous myocardial infarction or a history of an acute coronary syndrome; OR
  - **b)** Angina (stable or unstable); OR
  - **c)** A past of stroke or transient ischemic attack; OR
  - **d)** Peripheral arterial disease; OR

e) Patient has undergone a coronary or other arterial revascularization procedure in the past; AND

H) Note: Examples include coronary artery bypass graft surgery, percutaneous coronary intervention, angioplasty, and coronary stent procedures.

iii. Patient meets one of the following (a or b):

a) Patient meets both of the following [(1) and (2)]:

(1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

(2) Low-density lipoprotein cholesterol level after this treatment remains ≥ 70 mg/dL; OR

b) Patient has been determined to be statin intolerant by meeting one of the following [(1) or (2)]:

(1) Patient experienced statin-related rhabdomyolysis; OR

I) Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).

(2) Patient meets all of the following [(a), (b), and (c)]:

(a) Patient experienced skeletal-related muscle symptoms; AND

J) Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

K) (b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND

L) (c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

M) Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

iv. Medication is prescribed by or in consultation with a cardiologist, an endocrinologist, or a physician who focuses in the treatment of cardiovascular risk management and/or lipid disorders; OR

B) Patient Currently Receiving Praluent. Approve if according to the prescribing physician, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Praluent for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Praluent, Initial Therapy criteria must be met.

36. Heterozygous Familial Hypercholesterolemia (HeFH).* Approve for 1 year if the patient meets ONE the following (A or B):

A) Initial Therapy. Approve if the patient meets all of the following (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND

ii. Patient meets one of the following (a, b, or c):

a) Patient has an untreated low-density lipoprotein cholesterol (LDL-C) level ≥ 190 mg/dL (prior to treatment with antihyperlipidemic agents); OR

b) Patient has genetic confirmation of heterozygous familial hypercholesterolemia by mutations in the low-density lipoprotein receptor, apolipoprotein B, proprotein convertase subtilisin kexin type 9, or low-density lipoprotein receptor adaptor protein 1 gene; OR

c) Patient has been diagnosed with heterozygous familial hypercholesterolemia meeting one of the following diagnostic criteria thresholds [(1) or (2)]:

(1) Prescribing physician confirms that the Dutch Lipid Network criteria score was > 5; OR

(2) Prescribing physician confirms that Simone Broome criteria met the threshold for "definite" or "possible (or probable)" familial hypercholesterolemia; AND

iii. Patient meets one of the following (a or b):

(1) Patient meets both of the following [(1) and (2)]:

1. Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

2. Low-density lipoprotein cholesterol level after this treatment remains ≥ 70 mg/dL; OR

(2) Patient has been determined to be statin intolerant by meeting one of the following [(1) or (2)]:

1. Patient experienced statin-related rhabdomyolysis; OR

N) Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).

2. Patient meets all of the following [(a), (b), and (c)]:

(a) Patient experienced skeletal-related muscle symptoms; AND

O) Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

P) **(b)** The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND

Q) **(c)** When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

R) Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

iv. Medication is prescribed by or in consultation with a cardiologist, an endocrinologist, or a physician who focuses in the treatment of cardiovascular risk management and/or lipid disorders; OR

B) Patient Currently Receiving Praluent. Approve if according to the prescribing physician, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Praluent for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Praluent, Initial Therapy criteria must be met.

37. Homozygous Familial Hypercholesterolemia (HoFH).* Approve for 1 year if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve if the patient meets all of the following (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND

ii. Patient meets one of the following (a, b, or c):

a) Patient has genetic confirmation of two mutant alleles at the low-density lipoprotein receptor, apolipoprotein B, proprotein convertase subtilisin kexin type 9 (PCSK9), or low-density lipoprotein receptor adaptor protein 1 gene locus; OR

b) Patient has an untreated low-density lipoprotein (LDL-C) level > 500 mg/dL AND meets one of the following [(1) or (2)]:

Note: Untreated refers to prior therapy with any antihyperlipidemic agent.

(1) Patient had clinical manifestations of homozygous familial hypercholesterolemia before 10 years of age; OR

S) Note: Clinical manifestations of homozygous familial hypercholesterolemia are cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas, or xanthelasma.

(2) Both parents of the patient had untreated LDL-C levels or total cholesterol levels consistent with heterozygous familial hypercholesterolemia; OR

T) Note: An example of heterozygous familial hypercholesterolemia in both parents would be if both had an untreated LDL-C level ≥ 190 mg/dL and/or an untreated total cholesterol level > 250 mg/dL.

c) Patient has a treated LDL-C level ≥ 300 mg/dL AND meets one of the following [(1) or (2)]:

Note: Treated refers to after therapy with at least one antihyperlipidemic agent. Some examples of antihyperlipidemic agents include statins (e.g., atorvastatin, rosuvastatin, lovastatin, simvastatin, pravastatin), ezetimibe, a PCSK9 inhibitor (e.g., Repatha [evolocumab subcutaneous injection]), Evkeeza (evinacumab-dgnb intravenous infusion), and Juxtapid (lomitapide capsules).

1. Patient had clinical manifestations of homozygous familial hypercholesterolemia before 10 years of age; OR

Note: Examples of clinical manifestations of homozygous familial hypercholesterolemia are cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma.

2. Both parents of the patient had untreated LDL-C levels or total cholesterol levels consistent with heterozygous familial hypercholesterolemia; AND

U) Note: An example of heterozygous familial hypercholesterolemia in both parents would be if both had an untreated LDL-C ≥ 190 mg/dL and/or an untreated total cholesterol > 250 mg/dL.

iii. Patient meets one of the following (a or b):

a) Patient meets both of the following [(1) and (2)]:

(1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

(2) LDL-C level after this treatment remains ≥ 70 mg/dL; OR

b) Patient has been determined to be statin intolerant by meeting one of the following criteria [(1) or (2)]:

(1) Patient experienced statin-related rhabdomyolysis; OR

Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR

(2) Patient meets all of the following [(a), (b), and (c)]:

(a) Patient experienced skeletal-related muscle symptoms; AND

V) Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

W) (b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND

X) (c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

Y) Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

iv. Medication is prescribed by or in consultation with a cardiologist, an endocrinologist, or a physician who focuses in the treatment of cardiovascular risk management and/or lipid disorders; OR

B) Patient Currently Receiving Praluent. Approve if according to the prescribing physician, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Praluent for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Praluent, Initial Therapy criteria must be met.

38. Primary Hyperlipidemia.* Approve for 1 year if the patient meets ONE of the following (A or B):

Note: This is not associated with atherosclerotic cardiovascular disease (ASCVD) or heterozygous familial hypercholesterolemia (HeFH) and may be referred to as combined hyperlipidemia, hypercholesterolemia (pure, primary), dyslipidemia, or increased/elevated low-density lipoprotein cholesterol (LDL-C) levels.

A) Initial Therapy. Approve if the patient meets all of the following (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND

ii. Patient has a coronary artery calcium or calcification score ≥ 300 Agatston units; AND

iii. Patient meets one of the following (a or b):

a) Patient meets all of the following [(1), (2), and (3)]:

(1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]); AND

(2) Patient has tried the one high-intensity statin therapy above along with ezetimibe (as a single-entity or as a combination product) for ≥ 8 continuous weeks; AND

(3) LDL-C level after this treatment regimen remains ≥ 100 mg/dL; OR

b) Patient has been determined to be statin intolerant by meeting one of the following [(1) or (2)]:

(1) Patient experienced statin-related rhabdomyolysis; OR

Z) Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).

(2) Patient meets all of the following [(a), (b), and (c)]:

(a) Patient experienced skeletal-related muscle symptoms; AND

AA) Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).
BB) (b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND
CC) (c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND
Note: Examples of skeletal-related muscle symptoms include myopathy or myalgia.

iv. Medication is prescribed by or in consultation with a cardiologist, an endocrinologist, or a physician who focuses in the treatment of cardiovascular risk management and/or lipid disorders; OR

B) Patient Currently Receiving Praluent. According to the prescribing physician, the patient has experienced a response to therapy.
Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Praluent for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Praluent, Initial Therapy criteria must be met.

Note:
* A patient may have diagnoses that pertain to more than one FDA-approved indication, therefore, consider review under different approval conditions, if applicable (e.g., a patient with heterozygous familial hypercholesterolemia or homozygous familial hypercholesterolemia may have had a clinical ASCVD event, a patient with primary hyperlipidemia may have heterozygous familial hypercholesterolemia).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Praluent is not recommended in the following situations:

53. Concurrent use of Praluent with Repatha (evolocumab subcutaneous injection) or Leqvio (inclisiran subcutaneous injection). Repatha is another PCSK9 inhibitor and should not be used with Praluent.[2] Leqvio, a small interfering ribonucleic acid (RNA) directed to PCSK9 messenger RNA, is a similar product and should not be given with Praluent.[3]

54. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Proprotein Convertase Subtilisin Kexin Type 9 Inhibitors – Repatha Prior Authorization Policy
- Repatha® (evolocumab subcutaneous injection [single-use prefilled syringes and Pushtronex™ system] – Amgen)

REVIEW DATE: 04/26/2023

OVERVIEW

Repatha, a proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitor antibody, is indicated for the following uses:[1]

- **Established cardiovascular (CV) disease**, in adults to reduce the risk of myocardial infarction (MI), stroke, and coronary revascularization.
- **Primary hyperlipidemia (including heterozygous familial hypercholesterolemia [HeFH])**, in adults as an adjunct to diet, alone or in combination with other low-density lipoprotein cholesterol (LDL-C)-lowering therapies to reduce LDL-C.
- **HeFH, in pediatric patients ≥ 10 years of age**, as an adjunct to diet and other LDL-C lowering therapies.
- **Homozygous familial hypercholesterolemia (HoFH)**, as an adjunct to diet and other low-density lipoprotein (LDL)-lowering therapies (e.g., statins, ezetimibe, LDL apheresis) in patients ≥ 10 years of age and older, to reduce LDL-C.

The safety and effectiveness of Repatha have not been established in pediatric patients with HeFH or HoFH who are younger than 10 years of age.[1] Another PCSK9 inhibitor that is available is Praluent® (alirocumab subcutaneous injection).[2] Leqvio® (inclisiran subcutaneous injection), a small interfering ribonucleic acid (RNA) directed to PCSK9 messenger RNA, is a similar product.[3]

Guidelines

Many guidelines are available regarding the treatment of patients with dyslipidemia.[4-10] For patients with elevated LDL-C, statins are the cornerstone of therapy and recommended first-line to be used at maximally tolerated doses due to the established benefits regarding the reduction of CV risks. Atorvastatin 40 mg to 80 mg once daily (QD) and rosuvastatin 20 mg to 40 mg QD are considered high-intensity statins as they achieve LDL-C lowering of ≥ 50%. Ezetimibe is usually the next therapy added.

- The **American College of Cardiology Expert Consensus Decision Pathway on the Role of Non-Statin Therapies** for LDL-Cholesterol Lowering in the Management of Atherosclerotic cardiovascular disease (ASCVD) Risk (2022) make several recommendations regarding PCSK9 inhibitors.[4] For adults with clinical ASCVD at very high risk (e.g., patients with major ASCVD events, HeFH, diabetes) who are on statin therapy for secondary prevention, the general goal is ≥ 50% LDL-C reduction and an LDL-C < 55 mg/dL with maximally tolerated statin therapy. If the above goals are not achieved, the initial non-statin agents recommended include ezetimibe and/or a PCSK9 monoclonal antibody (i.e., Repatha or Praluent). For adults without clinical ASCVD or diabetes or LDL-C ≥ 190 mg/dL who have undergone subclinical atherosclerosis imaging, if the coronary artery calcium score is ≥ 1,000 Agatston units, PCSK9 monoclonal antibodies (i.e., Repatha or Praluent) may be non-statin agents to consider following high-intensity statin therapy and ezetimibe to achieve the goal of a ≥ 50% LDL-C reduction (and LDL-C threshold < 70 mg/dL).
- The **American Heart Association/American College of Cardiology guidelines on the management of blood cholesterol** (updated 2018) defines ASCVD as an acute coronary syndrome, those with a

history of MI, stable or unstable angina or coronary or other revascularizations, stroke, transient ischemic attack, or peripheral arterial disease.[5,6] Although LDL-C thresholds are not always recognized, in general, an LDL-C < 70 mg/dL is recommended for most patients with ASCVD to reduce CV risk. Use of a PCSK9 as an adjunct is justified if this goal is not met with maximally tolerated statins.[5,6] Additionally, guidelines and reviews have recognized that patients with an elevated coronary artery calcium or calcification score (e.g., ≥ 300 Agatston units) are at an increased risk of CV events.[8,11-14]

- The **National Lipid Association** published guidelines for the screening, diagnosis, and management of pediatric and adult patients with familial hypercholesterolemia (2011).[9] Genetic testing can identify HoFH and HeFH in some cases. Also, HeFH can be diagnosed utilizing Simon Broome criteria or Dutch Lipid Clinical Network criteria. Patients with an untreated LDL-C ≥ 190 mg/dL suggest familial hypercholesterolemia. Statins are the initial treatment for all adults with familial hypercholesterolemia, usually at high-potency doses. Ezetimibe can also be added. In general, for patients with HeFH who have not yet manifested ASCVD, LDL-C levels ≤ 100 mg/dL are recommended.
- The **2014 HoFH position paper from the Consensus Panel on familial hypercholesterolemia of the European Atherosclerosis Society** states the diagnosis of HoFH is made based on genetic or clinical criteria.[15] A definitive diagnosis can be made by genetic confirmation of two mutant alleles at the LDL receptor, apolipoprotein B, PCSK9, or LDL receptor adaptor protein 1 gene locus. However, in some patients genetic confirmation remains elusive. Historically, HoFH has been commonly diagnosed based on LDL-C levels such as an untreated LDL-C > 500 mg/dL, or a treated LDL-C ≥ 300 mg/dL. Also confirming the diagnosis is the presence of xanthomas (cutaneous or tendinous) before the age of 10 years or a family history of elevated LDL-C levels consistent with HeFH in both parents. Other clinical manifestations of HoFH include arcus cornea or xanthelasma. Initial therapy for HoFH is high-intensity statins.[15] Other guidelines note that ezetimibe and PCSK9 inhibitors can be added for patients with HoFH if further reductions are needed; Juxtapid® (lomitapide capsules) and Evkeeza® (evinacumab-dgnb intravenous infusion) can be considered.[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Repatha. All approvals are provided for the duration noted below. Due to the specialized skills required for evaluation and monitoring, approval requires Repatha to be prescribed by or in consultation with a physician who specializes in the condition being treated. Only a patient who has previously met initial therapy criteria for Repatha for the requested indication under the Coverage Review Department and is currently receiving the requested therapy is only required to meet continuation of therapy criteria (i.e., currently receiving therapy). If past criteria have not been met under the Coverage Review Department and the patient is currently receiving Repatha, or is restarting Repatha, initial criteria must be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Repatha is recommended in those who meet the following criteria:

FDA-Approved Indications

39. Atherosclerotic Cardiovascular Disease.* Approve for 1 year if the patient meets one of the following (A or B):

C) Initial Therapy. Approve if the patient meets allow the following (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND

ii. Patient has had one of the following conditions or diagnoses (a, b, c, d, or e):

a) A previous myocardial infarction or a history of an acute coronary syndrome; OR

b) Angina (stable or unstable); OR

c) A past of stroke or transient ischemic attack; OR

d) Peripheral arterial disease; OR

e) Patient has undergone a coronary or other arterial revascularization procedure in the past; AND

Note: Examples include coronary artery bypass graft surgery, percutaneous coronary intervention, angioplasty, and coronary stent procedures.

iii. Patient meets one of the following (a or b):

~~**a)**~~ Patient meets both of the following [(1) and (2)]:

(1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

(2) Low-density lipoprotein cholesterol level after this treatment remains ≥ 70 mg/dL; OR

b) Patient has been determined to be statin intolerant by meeting one of the following criteria [(1) or (2)]:

(1) Patient experienced statin-related rhabdomyolysis; OR

Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR

(2) Patient meets all of the following [(a), (b), and (c)]:

(a) Patient experienced skeletal-related muscle symptoms; AND

DD) Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

EE) (b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND

FF) (c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

GG) Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

iv. Medication is prescribed by, or in consultation with, a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders; OR

D) Patient Currently Receiving Repatha. Approve if according to the prescribing physician, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Repatha for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Repatha, Initial Therapy criteria must be met.

40. Heterozygous Familial Hypercholesterolemia (HeFH).* Approve for 1 year if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve if the patient meets all of the following (i, ii, iii, and iv):

i. Patient is ≥ 10 years of age; AND

ii. Patient meets one of the following (a, b, or c):

(1) Patient has an untreated low-density lipoprotein cholesterol (LDL-C) ≥ 190 mg/dL (prior to treatment with antihyperlipidemic agents); OR

(2) Patient has genetic confirmation of heterozygous familial hypercholesterolemia by mutations in the low-density lipoprotein receptor, apolipoprotein B, proprotein convertase subtilisin kexin type 9, or low-density lipoprotein receptor adaptor protein 1 gene; OR

(3) Patient has been diagnosed with heterozygous familial hypercholesterolemia by meeting one of the following diagnostic criteria thresholds [(1) or (2)]:

(1) Prescribing physician confirms that the Dutch Lipid Network criteria score was > 5; OR

(2) Prescribing physician confirms that Simone Broome criteria met the threshold for "definite" or "possible (or probable)" familial hypercholesterolemia; AND

iii. Patient meets one of the following (a or b):

a) Patient meets both of the following ([(1) and (2)]:

(1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

(2) Low-density lipoprotein cholesterol (LDL-C) level after this treatment remains ≥ 70 mg/dL; OR

b) Patient has been determined to be statin intolerant by meeting one of the following [(1) or (2)]:

(1) Patient experienced statin-related rhabdomyolysis; OR

Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).

(2) Patient meets all of the following [(a), (b), and (c)]:

(a) Patient experienced skeletal-related muscle symptoms; AND

HH) Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

II) (b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND

JJ) (c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

KK) Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

iv. Medication is prescribed by or in consultation with a cardiologist, an endocrinologist, or a physician who focuses in the treatment of cardiovascular risk management and/or lipid disorders; OR

D) Patient Currently Receiving Repatha. Approve if according to the prescribing physician, the patient has experienced a response to therapy.
Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Repatha for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Repatha, Initial Therapy criteria must be met.

41. Homozygous Familial Hypercholesterolemia (HoFH).* Approve for 1 year if the patient meets one of the following (A or B):

C) Initial Therapy. Approve if the patient meets all of the following (i, ii, iii, and iv):

i. Patient is ≥ 10 years of age; AND

ii. Patient meets one of the following (a, b, or c):

a) Patient has genetic confirmation of two mutant alleles at the low-density lipoprotein receptor, apolipoprotein B, proprotein convertase subtilisin kexin type 9 (PCSK9), or low-density lipoprotein receptor adaptor protein 1 gene locus; OR

b) Patient has an untreated low-density lipoprotein cholesterol (LDL-C) level > 500 mg/dL AND meets one of the following [(1) or (2)]:
Note: Untreated refers to therapy with any antihyperlipidemic agent.

(1) Patient had clinical manifestations of homozygous familial hypercholesterolemia before 10 years of age; OR

LL) Note: Clinical manifestations of homozygous familial hypercholesterolemia are cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas, or xanthelasma.

(2) Both parents of the patient had untreated LDL-C levels or total cholesterol levels consistent with heterozygous familial hypercholesterolemia; OR

MM) Note: An example of heterozygous familial hypercholesterolemia in both parents would be if both had an untreated LDL-C level ≥ 190 mg/dL and/or an untreated total cholesterol level > 250 mg/dL.

c) Patient has a treated LDL-C level ≥ 300 mg/dL AND meets one of the following [(1) or (2)]:
Note: Treated refers to after therapy with at least one antihyperlipidemic agent. Some examples of antihyperlipidemic agents include statins (e.g., atorvastatin, rosuvastatin, lovastatin, simvastatin, pravastatin), ezetimibe, a PCSK9 inhibitor (e.g., Praluent [alirocumab subcutaneous injection]), Evkeeza (evinacumab-dgnb intravenous infusion), or Juxtapid (lomitapide capsules).

(1) Patient had clinical manifestations of homozygous familial hypercholesterolemia before 10 years of age; OR
Note: Examples of clinical manifestations of homozygous familial hypercholesterolemia are cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma.

(2) Both parents of the patient had untreated LDL-C levels or total cholesterol levels consistent with heterozygous familial hypercholesterolemia; AND

NN) Note: An example of heterozygous familial hypercholesterolemia in both parents would be if both had an untreated LDL-C ≥ 190 mg/dL and/or an untreated total cholesterol > 250 mg/dL.

iii. Patient meets one of the following (a or b):

a) Patient meets both of the following [(1) and (2)]:

(1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

(2) LDL-C level after this treatment remains ≥ 70 mg/dL; OR

b) Patient has been determined to be statin intolerant by meeting one of the following criteria [(1) or (2)]:

(1) Patient experienced statin-related rhabdomyolysis; OR

Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR

(2) Patient meets all of the following [(a), (b), and (c)]:

(a) Patient experienced skeletal-related muscle symptoms; AND

OO) Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

PP) (b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND

QQ) (c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

RR) Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

iv. Medication is prescribed by or in consultation with a cardiologist, an endocrinologist, or a physician who focuses in the treatment of cardiovascular risk management and/or lipid disorders; OR

D) Patient Currently Receiving Repatha. Approve if according to the prescribing physician, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Repatha for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Repatha, Initial Therapy criteria must be met.

42. Primary Hyperlipidemia.* Approve for 1 year if the patient meets ONE of the following (A or B):

Note: This is not associated with atherosclerotic cardiovascular disease (ASCVD), heterozygous familial hypercholesterolemia (HeFH), or homozygous familial hypercholesterolemia (HoFH) and may be referred to as combined hyperlipidemia, hypercholesterolemia (pure, primary), dyslipidemia, or increased/elevated low-density lipoprotein cholesterol (LDL-C) levels.

C) Initial Therapy. Approve if the patient meets all of the following (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND
ii. Patient has a coronary artery calcium or calcification score ≥ 300 Agatston units; AND
iii. Patient meets one of the following criteria (a or b):
a) Patient meets all of the following [(1), (2), and (3)]:
~~(1)~~ Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]); AND
~~(2)~~ Patient has tried one high-intensity statin therapy above along with ezetimibe (as a single-entity or as a combination product) for ≥ 8 continuous weeks; AND
~~(3)~~ LDL-C level after this treatment regimen remains ≥ 100 mg/dL; OR
b) Patient has been determined to be statin intolerant by meeting one of the following [(1) or (2)]:
(1) Patient experienced statin-related rhabdomyolysis; OR
Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR
(2) Patient meets all of the following [(a), (b), and (c)]:
(a) Patient experienced skeletal-related muscle symptoms; AND
SS) Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).
TT) (b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND
UU) (c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND
VV) Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.
iv. Medication is prescribed by or in consultation with a cardiologist, an endocrinologist, or a physician who focuses in the treatment of cardiovascular risk management and/or lipid disorders; OR
D) Patient Currently Receiving Repatha. Approve if according to the prescribing physician, the patient has experienced a response to therapy.
Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Repatha for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Repatha, Initial Therapy criteria must be met.

Note:
* A patient may have diagnoses pertain to more than one FDA-approved indication, therefore, consider review under different approval conditions, if applicable (e.g., a patient with heterozygous familial hypercholesterolemia or homozygous familial hypercholesterolemia may have had a clinical ASCVD event, a patient with primary hyperlipidemia may have heterozygous familial hypercholesterolemia).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Repatha is not recommended in the following situations:

55. Concurrent use of Repatha with Praluent (alirocumab subcutaneous injection) or Leqvio (inclisiran subcutaneous injection). Praluent is another PCSK9 inhibitor and should not be used with Repatha.[2] Leqvio, a small interfering ribonucleic acid (RNA) directed to PCSK9 messenger RNA, is a similar product and should not be given with Repatha.[3]

56. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Proprotein Convertase Subtilisin Kexin Type 9 Related Products – Leqvio Prior Authorization Policy
- Leqvio® (inclisiran subcutaneous injection – Novartis)

REVIEW DATE: 04/26/2023; selected revision 08/30/2023

OVERVIEW

Leqvio, a small interfering ribonucleic acid (RNA) directed to proprotein convertase subtilisin kexin type 9 (PCSK9) messenger RNA, is indicated as an adjunct to diet and statin therapy for the treatment of adults with primary hyperlipidemia, including heterozygous familial hypercholesterolemia (HeFH), to reduce low-density lipoprotein cholesterol (LDL-C).[1] The safety and effectiveness have not been established in pediatric patients.

Dosing Information

Leqvio is given as a subcutaneous injection and should be administered by a healthcare professional. The dose is 284 mg given as a single subcutaneous injection initially, again at 3 months, and then once every 6 months.

Guidelines

Many guidelines are available regarding the treatment of patients with dyslipidemia which include the management of HeFH and atherosclerotic cardiovascular disease (ASCVD).[2-10] For patients with elevated LDL-C, statins are the cornerstone of therapy and recommended first-line to be used at maximally tolerated doses due to the established benefits regarding the reduction of cardiovascular (CV) risks. Atorvastatin 40 mg to 80 mg once daily (QD) and rosuvastatin 20 mg to 40 mg QD are considered high-intensity statins as they achieve LDL-C lowering of ≥ 50%.

- The **American College of Cardiology (ACC) Expert Consensus Decision Pathway on the Role of Non-Statin Therapies** for LDL-C Lowering in the Management of ASCVD Risk (2022) make several recommendations regarding PCSK9 inhibitors and Leqvio.[2] For adults with clinical ASCVD at very high risk (e.g., patients with major ASCVD events, HeFH, diabetes) who are on statin therapy for secondary prevention, the general goal is ≥ 50% LDL-C reduction and an LDL-C < 55 mg/dL with maximally tolerated statin therapy. If the above goals are not achieved, the initial non-statin agents recommended include ezetimibe and/or a PCSK9 monoclonal antibody (i.e., Repatha® [evolocumab subcutaneous injection] or Praluent® [alirocumab subcutaneous injection]). Leqvio may also be considered.
- **The American Heart Association (AHA)/ACC guidelines for chronic coronary disease (2023)** state that in patients with chronic coronary disease on maximally tolerated statin therapy who have an LDL-C level ≥ 70 mg/dL, and in whom ezetimibe and PCSK9 inhibitors are deemed insufficient or not tolerated, it may be reasonable to add Nexletol® (bempedoic acid tablets) or Leqvio (in place of a PCSK9 inhibitor) to further reduce LDL-C levels.[10]
- **The AHA** published a scientific statement regarding familial hypercholesterolemia (2015).[8] Key points are that the condition may start early (in childhood or adolescence) and is noted by LDL-C levels ≥ 190 mg/dL. Premature CV disease can result. Diagnosis can be confirmed by genetic testing. The Dutch Lipid Clinic Network criteria and Simon Broome criteria may also be used which incorporate cholesterol levels, family history, clinical findings, and physical manifestations. Aggressive lipid-lowering therapy is recommended to achieve LDL-C reductions of at least 50%.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Leqvio. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and monitoring, approval requires Leqvio to be prescribed by or in consultation with a physician who specializes in the condition being treated. A patient who has previously met Initial Therapy criteria for Leqvio for the requested indication under the Coverage Review Department and is currently receiving Leqvio is only required to meet continuation of therapy criteria (i.e., currently receiving therapy). If past criteria have not been met under the Coverage Review Department and the patient is currently receiving Leqvio, or is restarting Leqvio, Initial Therapy criteria must be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Leqvio is recommended in those who meet one of the following criteria:

FDA-Approved Indications

43. Heterozygous Familial Hypercholesterolemia (HeFH).* Approve for 1 year if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve if the patient meets all of the following (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND

ii. Patient meets one of the following (a, b, or c):

a) Patient has an untreated low-density lipoprotein cholesterol (LDL-C) level ≥ 190 mg/dL (prior to treatment with antihyperlipidemic agents); OR

b) Patient has genetic confirmation of heterozygous familial hypercholesterolemia by mutations in the low-density lipoprotein receptor, apolipoprotein B, proprotein convertase subtilisin kexin type 9, or low-density lipoprotein receptor adaptor protein 1 gene; OR

c) Patient has been diagnosed with heterozygous familial hypercholesterolemia meeting one of the following diagnostic criteria thresholds [(1) or (2)]:

(1) Prescribing physician confirms that the Dutch Lipid Network criteria score was > 5; OR

(2) Prescribing physician confirms that Simone Broome criteria met the threshold for "definite" or "possible (or probable)" familial hypercholesterolemia; AND

iii. Patient meets one of the following (a or b):

a) Patient meets all of the following [(1), (2), and (3)]:

(1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single entity or as a combination product]); AND

(2) Patient has tried one high-intensity statin along with ezetimibe (as a single-entity or as a combination product) for ≥ 8 continuous weeks; AND

(3) LDL-C level after this treatment regimen remains ≥ 70 mg/dL; OR

b) Patient has been determined to be statin intolerant by meeting one of the following [(1) or (2)]:

1. Patient experienced statin-related rhabdomyolysis; OR
Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).

2. Patient meets all of the following [(a), (b), and (c)]:

(a) Patient experienced skeletal-related muscle symptoms; AND

Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND

(c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

iv. Medication is prescribed by or in consultation with a cardiologist, an endocrinologist, or a physician who focuses in the treatment of cardiovascular risk management and/or lipid disorders; OR

E) Patient Currently Receiving Leqvio. Approve if according to the prescribing physician, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing LDL-C, total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Leqvio for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Leqvio, Initial Therapy criteria must be met.

44. Primary Hyperlipidemia.* Approve for 1 year if the patient meets ONE of the following (A or B):

Note: This is not associated with atherosclerotic cardiovascular disease (ASCVD) or heterozygous familial hypercholesterolemia (HeFH) and may be referred to as combined hyperlipidemia, hypercholesterolemia (pure, primary), dyslipidemia, or increased/elevated low-density lipoprotein cholesterol (LDL-C) levels.

A) Initial Therapy. Approve if the patient meets all of the following (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND

ii. Patient has a coronary artery calcium or calcification score ≥ 300 Agatston units; AND

iii. Patient meets one of the following (a or b):

a) Patient meets all of the following [(1]), (2), and (3)]:

(1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]); AND

(2) Patient has tried the one high-intensity statin therapy above along with ezetimibe (as a single-entity or as a combination product) for ≥ 8 continuous weeks; AND

(3) LDL-C level after this treatment regimen remains ≥ 100 mg/dL; OR

b) Patient has been determined to be statin intolerant by meeting one of the following [(1) or (2)]:

1. Patient experienced statin-related rhabdomyolysis; OR

Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).

2. Patient meets all of the following [(a), (b), and (c)]:

(a) Patient experienced skeletal-related muscle symptoms; AND

Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND

(c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

iv. Medication is prescribed by or in consultation with a cardiologist, an endocrinologist, or a physician who focuses in the treatment of cardiovascular risk management and/or lipid disorders; OR

B) Patient Currently Receiving Leqvio. Approve if according to the prescribing physician, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing LDL-C, total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Leqvio for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Leqvio, Initial Therapy criteria must be met.

Other Uses with Supportive Evidence

3. Atherosclerotic Cardiovascular Disease.* Approve for 1 year if the patient meets ONE of the following (A or B):

E) Initial Therapy. Approve if the patient meets all of the following (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND

ii. Patient has had one of the following conditions or diagnoses (a, b, c, d, e, or f):

a) A previous myocardial infarction or a history of an acute coronary syndrome; OR

b) Angina (stable or unstable); OR

c) A past of stroke or transient ischemic attack; OR

d) Coronary artery disease; OR

e) Peripheral arterial disease; OR

f) Patient has undergone a coronary or other arterial revascularization procedure in the past; AND

Note: Examples include coronary artery bypass graft surgery, percutaneous coronary intervention, angioplasty, and coronary stent procedures.

iii. Patient meets one of the following (a or b):

a) Patient meets all of the following ([(1), (2), and (3)]:

(1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single entity or as a combination product]); AND

(2) Patient has tried one high-intensity statin along with ezetimibe (as a single-entity or as a combination product) for ≥ 8 continuous weeks; AND

(3) Low-density lipoprotein cholesterol (LDL-C) level after this treatment regimen remains ≥ 70 mg/dL; OR

b) Patient has been determined to be statin intolerant by meeting one of the following [(1) or (2)]:

(1) Patient experienced statin-related rhabdomyolysis; OR

Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).

(2) Patient meets all of the following [(a), (b), and (c)]:

(a) Patient experienced skeletal-related muscle symptoms; AND
Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND

(c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND
Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

iv. Medication is prescribed by or in consultation with a cardiologist, an endocrinologist, or a physician who focuses in the treatment of cardiovascular risk management and/or lipid disorders; OR

F) Patient Currently Receiving Leqvio. Approve if according to the prescribing physician, the patient has experienced a response to therapy.
Note: Examples of a response to therapy include decreasing LDL-C, total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Leqvio for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Leqvio, Initial Therapy criteria must be met.

Note:
* A patient may have a diagnoses that pertains to more than one indication, therefore, consider review under different approval conditions, if applicable (e.g., a patient with heterozygous familial hypercholesterolemia may have had a clinical ASCVD event, a patient with primary hyperlipidemia may have heterozygous familial hypercholesterolemia).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Leqvio is not recommended in the following situations:

62. Concurrent use of Leqvio with Repatha (evolocumab subcutaneous injection) or Praluent (alirocumab subcutaneous injection). Repatha and Praluent are PCSK9 inhibitors and should not be used with Leqvio due to a similar mechanism of action.[1] Patients receiving PCSK9 inhibitors were excluded from the pivotal trials with Leqvio.

63. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Psychiatry – Spravato Prior Authorization Policy
- Spravato® (esketamine nasal spray – Janssen)

REVIEW DATE: 04/19/2023

OVERVIEW

Spravato, a non-competitive N-methyl D-aspartate (NMDA) receptor antagonist, is indicated in conjunction with an oral antidepressant for the treatment of:[1]

- Depressive symptoms in adults with **major depressive disorder (MDD) with acute suicidal ideation or behavior**.
- **Treatment-resistant depression** (TRD) in adults.

Limitation of Use: The effectiveness of Spravato in preventing suicide or in reducing suicidal ideation or behavior has not been demonstrated. Use of Spravato does not preclude the need for hospitalization if clinically warranted, even if patients experience improvement after an initial dose of Spravato. Spravato is not approved as an anesthetic agent. The safety and effectiveness of Spravato as an anesthetic agent have not been established.

Spravato should be administered in conjunction with an oral antidepressant.[1] For MDD with acute suicidal ideation or behavior, the recommended dosage is 84 mg twice weekly for 4 weeks. The dosage may be reduced to 56 mg twice weekly based on tolerability. After 4 weeks of treatment, evidence of therapeutic benefit should be evaluated to determine the need for continued treatment. The use of Spravato, in conjunction with an oral antidepressant, beyond 4 weeks has not been systematically evaluated in the treatment of depressive symptoms in patients with MDD with acute suicidal ideation or behavior. For treatment-resistant depression, the recommended dose is 56 mg intranasally on Day 1, followed by 56 mg or 84 mg intranasally twice weekly for Weeks 1 to 4. On Weeks 5 to 8, Spravato should be administered once weekly at a dose of 56 mg or 84 mg intranasally. On Week 9 and thereafter, the dosing frequency should be individualized to the least frequent dosing to maintain remission/response (either every 2 weeks or once weekly) at a dose of 56 mg or 84 mg. Spravato must be administered under the direct supervision of a healthcare provider.

Disease Overview

Major depressive disorder is a serious, life-threatening condition with high rates of morbidity and a chronic disease course.[2] Major depressive disorder is considered the leading cause of disability worldwide and is also associated with increased mortality rates.[3,4] About 30% to 40% of patients with major depressive disorder fail to respond to first-line treatments including oral antidepressant medications of all classes (e.g., selective serotonin reuptake inhibitors [SSRIs], serotonin-norepinephrine reuptake inhibitors [SNRIs], tricyclic antidepressants [TCAs], bupropion) and/or psychotherapy.[2,5] In addition, the onset of treatment response for these modalities, even when effective, often takes ≥ 4 weeks, leading to greater suffering, expense, and risk. For regulatory purposes, the FDA considers patients to have treatment-resistant depression if they have MDD and they have not responded to treatment despite trials of at least two antidepressants given at adequate doses for an adequate duration in the current episode.[2]

The available treatments for treatment-resistant depression are limited.[2] Prior to the approval of Spravato, only one medication was FDA-approved for treatment-resistant depression, Symbyax® (olanzapine and fluoxetine capsules). Symbyax is indicated for treatment-resistant depression (major depressive disorder

in patients who do not respond to two separate trials of different antidepressants of adequate dose and duration in the current episode) and acute depressive episodes in bipolar I disorder.[6]

Guidelines

According to the American Psychiatric Association practice guideline for the treatment of patients with major depressive disorder (2010), the effectiveness of antidepressants is generally comparable between classes and within classes.[7] Therefore, the initial selection of antidepressant will largely be based on the anticipated side effects, the safety or tolerability of these side effects for the individual patient, pharmacological properties of the medication (e.g., half-life, drug interactions), and additional factors such as medication response in prior episodes, cost, and patient preference. In patients with depression who either have not responded or have had trouble tolerating one SSRI agent, a trial of another SSRI (or another antidepressant) may be effective and/or better tolerated. Patients who have had a partial response to antidepressant monotherapy can be augmented with another antidepressant from a different pharmacological class or with another non-antidepressant medication, such as lithium, thyroid hormone, an anticonvulsant, a psychostimulant, or an atypical antipsychotic.

Abuse and Misuse

Spravato contains esketamine, a Schedule III controlled substance (CIII), which may be subject to abuse and diversion.[1] Assess each patient's risk for abuse or misuse prior to prescribing Spravato. All patients receiving Spravato should be monitored for the development of these behaviors or conditions, including drug-seeking behavior, while on therapy. Patients with a history of drug abuse or dependence are at greater risk. Careful consideration should be given prior to prescribing Spravato to individuals with a history of substance use disorder.

Safety

Spravato labeling includes a Boxed Warning regarding sedation, dissociation, abuse and misuse, and suicidal thoughts and behaviors in pediatric and young adult patients.[1] The most common psychological effects of Spravato were dissociative or perceptual changes (including distortion of time, space and illusions), derealization and depersonalization (61% to 84% of patients treated with Spravato developed dissociative or perceptual changes based on the Clinician-Administered Dissociative States Scale). Given its potential to induce dissociative effects, carefully assess patients with psychosis before administering Spravato; treatment should be initiated only if the benefit outweighs the risk.

Because of the risks of serious adverse outcomes resulting from sedation, dissociation, and abuse and misuse, Spravato is only available through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS).[1] Healthcare settings must be certified in the program and ensure that Spravato is only dispensed in healthcare settings and administered to patients who are enrolled in the program, administered by patients under the direct observation of a healthcare provider, and that patients are monitored by a healthcare provider for at least 2 hours after administration of Spravato. Pharmacies must be certified in the REMS and must only dispense Spravato to healthcare settings that are certified in the program.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Spravato. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Spravato as well as the monitoring required for adverse events and efficacy, approval requires Spravato to be prescribed by a physician who specializes in the condition being treated.

Note: A 2-month approval duration is applied for the indication of MDD with Acute Suicidal Ideation or Behavior to allow time for the scheduling and administration of a 4-week course of therapy at a certified

healthcare setting. If after completing the 4-week course of therapy for MDD with Acute Suicidal Ideation or Behavior, another request for Spravato is submitted and the patient meets the approval criteria, then another 4-week course of treatment (with a 2-month approval duration to complete the course of therapy) could be approved.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Spravato is recommended in those who meet one of the following criteria:

FDA-Approved Indications

4. **Major Depressive Disorder with Acute Suicidal Ideation or Behavior.** Approve for 2 months if the patient meets the following criteria (A, B, C, D, and E):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has major depressive disorder that is considered to be severe, according to the prescriber; AND
   - **C)** Patient is concomitantly receiving at least one oral antidepressant; AND
     Note: Antidepressants may include, but are not limited to, selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), mirtazapine, and bupropion.
   - **D)** Patient has one of the following (i or ii):
     - **i.** No history of psychosis; OR
     - **ii.** History of psychosis and the prescriber believes that the benefits of Spravato outweigh the risks; AND
   - **E)** The medication is prescribed by a psychiatrist.

5. **Treatment-Resistant Depression.** Approve for 6 months if the patient meets the following criteria (A, B, C, D, E, and F):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient meets both of the following (i and ii):
     - **i.** Patient has demonstrated nonresponse (≤ 25% improvement in depression symptoms or scores) to at least two different antidepressants, each from a different pharmacologic class, according to the prescriber; AND
       Note: Different pharmacologic classes of antidepressants include selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), bupropion, mirtazapine, etc.
     - **ii.** Each antidepressant was used at therapeutic dosages for at least 6 weeks in the current episode of depression, according to the prescriber; AND
   - **C)** Patient is concomitantly receiving at least one oral antidepressant; AND
     Note: Antidepressants may include, but are not limited to, selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), mirtazapine, and bupropion.
   - **D)** Patient has one of the following (i or ii):
     - **i.** No history of psychosis; OR
     - **ii.** History of psychosis and the prescriber believes that the benefits of Spravato outweigh the risks; AND
   - **E)** The patient's of controlled substance prescriptions has been checked using the state prescription drug monitoring program (PDMP), according to the prescriber; AND

F) The medication is prescribed by a psychiatrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Spravato is not recommended in the following situations:

64. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Psychiatry – Zulresso Prior Authorization Policy
- Zulresso® (brexanolone intravenous infusion – Sage Therapeutics)

REVIEW DATE: 06/07/2023

OVERVIEW

Zulresso, a neuroactive steroid gamma-aminobutric acid (GABA) A receptor positive modulator, is indicated for the **treatment of postpartum depression in patients ≥ 15 years of age**.[1]

Disease Overview

Postpartum (or peripartum) depression is a major depressive episode with onset during pregnancy or within 4 weeks of delivery that can have serious effects on the maternal-infant bond and later infant development.[3] Approximately 40% to 80% of cases of postpartum depression are considered moderate to severe.[2]

Clinical Efficacy

The efficacy of Zulresso was established in two Phase III, US-only, randomized, double-blind, placebo-controlled, multicenter, pivotal studies in patients with moderate to severe postpartum depression initiating treatment within 6 months of delivery.[2] Eligible patients were diagnosed with a major depressive episode, which had an onset no earlier than the third trimester of pregnancy and no later than 4 weeks after delivery.

Safety

Based on findings from animal studies of other drugs that enhance GABAergic inhibition, Zulresso may cause fetal harm.[1] Currently, there are no available data on Zulresso use in pregnant women to determine a drug-associated risk of major birth defects, miscarriage, or adverse maternal or fetal outcomes. A pregnancy exposure registry is available to monitor pregnancy outcomes in women exposed to antidepressants during pregnancy.

Zulresso has a Boxed Warning regarding excessive sedation and sudden loss of consciousness.[1] Because of the risk of serious harm, patients must be monitored for excessive sedation and sudden loss of consciousness and have continuous pulse oximetry monitoring. Patients must be accompanied during interactions with their children. During the infusion, patients must be monitored for sedative effects every 2 hours during planned non-sleep periods. If there are signs or symptoms of excessive sedation, the infusion must be stopped immediately. After symptom resolution, the infusion may be restarted at the same or a lower dose. Due to the risks of serious adverse events resulting from excessive sedation and sudden loss of consciousness, Zulresso is only available through a restricted distribution system under a Risk Evaluation and Mitigation Strategy program.[1,5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zulresso. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zulresso as well as the monitoring required for adverse events and long-term efficacy, approval requires Zulresso to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Note: A 1-month (30 days) approval duration is applied to allow for the scheduling and administration of the one-time, 60-hour infusion of Zulresso.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zulresso is recommended in those who meet the following criteria:

FDA-Approved Indication

6. Postpartum Depression. Approve for 1 month if the patient meets the following criteria (A, B, C, D, and E):
- **A)** Patient is ≥ 15 years of age; AND
- **B)** Patient has been diagnosed with moderate to severe depression with symptom onset during the third trimester of pregnancy or up to 4 weeks post-delivery; AND
- **C)** Patient is ≤ 6 months postpartum; AND
- **D)** Patient is not currently pregnant; AND
- **E)** Zulresso is being prescribed by or in consultation with a psychiatrist or an obstetrician-gynecologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zulresso is not recommended in the following situations:

65. Previous Treatment with Zulresso during the Current Episode of Postpartum Depression.

66. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Psychiatry – Zurzuvae Prior Authorization Policy
- Zurzuvae™ (zuranolone capsules – Sage Therapeutics/Biogen)

REVIEW DATE: 11/15/2023

OVERVIEW

Zuranolone, a neuroactive steroid gamma-aminobutric acid (GABA) A receptor positive modulator, is indicated for the **treatment of postpartum depression in adults**.[1]

Disease Overview

Postpartum (or peripartum) depression is a major depressive episode with onset during pregnancy or within 4 weeks of delivery that can have serious effects on the maternal-infant bond and later infant development.[3] Approximately 40% to 80% of cases of postpartum depression are considered moderate to severe.[2]

Clinical Efficacy

The efficacy of Zurzuvae was established in two Phase III, randomized, double-blind, placebo-controlled, multicenter, pivotal studies in patients with severe postpartum depression initiating treatment within 6 or 12 months of delivery.[2,3] Eligible patients were diagnosed with a major depressive episode, which had an onset no earlier than the third trimester of pregnancy and no later than 4 weeks after delivery.

Safety

Based on findings from animal studies, Zurzuvae may cause fetal harm.[1] Pregnant women should be advised of the potential risk to a fetus. Available data on Zurzuvae use in pregnant women from the clinical development program are insufficient to evaluate for a drug-associated risk of major birth defects, miscarriage, or adverse maternal or fetal outcomes. There is a pregnancy exposure registry that monitors pregnancy outcomes in women exposed to antidepressants, including Zurzuvae, during pregnancy.

Zurzuvae has a Boxed Warning regarding impairment in driving or engaging in other potentially hazardous activities due to central nervous system (CNS) depressant effects.[1] Warnings/Precautions for Zurzuvae also include suicidal thoughts and behaviors (which is similar to other antidepressants) and embryo-fetal toxicity.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zurzuvae. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zurzuvae as well as the monitoring required for adverse events and long-term efficacy, approval requires Zurzuvae to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zurzuvae is recommended in those who meet the following criteria:

FDA-Approved Indication

7. **Postpartum Depression.** Approve for 14 days if the patient meets the following (A, B, C, D, and E):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient meets BOTH of the following (i and ii):
     - **i.** Patient has been diagnosed with severe depression; AND
     - **ii.** Symptom onset began during the third trimester of pregnancy or up to 4 weeks post-delivery; AND
   - **C)** Patient is ≤ 12 months postpartum; AND
   - **D)** Patient is not currently pregnant; AND
   - **E)** Zurzuvae is being prescribed by or in consultation with a psychiatrist or an obstetrician-gynecologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zurzuvae is not recommended in the following situations:

67. **Previous Treatment with Zurzuvae during the Current Episode of Postpartum Depression**.

68. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary – Corticosteroid/Long-Acting Beta$_2$-Agonist Combination Inhalers Prior Authorization Policy

- Advair Diskus® (fluticasone propionate/salmeterol inhalation powder – GlaxoSmithKline, generic [including Wixela Inhub®])
- Advair® HFA (fluticasone propionate/salmeterol inhalation aerosol – GlaxoSmithKline, generic)
- AirDuo® Digihaler™ (fluticasone propionate/salmeterol inhalation powder – Teva)
- AirDuo® RespiClick® (fluticasone propionate/salmeterol inhalation powder – Teva, generic)
- Breo® Ellipta® (fluticasone furoate/vilanterol inhalation powder – GlaxoSmithKline; generic)
- Dulera® (mometasone furoate/formoterol fumarate inhalation aerosol – Merck)
- Symbicort® (budesonide/formoterol fumarate inhalation aerosol – AstraZeneca, generic [including Breyna™])

REVIEW DATE: 08/16/2023

OVERVIEW

The inhaled corticosteroid (ICS)/long-acting beta$_2$-agonist (LABA) combination inhalers are indicated for the treatment of asthma.[1-6] Age indications vary by agent. Fluticasone propionate and salmeterol inhalation powder (Advair Diskus, generics [including Wixela Inhub]), Breo Ellipta, and Symbicort (and authorized generic) are also indicated for the maintenance treatment of airflow obstruction and reducing exacerbations in patients with chronic obstructive lung disease (COPD), including chronic bronchitis and/or emphysema.[1,3,5] Advair HFA (and authorized generic) and Dulera are not FDA-approved for the treatment of COPD; however, both products have been studied for this use.[2,4,7-9] AirDuo Digihaler and AirDuo RespiClick (and authorized generic) also have not specifically been studied in patients with COPD. However, these agents were filed as a New Drug Application under Section 505(b)(2) of the Federal Food, Drug, and Cosmetic Act.[6] This approval pathway relies in part upon evidence not developed by the applicant. In the case of these agents, the literature and safety and effectiveness evidence supporting the approval and use of Advair Diskus (indicated in patients with COPD) are considered part of the evidence supporting the approval and use of the AirDuo products. Of note, another ICS/LABA inhaler, Symbicort Aerosphere® (budesonide/formoterol fumarate inhalation aerosol), was approved in 2023 for the maintenance treatment of patients with COPD. However, the manufacturer currently has no plans to launch this product in the US and this product is not targeted in this policy.

Guidelines

The 2023 Global Initiative for Chronic Obstructive Lung Disease (GOLD) guidelines for the diagnosis, management, and prevention of COPD support the use of combination ICS/LABA therapy in select highly symptomatic patients who are at high risk for COPD exacerbations.[10] The ICS/LABAs are also featured prominently in the 2023 Global Initiative for Asthma (GINA) Global Strategy for Asthma Management and Prevention. They are recommended as part of the step-wise treatment algorithm for patients ≥ 6 years of age.[29] European Respiratory Society (ERS) guidelines on the diagnosis and treatment of chronic cough in adults and children (2020) recommend a short-term trial (2 to 4 weeks) of ICS and long-acting bronchodilator (e.g. a

LABA) combination in adults with chronic cough and fixed airflow obstruction.[30]

Other Uses with Supportive Evidence

There are also data to support the use of ICS/LABA inhalers in patients with postinfectious cough. Subacute postinfectious cough may have multiple possible underlying etiologies, including asthma.[11,12] The underlying cause of the cough must be determined before making therapeutic decisions. In this situation, ICS/LABA combination therapy may be used as diagnostic empiric therapy in determining the cause of cough (i.e., rule out asthma). When a patient with subacute cough presents with wheezes, rhonchi, or crackles with a normal chest radiograph, it may be a reasonable option to consider therapy with an inhaled bronchodilator and ICS. If cough following an upper respiratory tract infection persists for > 8 weeks, diagnoses other than postinfectious cough should be considered.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of the Corticosteroid/Long-Acting Beta$_2$-Agonist Inhalers. The purpose of this policy is to support the use of the corticosteroid/long-acting beta$_2$-agonist combination inhalers in chronic conditions where the products are indicated or their use is appropriate. All approvals are provided for the duration listed below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: Prescription claims (prior 130 days) for respiratory medications (e.g., leukotriene receptor antagonists; xanthines; inhaled mast cell stabilizers; oral and inhaled beta-agonists; inhaled corticosteroids, inhaled anticholinergic agents) are used as a surrogate marker for a diagnosis of asthma or chronic obstructive pulmonary disease (COPD). If use of these medications is not met at the point-of-service, coverage will be determined by prior authorization criteria. When available, the ICD-10 codes for asthma and COPD (including chronic bronchitis/emphysema) will also be used in automation to generate an approval of the requested medication (see Appendix A).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of the Corticosteroid/Long-Acting Beta$_2$-Agonist Inhalers is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Asthma/Reactive Airway Disease.** Approve for 1 year.

2. **Chronic Obstructive Pulmonary Disease.** Approve for 1 year.

3. **Chronic Bronchitis.** Approve for 1 year.

4. **Emphysema.** Approve for 1 year.

Other Uses with Supportive Evidence

5. **Postinfectious Cough.** Approve for 2 months.
   Note: Postinfectious cough is cough that persists after an acute respiratory infection has resolved.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of the Corticosteroid/Long-Acting Beta$_2$-Agonist Inhalers is not recommended in the following situations:

57. **Acute Cough Associated with the Common Cold.** Note: This includes symptoms associated with a current rhinovirus infection.
    There are no data to support the use of ICS/LABA combination therapy in treating this condition. American College of Chest Physicians (ACCP) guidelines for the treatment of acute cough associated with the common cold do not recommend using an ICS or a bronchodilator in treating this condition.[11,26]

58. **Chronic Cough due to Gastroesophageal Reflux Disease (GERD).** There are no data to support the use of ICS/LABA combination therapy in treating this condition. The ACCP guidelines for the management of chronic cough due to GERD recommend treatment of the underlying condition and do not mention the use of any inhaled therapies.[13,24]

59. **Acute Cough due to an Acute Respiratory Infection.** Note: Examples of an acute respiratory infection are acute bronchitis, sinusitis, influenza, or pneumonia. An acute exacerbation of chronic bronchitis is not the same as acute bronchitis.
    ACCP guidelines for the management of acute cough due to acute bronchitis in immunocompetent adult outpatients do not recommend routine use of inhaled corticosteroids and inhaled beta-agonists.[14] Current evidence is not sufficient to prove that these therapies are safe and effective at reducing the severity and duration of cough in this setting. Bronchodilators are also not a recommended therapeutic option in treating cough associated with acute bacterial sinusitis.[12] Additional ACCP guidelines for the management of acute cough due to suspected pneumonia or influenza state that there is insufficient evidence on the use of nonantibiotic symptomatic therapies such as ICSs or bronchodilators.[26] There are no data to support the use of ICS/LABA combination therapy in treating these conditions.

60. **Chronic Cough due to Non-Asthmatic Eosinophilic Bronchitis (NAEB).** There are no data to support the use of ICS/LABA combination therapy in treating this condition. Per the guidelines for the management of chronic cough due to NAEB from ACCP ICSs are the recommended first-line treatment.[11,23] One of the clinical characteristics of NAEB is chronic cough without evidence of variable airflow obstruction or airway hyperresponsiveness. As a result, a beta-agonist bronchodilator would not be expected to be useful in treating this condition.

61. **Chronic Cough due to Bronchiolitis.** The ACCP guidelines do not recommend bronchodilators as a therapeutic option in treating bronchiolitis.[11,15] Use of asthma medications is discouraged unless other evidence of asthma is present. Guidelines from the American Academy of Pediatrics regarding the diagnosis and management of bronchiolitis (2014) also do not recommend inhaled corticosteroids or bronchodilators be routinely used in the management of bronchiolitis.[16]

62. **Chronic Cough due to Bronchiectasis.** Limited data are available with budesonide/formoterol (foreign formulation of Symbicort) for the treatment of non-cystic fibrosis (CF) bronchiectasis.[17,18] ACCP guidelines note that in patients with bronchiectasis due to CF or other causes, treatment of respiratory infections and airway clearance techniques are the mainstays of management.[27] In patients with airflow obstruction and/or bronchial hyperreactivity (e.g., asthma and/or COPD), bronchodilators may be of benefit.[11,19] However, the ACCP guidelines and the British Thoracic Society (BTS) guidelines do not recommend treatment with ICSs. Bronchiectasis guidelines from the European Respiratory Society also recommend against offering ICSs to adult, adolescent, and patients with bronchiectasis.[20,32] There may be a role for combination ICS/LABA therapy in patients with coexisting

asthma or COPD, but there is no evidence to support this therapy in patients without these concomitant conditions.[19,20,32]

63. Whooping Cough/Pertussis. There are no data to support the use of ICS/LABA combination therapy in treating this condition. According to the ACCP guidelines, LABAs and corticosteroids should not be offered to patients with whooping cough as there is no evidence to suggest benefit.[11] Although short-acting beta-agonists (SABA) [along with other treatments] have been proposed as standard treatment for whooping cough, one review article reported that treatment with the SABA salbutamol resulted in no change in coughing.[21]

64. Angiotensin-Converting Enzyme (ACE) Inhibitor-Induced Cough. There are no data to support the use of ICS/LABA combination therapy in treating this condition. Discontinuation of the ACE inhibitor is the only uniformly effective treatment for ACE inhibitor-induced cough. In those patients in whom the ACE inhibitor cannot be discontinued, pharmacologic therapy aimed at suppressing cough should be attempted. ICSs and beta-agonists are not recommended therapeutic options.[11]

65. Psychogenic Cough/Habit Cough/Tic Cough. There are no data to support the use of ICS/LABA combination therapy in treating these conditions. Non-pharmacological therapies, such as behavior modification, hypnosis and psychiatric therapy are the mainstays of treatment.[11,22]

66. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION WITH STEP THERAPY POLICY

POLICY: Pulmonary – Roflumilast Prior Authorization with Step Therapy Policy
- Daliresp® (roflumilast tablets – Astra Zeneca, generic)

REVIEW DATE: 01/11/2023

OVERVIEW

Roflumilast tablets (Daliresp, generic), a selective phosphodiesterase-4 inhibitor, is indicated as a treatment to reduce the risk of **chronic obstructive pulmonary disease** (COPD) exacerbations in patients with severe COPD associated with chronic bronchitis and a history of exacerbations.[1] Limitations of use: Roflumilast is not a bronchodilator and is not indicated for the relief of acute bronchospasm.

Clinical Efficacy

Roflumilast has been studied in patients currently receiving treatment with bronchodilators (e.g., long-acting beta$_2$-agonists [LABAs]) and inhaled corticosteroids (ICSs) with or without additional therapy with a long-acting muscarinic antagonist (LAMA).[2-7] Five placebo-controlled clinical trials evaluated the effect of roflumilast on COPD exacerbations.[1-7] Two of these studies initially included patients with severe COPD with chronic bronchitis and/or emphysema; in both studies, roflumilast did not demonstrate a significant reduction in COPD exacerbation rates. An exploratory analysis of these trials found that in the subgroup of patients with severe COPD who had chronic bronchitis and exacerbations within the previous year, roflumilast resulted in better exacerbation reduction than in the overall population. Two subsequent trials were conducted involving patients with severe COPD, chronic bronchitis, and at least one COPD exacerbation within the previous year. In both trials, roflumilast demonstrated a significant reduction in the rate of moderate or severe exacerbations compared to placebo.

Guidelines

The Global Initiative for Chronic Obstructive Lung Disease guidelines for the diagnosis, management, and prevention of COPD (2023) recommend bronchodilators as initial pharmacologic treatment.[8] Following initiation, therapies should be adjusted as needed based on symptom severity and exacerbation risk. ICSs are recommended for patients who continue to experience COPD exacerbations and who have elevated blood eosinophils. Roflumilast is listed as a possible therapeutic option in patients with chronic bronchitis who are receiving triple therapy with an ICS/LAMA/LABA, who have a forced expiratory volume in 1 second (FEV_1) < 50%, and who continue to experience exacerbations (especially if the patient has been hospitalized for one or more COPD exacerbations in the past year). This therapy is also recommended in patients who continue to experience exacerbations despite LAMA/LABA combination therapy and have a blood eosinophil level < 100 cells/microliter. Low blood eosinophils are predictive of an insufficient response to ICS therapy, thereby making roflumilast a more attractive option for add-on therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of roflumilast tablets (Daliresp, generic). This Prior Authorization Policy also contains a Step Therapy component. When clinically appropriate, the patient is directed to try generic roflumilast (Step 1) prior to brand Daliresp (Step 2). All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of roflumilast tablets (Daliresp, generic) is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Chronic Obstructive Pulmonary Disease (COPD).** Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient has severe COPD or very severe COPD, according to the prescriber; AND
   - **B)** Patient has a of exacerbations; AND
   - **C)** Patient meets ONE of the following (i or ii):
   - **i.** Patient meets both of the following (a and b):
     - **a)** Patient has chronic bronchitis; AND
     - **b)** Patient has tried an inhaled long-acting beta$_2$-agonist, an inhaled long-acting muscarinic antagonist, and an inhaled corticosteroid concomitantly; OR
       WW) Note: Use of a combination inhaler containing multiple agents from the medication classes listed would fulfil the requirement. Refer to the **Appendix** for examples of inhaled therapies used for COPD.
   - **ii.** Patient meets both of the following (a and b):
     - **a)** Patient has a blood eosinophil level < 100 cells/microliter; AND
     - **b)** Patient has tried an inhaled long-acting muscarinic antagonist and long-acting beta$_2$-agonist concomitantly.
       Note: Use of a combination inhaler containing multiple agents from the medication classes listed would fulfil the requirement. Refer to the **Appendix** for examples of inhaled therapies used for COPD.
   - **D)** If brand Daliresp is being requested, the patient meets both of the following criteria (i and ii):
   - **i.** Patient has tried generic roflumilast; AND
   - **ii.** Brand Daliresp is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of roflumilast tablets (Daliresp, generic) is not recommended for the following situations:

67. **Asthma.** The efficacy of roflumilast (formulation not specified) in patients with asthma[9-11], allergic asthma[12,13], and exercise-induced asthma[14] has been evaluated. More data are needed to define the place in therapy of roflumilast in the treatment of asthma. Current asthma guidelines do not address roflumilast as a recommended therapy for asthma management.[15-17]

68. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX

LABA – Long-acting beta$_2$-agonist; LAMA – Long-acting muscarinic antagonist; ICS – Inhaled corticosteroid.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Adempas Prior Authorization Policy
- Adempas® (riociguat tablets – Bayer)

REVIEW DATE: 10/11/2023

OVERVIEW

Adempas, a soluble guanylate cyclase stimulator, is indicated for the treatment of adults with:[1]

- **Chronic thromboembolic pulmonary hypertension** (CTEPH) [World Health Organization {WHO} Group 4], persistent/recurrent, after surgical treatment, or inoperable CTEPH, to improve exercise capacity and WHO functional class.
- **Pulmonary Arterial Hypertension** (PAH) [WHO Group 1], to improve exercise capacity, WHO functional class, and to delay clinical worsening.

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.[2,3] It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder, the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[2,3] Although the mean age of diagnosis is between 36 and 50 years, patients of any age may be affected, including pediatric patients. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.[7] The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved.

CTEPH is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.[4,5] It is classified within WHO Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy, including Adempas, may also be recommended. Anticoagulant therapy is also given.

Guidelines

Various guidelines are available for the management of pulmonary hypertension.

- **Pulmonary Arterial Hypertension:** The CHEST guideline and Expert Panel Report regarding therapy for PAH in adults (2019) cites Adempas as a vital therapy with several benefits in a variety of clinical scenarios. The European Society of Cardiology (ESC) and the European Respiratory Society (ERS) guidelines regarding the treatment of pulmonary hypertension (2022) also recognize Adempas as having a prominent role in the management of this condition, as monotherapy or in combination with other agents.
- **Chronic Thromboembolic Pulmonary Hypertension:** Guidelines from the ESC/ERS regarding the treatment of pulmonary hypertension (2022) recommended Adempas for patients who are symptomatic with inoperable CTEPH or persistent/recurrent pulmonary hypertension after pulmonary endarterectomy.[6]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Adempas. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Adempas as well as the monitoring required for adverse events and long-term efficacy, approval requires Adempas to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Adempas Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Adempas is recommended in those who meet one of the following criteria:

FDA-Approved Indications

17. **Chronic Thromboembolic Pulmonary Hypertension.** Approve for 1 year if prescribed by or in consultation with a pulmonologist or a cardiologist.

18. **Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1].** Approve for the duration noted if the patient meets ONE of the following (A or B):
    - **A)** Initial Therapy. Approve for 1 year if the patient meets all of the following (i, ii, and iii):
        - **i.** Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
        - **ii.** Patient meets the following (a and b):
            - Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
            - Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
        - **iii.** Medication is prescribed by or in consultation with a cardiologist or a pulmonologist.
    - **B)** Patient is Currently Receiving Adempas. Approve for 1 year if the patient meets all of the following (i ii, and iii):
        - **i.** Patient has a diagnosis of WHO Group 1 PAH; AND
        - **ii.** Patient meets the following (a and b):
            - **a)** Patient has had a right heart catheterization; AND
            - **b)** Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
        - **iii.** Medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Adempas is not recommended in the following situations:

1. **Concurrent Use with Phosphodiesterase Inhibitors Used for Pulmonary Hypertension or Other Soluble Guanylate Cyclase Stimulators.** Use of Adempas with phosphodiesterase inhibitors and/or with other soluble guanylate cyclase stimulators is a contraindication.[1]
   Note: Examples of phosphodiesterase inhibitors used for pulmonary hypertension include Revatio (sildenafil tablets, suspension, and intravenous injection), Adcirca (tadalafil tablets), Alyq (tadalafil tablets), and Tadliq (tadalafil oral suspension). An example of a soluble guanylate cyclase stimulator is Verquvo (vericiguat tablets).

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Endothelin Receptor Antagonists
- Letairis® (ambrisentan tablets – Gilead, generic)
- Opsumit® (macitentan tablets – Actelion/Janssen)
- Tracleer® (bosentan tablets and tablets for oral suspension – Actelion/Janssen, generic for tablets)

REVIEW DATE: 10/04/2023

OVERVIEW

Ambrisentan (Letairis, generic), Opsumit, and bosentan (Tracleer, generic [generic for tablets only]), oral endothelin receptor antagonists, are indicated for the treatment of **pulmonary arterial hypertension** (PAH), World Health Organization (WHO) Group 1.[1-3]

- Ambrisentan is indicated to improve exercise ability and delay clinical worsening as well as for use in combination with tadalafil to reduce the risks of disease progression and hospitalization for worsening PAH, and to improve exercise ability.[2]
- Opsumit is noted to reduce the risks of disease progression and hospitalization for PAH.[3]
- Bosentan is indicated in adults to improve exercise ability and decrease the rate of clinical worsening and in pediatric patients ≥ 3 years of age with idiopathic or congenital PAH to improve pulmonary vascular resistance (PVR), which is expected to result in an improvement in exercise ability.[1]

The BENEFiT (Bosentan Effects in iNopErable Forms of chronic Thromboembolic pulmonary hypertension) study was a double-blind trial involving patients with chronic thromboembolic pulmonary hypertension (CTEPH) who were randomized to Tracleer or placebo for 16 weeks (n = 156). Benefits were noted in some hemodynamic parameters (e.g., decreased PVR).[4] Adempas® (riociguat tablets), a soluble guanylate cyclase stimulator, is the only agent indicated for the treatment of adults with CTEPH (WHO Group 4) after surgical treatment, or inoperable CTEPH, to improve exercise capacity and WHO functional class.[5] The agent is also indicated for the treatment of adults with PAH (WHO Group 1). Adempas has a Boxed Warning regarding embryofetal toxicity and is contraindicated in patients using nitrates or nitric oxide donors in any forms, as well as in patients using phosphodiestase inhibitors. The main adverse event associated with Adempas is symptomatic hypotension.

Tracleer has been used in patients with systemic sclerosis who have digital ulcers.[6-13] In a prospective, multicenter, placebo-controlled, double-blind study patients (n = 122) with limited or diffuse systemic sclerosis (scleroderma) were randomized in a 2:1 ratio to receive Tracleer or placebo for 16 weeks.[6] Patients receiving Tracleer had a 48% reduction in the mean number of new ulcerations (1.4 vs. 2.7 new ulcers; P = 0.0083), the primary efficacy endpoint. The effect was more substantial in patients with digital ulcers at study entry. However, no differences were noted in the healing of established ulcers.[6] Another trial showed a reduction in the occurrence of new digital ulcers in patients given Tracleer for 24 weeks.[10]

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.[14,15] It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder, the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment. Although the mean age of diagnosis is between 36 and 50 years, patients of any age may be affected, including pediatric patients. PAH is

defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.[19] The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved.

CTEPH is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.[16,17] It is classified within Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy may also be recommended. Anticoagulant therapy is also given.

Guidelines

Various guidelines address endothelin receptor antagonists.

- **Pulmonary Arterial Hypertension (PAH):** The CHEST guideline and Expert Panel Report regarding therapy for PAH (2019) in adults details many medications. It was noted that endothelin receptor antagonists play a vital role and have various benefits in the management of PAH.[15] The European Society of Cardiology and the European Respiratory Society guidelines regarding the treatment of pulmonary hypertension (2022) also recognize endothelin receptor antagonists as having a prominent role in the management of this condition, as monotherapy or in use as combination with other agents.[18]
- **Systemic Sclerosis:** In 2017, the European League Against Rheumatism (EULAR) updated recommendations for the treatment of systemic sclerosis.[12] Tracleer should be considered to reduce the number of new digital ulcers in systemic sclerosis, especially in patients who have multiple digital ulcers despite use of calcium channel blockers, phosphodiesterase type 5 inhibitors or iloprost therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of ambrisentan, Opsumit, and bosentan. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with these agents, as well as the monitoring required for adverse events and long-term efficacy, approval requires the agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for initiation of therapy as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Endothelin Receptor Antagonist Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of ambrisentan (Letairis, generic), Opsumit, and bosentan (Tracleer, generic) is recommended in those who meet the following criteria:

FDA-Approved Indication

19. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve for 1 year if the patient meets all of the following (i , ii, and iii).

i. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. Patient meets the following (a and b):

a) Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iii. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

D) Patient is Currently Receiving the Requested Endothelin Receptor Antagonist (i.e., ambrisentan [Letairis, generic], Opsumit, or bosentan [Tracleer, generic]). Approve for 1 year if the patient meets the following (i, ii, and iii):

iv. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

v. Patient meets the following (a and b):

a) Patient has had a right heart catheterization; AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

vi. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

Other Uses with Supportive Evidence

Coverage of bosentan (Tracleer, generic) is also recommended in those who meet the following criteria:

20. Chronic Thromboembolic Pulmonary Hypertension (CTEPH). Approve Tracleer for 1 year if the patient meets the following (A and B):

A) Patient meets one of the following (i, ii, or iii):

i. Patient has tried Adempas; OR

ii. According to the prescriber, use of Adempas is contraindicated; OR

Note: Examples of contraindications to use of Adempas include that the patient is receiving nitrates or nitric oxide donors, the patient is receiving a phosphodiesterase inhibitor such as sildenafil or tadalafil, or that the patient is hypotensive or is at risk for hypotension.

iii. Patient is currently receiving Tracleer.

B) The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

21. Digital Ulcers in a Patient with Systemic Sclerosis. Approve Tracleer for 1 year if the patient meets ONE of the following (A or B):

A) Patient has tried one calcium channel blocker; OR

Note: Examples include amlodipine, felodipine and nifedipine.

B) Patient has tried one phosphodiesterase type 5 (PDE5) inhibitor.

Note: Examples include sildenafil, tadalafil and vardenafil.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of ambrisentan, Opsumit, and bosentan is not recommended in the following situations:

69. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Epoprostenol Products Prior Authorization Policy
- Flolan® (epoprostenol intravenous infusion – GlaxoSmithKline, generic)
- Veletri® (epoprostenol intravenous infusion – Actelion/Janssen)

REVIEW DATE: 10/04/2023

OVERVIEW

Epoprostenol intravenous infusion, a prostacyclin vasodilator, is indicated for the treatment of pulmonary arterial hypertension (PAH) [World Health Organization {WHO} Group 1] to improve exercise capacity.[1-3]

Epoprostenol injection has been used with varying results in patients with chronic thromboembolic pulmonary hypertension (CTEPH).[4-6] It is sometimes used as a bridge prior to surgery. Limited options are available for patients with CTEPH.

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.[7,8] The estimated incidence of PAH is 2 cases per 1 million per year with a prevalence of 10.6 cases per 1 million adults.[7] It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized.[7,8] In this progressive disorder, the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment. In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness, and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions (e.g., connective tissue disease, HIV) or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.[13] The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association system to evaluate activity tolerance.

CTEPH is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.[9,10] It is classified within Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy may also be recommended. Anticoagulant therapy is also given.

Guidelines

Several guidelines address intravenous epoprostenol products in the management of pulmonary hypertension.[8,11]

- **Pulmonary Arterial Hypertension:** The CHEST guidelines and Expert Panel Report regarding therapy for PAH in adults (2019) cites the many medications that have utility for this condition.[8]

In the absence of contraindications, patients with PAH should undergo acute vasoreactivity testing utilizing a short-acting agent (e.g., calcium channel blockers). For patients in Functional Class II, oral therapies are recommended such as endothelin receptor antagonists (ambrisentan, bosentan, Opsumit® [macitentan tablets]), phosphodiesterase type 5 inhibitors (tadalafil, sildenafil), and Adempas® (riociguat tablets). It is suggest that parenteral or inhaled prostanoids not be chosen as initial therapy for treatment naïve-patients with PAH with WHO Functional Class II symptoms or as second-line agents for patients with PAH with WHO Functional Class II who have not met their treatment goals. Parenteral prostanoids are recommended for patients with PAH in Functional Class III and IV.[8] The European Society of Cardiology (ESC) and the European Respiratory Society (ERS) guidelines regarding the treatment of pulmonary hypertension (2022) also recognize intravenous epoprostenol as having a prominent role in the management of this condition, usually in later therapy stages and after other therapies.[11]

- **Chronic Thromboembolic Pulmonary Hypertension:** Guidelines from the ESC/ERS regarding the treatment of pulmonary hypertension (2022) recommended to consider parenteral prostacyclin analogs for patients with inoperable CTEPH.[11]

Safety

Epoprostenol should not be abruptly discontinued or have the dose rapidly decreased as rebound pulmonary hypertension may occur.[1-3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of epoprostenol injection. All approvals are provided for 1 year in duration unless otherwise noted below. Specifically, approvals will remain up to 14 days for patients currently receiving the agent for the indication of PAH (WHO Group 1) with inadequate information or if the criteria are not met. These cases are reviewed by a nurse or pharmacist. Because of the specialized skills required for evaluation and diagnosis of patients treated with epoprostenol injection as well as the monitoring required for adverse events and long-term efficacy, approval requires epoprostenol injection to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: In the *Pulmonary Arterial Hypertension – Epoprostenol Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Epoprostenol Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of epoprostenol injection is recommended in those who meet one of the following criteria:

FDA-Approved Indication

22. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets all of the following (i, ii, iii, iv, and v):

i. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. Patient meets the following (a and b):

a) Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iii. Patient meets ONE of the following (a or b):

a) Patient is in Functional Class III or IV; OR

b) Patient is in Functional Class II and meets ONE of the following [(1) or (2)]:

(1) Patient has tried or is currently receiving one oral agent for PAH; OR

Note: Examples of oral agents for PAH include bosentan, ambrisentan, Opsumit (macitentan tablets), Adempas (riociguat tablets), sildenafil, tadalafil, Orenitram (treprostinil extended-release tablets), Alyq (tadalafil tablets), Tadliq (tadalafil oral suspension), and Uptravi (selexipag tablets).

(2) Patient has tried one inhaled or parenteral prostacyclin product for PAH; AND

Note: Examples of inhaled and parenteral prostacyclin products for PAH include Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation powder), Ventavis (iloprost inhalation solution), treprostinil injection, and epoprostenol injection.

iv. Patient with idiopathic PAH must meet ONE of the following (a, b, c, d, or e):

a) Patient must meet both of the following [(1) and (2)]:

(1) According to the prescriber, the patient has had an acute response to vasodilator testing that occurred during the right heart catheterization; AND

Note: An example of a response can be defined as a decrease in mean pulmonary artery pressure of at least 10 mm Hg to an absolute mean pulmonary artery pressure of less than 40 mm Hg without a decrease in cardiac output.

(2) Patient has tried one oral calcium channel blocker (CCB) therapy; OR

Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets.

b) According to the prescriber, the patient did not have an acute response to vasodilator testing; OR

c) According to the prescriber, the patient cannot undergo a vasodilator test; OR

d) Patient cannot take CCB therapy; OR

Note: Examples of reasons a patient cannot take CCB therapy include right heart failure or decreased cardiac output.

e) Patient has tried one CCB; AND

Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets.

v. Medication is prescribed by or in consultation with a cardiologist or a pulmonologist; OR

B) Patient Currently Receiving Epoprostenol. Approve for the duration noted below if the patient meets one of the following (i or ii):

i. Approve for 1 year if the patient meets ALL of the following (a, b, and c):

a) Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

b) Patient meets the following [(1) and (2)]:

(1) Patient has had a right heart catheterization; AND

(2) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

c) Medication is prescribed by or in consultation with a cardiologist or a pulmonologist; OR

ii. Approve a short-term supply of epoprostenol for up to 14 days if the patient does not meet the criteria in 1Bi above or if there is insufficient information available. All approvals are reviewed by a nurse or pharmacist.

Note: A 14-day supply should be sufficient to address coverage issues. However, multiple short-term approvals are allowed if a coverage determination cannot be made. Abrupt discontinuation of epoprostenol therapy may have severe adverse consequences.

Other Uses with Supportive Evidence

23. Chronic Thromboembolic Pulmonary Hypertension (CTEPH). Approve for 1 year if prescribed by or in consultation with a pulmonologist or a cardiologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of epoprostenol injection is not recommended in the following situations:

1. **Chronic Obstructive Pulmonary Disease (COPD) in a Patient Without PAH (WHO Group 1).** COPD is classified as Group 3 Pulmonary Hypertension (pulmonary hypertension associated with lung diseases and/or hypoxia). Pulmonary hypertension may develop late in the course of COPD, but medications used for the treatment of PAH (WHO Group 1) are not recommended therapies.[12]

2. **Concurrent Use with Parenteral Treprostinil Products, Oral Prostacyclin Products, or Inhaled Prostacyclin Agents Used for Pulmonary Hypertension.**
   Note: Examples of medications include Orenitram (treprostinil extended-release tablets), Uptravi (selexipag tablets and intravenous infusion), Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation powder), Ventavis (iloprost inhalation solution), and treprostinil subcutaneous injection and intravenous infusion (Remodulin, generic).

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Orenitram Prior Authorization Policy
- Orenitram® (treprostinil extended-release tablets – United Therapeutics)

REVIEW DATE: 10/11/2023

OVERVIEW

Orenitram, a prostacyclin mimetic, is indicated for the treatment of **pulmonary arterial hypertension (PAH) World Health Organization (WHO) Group 1** to delay disease progression and to improve exercise capacity.[1]

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.[2,3] It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder, the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment. Although the mean age of diagnosis is between 36 and 50 years, patients of any age may be affected, including pediatric patients. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.[5] The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved.

Guidelines

Various guidelines address oral prostacyclin products.[3,4] The CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension (2019) in adults details many medications.[3] It was cited that many agents with varying mechanisms of action are used for the management of PAH. It was noted that the addition of an oral prostanoid product is recommended in patients with PAH who are in Functional Class III without evidence of rapid disease progression or a poor prognosis among those not willing or able to manage parenteral prostanoids. The European Society of Cardiology and the European Respiratory Society guidelines regarding the treatment of pulmonary hypertension (2022) also recognize Orenitram as having a role in therapy, mainly as an agent to be added onto other PAH therapies.[4]

Safety

Abrupt discontinuation or sudden large reductions in the dosage of Orenitram may cause PAH symptoms to worsen.[1] In the event of a planned short-term treatment interruption for patients unable to take oral medication, consider a temporary infusion of subcutaneous or intravenous treprostinil.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Orenitram. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Orenitram as well as the monitoring required for adverse events and long-term efficacy, approval requires Orenitram to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and

catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Orenitram Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Orenitram is recommended in those who meet the following criteria:

FDA-Approved Indication

24. Pulmonary Arterial Hypertension (World Health Organization [WHO] Group 1). Approve for the duration noted if the patient meets ONE of the following (A or B):

E) Initial Therapy. Approve for 1 year if the patient meets all of the following (i, ii, iii, and iv):

i. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. Patient meets the following (a and b):

a) Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iii. Patient meets one of the following (a or b):

a) Patient has tried two oral therapies for PAH (or is currently receiving them) from two of the three following different categories (either alone or in combination) each for ≥ 60 days: one phosphodiesterase type 5 (PDE5) inhibitor, one endothelin receptor antagonist (ERA), or Adempas (riociguat tablets); OR

Note: Examples of phosphodiesterase type 5 inhibitors include sildenafil and tadalafil. Examples of endothelin receptor antagonists include bosentan, ambrisentan, and Opsumit (macitentan tablets).

b) Patient is receiving or has received in the past one PAH prostacyclin therapy or a prostacyclin receptor agonist (i.e., Uptravi [selexipag tablets]) for PAH; AND

Note: Examples of prostacyclin therapies for PAH include Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation), Ventavis (iloprost inhalation solution), treprostinil injection, and epoprostenol injection.

iv. Medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

F) Patient is Currently Receiving Orenitram. Approve for 1 year if the patient meets all of the following (i, ii, and iii):

vii. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

viii. Patient meets the following (a and b):

a) Patient has had a right heart catheterization; AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH); AND

The medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Orenitram is not recommended in the following situations:

70. Concurrent Use with Uptravi (selexipag tablets and intravenous infusion), Inhaled Prostacyclin Products, or Parenteral Prostacyclin Agents Used for Pulmonary Hypertension.
Note: Examples of medications include Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation powder), Ventavis (iloprost inhalation solution), epoprostenol intravenous infusion, and treprostinil subcutaneous or intravenous infusion (Remodulin, generic).

71. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Phosphodiesterase Type 5 Inhibitors Prior Authorization Policy

- Adcirca® (tadalafil tablets – Eli Lilly/United Therapeutics, generic)
- Alyq™ (tadalafil tablets – Teva, generic)
- LiQrev® (sildenafil oral suspension – CMP)
- Revatio® (sildenafil tablets and suspension – Pfizer, generic)
  Note: Revatio injection is not included in this policy
- Tadliq® (tadalafil oral suspension – CMP)

REVIEW DATE: 10/11/2023

OVERVIEW

Adcirca, Alyq, LiQrev, Revatio, and Tadliq are phosphodiesterase type 5 (PDE5) inhibitors indicated for the treatment of **pulmonary arterial hypertension** (PAH).[1-4] Alyq is a generic to Adcirca.[4]

- Adcirca, Alyq, and Tadliq are indicated for the treatment of PAH (World Health Organization [WHO] Group I) to improve exercise ability.[2-4]
- Liqrev and Revatio are indicated for the treatment of PAH (WHO Group I) in adults to improve exercise ability and delay clinical worsening.[1,16]
- Revatio is also indicated in pediatric patients 1 to 17 years old for the treatment of PAH to improve exercise ability and, in pediatric patients too young to perform standard exercise testing, pulmonary hemodynamics thought to underly improvements in exercise.[1]

Tadalafil and sildenafil have some data in patients with Raynaud's phenomenon at doses provided in strengths used for PAH.[5-8] In many situations, patients also had scleroderma. Benefits were noted, such as decrease frequency and shorter durations of attacks, as well as in selected parameters regarding digital ulceration.

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.[9,10] It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder, the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment. Although the mean age of diagnosis is between 36 and 50 years, patients of any age may be affected, including pediatric patients. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.[17] The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved.

Guidelines

Various guidelines address PDE5 inhibitors for the conditions cited above.

- **Pulmonary Arterial Hypertension:** The CHEST guideline and Expert Panel Report regarding therapy for PAH in adults (2019) details many medications. It was noted that PDE5 inhibitors play a vital role and have various benefits in the management of PAH.[10] The European Society of Cardiology and the European Respiratory Society guidelines regarding the treatment of pulmonary hypertension (2022) also recognize PDE5 inhibitors as having a prominent role in the management of this condition, as monotherapy or in use as combination with other agents.[11]

- **Systemic Sclerosis:** In 2017, the European League Against Rheumatism updated recommendations for the treatment of systemic sclerosis.[12] Dihydropyridine calcium channel blockers, usually oral nifedipine, are recommended for first-line therapy of Raynaud phenomenon in patients with systemic sclerosis. PDE5 inhibitors should be considered in such clinical scenarios as well.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Adcirca, Alyq, Liqrev, Revatio (tablets and suspension only), and Tadliq. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Adcirca, Alyq, Liqrev, Revatio (tablets and suspension only), and Tadliq, as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for initiation of therapy as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Phosphodiesterase Type 5 Inhibitors Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Adcirca, Alyq, Liqrev, Revatio, and Tadliq is recommended in those who meet the following criteria:

FDA-Approved Indication

25. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

G) Initial Therapy. Approve for 1 year if the patient meets all of the following (i and ii):

i. Patient meets the following (a and b):

a) Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

ii. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

H) Patient is Currently Receiving the Requested Phosphodiesterase Type 5 (PDE5) Inhibitor. Approve for 1 year if the patient meets the following (i and ii):

ix. Patient meets the following (a and b):

a) Patient has had a right heart catheterization; AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

x. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

Other Uses with Supportive Evidence

26. Raynaud's Phenomenon. Approve for 1 year if the patient meets ONE of the following (A or B):

A) Patient has tried one calcium channel blocker; OR
Note: Examples of calcium channel blockers include amlodipine, felodipine, and nifedipine.

B) According to the prescriber, use of a calcium channel blocker is contraindicated.
Note: Examples of reasons a patient cannot take calcium channel blocker therapy include right heart failure and decreased cardiac output.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Adcirca, Alyq, Liqrev, Revatio, and Tadliq is not recommended in the following situations:

3. Concurrent Use With Guanylate Cyclase Stimulators. Use of Adcirca, Alyq, Liqrev, Revatio, and/or Tadliq with guanylate cyclase stimulators is contraindicated.[13]
Note: An example of a guanylate cyclase stimulator is Adempas (riociguat tablets).

4. Erectile Dysfunction. Coverage is not recommended. Patients should use other phosphodiesterase type 5 (PDE5) inhibitors indicated for erectile dysfunction (i.e., Viagra [sildenafil tablets], Cialis [tadalafil tablets]).[14,15]

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Treprostinil Injection Prior Authorization Policy
- Remodulin® (treprostinil subcutaneous or intravenous infusion – United Therapeutics, generic)

REVIEW DATE: 10/04/2023

OVERVIEW

Treprostinil injection, a prostacyclin vasodilator, is indicated for the treatment of pulmonary arterial hypertension (PAH) [World Health Organization {WHO} Group 1] to:[1,2]
- **Diminish symptoms associated** with exercise.
- **Reduce the rate of clinical deterioration** for patients who require transition from epoprostenol.

Treprostinil injection has been used with varying results in patients with chronic thromboembolic pulmonary hypertension (CTEPH).[3-7] Benefits noted include improvement in functional class, six-minute walk distance, and in hemodynamic parameters. Treprostinil injection is sometimes used as a bridge prior to surgery. Limited options are available for patients with CTEPH.

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.[8,9] The estimated incidence of PAH is 2 cases per 1 million per year with a prevalence of 10.6 cases per 1 million adults.[8] It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized.[8,9] In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment. In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness, and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease (e.g., connective tissue disease, HIV) that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.[14] The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association system to evaluate activity tolerance.

CTEPH is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.[10,11] It is classified within Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy may also be recommended. Anticoagulant therapy is also given.

Guidelines

Several guidelines address treprostinil injection in the management of pulmonary hypertension.[9,12]

- **Pulmonary Arterial Hypertension:** An updated CHEST guideline and Expert Panel Report regarding therapy for PAH in adults (2019) provides the evidence for use of the many medications for this condition.[9] In the absence of contraindications, patients with PAH should undergo acute vasoreactivity testing utilizing a short-acting agent (e.g., calcium channel blockers). For patients in Functional Class II, oral therapies are recommended such as endothelin receptor antagonists (ambrisentan, bosentan, Opsumit® [macitentan tablets]), phosphodiesterase type 5 inhibitors (tadalafil, sildenafil), and Adempas® (riociguat tablets). It is suggested that parenteral or inhaled prostanoids not be chosen as initial therapy for treatment naïve patients with PAH with WHO Functional Class II symptoms or as second-line agents for patients with PAH with WHO Functional Class II who have not met their treatment goals. Prostanoids may be considered in patients who have contraindications or difficulty tolerating phosphodiesterase type 5 inhibitors or endothelin receptor antagonists. Parenteral prostanoids are recommended for patients with PAH in Functional Class III and IV.[9] The European Society of Cardiology (ESC) and the European Respiratory Society (ERS) guidelines regarding the treatment of pulmonary hypertension (2022) also recognize parenteral treprostinil as having a prominent role in the management of this condition, usually in later therapy stages and after other therapies.[12]
- **Chronic Thromboembolic Pulmonary Hypertension:** Guidelines from the ESC/ERS regarding the treatment of pulmonary hypertension (2022) recommended to consider parenteral prostacyclin analogs for patients with inoperable CTEPH.[12]

Safety

Treprostinil injection should not be abruptly discontinued or have the dose rapidly decreased as rebound pulmonary hypertension may occur.[1,2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of treprostinil injection. All approvals are provided for 1 year in duration unless otherwise noted below. Specifically, approvals will remain up to 14 days for patients currently receiving the agent for the indication of PAH (WHO Group 1) with inadequate information or if the criteria are not met. These cases are reviewed by a nurse or pharmacist. Because of the specialized skills required for evaluation and diagnosis of patients treated with treprostinil injection as well as the monitoring required for adverse events and long-term efficacy, approval requires treprostinil injection to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: In the *Pulmonary Arterial Hypertension – Treprostinil Injection Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory results. For a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Treprostinil Injection Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of treprostinil injection is recommended in those who meet one of the following criteria:

FDA-Approved Indication

1. **Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1].** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 1 year if the patient meets all of the following (i, ii, iii, iv, and v):
     - **i.** Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
     - **ii.** Patient meets the following (a and b):
       - **a)** Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
       - **b)** Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
     - **iii.** Patient meets ONE of the following (a or b):
       - **a)** Patient is in Functional Class III or IV; OR
       - **b)** Patient is in Functional Class II and meets ONE of the following criteria [(1) or (2)]:
         - **(1)** Patient has tried or is currently receiving one oral agent for PAH; OR
           XX) Note: Examples of oral agents for PAH include bosentan, ambrisentan, Opsumit (macitentan tablets), Adempas (riociguat tablets), sildenafil, tadalafil, Alyq (tadalafil tablets), Tadliq (tadalafil oral suspension), Orenitram (treprostinil extended-release tablets) and Uptravi (selexipag tablets).
         - **(2)** Patient has tried one inhaled or parenteral prostacyclin product for PAH; AND
           YY) Note: Examples of inhaled and parenteral prostacyclin products for PAH include Ventavis (iloprost inhalation solution), Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation powder), and epoprostenol intravenous infusion (Flolan, Veletri, generics).
     - **iv.** Patient with idiopathic PAH must meet ONE of the following (a, b, c, d, or e):
       - **a)** Patient meets both of the following criteria [(1) and (2)]:
         - According to the prescriber, the patient has had an acute response to vasodilator testing that occurred during the right heart catheterization; AND
           ZZ) Note: An example of a response can be defined as a decrease in mean pulmonary artery pressure of at least 10 mm Hg to an absolute mean pulmonary artery pressure of less than 40 mm Hg without a decrease in cardiac output.
         - Patient has tried one calcium channel blocker (CCB) therapy; OR
           AAA) Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets.
       - **b)** According to the prescriber, the patient did not have an acute response to vasodilator testing; OR
       - **c)** According to the prescriber, the patient cannot undergo a vasodilator test; OR
       - **d)** Patient cannot take CCB therapy; OR

       BBB) Note: Examples of reasons a patient cannot take CCB therapy include right heart failure or decreased cardiac output.
       - **e)** Patient has tried one CCB; AND

       CCC) Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets.
     - **v.** Medication is prescribed by or in consultation with a cardiologist or a pulmonologist; OR

B) Patient Currently Receiving Treprostinil Injection. Approve for the duration noted below if the patient meets ONE of the following (i or ii):

iii. Approve for 1 year if the patient meets ALL of the following (a , b, and c):

d) Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

e) Patient meets the following [(1) and (2)]:

(1) Patient has had a right heart catheterization; AND

(2) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

f) Medication is prescribed by or in consultation with a cardiologist or a pulmonologist; OR

iv. Approve a short-term supply of treprostinil injection for up to 14 days if the patient does not meet the criteria in 1Bi above or if there is insufficient information available. All approvals are reviewed by a nurse or pharmacist.

Note: A 14-day supply should be sufficient to address coverage issues. However, multiple short-term approvals are allowed if a coverage determination cannot be made. Abrupt discontinuation of treprostinil injection therapy may have severe adverse consequences.

Other Uses with Supportive Evidence

2. Chronic Thromboembolic Pulmonary Hypertension (CTEPH). Approve for 1 year if prescribed by or in consultation with a pulmonologist or a cardiologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of treprostinil injection is not recommended in the following situations:

4. Chronic Obstructive Pulmonary Disease (COPD) in a Patient without PAH (WHO Group 1). COPD is classified as Group 3 Pulmonary Hypertension (pulmonary hypertension associated with lung diseases and/or hypoxia). Pulmonary hypertension may develop late in the course of COPD, but medications used for the treatment of PAH (WHO Group 1) are not recommended therapies.[13]

5. Concurrent Use with Parenteral Epoprostenol Products, Oral Prostacyclin Products, or Inhaled Prostacyclin Agents Used for Pulmonary Hypertension.
Note: Examples of medications include Orenitram (treprostinil extended-release tablets), Uptravi (selexipag tablets and intravenous infusion), Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation powder), Ventavis (iloprost inhalation solution), and epoprostenol injection (Flolan, Veletri, generic).

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Uptravi Prior Authorization Policy
- Uptravi® (selexipag tablets – Actelion/Janssen)
  Note: Uptravi injection is not included in this policy

REVIEW DATE: 10/11/2023

OVERVIEW

Uptravi, a prostacyclin receptor agonist, is indicated for the treatment of **pulmonary arterial hypertension (PAH) World Health Organization (WHO) Group 1** to delay disease progression and reduce the risk of hospitalization for PAH.[1]

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.[2,3] It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment. Although the mean age of diagnosis is between 36 and 50 years, patients of any age may be affected, including pediatric patients. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.[5] The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved.

Guidelines

Various guidelines address oral prostacyclin products.[3,4] The CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension (2019) in adults details many medications.[3] It was cited that many agents with varying mechanisms of action are used for the management of PAH. It was noted that the addition of an oral prostanoid product is recommended in patients with PAH who are in Functional Class III without evidence of rapid disease progression or a poor prognosis among those not willing or able to manage parenteral prostanoids. The European Society of Cardiology and the European Respiratory Society guidelines regarding the treatment of pulmonary hypertension (2022) also recognize Uptravi as having a role in therapy, mainly as an agent to be added onto other PAH therapies.[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Uptravi (tablets). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Uptravi as well as the monitoring required for adverse events and long-term efficacy, approval requires Uptravi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Uptravi Prior Authorization Policy* is considered to be met.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Uptravi is recommended in those who meet the following criteria:

FDA-Approved Indication

3. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

I) Initial Therapy. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):

i. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. Patient meets the following (a and b):

a) Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND

b) Results for the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iii. Patient meets ONE the of following (a or b):

a) Patient has tried or is currently receiving at least one oral medication for PAH from one of the three following different categories (either alone or in combination) each for ≥ 60 days: one phosphodiesterase type 5 (PDE5) inhibitor, one endothelin receptor antagonist (ERA), or Adempas (riociguat tablets); OR

Note: Examples of phosphodiesterase type 5 inhibitors include sildenafil and tadalafil. Examples of endothelin receptor antagonists include bosentan, ambrisentan, and Opsumit (macitentan tablets).

b) Patient is currently receiving, or has a of receiving, one prostacyclin therapy for PAH; AND

Note: Examples of prostacyclin therapies for PAH include Orenitram (treprostinil tablets), Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil inhalation solution), Ventavis (iloprost inhalation solution), treprostinil injection, and epoprostenol injection.

iv. The medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

J) Patients Currently Receiving Uptravi. Approve for 1 year if the patient meets all of the following (i, ii, and iii):

i. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. Patient meets the following (a and b):

a) Patient has had a right heart catheterization; AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iii. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Uptravi is recommended in those who meet the following criteria:

72. Concurrent Use with Orenitram, Inhaled Prostacyclin Products, or Parenteral Prostacyclin Agents Used for Pulmonary Hypertension. Use in combination is not appropriate.
Note: Examples of medications include Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation powder), Ventavis (iloprost inhalation solution), epoprostenol intravenous infusion, and treprostinil subcutaneous or intravenous infusion (Remodulin, generic).

73. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension and Related Lung Disease – Inhaled Prostacyclin Products Prior Authorization Policy
- Tyvaso® (treprostinil inhalation solution – United Therapeutics)
- Tyvaso DPI™ (treprostinil oral inhalation powder – MannKind/United Therapeutics)
- Ventavis® (iloprost inhalation solution – Actelion)

REVIEW DATE: 10/04/2023

OVERVIEW

Tyvaso, Tyvaso DPI, and Ventavis are inhaled prostacyclin vasodilators (prostacyclin mimetics) indicated for the treatment of:[1-3]

- **Pulmonary arterial hypertension (PAH), World Health Organization (WHO) Group 1**. Tyvaso and Tyvaso DPI are specifically indicated to improve exercise ability whereas Ventavis is indicated to improve a composite endpoint consisting of exercise tolerance, symptoms, and lack of deterioration.

Tyvaso and Tyvaso DPI are also indicated for:[1,2]

- **Pulmonary hypertension associated with interstitial lung disease (WHO Group 3)**. Tyvaso and Tyvaso DPI are indicated to improve exercise ability for this population.

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.[4,5] It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder, the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment. Although the mean age of diagnosis is between 36 and 50 years, patients of any age may be affected, including pediatric patients. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.[11] The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved.

Pulmonary hypertension due to interstitial lung disease (WHO Group 3) can complicate the condition and is associated with an increased need for supplemental oxygen, reduced mobility, and decreased survival.[7-10] Over 80% of patients with interstitial lung disease can have pulmonary hypertension; patients tend to be older and male.[6] Severe restrictions on pulmonary function tests and marked fibrosis on computed tomography scans are distinctions. The exact etiology is unknown. The symptoms are non-specific and include increased dyspnea on exertion, cough, fatigue, chest pain, and lower extremity edema. Tyvaso is the only medication indicated for this specific use. Randomized controlled trials utilizing other pulmonary vasodilators indicated for patients with WHO Group 1 PAH in patients with interstitial lung disease have not shown clear benefit and some studies suggest harm with use of some medications (e.g., sildenafil, Tracleer® [bosentan tablets], ambrisentan, Adempas® [riociguat tablets], and Opsumit® [macitentan tablets]).

Guidelines

Inhaled prostatcyclin products are included in various guidelines regarding PAH (WHO Group 1). Tyvaso DPI is not addressed yet.

- **Pulmonary Arterial Hypertension (PAH):** The CHEST guideline and Expert Panel Report regarding therapy for PAH (2019) in adults details many medications.[5] One recommendation is that parenteral or inhaled prostanoids should not be used as initial therapy for patients with PAH who are treatment naïve with WHO functional class II symptoms or as second-line agents for patients with PAH with WHO functional class II symptoms who have not met original treatment goals. In general, these agents are utilized in later stages of therapy.[5] The European Society of Cardiology (ESC) and the European Respiratory Society (ERS) guidelines regarding the treatment of pulmonary hypertension (2022) recognize that inhaled prostacyclin products have a role in therapy, mainly as an agent to be added onto other PAH therapies.[6]
- **Pulmonary Hypertension due to Interstitial Lung Disease:** The ESC/ERS guidelines regarding the treatment of pulmonary hypertension (2022) recommend inhaled treprostinil (Tyvaso) for patients with pulmonary hypertension associated with interstitial lung disease.[6]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tyvaso, Tyvaso DPI, and Ventavis. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with these products as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for initiation of therapy as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For the use of PAH (WHO Group 1), for a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension and Related Lung Disease – Inhaled Prostacyclin Products Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Tyvaso, Tyvaso DPI, and Ventavis is recommended in those who meet the following criteria:

FDA-Approved Indication

4. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets the following (i, ii, and iii):

i. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. Patient meets one of the following (a or b):

a) Patient is in Functional Class III or IV; OR

b) Patient is in Functional Class II and meets ONE of the following [(1) or (2)]:

(1) Patient has tried or is currently receiving one oral agent for PAH; OR
Note: Examples of oral agents for PAH include bosentan, ambrisentan, Opsumit (macitentan tablets), sildenafil, tadalafil, Adempas (riociguat tablets), Orenitram (treprostinil extended-release tablets), and Uptravi (selexipag tablets).

(2) Patient has tried one inhaled or parenteral prostacyclin product for PAH; AND
Note: Examples of inhaled and parenteral prostacyclin products for PAH include Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation powder), Ventavis (iloprost inhalation solution), treprostinil injection, and epoprostenol injection.

iii. Patient meets the following (a and b):
- **a)** The patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
- **b)** The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iv. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

B) Patient is Currently Receiving the Requested Inhaled Prostacyclin. Approve for 1 year if the patient meets the following (i, ii, and iii):
- **i.** Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- **ii.** Patient meets the following (a and b):
  - **a)** Patient has had a right heart catheterization; AND
  - **b)** Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
- **iii.** The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

II. Coverage of Tyvaso and Tyvaso DPI is recommended in those who meet the following criteria:

FDA-Approved Indication

5. Pulmonary Hypertension Associated with Interstitial Lung Disease (World Health Organization [WHO] Group 3). Approve for the duration noted if the patient meets ONE of the following (A or B):
Note: This involves diagnosis such as idiopathic interstitial pneumonia, combined pulmonary fibrosis and emphysema, WHO Group 3 connective disease, and chronic hypersensitivity pneumonitis.

A) Initial Therapy. Approve for 4 months if the patient meets the following (i, ii, iii, iv, v, and vi):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Patient has a diagnosis of World Health Organization (WHO) Group 3 pulmonary hypertension associated with interstitial lung disease; AND
- **iii.** Patient has connective tissue disease with a baseline forced vital capacity < 70%; AND
- **iv.** Patient has evidence of diffuse parenchymal lung disease on computed tomography of the chest; AND
- **v.** Patient meets the following (a and b):
  - **a)** Patient has had a right heart catheterization **[documentation required]**; AND
  - **b)** Results of the right heart catheterization confirm the diagnosis of WHO Group 3 pulmonary hypertension associated with interstitial lung disease; AND
- **vi.** The medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

B) Patient is Currently Receiving Tyvaso or Tyvaso DPI for pulmonary hypertension associated with interstitial lung disease. Approve for 1 year if the patient meets the following (i, ii, iii, iv and v):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Patient has a diagnosis of World Health Organization (WHO) Group 3 pulmonary hypertension associated with interstitial lung disease; AND
- **iii.** Patient meets the following (a and b):

a) Patient has had a right heart catheterization; AND
b) Results of the right heart catheterization confirm the diagnosis of World Health Organization (WHO) Group 3 pulmonary hypertension associated with interstitial lung disease; AND

iv. Patient has had a response to therapy according to the prescriber; AND
Note: Examples of a response include an increase or maintenance in the six-minute walk distance from baseline, improved exercise capacity, decrease in N-terminal pro-B-type natriuretic peptide levels, lessened clinical worsening, and a reduced rate of exacerbations of underlying lung disease.

v. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tyvaso, Tyvaso DPI, and Ventavis are not recommended in the following situations:

- **Concurrent Use with Oral or Parenteral Prostacyclin Agents Used for Pulmonary Hypertension.** Concomitant use is not recommended.
  Note: Examples of medications include Orenitram (treprostinil extended-release tablets), Uptravi (selexipag tablets and intravenous infusion), epoprostenol intravenous infusion, and treprostinil subcutaneous or intravenous infusion (Remodulin, generic).

- Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Qbrexza Prior Authorization Policy
- Qbrexza™ (glycopyrronium cloth 2.4% for topical use – Journey Medical)

REVIEW DATE: 12/06/2023

OVERVIEW

Qbrexza, an anticholinergic, is indicated for the topical treatment of **primary axillary** (i.e., underarm) **hyperhidrosis** in patients ≥ 9 years of age.[1] Qbrexza is applied topically once every 24 hours to clean dry skin on the underarm areas only; it is not for use on other body areas.

Guidelines

There are currently no guidelines for the treatment of hyperhidrosis published by a professional society. However, the International Hyperhidrosis Society, an independent, non-profit organization, provides an algorithm for the treatment of axillary hyperhidrosis (updated 2018).[2] Topical antiperspirant therapy or Qbrexza are both listed as initial treatment choices. It is noted in the algorithm that typically aluminum chloride hexahydrate 20% solution is the most commonly prescribed agent.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Qbrexza. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Qbrexza is recommended in those who meet the following criteria:

FDA-Approved Indication

i. Hyperhidrosis, Primary Axillary. Approve for 1 year if the patient meets the following (A, B, C, and D):
   a. Patient is ≥ 9 years of age; AND
   b. Hyperhidrosis is significantly interfering with the ability to perform age-appropriate activities of daily living; AND
   c. The prescriber has excluded secondary causes of hyperhidrosis; AND
   d. Patient meets one of the following (i or ii):
      i. Patient has tried one prescription aluminum chloride-containing topical antiperspirant for at least 4 weeks and experienced inadequate efficacy; OR
      ii. According to the prescriber, the patient has experienced significant intolerance with an aluminum-containing topical antiperspirant.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Qbrexza is not recommended in the following situations:

74. Hyperhidrosis, other than Primary Axillary. Qbrexza is not intended for application to areas other than the axillae.[1]

75. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Repository Corticotropin – Acthar Gel Prior Authorization Policy
- Acthar® Gel (repository corticotropin intramuscular and subcutaneous injection – Mallinckrodt)

REVIEW DATE: 04/19/2023

OVERVIEW

Acthar, an adrenocorticotropic hormone (ACTH) analog, is indicated for the following uses:[1]
- **Infantile spasms**, treatment of, in infants and children < 2 years of age.
- **Multiple sclerosis, treatment of exacerbations** in adults.

Although data are limited, the prescribing information notes that Acthar may also be used for the following disorders and diseases:[1]
- **Allergic states**, such as serum sickness.
- **Collagen diseases**, during an exacerbation or as a maintenance therapy in selected cases of systemic lupus erythematosus and systemic dermatomyositis (polymyositis).
- **Dermatologic diseases**, such as severe erythema multiforme and Stevens-Johnson syndrome.
- **Edematous state** including to induce a diuresis or a remission of proteinuria in the nephrotic syndrome without uremia of the idiopathic type or that due to lupus erythematosus.
- **Respiratory diseases** such as symptomatic sarcoidosis.
- **Rheumatoid disorders**, as an adjunctive therapy for short-term administration (to tide the patient over an acute episode or exacerbation) in psoriatic arthritis, rheumatoid arthritis (including juvenile rheumatoid arthritis) [selected cases may require low-dose maintenance therapy], and ankylosing spondylitis.
- **Ophthalmic diseases** including severe acute and chronic allergic and inflammatory processes involving the eye and its adnexa such as keratitis, iritis, iridocyclitis, diffuse posterior uveitis and choroiditis, optic neuritis, chorioretinitis, and anterior segment inflammation.

Clinical Efficacy

A review regarding repository corticotropin found few randomized controlled trials supporting the clinical benefit of repository corticotropin or ACTH for various conditions (e.g., use in rheumatoid arthritis, ankylosing spondylitis, optic neuritis, systemic lupus erythematosus, and nephrotic syndrome).[2] Most data suggest that repository corticotropin or ACTH was not superior to corticosteroids for treating relapses in patients with multiple sclerosis.

Guidelines

Several guidelines discuss repository corticotropin or ACTH.
- The **American Academy of Neurology and the Child Neurology Society** published an evidence-based guideline for the medical treatment of infantile spasms (2012).[3] ACTH is a first-line agent for the short-term treatment of infantile spasms.
- **Infantile Spasms Working Group** published a US consensus report on infantile spasms in 2010.[4] Most patients with this condition (90%) present within the first year of life. ACTH is an effective first-line therapy for infantile spasms.
- **Kidney Disease Improving Global Outcomes (KDIGO) published clinical practice guidelines for the management of glomerular disease (2021)**.[5] This includes diagnoses such as nephrotic syndrome, membranous nephropathy, immunoglobulin A nephropathy, minimal change disease, infection-related

glomerulonephritis, focal segmental glomerulosclerosis, membranoproliferative glomerulonephritis, and lupus nephritis. ACTH is not prominent in the guidelines and there is a lack of quality evidence regarding ACTH.

- **National Multiple Sclerosis Society** has recommendations regarding corticosteroids in the management of multiple sclerosis relapses or exacerbations.[6] High-dose corticosteroids are the accepted standard of care short-term. The most common regimen is 500 to 1,000 mg of intravenous methylprednisolone given daily for 3 to 5 days, with or without an oral steroid tapering regimen (most often prednisone) for 1 to 3 weeks. ACTH and high-dose intravenous methylprednisolone have been shown to possess similar efficacy in the management of multiple sclerosis relapses.[7]
- The **American College of Rheumatology** has many guidelines regarding use in rheumatoid-type conditions.[8] ACTH does not have a prominent role and is generally not recommended for use in any of the related American College of Rheumatology guidelines.
- **The American College of Rheumatology has guidelines for the management of gout** (2020).[9] For gout flare management, using colchicine, non-steroidal anti-inflammatory drugs, or glucocorticoids (oral, intraarticular, or intramuscular) are appropriate first-line therapy for gout flare over interleukin-1 inhibitors or ACTH.
- **The European Respiratory Society published guidelines on the treatment of sarcoidosis (2021)**.[10] Repository corticotropin use should be reserved for patients who have failed prior treatments (e.g., steroids, antimetabolites). Only limited data are available. Repository corticotropin should be considered in a case by case basis only when other therapies are not effective or tolerated.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Acthar. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Acthar as well as monitoring required for adverse events and efficacy, approval requires Acthar to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Acthar is recommended in those who meet the following criteria:

FDA-Approved Indication

6. **Infantile Spasms, Treatment.** Approve Acthar for 1 month if the patient meets the following criteria (A and B):
   A) Child is < 2 years of age; AND
   B) Medication is prescribed by a physician who has consulted with or specializes in neurology.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Acthar is not recommended in the following situations:

76. Ankylosing Spondylitis. The American College of Rheumatology guidelines for the treatment of ankylosing spondylitis do not convey a role for ACTH in this condition.[11,12]

77. Dermatomyositis or Polymyositis. British Society for Rheumatology guidelines on the management of pediatric, adolescent, and adult patients with idiopathic inflammatory myopathy (2022) do not cite ACTH as an agent to utilize in patients with such conditions.[13]

78. Diabetic Nephropathy. ACTH is not a cited therapy or the standard of care for the management of chronic kidney disease in patients with diabetes.[5,14]

79. Glomerular Kidney Diseases.
Note: Diagnoses can include nephrotic syndrome, membranous nephropathy, immunoglobulin A nephropathy, minimal change disease, infection-related glomerulonephritis, focal segmental glomerulosclerosis, and membranoproliferative glomerulonephritis. ACTH is not prominent in related guidelines from KDIGO (2021) and there is a lack of quality evidence regarding ACTH to support its use.[5]

80. Gout. American College of Rheumatology guidelines for gout (2020) recommend other therapies beside ACTH for gout flare management (e.g., colchicine, non-steroidal anti-inflammatory drugs, or glucocorticoids).[9]

81. Juvenile Idiopathic Arthritis. Related guidelines from the American College of Rheumatology regarding the treatment of juvenile idiopathic arthritis (2021) do not mention ACTH as having a role for this disease.[15]

82. Lupus Nephritis. The KDIGO guidelines for the management of glomerular disease (2021) cite many other agents besides ACTH for the management of this condition.[5] The European League Against Rheumatism-European Renal Association-European Dialysis and Transplantation Association joint recommendations on the management of lupus nephritis do not cite ACTH as a therapy to use in this condition.[16]

83. Multiple Sclerosis, Acute Exacerbations. High-dose corticosteroids, usually intravenous methylprednisolone, are the accepted standard of care short-term for acute relapses or exacerbations.[6]

84. Ophthalmic Conditions. Only limited data describe the use of ACTH in ophthalmic-related conditions (e.g., acute optic neuritis, keratitis, retinal vasculitis).[2,17-19] Prospective data are needed to more rigorously define the efficacy and safety of ACTH in ocular disease.

85. Psoriatic Arthritis. The American College of Rheumatology/National Psoriasis Foundation guidelines for the treatment of psoriatic arthritis (2018) do not mention a role for ACTH in this condition.[20]

86. Rheumatoid Arthritis. The American College of Rheumatology guidelines for the treatment of rheumatoid arthritis (2021) do not mention a role for ACTH in this disease state.[21]

87. Sarcoidosis. The European Respiratory Society published guidelines on the treatment of sarcoidosis (2021).[10] Repository corticotropin use should be reserved for patients who have failed prior treatments

(e.g., steroids, antimetabolites). Only limited data are available. Repository corticotropin should be considered in a case by case basis only when other therapies are not effective or tolerated.

88. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Repository Corticotropin – Cortrophin Gel Prior Authorization Policy
- Purified Cortrophin™ Gel (repository corticotropin subcutaneous and intramuscular injection – ANI)

REVIEW DATE: 04/19/2023

OVERVIEW

Cortrophin Gel, a porcine derived purified corticotrophin (adrenocorticotropic hormone [ACTH] {1-39}) product, is indicated in the following disorders:[1]

- **Allergic states**, such as atopic dermatitis and serum sickness.
- **Collagen diseases**, during an exacerbation or as a maintenance therapy in selected cases of systemic lupus erythematosus and systemic dermatomyositis (polymyositis).
- **Dermatologic diseases**, such as severe erythema multiforme (Stevens-Johnson syndrome) and severe psoriasis.
- **Edematous state** including to induce a diuresis or a remission of proteinuria in the nephrotic syndrome without uremia of the idiopathic type or that due to lupus erythematosus.
- **Nervous system**, acute exacerbations of multiple sclerosis.
- **Respiratory diseases** such as symptomatic sarcoidosis.
- **Rheumatoid disorders**, as an adjunctive therapy for short-term administration (to tide the patient over an acute episode or exacerbation) in psoriatic arthritis, rheumatoid arthritis (including juvenile rheumatoid arthritis) [selected cases may require low-dose maintenance therapy], ankylosing spondylitis, and acute gouty arthritis.
- **Ophthalmic diseases** including severe acute and chronic allergic and inflammatory processes involving the eye and its adnexa such as allergic conjunctivitis, keratitis, iritis and iridocyclitis, diffuse posterior uveitis and choroiditis, optic neuritis, chorioretinitis, and anterior segment inflammation.

Clinical Efficacy

A recent review regarding repository corticotropin found few randomized controlled trials supporting the clinical benefit of repository corticotropin or ACTH for various conditions (e.g., use in rheumatoid arthritis, ankylosing spondylitis, optic neuritis, systemic lupus erythematosus, and nephrotic syndrome).[2] Most data suggest that repository corticotropin or ACTH was not superior to corticosteroids for treating relapses in patients with multiple sclerosis.

Guidelines

Several guidelines discuss repository corticotrophin or ACTH.

- **Kidney Disease Improving Global Outcomes (KDIGO) published clinical practice guidelines for the management of glomerular disease** (2021).[3] This includes diagnoses such as nephrotic syndrome, membranous nephropathy, immunoglobulin A nephropathy, minimal change disease, infection-related glomerulonephritis, focal segmental glomerulosclerosis, membranoproliferative glomerulonephritis, and lupus nephritis. ACTH is not prominent in the guidelines and there is a lack of quality evidence regarding ACTH.
- **National Multiple Sclerosis Society** has recommendations regarding corticosteroids in the management of multiple sclerosis relapses or exacerbations.[4] High-dose corticosteroids are the accepted standard of care short-term. The most common regimen is 500 to 1,000 mg of intravenous methylprednisolone given daily for 3 to 5 days, with or without an oral steroid tapering regimen (most

often prednisone) for 1 to 3 weeks. ACTH and high-dose intravenous methylprednisolone have been shown to possess similar efficacy in the management of multiple sclerosis relapses.[5]

- The **American College of Rheumatology** has many guidelines regarding use in rheumatoid-type conditions.[6] ACTH does not have a prominent role and is generally not recommended for use in any of the related American College of Rheumatology guidelines.
- The **American College of Rheumatology has guidelines for the management of gout** (2020).[7] For gout flare management, using colchicine, non-steroidal anti-inflammatory drugs, or glucocorticoids (oral, intraarticular, or intramuscular) are appropriate first-line therapy for gout flare over interleukin-1 inhibitors or ACTH.
- **The European Respiratory Society published guidelines on the treatment of sarcoidosis (2021)**.[8] Repository corticotropin use should be reserved for patients who have failed prior treatments (e.g., steroids, antimetabolites). Only limited data are available. Repository corticotropin should be considered in a case by case basis only when other therapies are not effective or tolerated.

POLICY STATEMENT

Due to the lack of updated clinical efficacy data and potential safety concerns with long-term use, **approval is not recommended** for Cortrophin Gel. The current Cortrophin Gel efficacy information is insufficient to determine if the medication demonstrates any clinically meaningful benefits beyond those provided by other available therapies.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cortrophin Gel is not recommended in the following situations:

89. Ankylosing Spondylitis. The American College of Rheumatology guidelines for the treatment of ankylosing spondylitis do not convey a role for ACTH in this condition.[9,10]

90. Dermatomyositis or Polymyositis. British Society for Rheumatology guidelines on the management of pediatric, adolescent, and adult patients with idiopathic inflammatory myopathy (2022) do not cite ACTH as an agent to utilize in patients with such conditions.[11]

91. Diabetic Nephropathy. ACTH is not a cited therapy or the standard of care for the management of chronic kidney disease in patients with diabetes.[3,12]

92. Glomerular Kidney Diseases.
Note: Diagnoses can include nephrotic syndrome, membranous nephropathy, immunoglobulin A nephropathy, minimal change disease, infection-related glomerulonephritis, focal segmental glomerulosclerosis, and membranoproliferative glomerulonephritis. ACTH is not prominent in related guidelines from KDIGO (2021) and there is a lack of quality evidence regarding ACTH to supports its use.[3]

93. Gout. American College of Rheumatology guidelines for gout (2020) recommend other therapies beside ACTH for gout flare management (e.g., colchicine, non-steroidal anti-inflammatory drugs, or glucocorticoids).[7]

94. Infantile Spasms, Treatment. Purified Cortrophin Gel is not FDA-approved for this use.[1]

95. Juvenile Idiopathic Arthritis. Related guidelines from the American College of Rheumatology regarding the treatment of juvenile idiopathic arthritis (2021) do not mention ACTH as having a role for this disease.[13]

96. Lupus Nephritis. The KDIGO guidelines for the management of glomerular disease (2021) cite many other agents besides ACTH for the management of this condition.[3] The European League Against Rheumatism-European Renal Association-European Dialysis and Transplantation Association joint recommendations on the management of lupus nephritis do not cite ACTH as a therapy to use in this condition.[14]

97. Multiple Sclerosis, Acute Exacerbations. High-dose corticosteroids, usually intravenous methylprednisolone, are the accepted standard of care short-term for acute relapses or exacerbations.[4]

98. Ophthalmic Conditions. Only limited data describes the use of ACTH in ophthalmic-related conditions (e.g., acute optic neuritis, keratitis, retinal vasculitis).[2,15-17] Prospective data are needed to more rigorously define the efficacy and safety of ACTH in ocular disease.

99. Psoriatic Arthritis. The American College of Rheumatology/National Psoriasis Foundation guidelines for the treatment of psoriatic arthritis (2018) do not mention a role for ACTH in this condition.[18]

100. Rheumatoid Arthritis. The American College of Rheumatology guidelines for the treatment of rheumatoid arthritis (2021) do not mention a role for ACTH in this disease state.[19]

101. Sarcoidosis. The European Respiratory Society published guidelines on the treatment of sarcoidosis (2021).[8] Repository corticotropin use should be reserved for patients who have failed prior treatments (e.g., steroids, antimetabolites). Only limited data are available. Repository corticotropin should be considered in a case by case basis only when other therapies are not effective or tolerated.

102. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Rituximab Intravenous Products Prior Authorization Policy
- Riabni™ (rituximab-arrx intravenous infusion – Amgen)
- Rituxan® (rituximab intravenous infusion – Genentech)
- Ruxience® (rituximab-pvvr intravenous infusion – Pfizer)
- Truxima® (rituximab-abbs intravenous infusion – Celltrion/Teva)

REVIEW DATE: 08/16/2023

OVERVIEW

Rituximab products are CD20-directed cytolytic antibodies. All approved rituximab intravenous products are indicated for treatment of the following conditions:

- **Chronic lymphocytic leukemia** (CLL), in combination with fludarabine and cyclophosphamide (FC) for the treatment of patients with previously untreated and previously treated CD20-positive disease.
- **Granulomatosis with polyangiitis** (Wegener's granulomatosis) and **microscopic polyangiitis** in adults, in combination with glucocorticoids.
- **Non-Hodgkin lymphoma** (NHL), for the following uses:
  - previously untreated follicular, CD20-positive disease, in combination with first-line chemotherapy, and in patients achieving a complete or partial response to rituximab in combination with chemotherapy, as a single-agent maintenance therapy.
  - for relapsed or refractory, low-grade or follicular, CD20-positive, B-cell disease.
  - for non-progressing (including stable disease) low-grade, CD20-positive, B-cell disease as a single agent after first-line cyclophosphamide/vincristine/prednisone (CVP) chemotherapy.
  - for previously untreated diffuse large B-cell, CD20-positive disease, in combination with cyclophosphamide/doxorubicin/vincristine/prednisone (CHOP) or other anthracycline-based chemotherapy regimens.
- **Rheumatoid arthritis**, in adult patients with moderately to severely active disease, in combination with methotrexate for patients who have had an inadequate response to one or more tumor necrosis factor inhibitors (TNFis).

In addition to the above indications, Rituxan intravenous is also indicated for treatment of the following conditions:

- **Granulomatosis with polyangiitis** (Wegener's granulomatosis) and **microscopic polyangiitis** in patients ≥ 2 years of age, in combination with glucocorticoids.
- **Pemphigus vulgaris**, for adults with moderate to severe disease.
- **B-cell lymphoma,** in patients ≥ 6 months of age with previously untreated, advanced stage, CD20-positive diffuse large B-cell lymphoma, Burkitt lymphoma, Burkitt-like lymphoma, or mature B-cell acute leukemia in combination with chemotherapy.

Riabni, Ruxience, and Truxima are approved as biosimilar to Rituxan intravenous, indicating no clinically meaningful differences in safety and effectiveness and the same mechanism of action, route of administration, dosage form, and strength as Rituxan intravenous. However, minor differences in clinically inactive components are allowed. At this time, the biosimilars have only demonstrated biosimilarity, not interchangeability.

Guidelines

The use of rituximab is supported in clinical guidelines in numerous situations, both as first-line therapy and in patients who are refractory or have relapsed following treatment with other therapies.[4-21]

- **Antineutrophil Cytoplasmic Antibody (ANCA)-Associated Vasculitis:** Guidelines from the American College of Rheumatology (ACR) [2021] list rituximab among the alternatives for induction or maintenance of remission. Various regimens are recommended with a typical maximum of 1,000 mg/infusion. For maintenance dosing, at least 4 months should separate doses. The optimal dose of rituximab for remission maintenance remains uncertain. Although scheduled maintenance is conditionally recommended over use of CD19+ B-cell counts and/or ANCA titers to guide retreatment, there are data to support both approaches.
- **Immune Thrombocytopenia (ITP):** Guidelines from the American Society of Hematology (ASH) for ITP (2019) mention rituximab as an alternative for children and adults with ITP who do not respond to first-line treatment, and for adults who are corticosteroid-dependent.[17]
- **Multiple Sclerosis (MS):** In June 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[18] Rituximab is listed among various options, involving different mechanisms of action and modes of administration, which have shown benefits in patients with MS. The American Academy of Neurology has practice guidelines regarding disease-modifying therapies for adults with MS.[19] The guidelines mention rituximab for use in MS.
- **Neuromyelitis Optica Spectrum Disorders:** A review article lists rituximab as an effective treatment for neuromyelitis optica.[20]
- Oncology indications covered in National Comprehensive Cancer Network (NCCN) guidelines:[6]
    - **Acute Lymphoblastic Leukemia (ALL):** Guidelines (version 2.2023 – July 28, 2023) list rituximab in multiple regimens for Philadelphia chromosome (Ph)-negative disease for patients with CD20-positive disease.[11] In those with Ph-positive disease, rituximab should be considered in addition to chemotherapy for those with CD20-positive disease, especially in those < 60 years of age.
    - **B-Cell Lymphomas:** In the guidelines (version 5.2023 – July 07, 2023), rituximab is included in multiple treatment regimens across the spectrum of disease.[8] Guidelines for pediatric aggressive mature B-cell lymphomas (version 1.2023 – April 04, 2023) include rituximab intravenous as a component of treatment regimens for induction therapy/initial treatment and as subsequent therapy for relapsed or refractory disease.[9] For primary cutaneous B-cell lymphomas (version 1.2023 – January 5, 2023), rituximab is a treatment option for patients with primary cutaneous B-cell lymphoma.[10]
    - **CLL/Small Lymphocytic Lymphoma:** Rituximab features prominently in the guidelines (version 3.2023 – June 12, 2023) and is included in multiple treatment regimens across the spectrum of disease.[7]
    - **Graft-Versus-Host Disease (GVHD):** The hematopoietic cell transplantation guidelines (version 1.2023 – March 31, 2023) list rituximab among the agents used for steroid-refractory chronic GVHD.[15]
    - **Hairy Cell Leukemia:** Guidelines (version 1.2023 – August 30, 2022) recommend rituximab as a component in a preferred primary regimen, and in multiple regimens for relapsed/refractory disease (including in patients with progressive disease after relapsed/refractory therapy).[12]
    - **Hodgkin Lymphoma:** Guidelines (version 2.2023 – November 8, 2022) recommend rituximab ± chemotherapy and/or radiation (depending on the clinical presentation) in the first-line setting for nodular lymphocyte-predominant disease.[13] Rituximab is also used for relapsed/refractory disease and for maintenance. Guidelines for pediatric disease (version 2.2023 – March 9, 2023) include rituximab in regimens for primary treatment of nodular lymphocyte-predominant disease.[25]

- **Primary Central Nervous System Lymphoma:** Guidelines for central nervous system cancers (version 1.2023 – March 24, 2023) recommend rituximab in multiple regimens for induction therapy and relapsed or refractory primary central nervous system lymphoma.[24]
- **Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma:** Guidelines (version 1.2023 – July 6, 2022) include rituximab in regimens across the spectrum of disease (primary therapy, previously treated disease, and maintenance).[14]

- **Immunotherapy-Related Toxicities Associated with Checkpoint Inhibitors:** NCCN (version 2.2023 – May 9, 2023) and the American Society of Clinical Oncology (ASCO) guidelines (2021) recommend rituximab as an option for corticosteroid-refractory dermatologic and hematologic immune mediated adverse events, as well as for immune-mediated encephalitis and myositis.[26,27]
- **Pemphigus Vulgaris:** British guidelines (2017) list rituximab in combination with corticosteroids as a first-line therapy.[23]
- **Rheumatoid Arthritis:** Guidelines from ACR (2021) recommend addition of a biologic or a targeted synthetic DMARD for a patient taking the maximum tolerated dose of methotrexate who is not at target.[16]
- **Systemic Lupus Erythematosus (SLE):** European League Against Rheumatism (EULAR) recommendations for the management of SLE (2019) mention rituximab as a therapeutic option for patients who are refractory to standard immunosuppressive therapies.[21]

DDD)

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of rituximab intravenous products. Because of the specialized skills required for evaluation and diagnosis of patients treated with rituximab as well as the monitoring required for adverse events and long-term efficacy, initial approval requires rituximab intravenous products to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration listed below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of rituximab intravenous products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

3. **Antineutrophil Cytoplasmic Antibody (ANCA)-Associated Vasculitis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Induction Treatment. Approve for 1 month if the patient meets ALL of the following (i, ii, and iii):
   - **i.** Patient has an ANCA-associated vasculotide; AND
     Note: Examples of ANCA-associated vasculitis include granulomatosis with polyangiitis (GPA) [Wegener's granulomatosis] or microscopic polyangiitis (MPA).
   - **ii.** The medication is being administered in combination with glucocorticoids; AND
   - **iii.** The medication is prescribed by or in consultation with a rheumatologist, nephrologist, or immunologist.
   - **B)** Follow-Up Treatment of Patients Who Have Received Induction Treatment for ANCA-Associated Vasculitis. Approve for 1 year if the patient meets BOTH of the following (i and ii):

Note: This includes a patient who received induction treatment using a rituximab product or other standard of care immunosuppressants.

i. According to the prescriber, the patient achieved disease control with induction treatment; AND

ii. If the patient previously received a course of therapy, at least 16 weeks will elapse between courses.

4. B-Cell Lymphoma. Approve for 1 year if prescribed by or in consultation with an oncologist.
Note: Examples of B-cell lymphomas include follicular lymphoma, diffuse large B-cell lymphoma, high-grade B-cell lymphoma, acquired immune deficiency (AIDS)-related B-cell lymphoma, Burkitt lymphoma, Castleman's disease, marginal zone lymphoma (e.g., extranodal or MALT [gastric or nongastric], nodal, or splenic marginal zone lymphoma), primary mediastinal large B-cell lymphoma, mantle cell lymphoma, post-transplant lymphoproliferative disorders, gray zone lymphoma, primary cutaneous B-cell lymphoma, pediatric aggressive mature B-cell lymphomas.

EEE)

5. Chronic Lymphocytic Leukemia or Small Lymphocytic Lymphoma. Approve for 1 year if prescribed by or in consultation with an oncologist.

FFF)

6. Pemphigus Vulgaris. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Treatment. Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets BOTH of the following (i and ii):

i. Therapy is initiated in combination with a corticosteroid unless contraindicated; AND
Note: An example of a corticosteroid is prednisone.

ii. The medication is prescribed by or in consultation with a dermatologist.

B) Patient is Being Treated for a Relapse or for Maintenance of Pemphigus Vulgaris. Approve for 1 year if the patient meets BOTH of the following (i and ii):

i. Subsequent infusions will be administered no sooner than 16 weeks following the previous infusion of a rituximab product; AND

ii. The medication is prescribed by or in consultation with a dermatologist.

7. Rheumatoid Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets ALL of the following conditions (i, ii, and iii):

i. Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
Note: Examples of conventional synthetic DMARDs include methotrexate [oral or injectable], leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient already has a 3-month trial of at least one biologic other than the requested drug. A biosimilar of the requested biologic does not count. Refer to Appendix A for examples of biologics used for rheumatoid arthritis. A patient who has already tried a biologic is not required to "step back" and try a conventional synthetic DMARD.

ii. The medication will not be used concurrently with another biologic or with a targeted synthetic DMARD; AND
Note: Refer to Appendix A for examples of biologics and targeted synthetic DMARDs.

iii. The medication is prescribed by or in consultation with a rheumatologist.

B) Patient has already Received One or More Courses of a Rituximab Product for Rheumatoid Arthritis. Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets ALL of the following conditions (i, ii, and iii):

i. 16 weeks or greater will elapse between treatment courses; AND
Note: For example, there will be a minimum of 16 weeks since the first dose of the previous course and the first dose of the next course of a rituximab product.

ii. The medication will not be used concurrently with another biologic or with a targeted synthetic DMARD; AND
Note: Refer to Appendix A for examples of biologics and targeted synthetic DMARDs.

iii. If the patient has already received two or more courses of therapy, the patient meets at least ONE of the following (a or b):

a) Patient experienced a beneficial clinical response when assessed by at least one objective measure; OR
Note: Examples of standardized and validated measures of disease activity include Clinical Disease Activity Index (CDAI), Disease Activity Score (DAS) 28 using erythrocyte sedimentation rate (ESR) or C-reactive protein (CRP), Patient Activity Scale (PAS)-II, Rapid Assessment of Patient Index Data 3 (RAPID-3), and/or Simplified Disease Activity Index (SDAI).

b) Patient experienced an improvement in at least one symptom, such as decreased joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths.

GGG)

Other Uses with Supportive Evidence

6. Acute Lymphoblastic Leukemia. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient has CD20-positive disease; AND

B) The medication is prescribed by or in consultation with an oncologist.

7. Graft-Versus-Host Disease. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 month if the patient meets the following (i and ii):

i. Patient has tried at least one conventional systemic treatment for graft versus host disease; AND
Note: Examples include systemic corticosteroids (methylprednisolone, prednisone), cyclosporine, tacrolimus, mycophenolate mofetil, Imbruvica (ibrutinib capsules and tablets), imatinib, antithymocyte globulin, Nipent (pentostatin infusion), or an infliximab product.

ii. The medication is prescribed by or in consultation with an oncologist, hematologist, or a physician affiliated with a transplant center.

B) Patient has Already Received a Course of a Rituximab Product for Graft-Versus-Host Disease. Approve for 1 year if the patient meets at least ONE of the following (i or ii):

i. When assessed by at least one objective measure, patient experienced a beneficial clinical response from baseline (prior to initiating a rituximab product); OR
Note: An example of objective measures is normalization of liver function tests, red blood cell count, or platelet count, or resolution of fever or rash.

ii. Compared with baseline (prior to initiating a rituximab product), patient experienced an improvement in at least one symptom, such as improvement in skin, oral mucosal, ocular, or gastrointestinal symptoms (e.g., nausea, vomiting, anorexia).

8. **Hairy Cell Leukemia.** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

9. **Hodgkin Lymphoma**. Approve for 1 year if the patient meets BOTH of the following (A and B):
   A) Patient has nodular lymphocyte-predominant disease; AND
   B) The medication is prescribed by or in consultation with an oncologist.

10. **Immune Thrombocytopenia (ITP).** Approve if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve for 1 month if the patient meets BOTH of the following (i and ii):
   i. Patient has tried one other therapy; AND
   Note: Examples of therapies for ITP include intravenous immunoglobulin (IVIG), anti-D (RHO) immunoglobulin, corticosteroids, and splenectomy.
   ii. The agent is prescribed by or in consultation with a hematologist.
   B) Patient has Already Received a Course of a Rituximab Product for ITP. Approve for 1 month if the patient meets ALL of the following (i, ii, and iii):
   i. At least 6 months will elapse between treatment courses; AND
   Note: For example, there will be a minimum of 6 months separating the first dose of the previous course and the first dose of the requested course of a rituximab product.
   ii. Patient responded to therapy as determined by the prescriber; AND
   Note: Examples of a response include a platelet count increase from baseline following treatment with a rituximab product.
   iii. The prescriber has determined that the patient has relapsed.
   Note: Examples of a relapse include the patient experiences thrombocytopenia after achievement of a remission.

11. **Immunotherapy-Related Toxicities Associated with Checkpoint Inhibitors.** Approve for the duration noted if the patient meets the following (A or B):
   Note: Examples of checkpoint inhibitors are Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion), Yervoy (ipilimumab intravenous infusion), Tecentriq (atezolizumab intravenous infusion), Bavencio (avelumab intravenous infusion), Imfinzi (durvalumab intravenous infusion), and Libtayo (cemiplimab-rwlc intravenous infusion).
   12. Initial Therapy. Approve for 1 month if the patient meets BOTH of the following (i and ii):
   i. Patient is symptomatic despite a trial of at least ONE systemic corticosteroid; AND
   Note: Examples of a corticosteroid include methylprednisolone and prednisone.
   ii. The medication is prescribed by or in consultation with an oncologist, neurologist, rheumatologist, or dermatologist.
   13. Patient has Already Received a Course of a Rituximab Product. Approve for 1 month if prescribed by or in consultation with an oncologist, neurologist, rheumatologist, or dermatologist.

14. **Multiple Sclerosis.** Approve for 1 year if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve if the patient meets ALL the following (i, ii, iii, and iv):
   i. According to the prescriber, the patient has experienced inadequate efficacy or significant intolerance to at least TWO other disease-modifying agents for multiple sclerosis; AND
   Note: See Appendix B for examples of disease-modifying agents used for multiple sclerosis.
   ii. Medication will not be used concurrently with another disease-modifying agent used for multiple sclerosis; AND
   Note: See Appendix B for examples of disease-modifying agents used for multiple sclerosis.
   iii. Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis; AND

iv. At least 6 months will elapse between treatment courses.
Note: For example, if the patient has already received a course of therapy there will be a minimum of 6 months separating the first dose of the previous course and the first dose of the requested course of therapy.

B) Patient is Currently Receiving Rituximab. Approve if the patient meets one of the following (i or ii):

i. Patient has been receiving Rituximab for < 1 year. Approve if the patient meets ALL of the following (a, b, and c):

1. Medication will not be used concurrently with another disease-modifying agent used for multiple sclerosis; AND
   Note: See Appendix B for examples of disease-modifying agents used for multiple sclerosis.
2. At least 6 months will elapse between treatment courses; AND
   Note: For example, if the patient has already received a course of therapy there will be a minimum of 6 months separating the first dose of the previous course and the first dose of the requested course of therapy.
3. Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis; OR

ii. Patient has been receiving Rituximab for 1 year or more. Approve for 1 year if the patient meets ALL of the following (a, b, c, and d):

a) Medication will not be used concurrently with another disease-modifying agent used for multiple sclerosis; AND
Note: See Appendix B for examples of disease-modifying agents used for multiple sclerosis.

b) At least 6 months will elapse between treatment courses; AND
Note: For example, if the patient has already received a course of therapy there will be a minimum of 6 months separating the first dose of the previous course and the first dose of the requested course of therapy.

c) Patient meets ONE of the following [(1) or (2)]:

a. Patient experienced a beneficial clinical response when assessed by at least one objective measure; OR
   Note: Examples include stabilization or reduced worsening in disease activity as evaluated by magnetic resonance imaging (MRI) [absence or a decrease in gadolinium enhancing lesions, decrease in the number of new or enlarging T2 lesions]; stabilization or reduced worsening on the Expanded Disability Status Scale (EDSS) score; achievement in criteria for No Evidence of Disease Activity-3 (NEDA-3) or NEDA-4; improvement on the fatigue symptom and impact questionnaire-relapsing multiple sclerosis (FSIQ-RMS) scale; reduction or absence of relapses; improvement or maintenance on the six-minute walk test or 12-Items Multiple Sclerosis Walking Scale; improvement on the Multiple Sclerosis Functional Composite (MSFC) score; and or attenuation of brain volume loss; OR
b. Patient experienced stabilization, slow progression, or improvement in at least one symptoms such as motor function, fatigue, vision, bowel/bladder function, spasticity, walking/gait, or pain/numbness/tingling sensation; AND

d) Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

13. Neuromyelitis Optica Spectrum Disorder. Approve for 1 month if prescribed by or in consultation with a neurologist.

14. **Primary Central Nervous System Lymphoma**. Approve for 1 year if prescribed by or in consultation with an oncologist.

15. **Systemic Lupus Erythematosus (SLE) [Lupus].** Approve for the duration noted if the patient meets ONE of the following (A or B):
    Note: This includes nephrotic syndrome in a patient with SLE.
    A) Initial Therapy. Approve for 1 month (adequate duration to receive one course) if the patient meets BOTH of the following (i and ii):
        i. Patient has tried at least ONE standard immunomodulating or immunosuppressant agent; AND
        Note: Examples of standard immunomodulating or immunosuppressant agents include hydroxychloroquine, corticosteroids (e.g., prednisone, methylprednisolone), methotrexate, azathioprine, mycophenolate, and cyclophosphamide.
        ii. The medication is prescribed by or in consultation with a rheumatologist, nephrologist, or neurologist.
    B) Patient has Already Received a Course of a Rituximab Product for SLE. Approve for 1 month (adequate duration to receive one course) if 6 months or greater will elapse between treatment courses
    Note: There will be a minimum of 6 months separating the first dose of the previous rituximab course and the first dose of the requested course of rituximab.

16. **Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma.** Approve for 1 year if prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of rituximab intravenous products is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX A

[*] Not an all-inclusive list of indications (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; AS – Ankylosing spondylitis; CD – Crohn's disease; JIA – Juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; IV – Intravenous, PJIA – Polyarticular juvenile idiopathic arthritis; IL – Interleukin; SJIA – Systemic juvenile idiopathic arthritis; [^] Off-label use of Kineret in JIA supported in guidelines; ERA – Enthesitis-related arthritis; DMARD – Disease-modifying antirheumatic drug; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AD – Atopic dermatitis.

APPENDIX B

PRIOR AUTHORIZATION POLICY

POLICY: Scenesse Prior Authorization Policy
- Scenesse® (afamelanotide subcutaneous implant – Clinuvel)

REVIEW DATE: 01/11/2023

OVERVIEW

Scenesse, a melanocortin 1 receptor agonist, is indicated to increase pain-free light exposure in adults with a history of phototoxic reactions from **erythropoietic protoporphyria (EPP)**.[1] Scenesse is a controlled-release dosage form that is implanted subcutaneously (SC). Scenesse should be administered by a healthcare professional. A single implant which contains 16 mg of afamelanotide is inserted SC above the anterior supra-iliac crest once every 2 months.

Disease Overview

Porphyrias are disorders caused by enzyme defects in heme biosynthesis.[2] There are at least eight different types of porphyrias, which are classified as cutaneous or acute depending on the specific enzyme that is deficient. EPP is a cutaneous porphyria characterized by extreme photosensitivity. It is estimated to occur in 2 to 5 in 1,000,000 individuals.[3]

EPP occurs due to excessive accumulation of protoporphyrin, a heme precursor. Classic EPP is autosomal recessive and occurs due to a defect in the enzyme ferrochelatase, the final enzymatic step in heme biosynthesis.[4] An X-linked subtype of EPP, often referred as X-linked protoporphyria (XLP), accounts for 2% to 10% of all EPP cases. This type develops due to a gain-of-function mutation in an upstream enzyme in heme biosynthesis, leading to excess protoporphyrin production.[3,4] The two subtypes share the same biochemical and clinical features, although females with XLP may be less severely affected. Diagnosis is confirmed by one or both of the following: 1) biochemically via markedly elevated free erythrocyte protoporphyrin, and/or 2) molecular genetic testing.[2,3]

In both EPP subtypes, protoporphyrin accumulation in superficial skin vessels leads to phototoxicity upon light exposure, resulting in the hallmark symptoms of burning, tingling, and itching, which often occur without visible damage.[2-4] Phototoxic pain is not responsive to analgesics, including narcotics; management is focused on prevention of phototoxic episodes.[3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Scenesse. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Scenesse as well as the monitoring required for adverse events and long-term efficacy, approval requires Scenesse to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Scenesse is recommended in those who meet the following criteria:

FDA-Approved Indication

8. Erythropoietic Protoporphyria (Including X-Linked Protoporphyria). Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has a of at least one porphyric phototoxic reaction; AND
- **C)** The diagnosis is confirmed by at least one of the following (i or ii):
  - **i.** Free erythrocyte protoporphyrin level above the normal reference range for the reporting laboratory; OR
  - **ii.** Molecular genetic testing consistent with the diagnosis; AND
- **D)** The agent is prescribed by or in consultation with a dermatologist, gastroenterologist, hepatologist, or physician specializing in the treatment of cutaneous porphyrias.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Scenesse is not recommended in the following situations:

69. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

- Quviviq® (daridorexant tablets – Idorsia)
- Rozerem® (ramelteon tablets – Takeda, generic)
- Restoril® (temazepam capsules – Mallinckrodt, generic)
- Silenor® (doxepin tablets – Somaxon, generic)
- Sonata® (zaleplon capsules – Pfizer, generic)
- Zolpimist® (zolpidem oral spray –Aytu BioScience)

REVIEW DATE: 06/07/2023; selected revision 07/12/2023

OVERVIEW

All of the medications included in this policy are indicated for the **treatment of insomnia**.[1-12]

Zolpidem immediate-release (IR) and extended-release (ER), Edluar, Zolpimist, zaleplon, and the benzodiazepine sedative hypnotics are indicated for the short-term treatment of insomnia.[1-3,5,6,12] Eszopiclone, Silenor, and Rozerem are also indicated for the treatment of insomnia, but their product labeling does not specifically limit their use to short-term.[4,8,9] All of the agents in this category have been shown to decrease sleep latency. Zaleplon and Rozerem are specifically indicated for the treatment of insomnia characterized by difficulty with sleep onset.[3,8] Zolpidem IR, zolpidem ER, Silenor, and eszopiclone have also been shown to improve sleep maintenance or increase the duration of sleep.[1,2,4,9] Belsomra, Dayvigo, and Quviviq are indicated for the treatment of insomnia characterized by difficulties with sleep onset and/or sleep maintenance.[10-12] Zolpidem sublingual tablets are indicated for use as needed for the treatment of insomnia when a middle-of-the-night awakening is followed by difficulty returning to sleep.[7]

Eszopiclone, zaleplon, zolpidem IR, zolpidem ER, zolpidem sublingual tablets, Edluar, Zolpimist, and the benzodiazepine sedative hypnotics are all schedule IV controlled substances.[1-7,12] Belsomra, Dayvigo, and Quviviq are also schedule IV controlled substances.[10-12] Neither Rozerem nor Silenor are controlled substances.[8,9] Doxepin is also available generically as oral capsules (10 mg, 25 mg, 50 mg, 75 mg, 100 mg, and 150 mg) and oral solution (10 mg/mL).[13] These higher dose formulations are recommended for use in patients with depression and/or anxiety of varying etiologies.

Disease Overview

Insomnia is defined in the International Classification of Sleep Disorders, Third Edition, as a complaint of trouble initiating or maintaining sleep, resulting in daytime consequences (e.g., daytime fatigue, irritability, and decreased concentration) which is not attributable to environmental circumstances or inadequate opportunity for sleep.[14] Generally, transient insomnia lasts less than 1 week, short-term (acute) insomnia lasts up to 3 months, and chronic insomnia lasts more than 3 months at a frequency of at least three times per week.[14,15] Describing insomnia by timing (difficulty falling asleep [sleep onset insomnia], difficulty staying asleep or getting back to sleep after awakening [sleep maintenance insomnia], or disrupted or non-refreshing sleep and/or early morning awakening) can be useful in the diagnosis and help to distinguish among sleep disorders. Additionally, the pattern of sleep difficulty provides a basis to match a medication based on timing of onset and duration of effect.

Guidelines

The American Academy of Sleep Medicine (AASM) published a clinical guideline for the evaluation and management of chronic insomnia in adults (2008).[17] The primary treatment goals are to improve sleep quality and quantity and to improve insomnia-related daytime impairments. Initial approaches to treatment should include at least one behavioral intervention such as stimulus control therapy or relaxation therapy, or the combination of cognitive therapy, stimulus control therapy, sleep restriction therapy with or without relaxation therapy. Patients should be instructed to keep a regular schedule; have a healthy diet, regular daytime exercise, and a quiet sleep environment; and avoid napping, caffeine, other stimulants, nicotine, alcohol, excessive fluids, or stimulating activities before bedtime. Short-term hypnotic treatment should be supplemented with behavioral and cognitive therapies when possible. Chronic hypnotic medication may be indicated for long-term use in patients with severe or refractory insomnia or chronic comorbid illness. Whenever possible, patients should receive an adequate trial of cognitive behavioral treatment during long-term pharmacotherapy. Long-term prescribing should be accompanied by regular follow-up, ongoing assessment of effectiveness, monitoring for adverse events, and evaluation for new onset or exacerbation of existing comorbid disorders.

The AASM published an updated clinical practice guideline for the pharmacologic treatment of chronic insomnia in adults (2017).[14] The recommendations are intended as a guide for choosing a specific pharmacological agent (vs. no treatment) for treatment of chronic insomnia in adults, when such treatment is indicated. Each of the recommendations listed is weak, meaning it reflects a lower degree of certainty in the outcome and appropriateness of the patient care strategy for all patients but should not be construed as an indication of ineffectiveness. The guideline suggests that clinicians can use Belsomra as a treatment for sleep maintenance insomnia; eszopiclone can be used as a treatment for sleep onset and sleep maintenance insomnia; zaleplon can be used as a treatment for sleep onset insomnia; zolpidem can be used as a treatment for sleep onset and sleep maintenance insomnia; triazolam can be used as a treatment for sleep onset insomnia; temazepam can be used as a treatment for sleep onset and sleep maintenance insomnia; ramelteon can be used as a treatment for sleep onset insomnia; and Silenor can be used as a treatment for sleep maintenance insomnia. The guideline suggested that clinicians not use trazodone, tiagabine, diphenhydramine, melatonin, tryptophan, or valerian as a treatment for sleep onset or sleep maintenance insomnia. The authors note that cognitive behavioral therapy for insomnia (CBT-I) is a standard of care for this condition; however, the AASM guideline does not address the relative benefits of CBT-I vs. pharmacotherapy.

The American College of Physicians (ACP) developed a guideline on the management of chronic insomnia disorder in adults (2016).[18,19] The guideline is consistent with the AASM guidelines on chronic insomnia. Psychological therapy options include CBT-I and other interventions, such as stimulus control, relaxation strategies, and sleep restriction. ACP recommends that all adults receive CBT-I as the initial treatment for chronic insomnia disorder (strong recommendation, moderate-quality evidence). ACP recommends that

clinicians use a shared decision-making approach, including a discussion of the benefits, harms, and costs of short-term use of medications, to decide whether to prescribe a medication in adults with chronic insomnia disorder in whom CBT-I alone was unsuccessful (weak recommendation, low-quality evidence). A review of the evidence found that eszopiclone, zolpidem, Belsomra, and Silenor may improve short-term global and sleep outcomes for adults with insomnia disorder (low- to moderate-quality evidence), but the comparative effectiveness and long-term efficacy of pharmacotherapies for insomnia are unknown.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of sedative hypnotics. All approvals are provided for the duration noted below.

Automation: A patient who uses at least 180 days of any sedative/hypnotic medication in a 365-day time period will require Prior Authorization. If the patient has a prescription for a cancer medication (see Appendix A) within a 180-day period, the claim will adjudicate. If a patient has received at least 300 days of a sedative/hypnotic medication in a 545-day time period, the claim will adjudicate. When available, the ICD-10 codes for cancer will be used as part of automation to allow approval of the requested medication (see Appendix B).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of a sedative hypnotic is recommended in those who meet the following criteria:

FDA-Approved Indication

F) Chronic Insomnia. Approve for 1 year if the patient meets ONE of the following (A or B):

E) Patient has a cancer diagnosis; OR

F) Patient meets ALL of the following (i, ii, iii, and iv):

- **i)** Patient has tried at least one form of behavioral therapy for insomnia; AND
  Note: Examples of behavioral therapy for insomnia include relaxation training, stimulus control therapy, or sleep restriction therapy.
- **ii)** Patient is not currently taking prescription stimulants (e.g., methylphenidate, amphetamine products); AND
- **iii)** Underlying psychiatric and/or medical conditions that may cause or exacerbate insomnia have been evaluated and are currently being addressed, according to the prescriber; AND
- **iv)** Patient's sleep quality and quantity and/or insomnia-related daytime impairments continue to improve or remain stable while on a sedative hypnotic agent, according to the prescriber.
  Note: Prior Authorization is required after 6 months of use of any (or any combination of) sedative-hypnotic agent(s) [not necessarily 6 months of the drug being requested].

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of sedative hypnotics is not recommended in the following situations:

70. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Sickle Cell Disease – Adakveo Prior Authorization Policy
- Adakveo® (crizanlizumab-tmca intravenous infusion – Novartis)

REVIEW DATE: 12/07/2022

OVERVIEW

Adakveo, a monoclonal antibody, is indicated to **reduce the frequency of vasoocclusive crises** in patients 16 years and older with **sickle cell disease**.[1]

Guidelines

The American Society of Hematology guidelines for sickle cell disease: management of acute and chronic pain associated with sickle cell disease (2020) does not address the use of Adakveo.[2] The National Institutes of Health – National Heart, Lung, and Blood Institute issued the Evidence-Based Management of Sickle Cell Disease, Expert Panel Report in 2014.[3] These guidelines were published prior to the approval of Adakveo. Hydroxyurea has been shown to reduce the frequency of painful episodes, the incidence of acute coronary syndrome events, and the need for transfusions and hospitalizations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Adakveo. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Adakveo as well as the monitoring required for adverse events and long-term efficacy, approval requires Adakveo to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Adakveo is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Sickle Cell Disease.** Approve for 1 year if the patient meets ONE of the following criteria (A or B):
   - **A)** Initial Therapy. Approve if the patient meets ALL of the following criteria (i, ii, iii, and iv):
     - **i.** Patient is ≥ 16 years of age; AND
     - **ii.** Patient has had at least one sickle-cell related crisis in the previous 12-month period; AND
     - **iii.** Patient meets one of the following criteria (a, b, or c):
       - **a)** Patient is currently receiving a hydroxyurea product; OR
       - **b)** According to the prescriber, patient has tried a hydroxyurea product and has experienced inadequate efficacy or significant intolerance; OR
       - **c)** According to the prescriber, patient is not a candidate for hydroxyurea therapy; AND
         Note: Examples of patients who are not candidates for hydroxyurea therapy include patients who are pregnant or who are planning to become pregnant and patients with an immunosuppressive condition (such as cancer).

iv. The medication is prescribed by or in consultation with a physician who specializes in sickle cell disease (e.g., a hematologist).

B) Patient is Currently Receiving Adakveo. Approve if the patient meets ALL of the following criteria (i, ii, and iii):

15. Patient is ≥ 16 years of age; AND

16. According to the prescriber, patient is receiving clinical benefit from Adakveo therapy; AND
Note: Examples of clinical benefit include reduction in the number of vasoocclusive crises/sickle cell-related crises; delay in time to sickle cell-related crises; and reduction in the number of days in the hospital.

17. The medication is prescribed by or in consultation with a physician who specializes in sickle cell disease (e.g., a hematologist).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Adakveo is not recommended in the following situations:

71. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Sickle Cell Disease – Endari Prior Authorization Policy
- Endari™ (L-glutamine oral powder – Emmaus Medical)

REVIEW DATE: 12/07/2022

OVERVIEW

Endari is indicated to **reduce the acute complications of sickle cell disease** in patients ≥ 5 years of age.[1]

L-GLUTAMINE IS AN ESSENTIAL AMINO ACID AND SERVES AS A PRECURSOR OF NUCLEIC ACIDS AND NUCLEOTIDES INCLUDING THE PYRIDINE NUCLEOTIDES (NICOTINAMIDE ADENINE DINUCLEOTIDE AND REDUCED NICOTINAMIDE ADENINE DINUCLEOTIDE).[1,2] THESE PYRIDINE NUCLEOTIDES PLAY KEY ROLES IN THE REGULATION AND PREVENTION OF OXIDATIVE DAMAGE IN RED BLOOD CELLS AND STUDIES HAVE SHOWN THAT OXIDATIVE PHENOMENA MAY PLAY A SIGNIFICANT ROLE IN THE PATHOPHYSIOLOGY OF SICKLE CELL DISEASE.

Guidelines

The American Society of Hematology guidelines for sickle cell disease: management of acute and chronic pain associated with sickle cell disease (2020) does not mention the use of L-glutamine.[2] The National Institutes of Health – National Heart, Lung, and Blood Institute issued the Evidence-Based Management of Sickle Cell Disease, Expert Panel Report in 2014.[3] The use of L-glutamine products in sickle cell disease is not mentioned (guidelines were published before the approval of Endari). Hydroxyurea has been shown to reduce the frequency of painful episodes, the incidence of acute coronary syndrome events, and the need for transfusions and hospitalizations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Endari. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Endari as well as the monitoring required for adverse events and long-term efficacy, approval requires Endari to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for use of Endari as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts, and/or other information.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Endari is recommended in those who meet the following criteria:

FDA-Approved Indication

18. Sickle Cell Disease [documentation required]. Approve for 1 year if the patient meets the following criteria (A and B):

B) Patient is ≥ 5 years of age; AND

C) The medication is prescribed by or in consultation with a physician who specializes in sickle cell disease (e.g., a hematologist).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Endari is not recommended in the following situations:

103. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Sickle Cell Disease – Oxbryta Prior Authorization Policy
- Oxbryta® (voxelotor tablets, tablets for oral suspension – Global Blood Therapeutics)

REVIEW DATE: 12/07/2022

OVERVIEW

Oxbryta, a hemoglobin S (or sickle hemoglobin) polymerization inhibitor, is indicated for the treatment of **sickle cell disease** in patients ≥ 4 years of age.[1]

Guidelines

The American Society of Hematology guidelines for sickle cell disease: management of acute and chronic pain associated with sickle cell disease (2020) does not address the use of Oxbryta.[2] The National Institutes of Health – National Heart, Lung, and Blood Institute issued the Evidence-Based Management of Sickle Cell Disease, Expert Panel Report in 2014.[3] These guidelines were published prior to the approval of Oxbryta. Hydroxyurea has been shown to reduce the frequency of painful episodes, the incidence of acute coronary syndrome events, and the need for transfusions and hospitalizations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Oxbryta. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Oxbryta as well as the monitoring required for adverse events and long-term efficacy, approval requires Oxbryta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Oxbryta is recommended in those who meet the following criteria:

FDA-Approved Indication

19. Sickle Cell Disease. Approve for 1 year if the patient meets ONE of the following criteria (A or B):

D) Initial Therapy. Approve if the patient meets ALL of the following criteria (i, ii, iii, iv, and v):

- **i.** Patient is ≥ 4 years of age; AND
- **ii.** If the patient is ≥ 12 years of age, patient has had at least one sickle cell-related crisis in the previous 12-month period; AND
- **iii.** Patient's baseline hemoglobin level was ≤ 10.5 g/dL (before initiating Oxbryta therapy); AND
- **iv.** Patient meets one of the following criteria (a, b, or c):
  - **a)** Patient is currently receiving a hydroxyurea product; OR
  - **b)** According to the prescriber, patient has tried a hydroxyurea product and has experienced inadequate efficacy or significant intolerance; OR
  - **c)** According to the prescriber, patient is not a candidate for hydroxyurea therapy; AND

Note: Examples of patients who are not candidates for hydroxyurea therapy include patients who are pregnant or who are planning to become pregnant and patients with an immunosuppressive condition (such as cancer).

v. The medication is prescribed by or in consultation with a physician who specializes in sickle cell disease (e.g., a hematologist).

B) Patient is Currently Receiving Oxbryta. Approve for 1 year if the patient meets ALL of the following criteria (i, ii, and iii):

i. Patient is ≥ 4 years of age; AND

ii. According to the prescriber, patient is receiving clinical benefit from Oxbryta therapy; AND
Note: Examples of clinical benefit include reduction in the number of vaso-occlusive crises/sickle cell-related crises; delay in time to sickle cell-related crises; and reduction in the number of days in the hospital.

iii. The medication is prescribed by or in consultation with a physician who specializes in sickle cell disease (e.g., a hematologist).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Oxbryta is not recommended in the following situations:

72. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Sohonos Prior Authorization Policy
- Sohonos™ (palovarotene capsules – Ipsen)

REVIEW DATE: 09/13/2023

OVERVIEW

Sohonos, a retinoid, is indicated for the reduction in volume of new heterotopic ossification in females ≥ 8 years of age and males ≥ 10 years of age with **fibrodysplasia ossificans progressiva**.[1]

Disease Overview

Fibrodysplasia ossificans progressiva is an ultra-rare, autosomal dominant genetic disorder of connective tissue characterized by progressive heterotopic ossification resulting in disability, immobility, and reduced quality/length of life.[2] Patients experience episodes of painful inflammatory swelling in soft tissues (flare-ups), some of which will spontaneously resolve, but most will transform soft connective tissues into mature heterotopic bone. Eventually, plates, sheets, and ribbons of heterotopic bone permanently replace muscles and connective tissue, encasing the patient almost like an armor, resulting in progressive and permanent immobility. There are no formal diagnostic criteria for fibrodysplasia ossificans progressiva.[2,3] A clinical diagnosis can be made in patients with great toe malformations, tissue swelling, and heterotopic ossification, but genetic confirmation of an Activin A Type 1 Receptor (ACVR1) gene mutation is needed. All patients with fibrodysplasia ossificans progressiva have a mutation in ACVR1, a gene encoding a bone morphogenetic protein type I receptor.[2,4] Approximately 97% of these patients have the same, heterozygous, single-nucleotide change in the glycine-serine activation domain of the ACVR1 ($ACVR1^{R206H}$).

Clinical Efficacy

In the pivotal study of Sohonos, patients were required to have fibrodysplasia ossificans progressiva as confirmed by a pathogenic variant in $ACVR1^{R206H}$.[1,5]

Guidelines

Medical management guidelines from the International Clinical Council on Fibrodysplasia Ossificans Progressiva and Consultants (2022) recommend that each patient with the disease should have a primary provider who is able to consult with an FOP expert and help coordinate a local care team.[2] The diagnosis of fibrodysplasia ossificans progressiva is based on clinical findings, but requires genetic confirmation (i.e., ACVR1 gene mutation), which can be detected by DNA sequence analysis.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Sohonos. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: males are defined as individuals with the biological traits of a male, regardless of the individual's gender identity or gender expression; females are defined as individuals with the biological traits of a female, regardless of the individual's gender identity or gender expression. Because of the specialized skills required for evaluation and diagnosis of patients treated with Sohonos as well as the monitoring required for adverse events and long-term efficacy, approval requires Sohonos to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sohonos is recommended in those who meet the following criteria:

FDA-Approved Indications

9. Fibrodysplasia ossificans progressiva. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

A) Patient meets ONE of the following (i or ii):

i. Patient is female* and ≥ 8 years of age; OR

ii. Patient is male* and ≥ 10 years of age; AND

B) Patient has had a genetic test confirming a mutation in Activin A Type 1 Receptor (ACVR1)^{R206H} consistent with a diagnosis of fibrodysplasia ossificans progressiva; AND

C) Patient has heterotopic ossification as confirmed by radiologic testing; AND

HHH) Note: Examples of radiologic testing are x-ray, computed tomography (CT), magnetic resonance imaging (MRI), or positron emission tomography (PET) scan.

D) The medication is prescribed by or in consultation with an endocrinologist or physician who specializes in bone disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sohonos is not recommended in the following situations:

73. Chronic Obstructive Pulmonary Disease (COPD). Sohonos is not indicated for the management of COPD.[1] Palovarotene was previously studied for the treatment of COPD, but was found to be ineffective for this condition.[4]

III)

74. Osteochondroma(s). Sohonos is not indicated for the treatment and/or prevention of osteochondroma.[1] One Phase II study was initiated to evaluate Sohonos for the prevention of disease progression in pediatric patients with multiple osteochondromas.[6] However, this study was terminated early in order to analyze accumulated data and evaluate the future of Sohonos for this use. Results are not available. More data are needed.

75. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Mycapssa Prior Authorization Policy
- Mycapssa® (octreotide delayed-release capsules – Amryt)

REVIEW DATE: 10/11/2023

OVERVIEW
Mycapssa, a somatostatin analog, is indicated for long-term maintenance treatment in **acromegaly** patients who have responded to and tolerated treatment with octreotide or lanreotide.[1] Mycapssa maintained growth hormone and insulin-like growth factor 1 levels in patients with acromegaly.

GUIDELINES
The Endocrine Society Clinical Practice Guidelines for Acromegaly (2014) recommend medical therapy as adjuvant treatment after surgical intervention.[2] Mycapssa is not addressed in the guidelines. Primary medical therapy with somatostatin analogs (no preferred agent) can be recommended for some patients (e.g., surgery is not curative or patient is a poor surgical candidate). Updated recommendations to the 2014 guidelines on therapeutic outcomes for patients with acromegaly were created by the Acromegaly Consensus Group (2017).[3] The guidelines recommend Somatuline® Depot (lanreotide deep subcutaneous injection) and Sandostatin® LAR Depot (octreotide intramuscular injection) as first-line medical therapies in patients with persistent disease after surgery. Signifor® LAR (pasireotide intramuscular injection) is recommended as a second-line medical therapy due to its potential for hyperglycemic-associated adverse events. The Pituitary Society Acromegaly Management Guidelines (2020) recommend oral octreotide capsules as suitable for patients who have demonstrated complete or partial biochemical response to injectable octreotide or lanreotide.[4]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Mycapssa. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Mycapssa as well as the monitoring required for adverse events and long-term efficacy, approval requires Mycapssa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Mycapssa is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Acromegaly.** Approve for 1 year if the patient meets the following (A, B, and C):
   A) Patient has (or had) a pretreatment (baseline) insulin-like growth factor 1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND
   Note: Pretreatment (baseline) refers to the IGF-1 level prior to the initiation of a somatostatin analog (e.g., Mycapssa [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen, Sandostatin {generic}, Sandostatin LAR Depot], Signifor LAR

[pasireotide injection], Somatuline Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.

B) According to the prescriber, patient has responded to one octreotide acetate injection product or Somatuline Depot (lanreotide injection); AND

C) The medication is prescribed by or in consultation with an endocrinologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mycapssa is not recommended in the following situations:

76. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Lanreotide Products Prior Authorization Policy
- Lanreotide subcutaneous injection – Cipla
- Somatuline® Depot (lanreotide subcutaneous injection – Ipsen)

REVIEW DATE: 08/16/2023

OVERVIEW

The lanreotide products are somatostatin analogs indicated for the following uses:[1,2]

- **Acromegaly**, in patients who have had an inadequate response to surgery and/or radiotherapy, or for whom surgery and/or radiotherapy, is not an option. The goal of treatment in acromegaly is to reduce growth hormone and insulin-like growth factor-1 levels to normal.
- **Gastroenteropancreatic neuroendocrine tumors (GEP-NETs)**, in adult patients with unresectable, well or moderately differentiated, locally advanced or metastatic GEP-NETs to improve progression-free survival.

Additionally, Somatuline Depot is indicated for **carcinoid syndrome**, in adult patients.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for **neuroendocrine and adrenal tumors** (version 1.2023 – August 2, 2023) recommend Somatuline Depot for the management of carcinoid syndrome; tumors of the gastrointestinal tract, lung, thymus (carcinoid tumors), and pancreas (including glucagonomas, gastrinomas, VIPomas, insulinomas); pheochromocytomas; and paragangliomas.[3] Patients who have local unresectable disease and/or distant metastases and clinically significant tumor burden or progression should be started on therapy with a somatostatin analog to potentially control tumor growth.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of lanreotide products. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with lanreotide products as well as the monitoring required for adverse events and long-term efficacy, approval requires lanreotide products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of lanreotide products is recommended in those who meet one of the following criteria:

I. Coverage of Somatuline Depot is recommended in those who meet one of the following criteria:

FDA-Approved Indications

2. Acromegaly. Approve for 1 year if the patient meets the following (A, B, and C):
- **A)** Patient meets ONE of the following (i, ii, or iii):
  - **i.** Patient has had an inadequate response to surgery and/or radiotherapy; OR

ii. Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
iii. Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND

B) Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal (ULN) based on age and gender for the reporting laboratory; AND
Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen, Sandostatin {generics}, Sandostatin LAR Depot], Signifor LAR [pasireotide injection], Somatuline Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.

C) The medication is prescribed by or in consultation with an endocrinologist.

2. **Carcinoid Syndrome.** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, endocrinologist, or gastroenterologist.

3. **Neuroendocrine Tumor(s) [NETs] of the Gastrointestinal Tract, Lung, Thymus (Carcinoid Tumors), and Pancreas (including glucagonomas, gastrinomas, vasoactive intestinal peptides-secreting tumors [VIPomas], insulinomas).** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, endocrinologist, or gastroenterologist.

Other Uses with Supportive Evidence

4. **Pheochromocytoma and Paraganglioma.** Approve for 1 year if the medication is prescribed by or in consultation with an endocrinologist, oncologist, or neurologist.

II. Coverage of lanreotide subcutaneous injection is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Acromegaly.** Approve for 1 year if the patient meets the following (A, B, and C):

A) Patient meets ONE of the following (i, ii, or iii):
i. Patient has had an inadequate response to surgery and/or radiotherapy; OR
ii. Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
iii. Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND

B) Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal (ULN) based on age and gender for the reporting laboratory; AND
Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen, Sandostatin {generics}, Sandostatin LAR Depot], Signifor LAR [pasireotide injection], Somatuline Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.

C) The medication is prescribed by or in consultation with an endocrinologist.

2. **Neuroendocrine Tumor(s) [NETs] of the Gastrointestinal Tract, Lung, Thymus (Carcinoid Tumors), and Pancreas (including glucagonomas, gastrinomas, vasoactive intestinal peptides-secreting tumors [VIPomas], insulinomas).** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, endocrinologist, or gastroenterologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of lanreotide products is not recommended in the following situations:

77. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Octreotide Immediate-Release Products Prior Authorization Policy
- Bynfezia Pen™ (octreotide acetate immediate-release subcutaneous injection – Sun Pharmaceutical [discontinued])
- Sandostatin® (octreotide acetate immediate-release subcutaneous or intravenous injection – Novartis, generic)

REVIEW DATE: 07/26/2023

OVERVIEW

Octreotide acetate immediate-release injection products (Bynfezia Pen, Sandostatin [generic]), somatostatin analogs, are indicated for the following uses:[1-3]

- **Acromegaly**, to reduce blood levels of growth hormone and insulin-like growth factor-1 in adults with acromegaly who have had inadequate response to or cannot be treated with surgical resection, pituitary irradiation, and bromocriptine mesylate at maximally tolerated doses.
- **Carcinoid tumors**, in adults with severe diarrhea and flushing episodes associated with metastatic carcinoid tumors. Studies were not designed to show an effect on the size, rate of growth, or development of metastases.
- **Vasoactive intestinal peptide (VIP) tumors**, in adults with profuse watery diarrhea associated with VIP-secreting tumors. Studies were not designed to show an effect on the size, rate of growth, or development of metastases.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of octreotide in multiple conditions.

- **Central Nervous System Cancers:** Guidelines (version 1.2023 – March 24, 2023) note that an octreotide scan may be used to confirm magnetic resonance imaging findings. NCCN also notes that everolimus and octreotide may be useful for patients with recurrent meningiomas.[4]
- **Neuroendocrine and Adrenal Tumors:** Guidelines (version 2.2022 – December 21, 2022) recommend octreotide for the management of carcinoid syndrome, tumors of the gastrointestinal tract, lung, thymus (carcinoid tumors), and pancreas (including glucagonomas, gastrinomas, VIPomas, insulinomas), pheochromocytomas, and paragangliomas.[5] Patients who have local unresectable disease and/or distant metastases and clinically significant tumor burden or progression should be started on therapy with a somatostatin analog to potentially control tumor growth.
- **Thymomas and Thymic Carcinomas:** Guidelines (version 1.2023 – December 15, 2022) note that in patients with thymoma who have positive octreotide scan or symptoms of carcinoid syndrome, octreotide therapy may be useful.[6]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of octreotide immediate-release products. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with octreotide immediate-release products as well as the monitoring required for adverse events and long-term efficacy, approval requires octreotide

immediate-release products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of octreotide immediate-release products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

3. Acromegaly. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **D)** Patient meets ONE of the following (i, ii, or iii):
  - **i.** Patient has had an inadequate response to surgery and/or radiotherapy; OR
  - **ii.** Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
  - **iii.** Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND
- **E)** Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND
  Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen, Sandostatin {generic}, Sandostatin LAR Depot], Signifor LAR [pasireotide injection], Somatuline Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.
- **F)** The medication is prescribed by or in consultation with an endocrinologist.

2. Neuroendocrine Tumor(s) [NETs] of the Gastrointestinal Tract, Lung, Thymus (Carcinoid Tumors), and Pancreas (including glucagonomas, gastrinomas, vasoactive intestinal peptides-secreting tumors [VIPomas], insulinomas). Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, endocrinologist, or gastroenterologist.

Other Uses with Supportive Evidence

5. Meningioma. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, radiologist, or neurosurgeon.

6. Pheochromocytoma and Paraganglioma. Approve for 1 year if the medication is prescribed by or in consultation with an endocrinologist, oncologist, or neurologist.

7. Thymoma and Thymic Carcinoma. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of octreotide immediate-release products is not recommended in the following situations:

78. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Sandostatin LAR Depot Prior Authorization Policy
- Sandostatin® LAR Depot (octreotide acetate intramuscular injection – Novartis)

REVIEW DATE: 08/16/2023

OVERVIEW

Sandostatin LAR Depot, a somatostatin analog, is indicated for the following uses:[1]

- **Acromegaly**, in patients who have had an inadequate response to surgery and/or radiotherapy, or for whom surgery and/or radiotherapy, is not an option. The goal of treatment in acromegaly is to reduce growth hormone and insulin-like growth factor-1 levels to normal.
- **Carcinoid tumors**, in patients with severe diarrhea and flushing episodes associated with metastatic carcinoid tumors.
- **Vasoactive intestinal peptide tumors (VIPomas)**, in patients with profuse watery diarrhea associated with vasoactive intestinal peptide (VIP)-secreting tumors.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of Sandostatin LAR Depot in multiple conditions:

- **Central Nervous System Cancers:** Guidelines (version 1.2023 – March 24, 2023) recommend Sandostatin LAR Depot for the treatment of meningiomas that recur despite surgery and/or radiation therapy, or are not amenable to treatment with surgery or radiation therapy.[2]
- **Neuroendocrine and Adrenal Tumors:** Guidelines (version 1.2023 – August 2, 2023) recommend Sandostatin LAR Depot for the management of carcinoid syndrome; tumors of the gastrointestinal tract, lung, thymus (carcinoid tumors), and pancreas (including glucagonomas, gastrinomas, VIPomas, insulinomas); pheochromocytomas; and paragangliomas.[3] Patients who have local unresectable disease and/or distant metastases and clinically significant tumor burden or progression should be started on therapy with a somatostatin analog to potentially control tumor growth. The North American Neuroendocrine Tumor Society (NANETS) consensus guidelines for the surveillance and medical management of midgut NETs (2017) also recommend Sandostatin LAR Depot as a first-line initial therapy in most patients with metastatic midgut NETs for control of carcinoid syndrome and inhibition of tumor growth.[4]
- **Thymomas and Thymic Carcinomas:** Guidelines (version 1.2023 – December 15, 2022) recommend Sandostatin LAR Depot as a therapy option with or without concomitant prednisone therapy.[5] In patients with thymoma who have positive octreotide scan or symptoms of carcinoid syndrome, octreotide therapy may be useful.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Sandostatin LAR Depot. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Sandostatin LAR Depot as well as the monitoring required for adverse events and long-term efficacy, approval requires Sandostatin LAR Depot to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sandostatin LAR Depot is recommended in those who meet one of the following criteria:

FDA-Approved Indications

4. Acromegaly. Approve for 1 year if the patient meets the following (A, B, and C):
- **G)** Patient meets ONE of the following (i, ii, or iii):
  - **i.** Patient has had an inadequate response to surgery and/or radiotherapy; OR
  - **ii.** Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
  - **iii.** Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND
- **H)** Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND
  Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen, Sandostatin {generic}, Sandostatin LAR Depot], Signifor LAR [pasireotide injection], Somatuline Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.
- **I)** The medication is prescribed by or in consultation with an endocrinologist.

2. Neuroendocrine Tumor(s) [NETs] of the Gastrointestinal Tract, Lung, Thymus (Carcinoid Tumors), and Pancreas (including glucagonomas, gastrinomas, vasoactive intestinal peptides-secreting tumors [VIPomas], insulinomas). Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, endocrinologist, or gastroenterologist.

Other Uses with Supportive Evidence

8. Meningioma. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, radiologist, or neurosurgeon.

9. Pheochromocytoma and Paraganglioma. Approve for 1 year if the medication is prescribed by or in consultation with an endocrinologist, oncologist, or neurologist.

10. Thymoma and Thymic Carcinoma. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sandostatin LAR Depot is not recommended in the following situations:

79. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Signifor LAR Prior Authorization Policy
- Signifor® LAR (pasireotide intramuscular injection – Recordati Rare Diseases)

REVIEW DATE: 08/16/2023

OVERVIEW

Signifor LAR, a somatostatin analog, is indicated for the following uses:[1]

- **Acromegaly**, in patients who have had an inadequate response to surgery and/or for whom surgery is not an option. *In vivo* studies show that Signifor LAR lowers growth hormone and insulin-like growth factor-1 levels in patients with acromegaly.
- **Cushing's disease**, in patients for whom pituitary surgery is not an option or has not been curative.

Disease Overview

Cushing's syndrome refers to the general state of excessive levels of cortisol (hypercortisolism) in the blood.[2,3] Hypercortisolism can occur for reasons that are either endogenous or exogenous in nature (e.g., Cushing's disease, cortisol-containing medications, adrenal gland tumor, certain cancers). Cushing's disease (hypercortisolism caused by pituitary adenomas) is the most common type of adrenocorticotropic hormone (ACTH)-dependent Cushing's syndrome. Treatment for Cushing's syndrome requires a multi-modal approach. The goals of treatment are normalization of cortisol excess, long-term disease control, avoidance of recurrence, and reversal of clinical features.[4]

Guidelines

The Endocrine Society published clinical practice guidelines for the treatment of Cushing's syndrome in (2015) and Cushing's disease (2021).[5,6] Recorlev is recognized in the 2021 guidelines for Cushing's disease as investigational; further details regarding this therapy are not discussed. Treatment goals for Cushing's syndrome are to normalize cortisol levels or its action at the receptors to eliminate signs and symptoms of Cushing's syndrome. Best practice adjunctive management include treating co-morbidities associated with hypercortisolism (psychiatric disorders, diabetes, hypertension, hypokalemia, infections, dyslipidemia, osteoporosis, and poor physical fitness). First-line treatment involves resection of the tumor, unless surgery is not possible or is unlikely to meaningfully reduce excess glucocorticoid. Specifically for Cushing's disease, transsphenoidal selective adenomectomy by a surgeon with extensive experience in pituitary surgery is recommended. In patients with ACTH-dependent Cushing's syndrome who underwent noncurative surgery or for whom surgery was not possible, the guidelines advocate several second-line therapies (e.g., repeat transsphenoidal surgery, radiotherapy, medical therapy, and bilateral adrenalectomy). For Cushing's disease, the guidelines recommend all medical therapies as second-line options after transsphenoidal surgery. These involve steroidogenesis inhibitors (ketoconazole, Metopirone® [metyrapone capsules], Lysodren® [mitotane tablets], etomidate) in patients either with or without radiotherapy/radiosurgery; pituitary-directed medical treatments (cabergoline, Signifor® [pasireotide subcutaneous injection]) in patients who are not surgical candidates or who have persistent disease; and Korlym® (mifepristone tablets) in patients with diabetes or glucose intolerance who are not surgical candidates or who have persistent disease after transsphenoidal surgery.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Signifor LAR. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Signifor LAR as well as the monitoring required for adverse events and long-term efficacy, approval requires Signifor LAR to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Signifor LAR is recommended in those who meet one of the following criteria:

FDA-Approved Indications

5. Acromegaly. Approve for 1 year if the patient meets the following (A, B, and C):
- **J)** Patient meets ONE of the following (i, ii, or iii):
  - **i.** Patient has had an inadequate response to surgery and/or radiotherapy; OR
  - **ii.** Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
  - **iii.** Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND
- **K)** Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND
  Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen, Sandostatin {generic}, Sandostatin LAR Depot], Signifor LAR [pasireotide injection], Somatuline Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.
- **L)** The medication is prescribed by or in consultation with an endocrinologist.

2. Cushing's Disease. Approve for the duration noted if the patient meets the following (A or B):
- **A)** Initial Therapy. Approve for 4 months of initial therapy if the patient meets the following (i and ii):
  - **i.** According to the prescriber, patient is not a candidate for surgery, or surgery has not been curative; AND
    Note: For patients with Cushing's disease/syndrome awaiting surgery, see *Other Uses with Supportive Evidence.*
  - **ii.** Signifor LAR is prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of Cushing's disease.
- **B)** Patient is Currently Receiving Signifor LAR/Signifor. Approve for 1 year of continuation therapy if the patient has responded to Signifor/Signifor LAR, as determined by the prescriber.
  Note: An example of patient response is decrease in the mean urinary free cortisol level.

Other Uses with Supportive Evidence

3. Endogenous Cushing's Syndrome – Patient Awaiting Surgery. Approve for 4 months if Signifor LAR is prescribed by or in consultation with an endocrinologist or a physician who specialized in the treatment of Cushing's syndrome.

4. **Endogenous Cushing's Syndrome – Patient Awaiting Therapeutic Response After Radiotherapy.** Approve for 4 months if Signifor LAR is prescribed by or in consultation with an endocrinologist or a physician who specialized in the treatment of Cushing's syndrome.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Signifor LAR is not recommended in the following situations:

80. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Somavert Prior Authorization Policy
- Somavert® (pegvisomant subcutaneous injection – Pfizer)

REVIEW DATE: 08/23/2023

OVERVIEW

Somavert, a growth hormone receptor antagonist, is indicated for the treatment of **acromegaly** in patients who have had inadequate response to surgery and/or radiation therapy and/or other medical therapies, or for whom these therapies are not appropriate.[1] The goal of treatment is to normalize serum insulin-like growth factor-1 levels.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Somavert. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Somavert as well as the monitoring required for adverse events and long-term efficacy, approval requires Somavert to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Somavert is recommended in those who meet the following criteria:

FDA-Approved Indication

6. Acromegaly. Approve for 1 year if the patient meets the following (A, B, and C):

M) Patient meets ONE of the following (i, ii, or iii):
- **i.** Patient has had an inadequate response to surgery and/or radiotherapy; OR
- **ii.** Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
- **iii.** Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND

N) Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND
Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen, Sandostatin {generics}, Sandostatin LAR Depot], Signifor LAR [pasireotide intramuscular injection], Somatuline Depot [lanreotide subcutaneous injection]), dopamine agonist (e.g., cabergoline, bromocriptine), or Somavert.

O) The medication is prescribed by or in consultation with an endocrinologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Somavert is not recommended in the following situations:

81. Treatment of Excess Growth Hormone Associated with McCune-Albright Syndrome. Five patients with growth hormone excess due to McCune-Albright Syndrome were treated with 20 mg of Somavert daily for 12 weeks in a randomized, double-blind, placebo-controlled trial at the National Institutes of Health.[2] Somavert reduced IGF-1 and IGF binding protein-3 in these patients but had no effect on fibrous dysplasia.

82. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Spinal Muscular Atrophy – Evrysdi Prior Authorization Policy
- Evrysdi® (risdiplam oral solution – Genentech/Roche)

REVIEW DATE: 11/01/2023

OVERVIEW
Evrysdi, a survival motor neuron (SMN)2 splicing modifier, is indicated for the **treatment of spinal muscular atrophy** in pediatric patients and adults.[1] The recommended dosing is as follows:
- 0.15 mg/kg once daily (QD) for patients < 2 months of age.
- 0.2 mg/kg QD for patients 2 months to < 2 years of age.
- 0.25 mg/kg QD for patients ≥ 2 years of age and < 20 kg.
- 5 mg QD for patients ≥ 2 years of age and ≥ 20 kg.

Disease Overview
Spinal muscular atrophy is a genetic, autosomal recessive muscular disorder caused by deletion or loss of function mutation in the SMN1 gene.[2-5] The reduced level of SMN protein causes degeneration of lower motor neurons.[5] The phenotypic expression of the disease is impacted by the SMN2 gene copy number. Data have shown that patients with a higher number of SMN2 copies generally have a more mild phenotypic disease expression. Gene deletion testing for spinal muscular atrophy can be performed at many diagnostic laboratories. Table 1 describes the disease types. Of note, various motor ability assessments are used in clinical practice to characterize functional impairment in spinal muscular atrophy. Different functional motor scales are utilized to evaluate patients.[6] When motor neuron function is lost, it cannot be regained, which greatly impacts patients who have experienced progression (e.g., patients with complete paralysis of limbs or permanent ventilator dependence).[1-6]

Table 1. Types of Spinal Muscular Atrophy.[2-5]
SMA – Spinal muscular atrophy; SMN2 – Survival motor neuron 2.

In addition to Evrysdi, other therapies are available. **Spinraza®** (nusinersen intrathecal injection), a SMN2-directed antisense oligonucleotide, is indicated for the treatment of spinal muscular atrophy in pediatric patients and adults.[7] Although studies and experience continue, the primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular atrophy primarily in children. Data are also available with Spinraza in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy. There are some data with Spinraza in adults as well.

Zolgensma® (onasemnogene abeparvovec-xioi intravenous infusion), an adeno-associated virus vector-based gene therapy, is indicated for the treatment of pediatric patients < 2 years of age with spinal muscular atrophy with bi-allelic mutations in the SMN1 gene.[7] The agent works by providing a copy of the gene encoding the SMN protein, which increases its production. Zolgensma is administered as a single-dose intravenous infusion over 60 minutes. Pivotal studies mainly involved infants with two or three SMN2 gene copies with primarily Type 1 or Type 2 disease.

Clinical Efficacy
The efficacy of Evrysdi for the treatment of patients with infantile-onset (Type 1), later-onset (Type 2 and 3), and pre-symptomatic spinal muscular atrophy was evaluated in three clinical studies.[1,9-11] **FIREFISH** involved patients with Type 1 spinal muscular atrophy who had symptom onset between 28 days and 3

months of age.[1] Genetic confirmation of homozygous deletion or compound heterozygosity predictive of loss of function of the SMN1 gene was required for trial entry. Patients had two SMN2 gene copies. Many patients gained improvements in the ability to sit for at least 5 seconds independently, and there was an increase in the percentages of patients who were alive without permanent ventilation. **SUNFISH** evaluated Evrysdi in patients with later-onset (Type 2 or Type 3) spinal muscular atrophy. Most patients (90%) had three SMN2 gene copies; 8% and 2% of patients had four and two SMN2 gene copies, respectively. In Part 2 of the study, benefits of Evrysdi vs. placebo were noted at Month 12 in motor function as well as in upper limb motor performance. **RAINBOWFISH** investigated Evrysdi in infants up to 6 weeks of age (at the first dose) who had been genetically diagnosed with spinal muscular atrophy but did not have symptoms. In total, seven patients have received Evrysdi for at least 12 months. Four patients had two SMN2 copies, two patients had three SMN2 gene copies, and one patient had four or more SMN2 copies. The median age at first dose among the seven patients was 35 days. The six patients with two or three SMN2 gene copies achieved various motor milestones at Month 12, including the ability to sit. Of note, in general, the onset of effect with Evrysdi was observed after approximately 4 months of therapy. Evrysdi has not been evaluated in patients with fewer than two or more than four SMN2 gene copies.[1,9-11]

Guidelines

Evrysdi is not addressed in guidelines. According to a treatment algorithm from the Spinal Muscular Atrophy Newborn Screening Multidisciplinary Working Group (2018), immediate treatment is recommended in patients with two or three SMN2 gene copies.[12] In 2020, the Working Group updated recommendations that infants diagnosed with spinal muscular atrophy via newborn screening with four SMN2 gene copies should receive immediate treatment.[13] Patients with five (or more) SMN2 gene copies should be observed and screened for symptoms.

Safety

Based on animal data, Evrysdi may cause fetal harm if given to a pregnant woman.[1] Pregnancy testing is recommended for females of reproductive potential prior to initiating Evrysdi. Advise females of reproductive potential to use effective contraception during treatment with Evrysdi and for at least 1 month after the last dose.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Evrysdi. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Evrysdi as well as the monitoring required for adverse events and long-term efficacy, approval requires Evrysdi to be prescribed by a physician who has consulted with or who specializes in the condition. For certain criteria, verification is required as noted by **[verification in claims history required]**. In the criteria for Evrysdi, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: females are defined as individuals with the biological traits of a woman, regardless of the individual's gender identity or gender expression. All reviews will be forwarded to the Medical Director for evaluation.

Automation: None.

Documentation: Documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, laboratory tests, claims records, and/or other information. In subsequent coverage reviews for a patient who has previously met the documentation requirements and related criteria in the *Spinal Muscular Atrophy – Evrysdi Prior Authorization Policy* through the Coverage Review Department, and who is requesting reauthorization, the criteria utilized do

NOT require resubmission of documentation for reauthorization, except for the criterion requiring documentation of response or benefit to Evrysdi therapy.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Evrysdi is recommended in those who meet the following criteria:

FDA-Approved Indication

10. Spinal Muscular Atrophy – Treatment. Approve if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets all of the following criteria (i, ii, iii, iv, v, vi, vii, and viii):

i. Baseline motor ability assessment that suggests spinal muscular atrophy (based on age, motor ability, and development) has been performed from one of the following exams (a, b, c, d, e, f, or g) **[documentation required]**:

a) Bayley Scales of Infant and Toddler Development; OR

b) Children's Hospital of Philadelphia Infant Test of Neuromuscular Disorders (CHOP-INTEND); OR

c) Hammersmith Functional Motor Scale Expanded (HFMSE); OR

d) Hammersmith Infant Neurological Exam Part 2 (HINE-2); OR

e) Motor Function Measure-32 Items (MFM-32); OR

f) Revised Upper Limb Module (RULM) test; OR

g) World Health Organization motor milestone scale; AND

ii. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic pathogenic variants in the survival motor neuron 1 (SMN1) gene **[documentation required]**; AND

JJJ) Note: Pathogenic variants may include homozygous deletion, compound heterozygous mutation, or a variety of other rare mutations.

iii. Patient meets one of the following criteria (a or b):

a) Patient has two or three survival motor neuron 2 (SMN2) gene copies **[documentation required]**; OR

b) Patient meets both of the following ([1] and [2]):

(1) Patient has four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND

(2) Patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND

iv. For a patient currently receiving or who has received prior treatment with Spinraza (nusinersen intrathecal injection), the prescribing physician confirms that further therapy with Spinraza will be discontinued; AND

v. Patient has not received Zolgensma (onasemnogene abeparvovec-xioi intravenous infusion) in the past **[verification in claims history required]**; AND

KKK) Note: Verify through claims history that the patient has NOT previously received Zolgensma. If no claim for Zolgensma is present, the prescribing physician confirms that the patient has not previously received Zolgensma.

vi. According to the prescribing physician, a female* patient of reproductive potential must meet both the following criteria (a and b):

a) Patient is not currently pregnant; AND

b) Effective contraception will be utilized during treatment and for 1 month after the last Evrysdi dose; AND

vii. Dosing of Evrysdi meets ONE of the following criteria based on the current (within the past 1 month) kg weight of the patient (a, b, c, or d):
- **a)** 0.15 mg/kg once daily if the patient is < 2 months of age; OR
- **b)** 0.2 mg/kg once daily if the patient is 2 months to < 2 years of age; OR
- **c)** 0.25 mg/kg once daily if the patient is ≥ 2 years of age and weighs < 20 kg; OR
- **d)** 5 mg once daily if the patient is ≥ 2 years of age and weighs ≥ 20 kg; AND

viii. The medication is prescribed by a physician who has consulted with a specialist or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; OR

B) Patient Currently Receiving Evrysdi. Approve for 4 months if the patient meets all of the following criteria (i, ii, iii, iv, v, vi, vii, and viii):

i. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic pathogenic variants in the survival motor neuron 1 (SMN1) gene **[documentation required]**; AND

LLL) Note: Pathogenic variants may include homozygous deletion, compound heterozygous mutation, or a variety of other rare mutations.

ii. Patient meets one of the following criteria (a or b):
- **a)** Patient has two or three survival motor neuron 2 (SMN2) gene copies **[documentation required]**; OR
- **b)** Patient meets both of the following criteria [(1) and (2)]:
  - **(1)** Patient has four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND
  - **(2)** Patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND

iii. For a patient currently receiving or who has received prior treatment with Spinraza (nusinersen intrathecal injection), the prescribing physician confirms that further therapy with Spinraza will be discontinued; AND

iv. Patient has not received Zolgensma (onasemnogene abeparvovec-xioi intravenous infusion) in the past **[verification in claims history required]**; AND

MMM) Note: Verify through claims that the patient has NOT previously received Zolgensma. If no claim for Zolgensma is present, the prescribing physician confirms that the patient has not previously received Zolgensma.

v. According to the prescribing physician, a female* patient of reproductive potential must meet both the following criteria (a and b):
- **a)** Patient is not currently pregnant; AND
- **b)** Effective contraception will be utilized during treatment and for 1 month after the last Evrysdi dose; AND

vi. Dosing of Evrysdi meets ONE of the following criteria based on the current (within the past 1 month) kg weight of the patient (a, b, c, or d):
- **a)** 0.15 mg/kg once daily if the patient is < 2 months of age; OR
- **b)** 0.2 mg/kg once daily if the patient is 2 months to < 2 years of age; OR
- **c)** 0.25 mg/kg once daily if the patient is ≥ 2 years of age and weighs < 20 kg; OR
- **d)** 5 mg once daily if the patient is ≥ 2 years of age and weighs ≥ 20 kg; AND

vii. The medication is prescribed by a physician who has consulted with a specialist or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; AND

viii. Patient must meet one of the following criteria (a or b):
- **a)** Patient must have had a positive clinical response (for example, improvement or stabilization) from pretreatment baseline status (i.e., within the past 4 months) with Evrysdi in one of the following exams [(1), (2), (3), (4), (5), (6), or (7)] **[documentation required]**:

(1) Bayley Scales of Infant and Toddler Development; OR
(2) Children's Hospital of Philadelphia Infant Test of Neuromuscular Disorders (CHOP-INTEND); OR
(3) Hammersmith Functional Motor Scale Expanded (HFMSE); OR
(4) Hammersmith Infant Neurological Exam Part 2 (HINE-2); OR
(5) Motor Function Measure-32 Items (MFM-32); OR
(6) Revised Upper Limb Module (RULM) test; OR
(7) World Health Organization motor milestone scale; OR

b) According to the prescribing physician, the patient has responded to Evrysdi and continues to benefit from ongoing Evrysdi therapy by the most recent (i.e., within the past 4 months) physician monitoring/assessment tools **[documentation required]**.

NNN) Note: Examples include pulmonary function tests showing improvement, bulbar function test results suggesting benefits, reduced need for respiratory support, decrease in the frequency of respiratory infections or complications, and/or prevention of permanent assisted ventilation.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Evrysdi is not recommended in the following situations:

83. Patient has Complete Paralysis of All Limbs. Data are needed to determine if this patient population with advanced spinal muscular atrophy would derive benefits from Evrysdi.
OOO)

84. Patient has Permanent Ventilator Dependence. Data are needed to determine if this patient population with advanced spinal muscular atrophy would derive benefits from Evrysdi.
PPP)

85. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Spinal Muscular Atrophy – Gene Therapy – Zolgensma Prior Authorization Policy
- Zolgensma® (onasemnogene abeparvovec-xioi intravenous infusion – Novartis)

REVIEW DATE: 11/01/2023

OVERVIEW

Zolgensma, an adeno-associated virus vector-based gene therapy, is indicated for the treatment of pediatric patients less than 2 years of age with spinal muscular atrophy with bi-allelic mutations in the survival motor neuron 1 (SMN1) gene.[1]

Limitations of use are that the safety and effectiveness of repeat administration of Zolgensma have not been evaluated.[1] The use of Zolgensma in patients with advanced spinal muscular atrophy (e.g., complete paralysis of limbs, permanent ventilator dependence) has not been assessed. Use of Zolgensma in premature neonates before reaching full-term gestational age is not recommended because concomitant treatment with corticosteroids may adversely affect neurological development. Zolgensma therapy should be delayed until full-term gestational age is achieved. The definition of full-term pregnancy commences at 39 weeks and 0 days gestation.[2]

Disease Overview

Spinal muscular atrophy is a genetic, autosomal recessive muscular disorder caused by deletion or loss of function mutation in the SMN1 gene.[3-6] The reduced levels of survival motor neuron (SMN) protein causes degeneration of lower motor neurons.[6] Although the condition is a multisystem disorder, it is clinically characterized by progressive muscle weakness and atrophy. Patients have difficulties with ambulation, head control, feeding, and respiration. Cognitive development is not impacted. In the US, spinal muscular atrophy affects approximately one in 11,000 infants and has an average carrier frequency of one in 54 individuals; as many as 10,000 to 20,000 children and adults in the US may be impacted.[6] Although the condition can be present in individuals of any age, it is more frequently diagnosed in infants and children, as it is more severe in this population.[3-6] The phenotypic expression of the disease is impacted by the presence of the survival motor neuron 2 (SMN2) gene copy number. SMN1 is responsible for producing most of the effective SMN protein, although some SMN protein can be made by the SMN2 gene. Therefore, patients with a deletion of the SMN1 gene may have the potential for making some SMN protein through the SMN2 gene copy, although in most cases the resulting protein made by this gene is truncated and is not as effective or functional. Data have shown that patients with a higher number of SMN2 gene copies generally have a more mild phenotypic disease expression. Gene deletion testing for spinal muscular atrophy can be performed at many diagnostic laboratories. Table 1 describes disease types. A different manner of categorization classifies the three most common types as follows: Type 1 patients are "non-sitters", Type 2 patients are "sitters", and Type 3 patients are "walkers".[4,6]

Table 1. Types of Spinal Muscular Atrophy.[3-6]

Table 1 (continued). Types of Spinal Muscular Atrophy.[3-6]
SMA – Spinal muscular atrophy; SMN2 – Survival motor neuron 2.

Besides Zolgensma, other therapies are available. **Spinraza®** (nusinersen intrathecal injection), a SMN2-directed antisense oligonucleotide, is indicated for the treatment of spinal muscular atrophy in pediatric and adult patients.[7] Spinraza is given by intrathecal injection. Although studies and experience continue, the primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular

atrophy primarily in children. Data are also available with Spinraza in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy. There is an accumulation of data with Spinraza in adults as well.

Evrysdi® (risdiplam oral solution), a SMN2 splicing modifier, is indicated for the treatment of spinal muscular atrophy in pediatric and adult patients.[8] The primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular atrophy primarily in children and adults up to 25 years of age. Trials are ongoing in older adults, as well as in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy.

Clinical Efficacy

The efficacy of Zolgensma was evaluated in patients less than 2 years of age with spinal muscular atrophy who had bi-allelic mutations in the SMN1 gene.[1,9-14] One trial was an open-label, single-arm study which is ongoing (STR1VE [n = 21])[11] and the other was an open-label, single-arm, ascending-dose clinical trial (START [n = 15] {12 patients received a therapeutic dose}).[1,9,10] Symptoms onset occurred before patients were 6 months of age. All patients had genetically confirmed bi-allelic SMN1 gene deletions and two SMN2 gene copies. In both trials, Zolgensma was given as a single-dose intravenous infusion. Efficacy was assessed on parameters such as survival and achievement of developmental motor milestones (e.g., sitting without support). The definition of survival was the time from birth to either death or permanent ventilation. Other efficacy parameters were evaluated (e.g., assessment of Children's Hospital of Philadelphia Infant Test of Neuromuscular Disorders [CHOP-INTEND] scores, evaluation of ventilator use). The ongoing clinical trial involved 21 patients with infantile-onset spinal muscular atrophy. The mean CHOP-INTEND score was 31.0 (range, 18 to 47). The mean patient age at the time of treatment was 3.9 months (range 0.5 to 5.9 months). As of the March 2019 cutoff date, 19 patients were alive without permanent ventilation. Compared with natural history data, Zolgensma is effective as more patients attained the ability to sit without support.[1] The completed clinical trial involved 15 patients with infantile-onset spinal muscular atrophy.[1,9] Three patients were in a low-dose cohort and 12 patients were in a high-dose cohort.[1] At the time of treatment, the mean age of patients in the low-dose cohort was 6.3 months (range 5.9 to 7.2 months) and 3.4 months (range 0.9 to 7.9 months) in the high-dose group. The dose in the low-dose cohort was approximately one-third of the dosage received by patients in the high-dose cohort. At 24 months following Zolgensma infusion, one patient in the low-dose cohort met the endpoint of permanent ventilation; all 12 patients in the high-dose cohort were alive without permanent ventilation. In the high-dose cohort, 9 of 12 patients (75%) were able to stand and walk without assistance.[1,9] At longer-term follow-up from the START trial, all 10 patients followed in the high-dose group were alive without permanent ventilation at the dataset on June 11, 2020. In STR1VE, at the March 2019 data cutoff, 19 patients were alive without permanent ventilation.[1] Up until November 2019, data revealed that 13 of 22 patients achieved the coprimary endpoint of functional independent sitting for 30 seconds or longer at the 18 months of age study visit.[11] Other data are also available.[12-15]

Guidelines

The Spinal Muscular Atrophy Newborn Screening Multidisciplinary Working Group is comprised of clinicians and geneticists with expertise in spinal muscular atrophy who developed a treatment algorithm in 2018 for infants who have positive results from a newborn screening test for spinal muscular atrophy.[16] Spinal muscular atrophy Types 1 and 2 comprise a large majority of cases and account for many patients who screen positively for spinal muscular atrophy with three or fewer SMN2 gene copies. Immediate treatment is recommended in patients with two or three SMN2 gene copies. Treatment recommendations for patients who screen positive for spinal muscular atrophy and have only one SMN2 gene copy are more complicated. It is likely that patients with only one SMN2 gene copy will likely be symptomatic at birth and the physician should determine if treatment is warranted.[16] In 2020, the Working Group updated recommendations that infants diagnosed with spinal muscular atrophy via newborn screening with four

SMN2 gene copies should receive immediate treatment.[17] Also, patients with five (or more) SMN2 gene copies should be observed and screened for symptoms.

Dosing

The recommended dose of Zolgensma is 1.1×10^{14} vector genomes (vg) per kg of body weight.[1] Administer Zolgensma as an intravenous infusion over 60 minutes. Starting 1 day prior to Zolgensma infusion, give systemic corticosteroids equivalent to oral prednisolone 1 mg/kg of body weight for a total of 30 days. Examine liver function after this juncture and follow recommended guidelines.

Safety

Zolgensma has a Boxed Warning regarding acute serious liver injury and acute liver failure.[1] Elevated aminotransferases can occur with Zolgensma. Patients with preexisting liver impairment may be at higher risk. Prior to infusion, evaluate liver function in all patients by clinical examination and laboratory testing. One day before Zolgensma infusion, commence administration of systemic corticosteroids equivalent to oral prednisolone at 1 mg/kg of body weight per day for a total of 30 days. Prior to administration of Zolgensma, evaluate creatinine and complete blood counts. Perform baseline anti-AAV9 antibody testing prior to Zolgensma infusion. Patients in the Zolgensma trials were required to have baseline anti-AAV9 antibody titers of $\leq$ 1:50.

POLICY STATEMENT

Prior Authorization is recommended for benefit coverage of Zolgensma. Approval is recommended for those who meet the Criteria for the listed indication. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zolgensma as well as the specialized training required for administration of Zolgensma, approval requires Zolgensma to be prescribed by a physician who has consulted with or who specializes in the condition. All approvals are provided for one dose per lifetime. The approval duration is 1 month to allow for an adequate timeframe to prepare and administer one dose of therapy. For certain criteria, verification is required as noted by **[verification in claims history required]**. All reviews (approvals and denials) will be forwarded to the Medical Director for evaluation.

Some clients have elected Embarc Benefit Protection. For these clients, the Medical Director will coordinate with eviCore to ensure the Embarc Benefit Protection portion of the review has been completed. If the Embarc Benefit Protection portion of the review has not been completed, the Medical Director will route to Embarc@eviCore.com prior to completing the review.

Documentation: Documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to chart notes, laboratory tests, claims records, and/or other information.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zolgensma is recommended in those who meet the following criteria:

FDA-Approved Indication

D) Spinal Muscular Atrophy – Treatment. Approve for a one-time per lifetime dose if the patient meets the following (A, B, C, D, E, F, G, H, I, J, K, L, M, and N):

- **i.** Patient is less than 2 years of age; AND

ii. If the patient is a premature neonate, full-term gestational age of 39 weeks and 0 days has been met; AND

Note: Full-term gestational age can be defined as the postmenstrual age (gestational age plus chronological age) being equal to ≥ 39 weeks and 0 days.

iii. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic pathogenic variants in the survival motor neuron 1 (SMN1) gene **[documentation required]**; AND

Note: Pathogenic variants may include homozygous deletion, compound heterozygous mutation, or a variety of other rare mutations.

iv. Patient meets one of the following (i or ii):

a) Patient has three or fewer survival motor neuron 2 (SMN2) gene copies **[documentation required]**; OR

b) Patient meets both of the following (a and b):

i. Patient has four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND

ii. The number of survival motor neuron 2 (SMN2) gene copies has been determined by a quantitative assay capable of distinguishing between four SMN2 gene copies and five or greater SMN2 gene copies; AND

v. According to the prescribing physician, patient has started or will receive systemic corticosteroids equivalent to oral prednisolone at a dose of 1 mg/kg per day commencing 1 day prior to Zolgensma infusion for a total of 30 days; AND

vi. Baseline anti-AAV9 antibody titers are ≤ 1:50 **[documentation required]**; AND

vii. Patient has undergone a liver function assessment within the last 30 days and meets all of the following (i, ii, iii, and iv):

a) Alanine aminotransferase levels are ≤ 2 times the upper limit of normal **[documentation required]**; AND

b) Aspartate aminotransferase levels are ≤ 2 times the upper limit of normal **[documentation required]**; AND

c) Total bilirubin levels are ≤ 2 times the upper limit of normal **[documentation required]**; AND

Note: Patient with elevated bilirubin levels due to neonatal jaundice are acceptable.

d) Prothrombin time results are ≤ 2 times the upper limit of normal **[documentation required]**; AND

viii. Patient has undergone a renal function assessment within the last 30 days and has a creatinine level < 1.0 mg/dL **[documentation required]**; AND

ix. A complete blood count has been obtained within the last 30 days and the patient meets both of the following (i and ii):

a) White blood cell count is ≤ 20,000 cells per mm^3 **[documentation required]**; AND

b) Hemoglobin levels are between 8 g/dL and 18 g/dL **[documentation required]**; AND

x. Patient has not received Zolgensma in the past **[verification in claims history required]**; AND

Note: Verify through claims that the patient has not previously received Zolgensma. If no claim for Zolgensma is present, the prescribing physician confirms that the patient has not previously received Zolgensma.

xi. For a patient currently receiving or who has received prior treatment with Spinraza (nusinersen intrathecal injection), the prescribing physician confirms that further therapy with Spinraza will be discontinued; AND

xii. For a patient currently receiving or who has received prior treatment with Evrysdi (risdiplam oral solution), the prescribing physician confirms that further therapy with Evrysdi will be discontinued; AND

xiii. Medication is prescribed by a physician who has consulted with or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; AND

xiv. If criteria A through M are met, approve one single intravenous infusion of Zolgensma at a dose of 1.1 x 10^{14} vector genomes per kg (vg/kg) based on the current patient weight in kg (within the past 14 days) **[documentation required]**. Zolgensma is provided as a customized kit to meet dosing requirements for each patient per their documented weight (in kilograms). Configuration of the dose kit is based on weight (per the cited NDC) as in Table 2 below.

Table 2. Dose of Zolgensma Based on Availability.[1]
[*] Dose volume is calculated using the upper limit of the patient weight range for pediatric patients less than 2 years of age between 2.6 kg and 21.0 kg.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zolgensma is not recommended in the following situations:

86. Patient has Complete Paralysis of All Limbs. This is cited as a limitation of use in the Zolgensma prescribing information.[1] Data are needed to determine if this patient population would derive benefits from Zolgensma.

87. Patient has Permanent Ventilator Dependence. This is cited as a limitation of use in the Zolgensma prescribing information.[1] Data are needed to determine if this patient population would derive benefits from Zolgensma.

88. Administration to Individuals In Utero. Zolgensma is not approved for in utero administration per the prescribing information.

89. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Spinal Muscular Atrophy – Spinraza Prior Authorization Policy
- Spinraza® (nusinersen intrathecal injection – Biogen)

REVIEW DATE: 11/01/2023

OVERVIEW

Spinraza, a survival motor neuron 2 (SMN2)-directed antisense oligonucleotide, is indicated for the treatment of spinal muscular atrophy in pediatric and adult patients.[1]

Disease Overview

Spinal muscular atrophy is a genetic, autosomal recessive muscular disorder caused by deletion or loss of function mutation in the survival motor neuron 1 (SMN1) gene.[2-5] The reduced levels of survival motor neuron (SMN) protein causes degeneration of lower motor neurons.[5] Although the condition is a multisystem disorder, it is clinically characterized by progressive muscle weakness and atrophy. Patients have difficulties with ambulation, head control, feeding, and respiration. Cognitive development is not impacted. In the US, spinal muscular atrophy affects approximately one in 11,000 infants and has an average carrier frequency of one in 54 individuals; as many as 10,000 to 20,000 children and adults in the US may be impacted.[5] Although the condition can be present in individuals of any age, it is more frequently diagnosed in infants and children, as it is more severe in this population.[2-5] The phenotypic expression of the disease is impacted by the presence of the SMN2 gene copy number. SMN1 is responsible for producing most of the effective SMN protein, although some SMN protein can be made by the SMN2 gene. Therefore, patients with a deletion of the SMN1 gene may have the potential for making some SMN protein through the SMN2 gene copy, although in most cases the resulting protein made by this gene is truncated and is not as effective or functional. Data have shown that patients with a higher number of SMN2 copies generally have a more mild phenotypic disease expression. Gene deletion testing for spinal muscular atrophy can be performed at many diagnostic laboratories. Of note, various motor ability assessments are used in clinical practice to characterize functional impairment in spinal muscular atrophy.[2-5] A variety of functional motor scales are utilized to evaluate patients.[6] Table 1 describes disease types. A different manner of categorization classifies the three most common types as follows: Type 1 patients are "non-sitters", Type 2 patients are "sitters", and Type 3 patients are "walkers".[3,5]

Table 1. Types of Spinal Muscular Atrophy.[2-5]
SMA – Spinal muscular atrophy; SMN2 – Survival motor neuron 2.

Besides Spinraza, other therapies are available. **Evrysdi®** (risdiplam oral solution), a SMN2 splicing modifier, is indicated for the treatment of spinal muscular atrophy in pediatric and adult patients.[7] The primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular atrophy primarily in children and adults up to 25 years of age. Data are also available in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy.

Zolgensma® (onasemnogene abeparvovec-xioi intravenous infusion), an adeno-associated virus vector-based gene therapy, is indicated for the treatment of pediatric patients < 2 years of age with spinal muscular atrophy with bi-allelic mutations in the SMN1 gene.[8] The agent works by providing a copy of the gene encoding the SMN protein, which increases its production. Zolgensma is administered as a single-dose intravenous infusion over 60 minutes. Pivotal studies mainly involve infants with two or three SMN2 gene copies with primarily Type 1 or Type 2 disease.

Clinical Efficacy

Spinraza was investigated in a pivotal trial called ENDEAR, which was a Phase III, multicenter, multinational, randomized, double-blind, sham-procedure controlled study involving 121 symptomatic infants diagnosed with infantile-onset spinal muscular atrophy (Type I).[1,9] Patients were randomized 2:1 to receive either Spinraza (n = 80) or sham injection (n = 41).[1] Eligible patients were ≤ 7 months of age at the time of the first dose and diagnosed with spinal muscular atrophy with a symptom onset prior to 6 months of age. Baseline demographics were balanced between the Spinraza and control groups with the exception of age at first treatment (median age of 175 and 206 days, respectively).[1] At baseline, all infants were symptomatic, hypotonic and weak, which are features consistent with a phenotype that is most likely to be categorized as spinal muscular atrophy Type 1.[9] Patients had two SMN2 gene copies. The median time of treatment was 261 days (range 6 to 442 days).[1] Those who received Spinraza compared with sham-control experienced improvement on achieving motor milestone responses. Outcomes assessing survival also revealed improvements for patients receiving Spinraza vs. sham control.

CHERISH was a multicenter, double-blind, sham-controlled, Phase III trial which involved children with symptomatic later-onset spinal muscular atrophy who were 2 to 12 years of age (n = 126) with likely Type 2 or 3 disease (symptom onset after 6 months of age).[1,10] Patients were randomized (2:1) to receive Spinraza or sham injection. Three SMN2 gene copies were reported among 88% of patients; approximately 8% of patients had two SMN2 gene copies. The median age at screening was 4 years and 3 years in the Spinraza and sham procedure control groups, respectively.[1,10] Patients who received Spinraza experienced more improvement in motor milestones compared with sham control.

NURTURE was an open-label uncontrolled trial involving patients with presymptomatic spinal muscular atrophy who ranged in age from 3 days to 42 days at the time of the first dose (n = 25).[1,11] Patients were required to have two or three SMN2 gene copies.[11] Some patients who were given Spinraza prior to the onset of symptoms related to spinal muscular atrophy survived without requiring permanent ventilation beyond what would be anticipated based on their SMN2 copy number. Also, some patients also met age-appropriate growth and development motor milestones (e.g., ability to sit unassisted, stand, or walk). Data are available from almost a median of 3-year follow-up.

The EMBRACE trial showed benefits of Spinraza in infants/children with infantile- or later-onset spinal muscular atrophy who were not eligible for the ENDEAR or CHERISH studies.[12] Other data with Spinraza are also available, including an accumulation of data in adults.[13-26] Follow-up is available for up to 4 years. Patients had a slowing of decline, achieved milestones, and experienced additional improvement in scales assessing motor function.

Dosing

Spinraza is given intrathecally by, or under the direction of, healthcare professionals experienced in performing lumbar punctures.[1] The recommended dosage is 12 mg (5 mL) per administration. Initiate Spinraza treatment with four loading doses. The first three loading doses should be administered at 14-day intervals. The fourth loading dose should be given 30 days after the third dose. A maintenance dose should be given once every 4 months thereafter. There are additional recommendations in patients who have missed doses. The safety and effectiveness of Spinraza in pediatric patients from newborn to 17 years of age have been established.

Guidelines

The Spinal Muscular Atrophy Newborn Screening Multidisciplinary Working Group is comprised of clinicians and geneticists with expertise in spinal muscular atrophy who developed a treatment algorithm in 2018 for infants who have positive results from a newborn screening test for spinal muscular atrophy.[27] Spinal muscular atrophy Types 1 and 2 comprise a large majority of cases and account for many patients

who screen positively for spinal muscular atrophy with three or fewer SMN2 gene copies. Immediate treatment is recommended in patients with two or three SMN2 gene copies. Treatment recommendations for patients who screen positive for spinal muscular atrophy and have only one SMN2 gene copy is more complicated.[27] In 2020, the Working Group updated recommendations that infants diagnosed with spinal muscular atrophy via newborn screening with four SMN2 gene copies should receive immediate treatment.[28] Also, patients with five (or more) SMN2 gene copies should be observed and screened for symptoms.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Spinraza. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Due to the specialized skills required for evaluation and diagnosis of patients treated with Spinraza, as well as the monitoring required for adverse events and long-term efficacy, approval requires Spinraza to be prescribed by a physician who has consulted with or who specializes in the condition. For certain criteria, verification is required as noted by **[verification in claims history required]**. All reviews will be forwarded to the Medical Director for evaluation.

Documentation: Documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, laboratory tests, claims records, and/or other information. Subsequent coverage reviews for a patient who has previously met the documentation requirements and related criteria in the *Spinal Muscular Atrophy – Spinraza Prior Authorization Policy* through the Coverage Review Department, and who is requesting reauthorization, are NOT required to re-submit documentation for reauthorization, except for the criterion requiring documentation of response or benefit to Spinraza therapy.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Spinraza is recommended in those who meet the following criteria:

FDA-Approved Indication

11. Spinal Muscular Atrophy – Treatment. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets all of the following (i, ii, iii, iv, v, and vi):

ii. Baseline motor ability assessment that suggests spinal muscular atrophy (based on age, motor ability, and development) has been performed from one of the following exams (a, b, c, d, e, f, or g) **[documentation required]**:

a) Bayley Scales of Infant and Toddler Development; OR

b) Children's Hospital of Philadelphia Infant Test of Neuromuscular Disorders (CHOP-INTEND); OR

c) Hammersmith Functional Motor Scale Expanded (HFMSE); OR

d) Hammersmith Infant Neurological Exam Part 2 (HINE-2); OR

e) Motor Function Measure-32 Items (MFM-32); OR

f) Revised Upper Limb Module (RULM) test; OR

g) World Health Organization motor milestone scale; AND

iii. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic pathogenic variants in the survival motor neuron 1 (SMN1) gene **[documentation required]**; AND

Note: Pathogenic variants may include homozygous deletion, compound heterozygous mutation, or a variety of other rare mutations.

iv. Patient meets one of the following (a or b):

a) Patient has two or three survival motor neuron 2 (SMN2) gene copies **[documentation required]**; OR

b) Patient meets both of the following criteria [(1) and (2)]:

(1) Patient has four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND

(2) Patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND

v. For a patient currently receiving or who has received prior treatment with Evrysdi (risdiplam oral solution), the prescribing physician confirms that further therapy with Evrysdi will be discontinued; AND

vi. Patient has not received Zolgensma (onasemnogene abeparvovec-xioi intravenous infusion) in the past **[verification in claims history required]**; AND

Note: Verify through claims history that the patient has not previously received Zolgensma. If no claim for Zolgensma is present, the prescribing physician confirms that the patient has not previously received Zolgensma.

vii. Medication is prescribed by a physician who has consulted with or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; OR

B) Patient Currently Receiving Spinraza Therapy. Approve for one dose (for a dose to be used once within the next 4 months as maintenance therapy) if the patient meets all of the following (i, ii, iii, iv, v, vi, and vii):

i. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic pathogenic variants in the survival motor neuron 1 (SMN1) gene **[documentation required]**; AND

Note: Pathogenic variants may include homozygous deletion, compound heterozygous mutation, or a variety of other rare mutations.

ii. Patient meets one of the following (a or b):

a) Patient has two or three survival motor neuron 2 (SMN2) gene copies **[documentation required]**; OR

b) Patient meets both of the following [(1) and (2)]:

(3) Patient has four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND

(4) Patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND

iii. Four months has elapsed since the last dose; AND

iv. For a patient currently receiving or who has received prior treatment with Evrysdi (risdiplam oral solution), the prescribing physician confirms that further therapy with Evrysdi will be discontinued; AND

v. Patient has not received Zolgensma (onasemnogene abeparvovec-xioi intravenous infusion) in the past **[verification in claims history required]**; AND

Note: Verify through claims that the patient has not previously received Zolgensma. If no claim for Zolgensma is present, the prescribing physician confirms that the patient has not previously received Zolgensma.

vi. Medication is prescribed a physician who has consulted with or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; AND

vii. Patient must meet one of the following (a or b):

a) Patient must have had a positive clinical response (for example, improvement or stabilization) from pretreatment baseline status (i.e., within the past 4 months) with Spinraza from one of the following [(1), (2), (3), (4), (5), (6), or (7)] **[documentation required]**:

(1) Bayley Scales of Infant and Toddler Development; OR

(2) Children's Hospital of Philadelphia Infant Test of Neuromuscular Disorders (CHOP-INTEND); OR

(3) Hammersmith Functional Motor Scale Expanded (HFMSE); OR

(4) Hammersmith Infant Neurological Exam Part 2 (HINE-2); OR

(5) Motor Function Measure-32 Items (MFM-32); OR

(6) Revised Upper Limb Module (RULM) test; OR

(7) World Health Organization motor milestone scale; OR

b) According to the prescribing physician, the patient has responded to Spinraza and continues to benefit from ongoing Spinraza therapy by the most recent (i.e., within the past 4 months) physician monitoring/assessment tools **[documentation required]**.

Note: Examples include pulmonary function tests showing improvement, bulbar function test results suggest benefits, reduced need for respiratory support, decrease in the frequency of respiratory infections or complications and/or prevention of permanent assisted ventilation.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Spinraza is not recommended in the following situations:

90. Patient has Complete Paralysis of All Limbs. Data are needed to determine if this patient population with advanced spinal muscular atrophy would derive benefits from Spinraza.

91. Patient has Permanent Ventilator Dependence. Data are needed to determine if this patient population with advanced spinal muscular atrophy would derive benefits from Spinraza.

92. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Synagis Prior Authorization Policy
- Synagis® (palivizumab intramuscular injection – Sobi)

REVIEW DATE: 08/16/2023

OVERVIEW

Synagis, a respiratory syncytial virus (RSV) F protein inhibitor monoclonal antibody, is indicated for the **prevention of serious lower respiratory tract disease caused by RSV in children at high risk of RSV disease**.[1] Safety and efficacy were established in children with bronchopulmonary dysplasia, infants with a of premature birth, and children with hemodynamically significant congenital heart disease.

The safety and efficacy of Synagis for the treatment of RSV have not been established.[1] The recommended dose is 15 mg/kg intramuscularly once monthly (every 30 days). The first dose of Synagis should be administered prior to commencement of the RSV season and the remaining doses should be administered monthly throughout the RSV season.

RSV Seasonality

The Centers for Disease Control and Prevention National Respiratory and Enteric Virus Surveillance System provides reports determining RSV seasonality, nationally and by region. The COVID-19 pandemic disrupted RSV seasonality from 2020 to 2022.[2] To describe US RSV seasonality during pre-pandemic and pandemic periods, polymerase chain reaction (PCR) test results reported to the National Respiratory and Enteric Virus Surveillance System during July 2017 through February 2023 were analyzed. Seasonal RSV epidemics were defined as the weeks during which ≥ 3% of PCR test results were positive for RSV. Nationally, pre-pandemic seasons (2017 to 2020) began in October, peaked in December, and ended in April. During 2020/2021, the typical winter RSV epidemic did not occur. The 2021/2022 season began in May, peaked in July, and ended in January. The 2022/2023 season started (June) and peaked (November) later than the 2021/2022 season, but earlier than pre-pandemic seasons. In both pre-pandemic and pandemic periods, epidemics began earlier in Florida and the southeast and later in regions further north and west. Although the timing of the 2022/2023 season suggests that seasonal patterns are returning toward those observed in pre-pandemic years, off-season RSV circulation may continue.

During the 2022/2023 surveillance year, onset occurred in June, the proportion of positive PCR results peaked in November, and the peak was higher (19%) than that during pre-pandemic seasons (range 13% to 16%). The epidemic lasted 32 weeks until the offset occurred in January.

Guidelines

The American Academy of Pediatrics (AAP) Policy Statement on the Updated Guidance for Synagis Prophylaxis Among Infants and Young Children at Increased Risk of Hospitalization for RSV Infection was updated on August 1, 2014.[3] Additionally, the AAP Red Book was updated in 2021.[4] The AAP Red Book provides eligibility criteria for prophylaxis of high-risk infants and children in the following situations: preterm infants with chronic lung disease, infants with congenital heart disease (including those who undergo cardiac transplantation during the RSV season), preterm infants (before 29 weeks, 0 days' gestation) without chronic lung disease or congenital heart disease, children with anatomic pulmonary abnormalities or neuromuscular disorders, and immunocompromised children. Data are insufficient to justify a recommendation for routine use of prophylaxis in patients with Down syndrome or among those with cystic fibrosis, unless other indications are present.

The Centers for Disease Control and Prevention's (CDC) Advisory Committee on Immunization Practices (ACIP) [August 25, 2023] recommend one dose of Beyfortus (nirsevimab-alip intramuscular injection) for all infants < 8 months of age born during or entering their first RSV season (50 mg for infants < 5 kg and 100 mg for infants ≥ 5 kg).[11] ACIP recommends one dose of Beyfortus (200 mg, administered as two 100-mg injections given at the same time at different injection sites) for infants and children 8 to 19 months of age who are at increased risk for severe RSV disease and entering their second RSV season.

The ACIP and AAP have published considerations for the 2023/2024 RSV season with regard to Synagis vs. Beyfortus in high-risk infants (August 15, 2023).[13] In general, the joint recommendations mirror the ACIP recommendations above. In addition, if Beyfortus is administered, Synagis should not be administered later that season. If Synagis was initially administered for the season, and < 5 doses were administered, the infant should receive one dose of Beyfortus. No further Synagis should be administered. If Synagis was administered in the first RSV season, and the child is eligible for RSV prophylaxis in the second RSV season, the child should receive Beyfortus in the second RSV season, if available. An additional recommendation regarding Beyfortus is that in healthy infants born at the end of their first RSV season, who did not receive Beyfortus and are < 8 months of age entering their second RSV season, a single dose of Beyfortus may be given.

On October 23, 2023, the CDC issued a Health Alert Network Health Advisory to provide options for clinicians to protect infants from RSV in the context of a limited supply of Beyfortus.[14] In the context of limited supply during the 2023/2024 RSV season, CDC recommends prioritizing available Beyfortus 100 mg doses for infants at the highest risk for severe RSV disease: young infants (< 6 months of age) and infants with underlying conditions that place them at highest risk for severe RSV disease. Recommendations for using 50 mg doses remain unchanged at this time. The CDC further recommends that providers suspend using Beyfortus in Synagis-eligible children who are 8 to 19 months of age for the 2023/2024 RSV season. These children should receive Synagis according to the AAP recommendations. Beyfortus should continue to be offered to American Indian and Alaska Native children aged 8 to 19 months who are not Synagis-eligible and who live in remote regions, where transporting children with severe RSV for escalation of medical care is more challenging or in communities with known high rates of RSV among older infants and toddlers.

RSV Seasonality and Recommendations

Although typical RSV seasonality in the US occurs primarily in the fall and winter months, there was a rapid decrease in RSV infections in the US beginning in March 2020 following non-pharmacologic interventions to prevent COVID-19.[6] RSV activity remained very low through the traditional 2020-2021 fall-winter season but began to increase in spring 2021 and cases rose to a level similar to a fall-winter season throughout the US over the summer and fall of 2021.[7] This was a deviation from usual RSV epidemiology.[6,7] Because of the change in RSV circulation, AAP strongly supported consideration for use of Synagis in eligible patients during the interseasonal spread of RSV.[6] According to a statement released by AAP on December 17, 2021, the 2021-2022 winter RSV season is considered a new season, rather than a continuation of the interseason spread in the spring and summer of 2021.

As of July 2022, RSV activity in the US remains variable by region but is increasing in some parts of the country.[7] Due to the shift in RSV seasonality noted in 2021 and the current regional rise in interseason RSV cases, the AAP continues to support the use of Synagis in eligible infants in any region experiencing rates of RSV activity at any time in 2022 similar to a typical fall-winter season. The standard administration of Synagis, 5 consecutive monthly doses, is recommended by the AAP to provide serum levels associated with protection for 6 months, the length of a typical RSV season. The AAP will continue to monitor the interseasonal trends and update this guidance as needed if the RSV season extends longer than 6 months.

The start of the RSV season has historically been defined as case positivity rate of 10% by antigen or PCR testing.[8] However, a 10% threshold for PCR tests has been found to be imprecise for characterizing the RSV season. Therefore, other thresholds have been used for PCR tests. A 3% threshold has been found to be a simple method to assess the onset and offset of the RSV season (defining the RSV season onset as the first of 2 consecutive weeks when the weekly percentage of positive tests for RSV is > 3% and season offset as the last week that the percentage of positive tests is >3%).[8,9] A 10% threshold appears reasonable for antigen testing.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Synagis. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because five monthly doses of Synagis at 15 mg/kg per dose will provide more than 6 months of serum Synagis concentrations for most infants, administration of more than five monthly doses is not recommended within the continental US. Children who qualify for five monthly doses of Synagis should receive the first dose at the time of onset of the RSV season. For qualifying infants born during the RSV season, fewer than five monthly doses will be needed to provide protection until the RSV season ends in their region (maximum of five monthly doses). For the purposes of this policy, RSV season onset is defined as the first 2 consecutive weeks when the percentage of positive tests for RSV is > 3% by PCR or > 10% by antigen testing. RSV season offset is defined as the last week that the percentage of positive tests for RSV is > 3% by PCR of > 10% by antigen testing.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Synagis is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Chronic Lung Disease**. Approve for a maximum of 5 months during the RSV season if the patient meets one of the following (A or B):
    - **a)** Patient is < 12 months of age at the start of the RSV season and meets the following (i and ii):
        - **a)** Patient was born at < 32 weeks, 0 days gestation; AND
        - **b)** Patient required > 21% oxygen for at least 28 days after birth; OR
    - **b)** Patient is ≥ 12 months of age but < 24 months of age at the start of the RSV season and meets the following (i, ii, and iii):
        - **a)** Patient was born at < 32 weeks, 0 days gestation; AND
        - **b)** Patient required > 21% oxygen for at least 28 days after birth; AND
        - **c)** Patient has required medical therapy (i.e., supplemental oxygen, diuretic therapy, or chronic corticosteroid therapy) during the 6 months before the start of the second RSV season.

2. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Congenital Heart Disease.** Approve for a maximum of 5 months during the RSV season if the patient meets the following (A, B, and C):

a) Patient is < 12 months of age at the start of the RSV season; AND
b) According to the prescriber, patient meets one of the following (i, ii, iii, or iv):
i. Patient is considered to have hemodynamically significant cyanotic congenital heart disease; OR
ii. Patient meets all of the following (a, b, and c):
1. Patient has acyanotic heart disease; AND
2. Patient is receiving medication to control heart failure; AND
3. Patient will require cardiac surgical procedures; OR
iii. Patient has moderate to severe pulmonary hypertension; OR
iv. Patient meets both of the following (a and b):
1. Patient has lesions that have been adequately corrected by surgery; AND
2. Patient continues to require medication for congestive heart failure; AND
c) Synagis is prescribed by or in consultation with a cardiologist or intensivist.

3. **Respiratory Syncytial Virus (RSV), Prevention in a Patient Born Prematurely.** Approve for a maximum of 5 months during the RSV season if the patient meets the following (A and B):
A) Patient is < 12 months of age at the start of the RSV season; AND
B) Patient was born before 29 weeks, 0 days gestation (≤ 28 weeks, 6 days gestation).

Other Uses with Supportive Evidence

4. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Anatomic Pulmonary Abnormalities or a Neuromuscular Disorder.** Approve for a maximum of 5 months during the RSV season if the patient meets the following (A and B):
A) Patient is < 12 months of age at the start of the RSV season; AND
B) According to the prescriber, the patient's condition compromises the handling of respiratory secretions.

5. **Respiratory Syncytial Virus (RSV), Prevention in an Immunocompromised Patient.** Approve for a maximum of 5 months during the RSV season if the patient meets the following (A, B, and C):
Note: Examples of immunocompromised patients include those receiving chemotherapy and those with hematopoietic stem cell transplant or solid organ transplant.
a) Patient is < 24 months of age at the start of the RSV season; AND
b) According to the prescriber, the patient is/will be profoundly immunocompromised during the RSV season; AND
c) Synagis is prescribed by or in consultation with an immunologist or an infectious diseases specialist.

D) 6. Respiratory Syncytial Virus (RSV), Prevention in a Patient with Cardiac Transplant. Approve for a maximum of 5 months during the RSV season if the patient meets the following (A, B, and C):
E) Note: A patient with cardiac transplant may also be immunocompromised. In a patient who does not meet criteria for cardiac transplant below, please see criterion 5 above (Respiratory Syncytial Virus [RSV], Prevention in an Immunocompromised Patient).
a) Patient is < 24 months of age at the start of the RSV season; AND
b) Patient has undergone or will undergo cardiac transplantation during the current RSV season; AND

c) Synagis is prescribed by or in consultation with a cardiologist, intensivist, or transplant physician.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Synagis is not recommended in the following situations:

1. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Cystic Fibrosis Who Does Not Meet Any of the Approval Criteria.** The AAP guidelines for RSV note that routine use of Synagis prophylaxis in patients with cystic fibrosis, including neonates diagnosed with cystic fibrosis by newborn screening, is not recommended unless other indications are present.[4] Available studies indicate the incidence of RSV hospitalization in children with cystic fibrosis is uncommon and unlikely to be different from children without cystic fibrosis.[3] A Cochrane Review identified one trial (presented in poster/abstract form) eligible for their review of Synagis prophylaxis in children with cystic fibrosis.[5] In this prospective, double-blind, placebo-controlled, multi-center study, 14.1% vs. 14.9% of Synagis and placebo-treated patients, respectively were hospitalized within the first 6 months, and only one patient in each group was identified with RSV infection. There were no deaths in either group of patients during the first 6 months follow-up; this outcome was not reported at 12 months follow-up.

2. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Down Syndrome Who Does Not Meet Any of the Approval Criteria.** Data suggest that children with Down syndrome have a slightly higher hospitalization rate for RSV, but the absolute number of hospitalizations is small, and a number of children with Down syndrome are at increased risk because of other qualifying risk factors (e.g., congenital heart disease, abnormalities of the respiratory tract, muscle dystonia).[3]

3. **Respiratory Syncytial Virus (RSV), Treatment of Disease.** There are limited data investigating Synagis for the treatment of established RSV infections. Passive antibody administration is not effective in treatment of RSV disease and is not approved or recommended for this indication.[3,4] If any infant or young child receiving monthly Synagis prophylaxis experiences a breakthrough RSV hospitalization, monthly prophylaxis should be discontinued because of the extremely low likelihood of a second RSV hospitalization (< 0.5%).[4]

4. **Use in a Patient who has Received Beyfortus (nirsevimab-alip intramuscular injection) in the Same RSV Season.** Synagis should not be administered to infants who have already received Beyfortus for the same RSV season.[10,11,12] However, if Synagis was initially administered for the season, and < 5 doses were administered, the infant should receive one dose of Beyfortus.[12] No further Synagis should be administered. If Synagis was administered in the first RSV season, and the child is eligible for RSV prophylaxis in the second RSV season, the child should receive Beyfortus in the second RSV season, if available. Note: The RSV season is generally 6 months in duration.

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Tasimelteon Products Prior Authorization Policy
- Hetlioz™ (tasimelteon capsules – Vanda, generic)
- Hetlioz LQ™ (tasimelteon oral suspension – Vanda)

REVIEW DATE: 01/18/2023

OVERVIEW

Tasimelteon products are melatonin receptor agonists indicated for the following uses:[1,2]

- Tasimelteon capsule is indicated for the treatment of:
  - **Non-24-Hour Sleep-Wake Disorder** (Non-24).
  - **Nighttime Sleep Disturbances in Smith-Magenis Syndrome (SMS)**, in patients ≥ 16 years of age.
- Hetlioz LQ is indicated for the treatment of **nighttime sleep disturbances in SMS**, in patients 3 to 15 years of age.

Disease Overview

Non-24 is a chronic circadian rhythm disorder that is due to the misalignment of the endogenous master body clock to the 24-hour day which disrupts the sleep-wake cycle and commonly is thought to be caused by the failure of light to reach the suprachiasmatic nuclei. Patients who are completely blind are particularly susceptible to this condition; as many as one-half to three-quarters of totally blind patients have Non-24, which is approximately 65,000 to 95,000 Americans.[3-8] Patients can be diagnosed using circadian phase markers (e.g., measurement of urinary melatonin levels, dim light melatonin onset [assessed in blood or saliva], or assessing core body temperature).[3,8,9] Alternative forms of diagnosis include actigraphy and assessment of sleep logs (sleep diaries).[3,8,9] Actigraphy is a non-invasive method of monitoring human rest and activity cycles and involves the use of a portable device to document movement. Other reviews confirm these diagnostic methods.[8,9]

SMS is a rare disorder identified by an array of physical, neurobehavioral, and developmental characteristics.[15] In the United States, the incidence is estimated to be 1 in 15,000 to 25,000 people in the general population. Cases of SMS are predominantly related to either a deletion or mutation in the *RAI1* gene. Sleep disturbances start as early as one year of age and continue into adulthood and include shortened sleep cycles with multiple awakenings during the night, early morning arousal from sleep, and increased somnolence during daytime hours. Inability to achieve a normal sleeping pattern appears to aggravate behavioral issues such as impulsivity, aggression, hyperactivity and frequent temper tantrums. Sleep issues in SMS have been attributed to a primary disturbance of the circadian clock disruption and instabilities in melatonin secretion. Physical traits such as muscle weakness, obesity-related breathing difficulties, and facial composition can be underlying factors that affect sleep.

Clinical Efficacy

The efficacy of Hetlioz for Non-24 was established in two Phase III pivotal studies involving totally blind patients who reported no light perception with Non-24 for up to 6 months and evaluated the effects of Hetlioz withdrawal.[1,3] In the Hetlioz group, 29% of patients (n = 12) met responder criteria, defined as patients with both a ≥ 45 minute increase in nighttime sleep and a ≥ 45 minute decrease in daytime nap time, compared with 12% of patients (n = 5) who received placebo (time of endpoint assessment not stated).[1] During the withdrawal period of the trial, which lasted 8 weeks, 90% of patients who continued

Hetlioz (n = 9/10) remained entrained (circadian rhythm synchronized to 24-hour day) compared with 20% of patients randomized to receive placebo (n = 2/10).[3,4]

The data of Hetlioz and Hetlioz LQ supporting benefits for nighttime sleep disturbances in SMS are underwhelming.[1,17] The pivotal trial for SMS included very few patients and was relatively short-term; this condition would likely require long-term therapy. Only one of the two primary efficacy endpoints was statistically significant after controlling for multiple comparisons.

Guidelines

In 2015, clinical practice guidelines were published by the American Academy of Sleep Medicine that address Non-24.[6] The condition mainly occurs in patients who are blind. The Task Force states that there is no evidence to support the use of sleep-promoting medications in patients with Non-24. Data suggest that melatonin entrainment occurs with melatonin at a greater rate than placebo and melatonin can be an effective treatment for Non-24. The Task Force recommendation was that clinicians use strategically timed melatonin for the treatment of Non-24 in adults who are blind (versus no treatment). There are insufficient data to support use of melatonin among sighted patients with Non-24 (versus no treatment).

The Parents and Researchers Interested in SMS (PRISMS) created medical management guidelines for the diagnosis, treatment of manifestations, and ongoing surveillance of SMS.[16] The guidelines do not address Hetlioz/Hetlioz LQ. Multidisciplinary treatment is recommended. The guidelines recognize sleep management is a challenge and no well controlled treatment trials have been reported. The first suggestion is to incorporate a good sleep routine (e.g., consistent bedtime and bedtime routine, quiet/non-stimulating activities, use of white noise or a rhythmic sound, and a comfortably cool/dark room). Concerns for sleep apnea should be addressed. Melatonin is endorsed as monotherapy for sleep management. The concomitant use of a morning beta-blocker (acebutolol) with an evening dose of melatonin for 6 to 8 weeks could be beneficial to restore circadian plasma melatonin rhythmicity, decrease daytime sleepiness, improve daytime behavior, and enhance sleep in children with SMS.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of tasimelteon capsules. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with tasimelteon capsules as well as the monitoring required for adverse events and long-term efficacy, approval requires tasimelteon capsules to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Due to insufficient clinical efficacy data for its FDA-approved use, **approval is not recommended** for Hetlioz LQ.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of tasimelteon capsule is recommended in those who meet the following criteria:

FDA-Approved Indication

12. Non-24-Hour Sleep-Wake Disorder (Non-24). Approve for the duration noted if the patient meets one of the following conditions (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets all of the following criteria (i, ii, iii, iv, and v):

i. Patient is ≥ 18 years of age; AND

ii. Patient is totally blind with no perception of light; AND

iii. Diagnosis of Non-24 is confirmed by meeting ONE of the following conditions (a or b):

a) Assessment of at least one physiologic circadian phase marker; OR

Note: Examples of physiologic circadian phase markers include measurement of urinary melatonin levels, dim light melatonin onset (as measured in blood or saliva), and assessment of core body temperature.

b) If assessment of at least one physiologic circadian phase marker cannot be done, the diagnosis must be confirmed by actigraphy performed for ≥ 1 week plus evaluation of sleep logs recorded for ≥ 1 month; AND

iv. Patient meets BOTH of the conditions (a and b):

a) Patient has received at least 6 months of continuous therapy (i.e., 6 consecutive months of daily treatment) with melatonin under the guidance of a physician who specializes in the treatment of sleep disorders; AND

b) Patient had inadequate efficacy with melatonin therapy according to the prescriber; AND

Note: Examples of efficacy with melatonin therapy include entrainment, clinically meaningful or significant increases in nighttime sleep, and clinically meaningful or significant decreases in daytime sleep.

v. The medication is prescribed by, or in consultation with, a physician who specializes in the treatment of sleep disorders.

B) Patient is Currently Receiving Tasimelteon Capsules. Approve for 1 year if the patient meets all of the following criteria (i, ii, iii, iv, v, and vi):

i. Patient is ≥ 18 years of age; AND

ii. Patient is totally blind with no perception of light; AND

iii. Patient meets both of the following conditions (a and b):

a) Patient has received at least 6 months of continuous therapy (i.e., 6 consecutive months of daily treatment) with melatonin under the guidance of a physician who specializes in the treatment sleep disorders; AND

b) Patient had inadequate efficacy with melatonin therapy according to the prescriber; AND

Note: Examples of efficacy with melatonin therapy include entrainment, clinically meaningful or significant increases in nighttime sleep, and clinically meaningful or significant decreases in daytime sleep.

iv. Patient meets both of the following conditions (a and b):

a) Patient has received at least 6 months of continuous therapy (i.e., 6 consecutive months of daily treatment) with tasimelteon capsules under the guidance of a physician who specializes in the treatment of sleep disorders; AND

Note: A patient who has not received at least 6 months of continuous tasimelteon capsules therapy, or if the therapy has not been continuous (i.e., 6 consecutive months of daily treatment), should follow criterion 1 (initial therapy).

b) Patient has achieved adequate results with tasimelteon capsules therapy according to the prescriber; AND

Note: Examples of adequate results with tasimelteon capsules therapy include entrainment, clinically meaningful or significant increases in nighttime sleep, clinically meaningful or significant decreases in daytime sleep.

v. The medication is prescribed by, or in consultation with, a physician who specializes in the treatment of sleep disorders.

II. Coverage of Hetlioz LQ is not recommended.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of tasimelteon /Hetlioz LQ is not recommended in the following situations:

104. Insomnia, Primary. Many other agents are available.[10] Only limited data have investigated use of Hetlioz in patients with primary insomnia.[10] Further data are needed to establish the safety and efficacy of Hetlioz.

105. Nighttime Sleep Disturbances in Smith-Magenis Syndrome (SMS). Efficacy data for Hetlioz/Hetlioz LQ supporting benefits for nighttime sleep disturbances in SMS are underwhelming.[1,17]

106. Ramelteon Tablets (Rozerem™, generic), Concomitant Therapy. Ramelteon, a melatonin receptor agonist, is indicated for the treatment of insomnia characterized by difficulty with sleep onset.[12] The safety and efficacy of concomitant use of ramelteon tablets and Hetlioz have not been studied and it is suspected that the adverse events with use of these agents with a similar mechanism of action taken together may be additive (e.g., central nervous system effects [somnolence], hepatic impairment). Ramelteon has not been studied in Non-24. In the clinical trials with Hetlioz, patients were not permitted to use medications that could interfere with the assessment of circadian rhythms.

107. Sedative Hypnotic Medications or Other Medications for Insomnia or Other Sleep-Related Disorders, Concomitant Therapy (e.g., benzodiazepines [triazolam, temazepam], nonbenzodiazepine hypnotics [e.g., zolpidem, zaleplon], chloral hydrate). There are no data to support the safety and efficacy of hypnotic medications in patients with Non-24.[6] Also, there are no data to determine the safety and efficacy of Hetlioz when used with other sedative hypnotic medications or other medications for insomnia or sleep-related disorders.[13]

108. Sleep-Related Disorders, Other Types (e.g. shift work disorder, jet lag disorder, advanced sleep phase disorder, delayed sleep phase disorder, irregular sleep-wake rhythm disorder). A published investigation details a Phase II study (n = 29) and a Phase III study (n = 411) assessing Hetlioz treatment in adults with transient insomnia associated with shifted sleep and wake time.[14] Further studies are needed to establish the efficacy and safety of Hetlioz in patients with other types of sleep-related disorders.

109. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

- testosterone 2% solution – Actavis, generics only

Nasal Gel

- Natesto™ (testosterone nasal gel – Acerus)

REVIEW DATE: 11/08/2023

OVERVIEW

The oral, topical, and nasal testosterone replacement products are all indicated for testosterone replacement therapy in adult males for conditions associated with a deficiency or absence of endogenous testosterone.[1-10,15] The labels for the FDA-approved products define those patients and/or conditions for which use of testosterone replacement products is indicated:

- **Primary hypogonadism (congenital or acquired):** testicular failure due to conditions such as cryptorchidism, bilateral torsion, orchitis, vanishing testis syndrome, orchiectomy, Klinefelter's syndrome, chemotherapy, or toxic damage from alcohol or heavy metals. These men usually have low serum testosterone concentrations and above-normal gonadotropins (follicle-stimulating hormone [FSH], luteinizing hormone [LH]).
- **Hypogonadotropic hypogonadism (congenital or acquired):** gonadotropin or luteinizing hormone-releasing hormone (LHRH) deficiency or pituitary-hypothalamic injury from tumors, trauma, or radiation. These men have low serum testosterone concentrations, but have gonadotropins in the normal or low range.

The diagnosis of male hypogonadism is based on both signs/symptoms and low testosterone levels. By restoring normal levels of testosterone, the replacement regimens correct symptoms of hypogonadism, which can include malaise, loss of muscle strength, depressed mood, and decreased libido.[12]

All of the oral, topical, and nasal testosterone replacement product labeling states that due to the lack of controlled evaluations in women and potential virilizing effects, the products are not indicated for use in women.[1-10,15]

Guidelines

- **Hypogonadism:** Guidelines from the American Urological Association (2018) note that clinicians should use a total testosterone level below 300 ng/dL as a reasonable cutoff in support of the diagnosis of low testosterone.[13] A clinical diagnosis requires low testosterone levels (two separate levels, both conducted in the early morning) combined with signs and symptoms. The Endocrine Society guidelines on testosterone therapy in men with hypogonadism (2018) recommend diagnosing hypogonadism in men with symptoms and signs of testosterone deficiency and unequivocally and consistently low serum total testosterone and/or free testosterone concentrations (when indicated).[11]
- **Gender-Dysphoric/Gender-Incongruent Persons; Persons Undergoing Female-To-Male (FTM) Gender Reassignment (i.e., Endocrinologic Masculinization):** A clinical practice guideline published by the Endocrine Society (2017) recommends that, prior to initiation of hormonal therapy, the treating endocrinologist should confirm the diagnostic criteria of gender dysphoria/gender incongruence and the criteria for the endocrine phase of gender transition.[14] The clinician should also evaluate and address medical conditions that can be exacerbated by hormone depletion and treatment with sex hormones of the affirmed gender before beginning treatment. Guidelines mention that clinicians can use either parenteral or transdermal preparations to achieve appropriate testosterone values.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of oral, topical, and nasal testosterone products. In the approval indications, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: males are defined as individuals with the biological traits of a male, regardless of the individuals' gender identity or gender expression. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of some patients treated with testosterone, certain approval conditions require testosterone to be prescribed by or in consultation with a physician who specializes in the conditions being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of oral, topical, and nasal testosterone products is recommended in those who meet one of the following criteria:

FDA-Approved Indication

11. Hypogonadism (Primary or Secondary) in Males* [Testicular Hypofunction/Low Testosterone with Symptoms]. Approve for 1 year if the patient meets the following (A or B):
Note: The pretreatment timeframe refers to signs and symptoms of androgen deficiency and serum testosterone levels prior to the initiation of any testosterone therapy.

A) Initial Therapy. Patient with hypogonadism as confirmed by the following (i, ii, and iii):
- **i.** Patient has had persistent signs and symptoms of androgen deficiency (pretreatment); AND
  Note: Signs and symptoms of androgen deficiency include depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, and loss of libido.
- **ii.** Patient has had two pretreatment serum testosterone (total or bioavailable) measurements, each taken in the morning, on two separate days; AND
- **iii.** The two serum testosterone levels are both low, as defined by the normal laboratory reference values.

B) Patient is Currently Receiving Testosterone Therapy. Approve if the patient meets the following (i and ii):

- **i.** Patient has had persistent signs and symptoms of androgen deficiency (pretreatment); AND
  Note: Signs and symptoms of androgen deficiency include depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, and loss of libido.
- **ii.** Patient has had at least one pretreatment serum testosterone (total or bioavailable) level, which was low, as defined by the normal laboratory reference values.

*Refer to the Policy Statement.

Other Uses with Supportive Evidence

12. Gender-Dysphoric/Gender-Incongruent Persons; Persons Undergoing Female-To-Male (FTM) Gender Reassignment (i.e., Endocrinologic Masculinization). Approve for 1 year if prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of transgender patients.
Note: For a patient who has undergone gender reassignment, use this FTM criterion for hypogonadism indication.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of oral, topical, and nasal testosterone products is not recommended in the following situations:

93. To Enhance Athletic Performance. Topical testosterone products are not recommended for approval because this indication is excluded from coverage in a typical pharmacy benefit.

94. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Testosterone (Injectable) Products Prior Authorization Policy
- Depo®-Testosterone (testosterone cypionate intramuscular injection – Pfizer, generics)
- testosterone enanthate intramuscular injection – Hikma, generic only
- Aveed™ (testosterone undecanoate intramuscular injection – Endo)
- Testopel® (testosterone subcutaneous pellet – Endo)
- Xyosted™ (testosterone enanthate subcutaneous injection – Antares)

REVIEW DATE: 09/06/2023

OVERVIEW

Testosterone regimens can be administered orally, parenterally, or transdermally. All of the injectable agents are indicated for testosterone replacement therapy in adult males for conditions associated with a deficiency or absence of endogenous testosterone.[1-5] The prescribing information define these patients and/or conditions for which use of testosterone replacement products are indicated:

- **Primary hypogonadism (congenital or acquired),** for testicular failure due to cryptorchidism, bilateral torsion, orchitis, vanishing testis syndrome, or orchiectomy.
- **Hypogonadotropic hypogonadism (congenital or acquired),** for gonadotropin or luteinizing hormone-releasing hormone (LHRH) deficiency or pituitary-hypothalamic injury from tumors, trauma, or radiation.

The diagnosis of male hypogonadism is based on both signs/symptoms and low testosterone levels. By restoring normal levels of testosterone, the replacement regimens correct symptoms of hypogonadism, which can include malaise, loss of muscle strength, depressed mood, and decreased libido.[6]

Testopel and testosterone enanthate are also indicated for **delayed puberty**.[2,3] Testosterone enanthate (per the product labeling) may also be used secondarily in **advanced inoperable metastatic mammary cancer** in women who are 1 to 5 years postmenopausal.[2] The goal of therapy is ablation of ovaries. Per labeling, it also can be used in premenopausal women with breast cancer who have benefited from oophorectomy and are considered to have hormone-responsive tumors.

Guidelines

- **Hypogonadism:** Guidelines from the American Urological Association (2018) note that clinicians should use a total testosterone level below 300 ng/dL as a reasonable cut-off in support of the diagnosis of low testosterone.[7] The guidelines additionally note that a diagnosis of low testosterone should be made only after two total testosterone measurements are taken on separate occasions with both conducted in an early morning fashion and that a clinical diagnosis should be made when patients have low testosterone levels combined with signs and symptoms. The Endocrine Society guidelines on testosterone therapy in men with hypogonadism (2018) recommend diagnosing hypogonadism in men with symptoms and signs of testosterone deficiency and unequivocally and consistently low serum total testosterone and/or free testosterone concentrations (when indicated).[8]
- **Gender-Dysphoric/Gender-Incongruent Persons; Persons Undergoing Female-To-Male (FTM) Gender Reassignment (i.e., Endocrinologic Masculinization):** A clinical practice guideline published by the Endocrine Society (2017) recommends that, prior to initiation of hormonal therapy, the treating endocrinologist should confirm the diagnostic criteria of gender dysphoria/gender incongruence and the criteria for the endocrine phase of gender transition.[9] The clinician should also evaluate and address medical conditions that can be exacerbated by hormone

depletion and treatment with sex hormones of the affirmed gender before beginning treatment. Guidelines mention that clinicians can use either parenteral or transdermal preparations to achieve appropriate testosterone levelsvalues.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of injectable testosterone. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: males are defined as individuals with the biological traits of a male, regardless of the individual's gender identity or gender expression; females are defined as individuals with the biological traits of a female, regardless of the individual's gender identity or gender expression. Because of the specialized skills required for evaluation and diagnosis of some patients treated with testosterone, certain approval requires testosterone to be prescribed by or in consultation with a physician who specializes in the conditions being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of injectable testosterone is recommended in those who meet one of the following criteria:

FDA-Approved Indications

13. **Hypogonadism (Primary or Secondary) in Males* [Testicular Hypofunction/Low Testosterone with Symptoms].** Approve for 1 year if the patient meets the following (A or B):
    Note: The pre-treatment timeframe refers to sign and symptoms of androgen deficiency and serum testosterone levels prior to the initiation of any testosterone therapy.
    - **A)** Initial Therapy. Approve in a patient with hypogonadism as confirmed by the following (i, ii, and iii):
        - **i.** Patient has had persistent signs and symptoms of androgen deficiency (pre-treatment); AND
          Note: Signs and symptoms of androgen deficiency include depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, and loss of libido.
        - **ii.** Patient has had two pre-treatment serum testosterone (total or bioavailable) measurements, each taken in the morning, on two separate days; AND
        - **iii.** The two serum testosterone levels are both low, as defined by the normal laboratory reference values.
    - **B)** Patient Currently Receiving Testosterone Therapy. Approve if the patient meets the following (i and ii):
        - **i.** Patient has had persistent signs and symptoms of androgen deficiency (pre-treatment); AND
          Note: Signs and symptoms of androgen deficiency include depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, and loss of libido.
        - **ii.** Patient has had at least one pre-treatment serum testosterone (total or bioavailable) level, which was low, as defined by the normal laboratory reference values.

    * Refer to the Policy Statement

14. **Delayed Puberty or Induction of Puberty in Males* 14 years of Age or Older.** Approve Depo-Testosterone (testosterone cypionate intramuscular injection, generics), testosterone enanthate intramuscular injection, or Testopel for 6 months.

*Refer to the Policy Statement

15. Breast Cancer in Females*. Approve testosterone enanthate intramuscular injection for 6 months if prescribed by or in consultation with an oncologist.

*Refer to the Policy Statement.

Other Uses with Supportive Evidence

16. Gender-Dysphoric/Gender-Incongruent Persons; Persons Undergoing Female-to-Male (FTM) Gender Reassignment (i.e., Endocrinologic Masculinization). Approve for 1 year if prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of transgender patients.
Note: For a patient who has undergone gender reassignment, use this FTM criterion for hypogonadism indication.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of injectable testosterone is not recommended in the following situations:

95. To Enhance Athletic Performance. Injectable testosterone products are not recommended for approval because this indication is excluded from coverage in a typical pharmacy benefit.

96. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Doptelet Prior Authorization Policy
- Doptelet® (avatrombopag tablets – Dova/AkaRx)

REVIEW DATE: 04/12/2023

OVERVIEW

Doptelet, a thrombopoietin receptor agonist, is indicated for the following uses:[1]

- **Immune thrombocytopenia (ITP)**, chronic for treatment in adults who have had an insufficient response to a previous treatment.
- **Thrombocytopenia,** as treatment in adults with **chronic liver disease** who are scheduled to undergo a procedure.

For chronic ITP, Doptelet should be discontinued if the platelet count does not increase to $\geq 50 \times 10^9$/L within 4 weeks at the maximum dose of 40 mg once daily. The safety and efficacy of Doptelet have not been established in pediatric patients. For chronic liver disease in patients undergoing a procedure, Doptelet is given as a 5-day course beginning 10 to 13 days before the scheduled procedure. In general, patients in the pivotal studies had a platelet count $< 50 \times 10^9$/L.

Guidelines

In 2019, the American Society of Hematology updated guidelines for ITP.[4] Doptelet is not addressed specifically, but there are several recommendations. For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to corticosteroid, a thrombopoietin receptor agonist (either Promacta® [eltrombopag tablets and oral suspension] or Nplate® [romiplostim subcutaneous injection]) or a splenectomy are recommended. In children with newly diagnosed ITP who have non-life-threatening mucosal bleeding, corticosteroids are recommended. For children who have non-life-threatening mucosal bleeding and did not respond to first-line treatment, thrombopoietin receptor agonists are recommended. Other treatment options in children and adults include intravenous immunoglobulin, anti-D immunoglobulin, and rituximab.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Doptelet. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Doptelet as well as the monitoring required for adverse events and long-term efficacy, approval may require Doptelet to be prescribed by or in consultation with a physician who specializes in the condition being treated in certain indications.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Doptelet is recommended in those who meet one of the following criteria:

FDA-Approved Indications

13. Chronic Immune Thrombocytopenia. Approve if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets all of the following (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND

ii. Patient meets one of the following criteria (a or b):

a) Patient has a platelet count < 30 x 10^9/L (< 30,000/mcL); OR

b) Patient meets both of the following criteria [(1) and (2)]:

(1) Patient has a platelet count < 50 x 10^9/L (< 50,000/mcL); AND

(2) According to the prescriber, the patient is at an increased risk of bleeding; AND

iii. Patient meets one of the following criteria (a or b):

a) Patient has tried at least one other therapy; OR

Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Promacta (eltrombopag tablets and oral suspension), Nplate (romiplostim subcutaneous injection), Tavalisse (fostamatinib tablets), and rituximab.

b) Patient has undergone splenectomy; AND

iv. The medication is prescribed by or in consultation with a hematologist; OR

B) Patient is Currently Receiving Doptelet. Approve for 1 year if the patient meets both of the following criteria: (i and ii):

i. According to the prescriber, the patient demonstrates a beneficial clinical response; AND

Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes.

ii. Patient remains at risk for bleeding complications.

14. Thrombocytopenia in a Patient with Chronic Liver Disease. Approve for 5 days if the patient meets the following criteria (A, B, and C):

G) Patient is ≥ 18 years of age; AND

H) Patient has a current platelet count < 50 x 10^9/L (< 50,000/mcL); AND

I) Patient is scheduled to undergo a procedure within 10 to 13 days after starting Doptelet therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Doptelet is not recommended in the following situations:

110. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Mulpleta Prior Authorization Policy
- Mulpleta® (lusutrombopag tablets – Shionogi/Quotient)

REVIEW DATE: 04/12/2023

OVERVIEW

Mulpleta, a thrombopoietin receptor agonist, is indicated for the treatment of **thrombocytopenia** in adults with **chronic liver disease** who are scheduled to undergo a procedure.[1]

Begin Mulpleta dosing 8 to 14 days before the scheduled procedure. The recommended dose is 3 mg once daily with or without food for 7 days. In the pivotal clinical studies for the approved indication, patients had a platelet count < 50 x 10^9/L.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Mulpleta. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mulpleta is recommended in those who meet the following criteria:

FDA-Approved Indication

15. Thrombocytopenia in a Patient with Chronic Liver Disease. Approve for 7 days if the patient meets the following criteria (A, B, and C):
- **J)** Patient is ≥ 18 years of age; AND
- **K)** Patient has a current platelet count < 50 x 10^9/L (< 50,000/mcL); AND
- **L)** Patient is scheduled to undergo a procedure within 8 to 14 days after starting Mulpleta therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mulpleta is not recommended in the following situations:

111. Chronic Immune Thrombocytopenia. Data are not available regarding use of Mulpleta in patients with persistent and chronic immune thrombocytopenia. Many other agents are FDA-approved for this condition and are recommended in standard guidelines and have established efficacy and safety.[2]

112. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

87. Mulpleta® tablets [prescribing information]. Florham Park, NJ and Philadelphia, PA: Shionogi and Quotient; April 2020.
88. Neunert C, Terrell DR, Arnold DM, et al. American Society of Hematology 2019 guidelines for immune thrombocytopenia. *Blood Adv*. 2019;3(23):3829-3866.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Nplate Prior Authorization Policy
- Nplate® (romiplostim subcutaneous injection – Amgen)

REVIEW DATE: 04/12/2023

OVERVIEW

Nplate, a thrombopoietin receptor agonist, is indicated for the treatment of:[1]

- **Hematopoietic syndrome of acute radiation syndrome**, to increase survival in adults and pediatric patients (including term neonates) acutely exposed to myelosuppressive doses of radiation.
- **Immune thrombocytopenia (ITP), in adults** who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy.
- **Immune thrombocytopenia (ITP), in pediatric patients ≥ 1 year of age** with ITP for at least 6 months who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy.

Nplate should only be utilized in patients with ITP whose degree of thrombocytopenia and clinical condition increase the risk for bleeding. Nplate should not be used in an attempt to normalize platelet counts.

Guidelines

Nplate is mentioned in various clinical guidelines.

- **Chemotherapy Induced Thrombocytopenia:** The National Comprehensive Cancer Network (NCCN) guidelines for hematopoietic growth factors (version 2.2023 – March 6, 2023) recommend consideration of Nplate for the management of suspected chemotherapy induced thrombocytopenia (category 2A) in addition to other modalities (e.g., platelet transfusion, chemotherapy dose reduction, or change in treatment regimen).[14]
- **Immune Thrombocytopenia:** The American Society of Hematology has updated guidelines for ITP (2019). For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to a corticosteroid, a thrombopoietin receptor agonist (Nplate or Promacta® [eltrombopag tablets and oral suspension]) or a splenectomy are recommended.[2] In children with newly diagnosed ITP who have non-life-threatening mucosal bleeding, corticosteroids are recommended. For children who have non-life-threatening mucosal bleeding and do not respond to first-line treatment, thrombopoietin receptor agonists are recommended.
- **Myelodysplastic Syndrome (MDS):** NCCN recommendations regarding MDS (version 1.2023 – September 12, 2022) state to consider treatment with a thrombopoietin receptor agonist in patients with lower-risk MDS who have severe or life-threatening thrombocytopenia.[3] Data are available that describe the use of Nplate in patients with MDS.[4-13] The data with Nplate are discussed noting an increased rate of platelet response and decreased overall bleeding events among patients with low to intermediate risk MDS.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Nplate. All approvals are provided for the duration noted below. Regarding the approval duration of one dose, the approval is for 30 days, which is an adequate duration for the patient to receive one dose. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nplate as well as the monitoring required for adverse events and efficacy, approval for some indications requires Nplate to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Nplate is recommended in those who meet one of the following criteria:

FDA-Approved Indications

7. **Hematopoietic Syndrome of Acute Radiation Syndrome.** Approve for one dose if the patient has been acutely exposed to myelosuppressive doses of radiation.

8. **Immune Thrombocytopenia.** Approve if the patient meets one of the following criteria (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets all of the following criteria (i, ii, and iii):
     - **i.** Patient meets one of the following (a or b):
       - **a)** Patient has a platelet count < 30 x 10^9/L (< 30,000/mcL); OR
       - **b)** Patient meets both of the following [(1) and (2)]:
         - Patient has a platelet count < 50 x 10^9/L (< 50,000/mcL); AND
         - According to the prescriber the patient is at an increased risk of bleeding; AND
     - **ii.** Patient meets one of the following (a or b):
       - **a)** Patient has tried at least one other therapy; OR
         Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Promacta (eltrombopag tablets and oral suspension), Tavalisse (fostamatinib tablets), Doptelet (avatrombopag tablets), or ritixumab.
       - **b)** Patient has undergone splenectomy; AND
     - **iii.** Medication is prescribed by or in consultation with a hematologist; OR
   - **B)** Patient is Currently Receiving Nplate. Approve for 1 year if the patient meets both of the following criteria (i and ii):
     - **iii.** According to the prescriber the patient demonstrates a beneficial clinical response; AND
       Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes.
     - **iv.** Patient remains at risk for bleeding complications.

Other Uses with Supportive Evidence

3. **Thrombocytopenia, Chemotherapy-Induced.** Approve if the patient meets one of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets all of the following (i, ii, iii, and iv):
     - **i.** Patient is ≥ 18 years of age; AND
     - **ii.** Patient has a platelet count < 100 x 10^9/L (< 100,000/mcL); AND
     - **iii.** Patient meets one of the following (a or b):

a) Patient has thrombocytopenia at least 3 weeks after the most recent dose of chemotherapy; OR

b) Patient has experienced a delay in chemotherapy administration related to thrombocytopenia; AND

iv. Medication is prescribed by or in consultation with a hematologist or an oncologist; OR

B) Patient is Currently Receiving Nplate. Approve for 6 months if the patient meets the following criteria (i, ii, and iii):

i. Patient is ≥ 18 years of age; AND

ii. Patient continues to receive treatment with chemotherapy; AND

iii. Patient demonstrates a beneficial clinical response according to the prescriber.

Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or decreased frequency of bleeding episodes.

4. Thrombocytopenia in Myelodysplastic Syndrome. Approve if the patient meets one the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets all of the following criteria (i, ii, and iii):

i. Patient has low- to intermediate-risk myelodysplastic syndrome; AND

ii. Patient meets one of the following (a or b):

a) Patient has a platelet count < 30 x 10^9/L (< 30,000/mcL); OR

b) Patient meets both of the following [(1) and (2)]:

(1) Patient has a platelet count < 50 x 10^9/L (< 50,000/mcL); AND

(2) According to the prescriber the patient is at an increased risk for bleeding; AND

iii. Medication is prescribed by or in consultation with a hematologist or an oncologist; OR

B) Patient is Currently Receiving Nplate. Approve for 1 year if the patient meets both of the following criteria (i and ii):

i. According to the prescriber the patient demonstrates a beneficial clinical response; AND

Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or decreased frequency of bleeding episodes.

ii. Patient remains at risk for bleeding complications.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nplate is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Promacta Prior Authorization Policy
- Promacta® (eltrombopag tablets and oral suspension – Novartis)

REVIEW DATE: 04/12/2023

OVERVIEW

Promacta, a thrombopoietin receptor agonist, is indicated for the following uses:[1]

- **Aplastic anemia**, severe, in combination with standard immunosuppressive therapy for the first-line treatment of adults and pediatric patients ≥ 2 years of age as well as for treatment in patients who have had an insufficient response to immunosuppressive therapy.
- **Chronic hepatitis C, treatment of thrombocytopenia**, to allow the initiation and maintenance of interferon-based therapy.
- **Immune thrombocytopenia (ITP), treatment, in adults and pediatric patients ≥ 1 year of age** with persistent or chronic ITP who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy. Of note, Promacta should only be used in patients whose degree of thrombocytopenia and clinical condition increase the risk for bleeding.

For patients with refractory severe aplastic anemia, if no hematologic response has occurred after 16 weeks of treatment with Promacta, discontinue therapy. For ITP, Promacta should be discontinued if the platelet count does not increase to a level sufficient to avoid clinically important bleeding after 4 weeks of therapy with Promacta at the maximum daily dose of 75 mg. Use Promacta only in patients with chronic hepatitis C whose degree of thrombocytopenia prevents the initiation of interferon-based therapy or limits the ability to maintain interferon-based therapy.[1] The safety and efficacy of Promacta have not been established in combination with direct-acting antiviral agents used without interferon for the treatment of chronic hepatitis C infection. For the management of chronic hepatitis C, Promacta should be stopped upon discontinuation of antiviral treatment futility.

Guidelines

Promacta is addressed in several guidelines.

- **Aplastic Anemia:** Guidelines for the diagnosis and management of adults with aplastic anemia are available from the British Society for Standards in Hematology (2016).[2] Immunosuppressive therapy is recommended first-line for non-severe aplastic anemia in patients requiring treatment, severe or very severe aplastic anemia in patients who lack a matched sibling donor, and severe or very severe aplastic anemia in patients between 35 to 50 years of age. Other recommended immunosuppressives have been studied (e.g., mycophenolate mofetil, sirolimus, corticosteroids) but expertise should be provided prior to consideration of such agents. Hematopoietic stem cell transplantation (HSCT) is also recommended in certain circumstances. Promacta is an option is some clinical scenarios (e.g., heavily pre-treated patients, those unsuitable for HSCT).
- **Immune Thrombocytopenia (ITP):** In 2019, the American Society of Hematology updated guidelines for ITP.[3] There are several recommendations. For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to corticosteroid, a thrombopoietin receptor agonist (Promacta or Nplate® [romiplostim subcutaneous injection]) or a splenectomy are recommended. In children with newly diagnosed ITP who have non-life-threatening mucosal bleeding, corticosteroids are recommended. For children who have non-life-threatening mucosal bleeding and did not respond to first-line treatment, thrombopoietin receptor agonists are

recommended. Other treatment options in children and adults include intravenous immunoglobulin, anti-D immunoglobulin, and rituximab.

- **Myelodysplastic Syndrome (MDS):** Recommendations from the National Comprehensive Cancer Network for MDS (version 1.2023 – September 12, 2022) state that treatment with a thrombopoietin receptor agonist should be considered in patients with lower-risk MDS who have severe or life-threatening thrombocytopenia.[4] The data with Promacta are discussed noting an increased rate of platelet response and decreased overall bleeding events in patients with low- to intermediate-risk MDS. Other data are also available that describe the use of Promacta in patients with MDS.[5-7]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Promacta. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Promacta as well as the monitoring required for adverse events and long-term efficacy, approval requires Promacta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Promacta is recommended in those who meet one of the following criteria:

FDA-Approved Indications

9. Aplastic Anemia. Approve if the patient meets one of the following criteria (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets the following criteria (i, ii, and iii):

i. Patient has low platelet counts at baseline (pretreatment); AND
Note: An example of a low platelet count is < 30 x 10^9/L (< 30,000/mcL).

ii. Patient meets one of the following criteria (a or b):

a) Patient had tried at least one immunosuppressant therapy; OR
Note: Examples of therapies are cyclosporine, Atgam (lymphocyte immune globulin, anti-thymocyte globulin [equine] sterile solution for intravenous use only), mycophenolate mofetil, or sirolimus.

b) Patient will be using Promacta in combination with standard immunosuppressive therapy; AND
Note: Examples of therapies are cyclosporine, Atgam (lymphocyte immune globulin, anti-thymocyte globulin [equine] sterile solution for intravenous use only), mycophenolate mofetil, or sirolimus.

iii. Promacta is prescribed by or in consultation with a hematologist; OR

B) Patient is Currently Receiving Promacta. Approve for 1 year if, according to the prescriber, the patient demonstrates a beneficial clinical response.
Note: Examples include increases in platelet counts, reduction in red blood cell transfusions, hemoglobin increase, and/or absolute neutrophil count increase.

10. Immune Thrombocytopenia. Approve if the patient meets one of the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets all of the following criteria (i, ii, and iii):

i. Patient meets one of the following criteria (a or b):

a) Patient has a platelet count < 30 x 10^9/L (< 30,000/mcL); OR

b) Patient meets both of the following criteria [(1) and (2)]:

- Patient has a platelet count < 50 x 10^9/L (< 50,000/mcL); AND
- According to the prescriber the patient is at an increased risk for bleeding; AND

ii. Patient meets one of the following criteria (a or b):

a) Patient has tried at least one other therapy; OR

Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Nplate (romiplostim subcutaneous injection), Tavalisse (fostamatinib tablets), Doptelet (avatrombopag tablets), or rituximab.

b) Patient has undergone splenectomy; AND

iii. The medication is prescribed by or in consultation with a hematologist; OR

B) Patient is Currently Receiving Promacta. Approve for 1 year if the patient meets both of the following criteria (i and ii):

i. According to the prescriber, the patient demonstrates a beneficial clinical response; AND

Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes.

ii. Patient remains at risk for bleeding complications.

11. Thrombocytopenia in a Patient with Chronic Hepatitis C. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient has low platelet counts at baseline (pretreatment); AND

Note: An example of a low platelet count is < 75 x 10^9/L (< 75,000/mcL).

B) Patient will be receiving interferon-based therapy for chronic hepatitis C; AND

Note: Examples of therapies are pegylated interferon (Pegasys [peginterferon alfa-2a injection], PegIntron [peginterferon alfa-2b injection]), or Intron A (interferon alfa-2b).

C) The medication is prescribed by or in consultation with a gastroenterologist, a hepatologist, or a physician who specializes in infectious disease.

Other Uses with Supportive Evidence

4. Thrombocytopenia in a Patient with Myelodysplastic Syndrome. Approve if the patient meets one of the following criteria (A or B):

B) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and, iii):

a. Patient has low- to intermediate-risk myelodysplastic syndrome; AND

b. Patient meets one of the following criteria (a or b):

a) Patient has a platelet count < 30 x 10^9/L (< 30,000/mcL); OR

b) Patient meets one of the following criteria [(1) and (2)]:

(1) Patient has a platelet count < 50 x 10^9/L (< 50,000/mcL); AND

(2) According to the prescriber, the patient is at an increased risk for bleeding; AND

c. The medication is prescribed by or in consultation with a hematologist or an oncologist; OR

B) Patient is Currently Receiving Promacta. Approve for 1 year if the patient meets both of the following criteria (i and ii):

iii. According to the prescriber, the patient demonstrates a beneficial clinical response; AND

Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or decreased frequency of bleeding episodes.

iv. Patient remains at risk for bleeding complications.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Promacta is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Tavalisse Prior Authorization Policy
- Tavalisse® (fostamatinib disodium hexahydrate tablets – Rigel/Patheon Whitby)

REVIEW DATE: 04/12/2023

OVERVIEW

Tavalisse, a tyrosine kinase inhibitor with demonstrated activity against spleen tyrosine kinase, is indicated for the treatment of thrombocytopenia in adults with **chronic immune thrombocytopenia** (ITP) who have had an insufficient response to a previous treatment.[1]

The safety and efficacy of Tavalisse have not been established in pediatric patients. Use of Tavalisse is not recommended for patients < 18 years of age because adverse events on actively growing bones were observed in nonclinical studies. Discontinue Tavalisse if after 12 weeks of treatment, the platelet count does not increase to a sufficient level to control bleeding.

Guidelines

In 2019, the American Society of Hematology updated guidelines for ITP.[2] Tavalisse is noted as an agent that has been studied in the third-line setting and its role is not specifically addressed. However, there are several other recommendations. For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to corticosteroid, a thrombopoietin receptor agonist (either Promacta® [eltrombopag tablets and oral suspension] or Nplate® [romiplostim subcutaneous injection]) or a splenectomy are recommended. Other treatment options in children and adults include intravenous immunoglobulin, anti-D immunoglobulin, and rituximab.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tavalisse. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tavalisse as well as the monitoring required for adverse events and long-term efficacy, approval requires Tavalisse to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tavalisse is recommended in those who meet the following criteria:

FDA-Approved Indication

16. Chronic Immune Thrombocytopenia. Approve if the patient meets one of the following criteria (A or B):

M) Initial Therapy. Approve for 3 months if the patient meets all of the following criteria (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND

ii. Patient meets one of the following criteria (a or b):
- **a)** Patient has a platelet count < 30 x 10^9/L (< 30,000/mcL): OR
- **b)** Patient meets both of the following criteria [(1) and (2)]:
  - **1.** The patient has a platelet count < 50 x 10^9/L (< 50,000/mcL); AND
  - **2.** According to the prescriber, the patient is at an increased risk of bleeding; AND

iii. Patient meets one of the following criteria (a or b):
- (1) Patient has tried at least one other therapy; OR
  Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Promacta (eltrombopag tablets and oral suspension), Nplate (romiplostim subcutaneous injection), Doptelet (avatrombopag tablets), or rituximab.
- (2) Patient has undergone splenectomy; AND

iv. The medication is prescribed by or in consultation with a hematologist; OR

B) Patient is Currently Receiving Tavalisse. Approve for 1 year if the patient meets both of the following criteria (i and ii):

iii. According to the prescriber, the patient demonstrates a beneficial clinical response; AND
Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes; AND

iv. Patient remains at risk for bleeding complications.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tavalisse is not recommended in the following situations:

5. **B-Cell Lymphomas.** Tavalisse has been investigated in patients with various B-cell lymphomas (e.g., non-Hodgkin's lymphoma, diffuse large B-cell lymphoma [DLBCL]).[3,4] Many other therapies are available for this use.

6. **Rheumatoid Arthritis.** Although Tavalisse has been studied in patients with rheumatoid arthritis, other therapies are more well-established and are recommended in guidelines.[5-9]

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Tolvaptan Products – Jynarque Prior Authorization Policy
- Jynarque® (tolvaptan tablets – Otsuka)

REVIEW DATE: 06/28/2023

OVERVIEW

Jynarque, a selective vasopressin V_2-receptor antagonist, is indicated to slow kidney function decline in adults at risk of rapidly-progressing **autosomal dominant polycystic kidney disease** (ADPKD).[1]

Disease Overview

ADPKD is a heterogeneous, inherited kidney disorder associated with the development of kidney cysts, which result in kidney pain, hypertension, renal failure, and other clinical sequelae.[2-5] The condition is a common cause of end-stage renal disease; however, other organs are also impacted (e.g., hepatic and vascular systems). Progressive kidney enlargement occurs; however, manifestations generally do not occur until later in life (fourth decade) due to compensatory renal mechanisms. If a parent has the condition, a child has a 50% chance of inheritance. Approximately 600,000 people in the US have this condition.

Guidelines

The European Renal Association Working Groups on Inherited Kidney Disorders, the European Rare Kidney Disease Reference Network, and the Polycystic Kidney Disease International published a consensus statement regarding use of tolvaptan in ADPKD (2022).[7] A confirmed annual estimated glomerular filtration rate decline ≥ 3.0 mL/min/1.73 m^2 over a period of ≥ 4 years defines rapid progression. Also, a Mayo Classification of 1D or 1E indicates rapid disease progression. Patients with Mayo Classification of 1C should be further evaluated for additional evidence of rapid disease progression. Total kidney volume changes should not be used as a marker of progression in individual patients. Finally, Jynarque should be discontinued when the patient approaches kidney failure (i.e., the need for renal replacement therapy).

The National Kidney Foundation and the Polycystic Kidney Disease Foundation list tolvaptan as an FDA-approved treatment option for patients with ADPKD.[5,8]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Jynarque. All approvals are provided for the duration noted below. Due to the specialized skills required for evaluation and diagnosis of patients treated with Jynarque as well as the monitoring required for adverse events and long-term efficacy, approval requires Jynarque to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Jynarque is recommended in those who meet the following:

FDA-Approved Indication

17. **Autosomal Dominant Polycystic Kidney Disease.** Approve for 1 year if the patient meets the following (A, B, C, and D):
    N) Patient is ≥ 18 years of age; AND
    O) According to the prescriber, the patient has rapidly-progressing autosomal dominant polycystic kidney disease; AND
    Note: Examples of rapidly declining renal function include estimated glomerular filtration rate decline of ≥ 3.0 mL/min/1.73 m^2, and Mayo Classification of 1D or 1E.
    P) Patient does not have Stage 5 chronic kidney disease; AND
    Note: Stage 5 chronic kidney disease is defined as glomerular filtration rate < 15 mL/min/1.73 m^2 or receiving dialysis.
    Q) The medication is prescribed by or in consultation with a nephrologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Jynarque is not recommended in the following situations:

8. **Patient is Currently Receiving Samsca (tolvaptan tablets).** Samsca is a tolvaptan product that is indicated for the treatment of clinically-significant hypervolemic and euvolemic hyponatremia, including patients with heart failure and syndrome of inappropriate antidiuretic hormone (SIADH).[6] Concomitant use is not recommended.

9. **Hyponatremia.** Samsca is another tolvaptan product indicated for the treatment of clinically-significant hypervolemic and euvolemic hyponatremia (serum sodium < 125 mEq/L or less marked hyponatremia that is symptomatic and has resisted correction and fluid restriction), including patients with heart failure and SIADH. Samsca should be used for this condition.

10. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Tolvaptan Products – Tolvaptan (Samsca) Prior Authorization Policy
- Samsca® (tolvaptan tablets – Otsuka, generic)

REVIEW DATE: 06/28/2023

OVERVIEW

Tolvaptan (Samsca, generic), a selective vasopressin V_2-receptor antagonist, is indicated for the treatment of **clinically significant hypervolemic and euvolemic hyponatremia** (serum sodium < 125 mEq/L or less marked hyponatremia that is symptomatic and has resisted correction with fluid restriction), including patients with heart failure and syndrome of inappropriate antidiuretic hormone (SIADH). Patients requiring intervention to raise serum sodium urgently to prevent or to treat serious neurological symptoms should not be treated with Samsca. It has not been established that raising serum sodium with Samsca provides a symptomatic benefit to patients.

Clinical Data

Two trials (Study of Ascending Levels of Tolvaptan in Hyponatremia 1 and 2 [SALT-1 and SALT-2; n = 424]) demonstrated that Samsca increased serum sodium effectively in patients with euvolemic or hypervolemic hyponatremia that was due to many underlying causes (e.g., heart failure, liver cirrhosis, SIADH).[1,2] Patients ≥ 18 years of age received therapy for 30 days with Samsca or placebo and were followed for an additional 7 days after study withdrawal. Patients in the trial had a serum sodium < 135 mEq/L at study entry (baseline 129 mEq/L). In both trials, Samsca therapy led to a greater increase in serum sodium compared with baseline for the measured endpoints at Day 4 and Day 30. The effects of sustained serum sodium were demonstrated for up to 1 year in an open-label study.[1]

SALTWATER (the Safety and sodium Assessment of Long-term Tolvaptan With hyponatremia: A year-long, open-label Trial to gain Experience under Real-world conditions [SALTWATER]) was an open-label extension study of the SALT-1 and SALT-2 trials.[1,3] Patients were eligible if they had completed either SALT-1 or SALT-2 and had a need and desire to continue therapy. There were 111 patients enrolled in the study with a mean baseline serum sodium concentration of 130.8 ± 4.4 mmol/L. Patients received Samsca for a mean of 701 days (1.92 years). Serum sodium concentrations increased to a mean of > 135 mmol/L by Day 14 and remained above this level at all observation time points going forward. Upon discontinuation of tolvaptan, the serum sodium concentration declined by ≥ 3 mmol/L in 68% of patients and an equal amount had serum sodium concentrations fall to < 135 mmol/L. One patient discontinued tolvaptan due to hypernatremia.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of tolvaptan. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of tolvaptan is recommended in those who meet the following criteria:

FDA-Approved Indication

12. Hyponatremia. Approve for the duration noted if patient meets ONE of the following (A or B):
- **A)** Initial Therapy. Approve for 30 days if the patient meets the following (i and ii):
  - **i.** Patient is ≥ 18 years of age; AND
  - **ii.** Patient meets ONE of the following criteria (a, b, or c):
    - **a)** Patient has a serum sodium < 125 mEq/L at baseline; OR
    - **b)** Patient meets the following criteria [(1) and (2)]:
      - **(1)** Patient has less marked hyponatremia, defined as serum sodium < 135 mEq/L at baseline; AND
      - **(2)** Patient has symptomatic hyponatremia; OR
        Note: Symptoms of hyponatremia include nausea, vomiting, headache, lethargy, confusion.
    - **c)** Patient has already been started on tolvaptan and has received < 30 days of therapy.
      Note: For a patient who has been started on tolvaptan and has received < 30 days of therapy, approve for a sufficient duration to complete 30 total days of therapy.
- **B)** Patient is Currently Receiving Tolvaptan. Approve for 3 months if the patient meets the following (i and ii):
  - **i.** Patient has been established on therapy for at least 30 days; AND
    Note: A patient who has received < 30 days of therapy or is restarting therapy is reviewed under criterion A (Initial Therapy).
  - **ii.** Patient meets at least one of the following (a or b):
    - **a)** According to the prescriber, the serum sodium level has increased from baseline (prior to initiating the requested drug); OR
    - **b)** According to the prescriber, patient experienced improvement in at least one symptom, such as nausea, vomiting, headache, lethargy, or confusion.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of tolvaptan is not recommended in the following situations:

11. Autosomal Dominant Polycystic Kidney Disease (ADPKD). Jynarque® (tolvaptan tablets) is another tolvaptan product that is indicated to slow kidney function decline in adults at risk of rapidly-progressing ADPKD. The recommended dosing differs.[4] The Samsca prescribing information states that tolvaptan should not be prescribed or used to treat ADPKD outside of the FDA-approved Risk Evaluation and Mitigation Strategies for ADPKD.[1]

12. Patient is Currently Receiving Jynarque. Jynarque is another tolvaptan product that is indicated to slow kidney function decline in adults at risk of rapidly-progressing ADPKD. Concomitant use is not recommended.

13. Patients Requiring Intervention to Raise Serum Sodium Urgently to Prevent or to Treat Serious Neurological Symptoms. Samsca has not been studied in a setting of urgent need to raise serum sodium acutely.[1]

14. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Acne – Winlevi Prior Authorization Policy
- Winlevi® (clascoterone 1% cream – Sun)

REVIEW DATE: 12/20/2023

OVERVIEW

Winlevi, an androgen receptor inhibitor, is indicated for the topical treatment of **acne vulgaris** in patients ≥ 12 years of age.[1]

Safety

Winlevi is the only topical acne product with a Warning about hypothalamic-pituitary-adrenal (HPA) axis suppression.[1] This may result when Winlevi is used over large surface areas or if use is prolonged. In addition, pediatric patients may be more susceptible. This adverse event was not observed in the pivotal studies or in the long-term open-label extension study. However, it was observed in a small group of patients on Day 14 in a pharmacokinetic study. Normal HPA axis function was observed at follow-up at 4 weeks after end of treatment.

Guidelines

The most recent guidelines for management of acne from the American Academy of Dermatology was published in 2016, before the approval of Winlevi.[2] Topical therapies, either as monotherapy or in combination with other topical agents or oral agents, are recommended for initial control and maintenance therapy of acne. Topical retinoids (tretinoin, adapalene, tazarotene) are the cornerstone of acne management due to their comedolytic and anti-inflammatory properties. Other topical therapies mentioned in the guidelines for management and treatment of acne include antibiotics (e.g., clindamycin, erythromycin), azelaic acid, dapsone, and salicylic acid.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Winlevi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Winlevi is recommended in those who meet the following criteria:

FDA-Approved Indication

1. Acne Vulgaris. Approve for 1 year if the patient meets the following (A, B, and C):
- **13.** Patient is ≥ 12 years of age; AND
- **14.** Patient has tried at least one prescription topical retinoid.

QQQ) Note: Examples of a prescription topical retinoid are adapalene (Differin, generic), Aklief (trifarotene 0.005% cream), tazarotene 0.1% cream (Tazorac, generic), taxarotene 0.1% gel (Tazorac, generic), and tretinoin; AND
- **15.** Patient has tried at least three other prescription topical therapies.

Note: Examples of other prescription topical therapies for acne include: dapsone gel (Aczone, generic), Azelex (azelaic acid 20% cream), topical clindamycin, topical erythromycin, and topical minocycline (Amzeeq [minocycline 4% foam]).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Winlevi is not recommended in the following situations:

15. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

1. Winlevi® cream [prescribing information]. Cranbury, NJ: Sun; July 2022.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Acyclovir Products Prior Authorization Policy
- Zovirax® (acyclovir 5% cream –Bausch Health, generic)
- Zovirax® (acyclovir 5% ointment – Bausch Health, generic)

REVIEW DATE: 07/26/2023

OVERVIEW

Acyclovir 5% cream (Zovirax, generic) is indicated for the treatment of **recurrent herpes labialis (cold sores)** in immunocompetent patients ≥ 12 years of age.[1]

Acyclovir 5% ointment (Zovirax, generics) is indicated for the following uses:[2]
- **Genital herpes**, initial treatment.
- **Limited non-life-threatening mucocutaneous herpes simplex virus infections**, in immunocompromised patients.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of topical acyclovir products. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of acyclovir 5% cream (Zovirax 5% cream, generic) is recommended in those who meet the following criteria:

FDA-Approved Indication

3. Herpes Labialis (Cold Sores). Approve for 1 year if the patient meets the following (A and B):
- **a)** Patient is ≥ 12 years of age; AND
- **b)** Patient is immunocompetent.

II. Coverage of acyclovir 5% ointment (Zovirax 5% ointment, generic) is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. Genital Herpes. Approve for 1 year if the patient meets one of the following (A or B):
- **A)** Generic acyclovir 5% ointment is requested; OR
- **B)** Patient meets the following (i and ii):
  - **i.** Patient has tried generic acyclovir 5% ointment; AND
  - **ii.** Patient cannot use the generic product due to a formulation difference in the inactive ingredient(s) [e.g., difference in buffers, emollients, emulsifiers, preservatives, surfactants]

between the brand and the bioequivalent generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

2. **Limited Non-Life-Threatening Mucocutaneous Herpes Simplex Virus Infections.** Approve for 1 year if the patient meets one of the following (A and B):
   - **A)** Patient is immunocompromised; AND
   - **B)** Patient meets one of the following (i or ii):
     - **i.** Generic acyclovir 5% ointment is requested; OR
     - **ii.** Patient meets the following criteria (a and b):
       - **a)** Patient has tried generic acyclovir 5% ointment; AND
       - **b)** Patient cannot use the generic product due to a formulation difference in the inactive ingredient(s) [e.g., difference in buffers, emollients, emulsifiers, preservatives, surfactants] between the brand and the bioequivalent generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of topical acyclovir products are not recommended in the following situation:

1. **Shingles (Herpes Zoster).** Shingles is a viral infection caused by the varicella zoster virus, the same virus that causes chickenpox.[3] The Centers for Disease Control and Prevention cite the use of oral antivirals (acyclovir capsules/tablets/suspension, famciclovir tablets, and valacyclovir caplets) for the treatment of shingles. Oral antivirals speed healing and reduce the risk of complications. Topical antivirals are not noted as treatment options for shingles.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Alpha-Adrenergic Agonists for Rosacea – Brimonidine Prior Authorization Policy
- Mirvaso® (brimonidine gel, 0.33% – Galderma, generic)

REVIEW DATE: 01/25/2023; selected revision 03/01/2023

OVERVIEW

Brimonidine 0.33% gel, an alpha$_2$-adrenergic agonist, is indicated for the topical treatment of persistent (non transient) **facial erythema of rosacea** in patients ≥ 18 years of age.[1]

Brimonidine 0.33% gel has been shown to decrease the erythema associated with rosacea; brimonidine 0.33% gel has not been shown to exert any beneficial effects on inflammatory lesions.[1-3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Mirvaso/brimonidine 0.33% gel. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mirvaso/brimonidine 0.33% gel is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Facial Erythema.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has facial erythema due to rosacea.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mirvaso/brimonidine 0.33% gel is not recommended in the following situations:

16. **Erythema Caused by Conditions Other Than Rosacea**.

17. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Alpha-Adrenergic Agonists for Rosacea – Rhofade Prior Authorization Policy
- Rhofade® (oxymetazoline 1% hydrochloride cream – EPI Health)

REVIEW DATE: 06/28/2023

OVERVIEW

Rhofade, an alpha$_{1A}$-adrenergic agonist, is indicated for the topical treatment of persistent **facial erythema associated with rosacea** in adults.[1]

Rhofade has been shown to decrease the erythema associated with rosacea and has not been shown to exert any beneficial effects on inflammatory lesions.[1-3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rhofade. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rhofade is recommended in those who meet the following criteria:

FDA-Approved Indication

2. Facial Erythema. Approve for 1 year if the patient meets both of the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has facial erythema associated with rosacea.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rhofade is not recommended in the following situations:

18. Erythema Caused by Conditions Other Than Rosacea.

19. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Anesthetic – Lidocaine, Tetracaine Products Prior Authorization with Step Therapy Policy
- Pliaglis® (lidocaine 7%/tetracaine 7% topical cream – Taro/Oba, generic)
- Synera® (lidocaine 70 mg/tetracaine 70 mg topical patches – Galen [obsolete 2022])

REVIEW DATE: 05/24/2023

OVERVIEW

Lidocaine 7%/tetracaine 7% topical cream (Pliaglis, generic) is indicated to provide topical local analgesia for **superficial dermatological procedures** (e.g., dermal filler injection, pulsed dye laser therapy, facial laser resurfacing, laser-assisted tattoo removal) in adults, for use on intact skin.[1]

Synera is indicated to provide local dermal analgesia in patients ≥ 3 years of age on intact skin for the following uses:[2]
- **Superficial dermatological procedures**.
- **Venipuncture or intravenous cannulation**.

Lidocaine cream and combination lidocaine/prilocaine cream are other topical local anesthetics used for various conditions.[3,4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of lidocaine 7%/tetracaine 7% topical cream (Pliaglis, generic) and Synera. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of lidocaine 7%/tetracaine 7% topical cream (Pliaglis, generic) is recommended in those who meet the following criteria:

FDA-Approved Indication

17. Superficial Dermatological Procedures. Approve for 1 week if the patient meets all of the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The procedure is for a non-cosmetic condition; AND
- **C)** The medication will be applied to intact skin; AND
- **D)** Patient has tried both of the following topical anesthetics (i and ii):
  - **i.** One lidocaine cream product; AND
  - **ii.** One lidocaine/prilocaine cream product.

II. Coverage of Synera is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Superficial Dermatological Procedures.** Approve for 1 week if the patient meets all of the following criteria (A, B, C, and D):
   - **A)** Patient is ≥ 3 years of age; AND
   - **B)** The procedure is for a non-cosmetic condition; AND
   - **C)** The medication will be applied to intact skin; AND
   - **D)** Patient has tried both of the following topical anesthetics (i and ii):
     - **i.** One lidocaine cream product; AND
     - **ii.** One lidocaine/prilocaine cream product.

2. **Venipuncture or Intravenous Cannulation.** Approve for 1 week if the patient meets all of the following criteria (A, B, and C):
   - **A)** Patient is ≥ 3 years of age; AND
   - **B)** The medication will be applied to intact skin; AND
   - **C)** Patient has tried both of the following topical anesthetics (i and ii):
     - **i.** One lidocaine cream product; AND
     - **ii.** One lidocaine/prilocaine cream product.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of lidocaine 7%/tetracaine 7% topical cream (Pliaglis, generic) and Synera is not recommended in the following situations:

97. Cosmetic Conditions. Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.
Note: Examples of cosmetic conditions include dermal filler injection, pulsed dye laser therapy, facial laser resurfacing, and laser-assisted tattoo removal.

98. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Diclofenac Sodium 3% Gel Prior Authorization Policy
- diclofenac sodium 3% gel (generic only)

REVIEW DATE: 08/16/2023

OVERVIEW

Diclofenac sodium 3% gel, a nonsteroidal anti-inflammatory drug, is indicated for the topical treatment of **actinic keratoses**.[1] It is also noted in the labeling that sun avoidance is indicated during therapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) Squamous Cell Skin Cancer guidelines (version 1.2023 – March 10, 2023) cite topical diclofenac (formulation is not specified) as a treatment option for the treatment of actinic keratoses.[2] The guidelines also note diclofenac as a (potential) treatment option for the treatment of actinic keratosis on the lips (actinic cheilitis); other treatment options are: surgical vermillionectomy, lip shave, electrodessication, laser vermilion ablation, laser resurfacing, 5-fluorouracil, laser + 5-fluorouracil, trichloroacetic acid chemical peel, photodynamic therapy, and photodynamic therapy plus imiquimod.

Other Uses

Disseminated Superficial Actinic Porokeratosis (DSAP)

Diclofenac gel is noted as a treatment that may be effective for DSAP.[3] Pharmacologic treatment options for DSAP include topical 5-fluorouracil, topical vitamin D_3 analogs, topical imiquimod, topical tacrolimus, oral retinoids (e.g., isotretinoin, acitretin) and topical retinoids (tretinoin, tazarotene), and diclofenac. Diclofenac was studied in an open-label study where patients (n = 17) received 12 weeks of therapy with diclofenac sodium 3% gel and at the end of 12 weeks, treatment could be extended for an additional 12 weeks.[4] At Week 12, the target area lesions (treated lesions) had a mean reduction of 4% vs. a 12% mean increase in the total body lesions (global). Ten patients received 24 weeks of treatment and there was a mean increase of 10% in lesions in the target area vs. a 19% increase in global lesions.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of diclofenac sodium 3% gel. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of diclofenac sodium 3% gel is recommended in those who meet one of the following criteria:

FDA-Approved Indication

16. Actinic Keratoses. Approve for 6 months.

Other Uses with Supportive Evidence

17. **Actinic Cheilitis (Actinic Keratoses of the Lip[s]).** Approve for 6 months.

3. **Disseminated Superficial Actinic Porokeratosis.** Approve for 6 months if the patient has tried at least two other therapies used for the management of disseminated superficial actinic porokeratosis. Note: Examples of therapies for management of disseminated superficial actinic porokeratosis include topical 5-fluorouracil (5-FU), imiquimod, topical corticosteroids, topical vitamin D_3 analogs, topical or oral retinoids, cryotherapy, photodynamic therapy, and laser.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of diclofenac sodium 3% gel is not recommended in the following situations:

20. **Osteoarthritis (OA).** The benefit of topical diclofenac gel 3% in osteoarthritis is uncertain. There has been one small, randomized, placebo-controlled study assessing the efficacy of a topical diclofenac 3%/sodium hyaluronate 2.5% gel (Canadian formulation) applied as 2 grams four times daily to one joint for 2 weeks in patients (n = 119) with uncontrolled OA pain despite chronic (≥ 1 month) oral nonsteroidal anti-inflammatory drug (NSAID) use.[5] The addition of topical diclofenac 3%/sodium hyaluronate to oral NSAID therapy resulted in only marginally greater analgesic effect than NSAID alone. Other topical agents are indicated for this use.

21. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Retinoids – Aklief Prior Authorization Policy
- Aklief® (trifarotene cream – Galderma)

REVIEW DATE: 12/20/2023

OVERVIEW
Aklief, a topical retinoid, is indicated for the topical treatment of **acne vulgaris** in patients ≥ 9 years of age.[1]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Aklief. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Aklief is recommended in those who meet the following criteria:

FDA-Approved Indication

18. Acne Vulgaris. Approve for 1 year if the patient is ≥ 9 years of age.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Aklief is not recommended in the following situations:

22. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

14. Aklief® cream [prescribing information]. Fort Worth, TX: Galderma; January 2022.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Retinoids – Panretin Prior Authorization Policy
- Panretin® (alitretinoin topical gel – Eisai)

REVIEW DATE: 08/02/2023

OVERVIEW

Panretin, a topical retinoid, is indicated for the topical treatment of cutaneous lesions in patients with Acquired Immunodeficiency Syndrome (AIDS)-related **Kaposi sarcoma**.[1] It is not indicated when systemic anti-Kaposi sarcoma therapy is required (e.g., more than 10 new Kaposi sarcoma lesions in the prior month, symptomatic lymphedema, symptomatic pulmonary Kaposi sarcoma, or symptomatic visceral involvement). Per the prescribing information, there is no experience to date using Panretin gel with systemic anti-Kaposi sarcoma treatment.

RRR)

SSS) Guidelines

Use of Panretin is addressed in the National Comprehensive Cancer Network guidelines for Kaposi sarcoma (version 1.2023 – December 20, 2022).[2] Topical agents are among the first-line therapy recommendations for symptomatic and/or cosmetically unacceptable cutaneous disease; this applies both for patients with human immunodeficiency virus (HIV) and patients without HIV. Panretin is listed as an option for topical treatment (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Panretin. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Panretin, approval requires Panretin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Prior authorization and prescription benefit coverage are not recommended for cosmetic uses.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Panretin is recommended in those who meet the following criteria:

FDA-Approved Indication

4. Kaposi Sarcoma. Approve for 1 year if the patient meets both of the following (A and B):
- **A)** Patient is not receiving systemic therapy for Kaposi sarcoma; AND
- **B)** The medication is prescribed by or in consultation with a dermatologist, oncologist, or infectious disease specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Panretin is not recommended in the following situations:

2. **Cosmetic Uses.** Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.
   Note (this is not an all-inclusive list): Examples of cosmetic conditions include actinic purpura, age spots (also called liver spots, solar lentigines, sun spots), melasma/cholasma, milia, mottled hyperpigmentation, mottled hypopigmentation, photo-aged or photo-damaged skin, pokiloderma (of Civatte), premature aging, scarring, sebaceous hyperplasia, seborrheic keratosis, skin laxity, skin roughness, solar elastosis, solar purpura, stretch marks, and wrinkles.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

234. Panretin® topical gel [prescribing information]. Woodcliff Lake, NJ: Eisai; June 2018.
235. The NCCN Kaposi Sarcoma Clinical Practice Guidelines in Oncology (version 1.2023 – December 20, 2022). © 2022 National Comprehensive Cancer Network. Available at: http://www.nccn.org. Accessed on July 25, 2023.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Retinoids – Tazarotene Products Prior Authorization Policy
- Arazlo™ (tazarotene 0.045% lotion – Bausch Health)
- Fabior® (tazarotene 0.1% foam – Mayne Pharma)
- Tazorac® (tazarotene 0.05% cream, 0.05% gel, 0.1% cream, and 0.1% gel – Allergan, generic to 0.1% cream only)

REVIEW DATE: 08/02/2023

OVERVIEW

Tazorac gel is indicated for the following uses:[1]
- **Plaque psoriasis**, in patients with up to 20% body surface area involvement (0.05% and 0.1% strengths).
- **Facial acne vulgaris,** in patients with mild to moderate severity (0.1% strength only).

Tazorac cream is indicated for the following uses:[2]
- **Plaque psoriasis** (0.05% and 0.1% strengths).
- **Acne vulgaris** (0.1% strength only).

Both Arazlo lotion and Fabior foam are indicated for the topical treatment of **acne vulgaris**.[3,4]

In addition to acne vulgaris and plaque psoriasis, topical tazarotene products have been used to treat other medical skin conditions, such as basal cell carcinoma and congenital ichthyoses.[5-13] Topical tazarotene products have also been used to treat cosmetic skin conditions such as wrinkles, premature aging, and treatment of photo-aged or photo-damaged skin.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of topical tazarotene products. All approvals are provided for the duration noted below.

Prior authorization and prescription benefit coverage are not recommended for cosmetic uses.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of topical tazarotene products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Acne Vulgaris.** Approve for 1 year.

2. **Plaque Psoriasis.** Approve for 1 year.

Other Uses with Supportive Evidence

3. **Treatment of Other Non-Cosmetic Conditions.** Approve for 1 year.
   Note: Examples of other non-cosmetic conditions include: acne keloidalis nuchae, basal cell carcinoma, comedonal acne, cystic acne, cutaneous T-cell lymphoma, ichthyosis (e.g., congenital lamellar, vulgaris, X-linked), keratoderma blennorrhagicum, keratosis (e.g., keratosis follicularis [Darier's disease], keratosis pilaris), mycosis fungoides, nail psoriasis, oral lichen planus, and warts.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of topical tazarotene products is not recommended in the following situations:

1. **Cosmetic Conditions.** Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.
   Note (this is not an all-inclusive list): Examples of cosmetic conditions include actinic purpura, age spots (also called liver spots, solar lentigines, sun spots), melasma/cholasma, milia, mottled hyperpigmentation, mottled hypopigmentation, photo-aged or photo-damaged skin, pokiloderma (of Civatte), premature aging, scarring, sebaceous hyperplasia, seborrheic keratosis, skin laxity, skin roughness, solar elastosis, solar purpura, stretch marks, and wrinkles.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Uplizna Prior Authorization Policy
- Uplizna® (inebilizumab-cdon intravenous infusion – Horizon Therapeutics)

REVIEW DATE: 07/12/2023

OVERVIEW

Uplizna, a CD19-directed cytolytic antibody, is indicated for the treatment of **neuromyelitis optica spectrum disorder** (NMOSD) in adults who are anti-aquaporin-4 antibody-positive.[1]

Disease Overview

NMOSD is a rare, relapsing, autoimmune central nervous system inflammatory disorder that can lead to significant morbidity and mortality.[2,3] The predominant symptoms are inflammation of the optic nerve (optic neuritis) and inflammation of the spinal cord (myelitis). Optic neuritis may lead to pain inside the eye and can progress to blindness. Myelitis tends to affect some, and often all, motor, sensory, and autonomic functions (bladder and bowel). Affected patients may experience pain in the spine or limbs, mild to severe paralysis of the lower limbs, and loss of bowel and bladder control. For acute attacks, typical treatment is high-dose intravenous corticosteroids.[2] Plasma exchange may be effective in patients who suffer acute severe attacks and who do not respond to intravenous corticosteroids. For long-term control of the disease (relapse prevention), a variety of immunosuppressive drugs are utilized as first-line therapy; most widely prescribed are corticosteroids, azathioprine, mycophenolate mofetil, and rituximab. Interleukin-6 signaling blocking agents (e.g., Enspryng® [satralizumab-mwge subcutaneous {SC} injection], Actemra [tocilizumab injection for intravenous {IV} or SC use]), Soliris® (eculizumab IV infusion), and IV immunoglobulins are also used for relapse prevention.[3] Note that of the listed agents, only Enspryng and Soliris are FDA-approved for NMOSD.[4,5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Uplizna. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Uplizna as well as the monitoring required for adverse events and long-term efficacy, approval requires Uplizna to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Uplizna is recommended in those who meet the following criteria:

FDA-Approved Indication

18. Neuromyelitis Optica Spectrum Disorder. Approve if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets the following (i, ii, iii, iv, and v):

- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Diagnosis of neuromyelitis optica spectrum disorder was confirmed by blood serum test for anti-aquaporin-4 antibody positive disease; AND
- **iii.** Patient is currently receiving or has previously tried two of the following systemic therapies (a, b, c, or d):
  - **a)** Azathioprine; OR
  - **b)** Corticosteroid; OR
  - **c)** Mycophenolate mofetil; OR
  - **d)** Rituximab; AND

  Note: An exception to the requirement for a trial of a systemic therapy can be made if the patient has already tried Soliris (eculizumab intravenous infusion) or Enspryng (satralizumab-mwge subcutaneous injection) for neuromyelitis optica spectrum disorder. Patients who have already tried Soliris or Enspryng for neuromyelitis optica spectrum disorder are not required to try another systemic agent.
- **iv.** Patient has a of at least one relapse in the last 12 months or two relapses in the last 2 years; AND
- **v.** The medication is being prescribed by or in consultation with a neurologist.

B) Patient is Currently Receiving Uplizna. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):

- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Diagnosis of neuromyelitis optica spectrum disorder was confirmed by blood serum test for anti-aquaporin-4 antibody-positive disease; AND
- **iii.** According to the prescriber, patient has had clinical benefit from the use of Uplizna; AND
  Note: Examples of clinical benefit include reduction in relapse rate, reduction in symptoms (e.g., pain, fatigue, motor function), and a slowing progression in symptoms.
- **iv.** The medication is being prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Uplizna is not recommended in the following situations:

99. Concomitant Use With a Rituximab Product, Soliris (eculizumab intravenous infusion), or Enspryng (satralizumab-mwge subcutaneous injection). There is no evidence to support additive efficacy of combining Uplizna with rituximab, Soliris, or Enspryng.

100. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vasculitis – Tavneos Prior Authorization Policy
- Tavneos™ (avacopan capsules – ChemoCentryx)

REVIEW DATE: 11/15/2023

OVERVIEW

Tavneos, a complement 5a receptor antagonist, is indicated as an adjunctive treatment for **severe active anti-neutrophil cytoplasmic autoantibody (ANCA)-associated vasculitis** (granulomatosis with polyangiitis [GPA] and microscopic polyangiitis [MPA]) in combination with standard therapy including glucocorticoids in adults.[1] Tavneos does not eliminate glucocorticoid use.[1]

Disease Overview

ANCA-associated vasculitis is a group of diseases, which includes GPA (Wegener's granulomatosis), MPA, and eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome).[2] Patients who have ANCA-associated vasculitis produce antibodies that cause inflammation, which damages small blood vessels. The clinical signs and symptoms vary and affect several organs, such as the kidney, lungs, stomach, and intestine. Many patients are positive for proteinase 3 or myeloperoxidase antibodies.[2] Patients normally undergo two phases of treatment; one designed to induce the remission of symptoms (induction treatment), and a second phase meant to keep patients in remission for as long as possible (maintenance treatment).[2] Response is measured by achieving remission or improvement of signs and symptoms, which can be assessed by improvement in the Birmingham Vasculitis Activity Score. Other indicators of clinical response include improvement in kidney function (i.e. improvement in estimated glomerular filtration rate), or decrease in urinary albumin creatinine ratio.[3]

Clinical Efficacy

The efficacy of Tavneos was evaluated in one Phase III, randomized, double-blind, active-controlled pivotal study that assessed the efficacy of Tavneos in patients with newly diagnosed or relapsing active ANCA-associated vasculitis.[3] Patients were randomized in a 1:1 ratio to receive Tavneos twice daily orally plus prednisone-matching placebo or a tapering oral regimen of prednisone plus Tavneos-matching placebo in a double-dummy design. Patients in both groups also received an immunosuppressive regimen (cyclophosphamide followed by azathioprine or mycophenolate mofetil; or rituximab). Patients included were positive for either proteinase 3 or myeloperoxidase antibodies.[3] Glucocorticoid use was allowed in each treatment group, if needed for certain situations.[3] The primary endpoints were remission at Week 26 and sustained remission at Week 52.[3] This pivotal trial demonstrated that Tavneos was noninferior but not superior to the prednisone taper with respect to remission at Week 26 and was superior to prednisone taper with respect to sustained remission at Week 52.[3]

Guidelines

The American College of Rheumatology/Vasculitis Foundation guidelines (2021) for the management of ANCA-associated vasculitis mention that a clinical trial of Tavneos in patients with GPA and MPA was published.[2] Treatment for ANCA-associated vasculitis is based on the severity of the disease, the disease status, and type. The following are recommendations from the guidelines for active, severe GPA/MPA. For remission induction, the guidelines recommend rituximab with reduced-dose glucocorticoids; cyclophosphamide may be used in certain clinical scenarios (i.e. contraindication or failure with rituximab).[2] If remission is not induced, the guidelines recommend switching to a different remission induction agent. For disease relapse, rituximab is recommended if the patient is not receiving rituximab

for remission maintenance; if the patient is taking rituximab for disease maintenance, the guidelines recommend switching from rituximab to cyclophosphamide.[2]

The European League against Rheumatism (EULAR)/European Renal Association –European Dialysis and Transport Association (2022) also have guidelines for ANCA-associated vasculitis.[4] The guidelines state that Tavneos, in combination with rituximab or cyclosporine may be considered for induction of remission in GPA or MPA as part of a strategy to substantially reduce exposure to glucocorticoids. Tavneos should be stopped after a duration of treatment of 6-12 months as there is no data on the use of Tavneos beyond 1 year, so longer-term use cannot be recommended.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tavneos. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tavneos as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Tavneos to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tavneos is recommended in those who meet the following criteria:

FDA-Approved Indication

18. Anti-Neutrophil Cytoplasmic Autoantibody (ANCA)-Associated Vasculitis. Approve for the duration noted if the patient meets ONE of the following (A or B):

- **A)** Initial Therapy. Approve for 6 months if the patient meets ALL of the following (i, ii, iii, iv, v and vi):
  - **i.** Patient is ≥ 18 years of age; AND
  - **ii.** Patient has granulomatosis with polyangiitis or microscopic polyangiitis; AND
    Note: Granulomatosis with polyangiitis is also known as Wegener's granulomatosis.
  - **iii.** Patient has active disease; AND
    Note: This includes patients that have newly diagnosed or relapsed disease. This does not include patients already in remission.
  - **iv.** Patient is positive for proteinase 3 antibodies, myeloperoxidase antibodies, or anti-neutrophil cytoplasmic autoantibody (ANCA); AND
  - **v.** Patient is using this medication in combination with at least one immunosuppressant; AND
    Note: Examples of immunosuppressants include rituximab, methotrexate, azathioprine, or mycophenolate mofetil.
  - **vi.** The medication is prescribed by or in consultation with a rheumatologist, nephrologist, or immunologist.
- **B)** Patient is Currently Receiving Tavneos. Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):
  - **i.** Patient is ≥ 18 years of age; AND
  - **ii.** Patient has been established on Tavneos for at least 6 months; AND
  - **iii.** Patient meets at least one of the following (a or b):
    - **a)** When assessed by at least one objective measure, patient experienced a beneficial clinical response from baseline (prior to initiating Tavneos); OR

Note: Examples of objective measure include improvement in estimated glomerular filtration rate, decrease in urinary albumin creatinine ratio, or improvement in the Birmingham Vasculitis Activity Score [BVAS].

b) Compared with baseline (prior to receiving Tavneos), patient experienced an improvement in at least one symptom, such as joint pain, ulcers, myalgia, persistent cough, skin rash, abdominal pain, or improvement in function or activities of daily living.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tavneos is not recommended in the following situations:

101. Eosinophilic Granulomatosis with Polyangiitis (EGPA). There are no data evaluating Tavneos for EGPA. Patients with this condition were excluded from the pivotal study.
Note: EGPA is also known as Churg-Strauss syndrome.

102. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vecamyl Prior Authorization Policy
- Vecamyl™ (mecamylamine hydrochloride tablets – Vyera)

REVIEW DATE: 06/14/2023

OVERVIEW

Vecamyl, a nicotinic parasympathetic ganglionic blocker, is indicated for the following uses:[1]
- **Moderately severe to severe essential hypertension**.
- **Uncomplicated malignant hypertension**.

Guidelines

The clinical practice guidelines from the American College of Cardiology (ACC)/American Heart Association (AHA) Task Force (2017) state the prevalence of severe hypertension has been declining, but approximately 12.3% of US adults with hypertension have an average systolic blood pressure ≥ 160 mm Hg or average diastolic blood pressure ≥ 100 mm Hg. Numerous classes of antihypertensive agents are available to treat high blood pressure. Vecamyl is not suggested as a primary or secondary agent in the treatment of hypertension. The ACC/AHA guidelines advise selection among four specific medication classes (thiazide-type diuretics, calcium channel blockers, angiotensin-converting enzyme inhibitors, or angiotensin receptor blockers) as initial and secondary choices in treatment.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vecamyl. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vecamyl is recommended in those who meet one of the following criteria:

FDA-Approved Indications

19. Essential Hypertension, Moderately Severe to Severe. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient has tried four antihypertensive therapies, each from different pharmacologic classes (e.g., diuretics, calcium channel blockers, angiotensin-converting enzyme inhibitors, and angiotensin receptor blockers [as single-entity or as combination products]); AND
- **B)** For each of these agents, patient meets one of the following criteria (i or ii):
  - **i.** Patient has had inadequate efficacy; OR
  - **ii.** Patient has experienced adverse event(s) severe enough to warrant discontinuation of this agent, according to the prescriber.

20. Uncomplicated Malignant Hypertension. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient has tried four antihypertensive therapies, each from different pharmacologic classes (e.g., diuretics, calcium channel blockers, angiotensin-converting enzyme inhibitors, and angiotensin receptor blockers [as single-entity or as combination products]); AND

B) For each of these agents, patient meets one of the following criteria (i or ii):
   - **i.** Patient has had inadequate efficacy; OR
   - **ii.** Patient has experienced adverse event(s) severe enough to warrant discontinuation of this agent, according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vecamyl is not recommended in the following situations:

23. Tourette Syndrome. Limited data are available to validate the use of mecamylamine in Tourette Syndrome. A clinical trial has shown mecamylamine to not be an effective treatment for tics or for the total spectrum of symptoms associated with Tourette Syndrome.[4]

24. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Veregen Prior Authorization Policy
- Veregen® (sinecatechins ointment – Fougera)

REVIEW DATE: 01/18/2023

OVERVIEW

Veregen, a botanical drug product, is indicated for the topical treatment of **external genital and perianal warts** (*Condylomata acuminata*) in immunocompetent patients ≥ 18 years of age.[1]

Guidelines

The Centers for Disease Control and Prevention (CDC) Sexually Transmitted Diseases Treatment Guidelines (2021) detail the patient-applied and provider-applied treatment options for the management of genital warts.[2] The CDC guidelines note that treatment should be guided by wart size, number of lesions, location of the wart(s), the preference of the patient, cost of treatment, convenience, adverse effects, and the experience of the health care provider with the various provider-applied options. There is no definitive evidence available which has demonstrated the superiority of one product over others for all patients and all warts. Most patients will require a course of therapy vs. a single treatment. Most warts will typically respond to therapy in 3 months, but if response does not occur, then treatment options should be reassessed and modified if needed. The CDC recommended patient-applied regimens include: imiquimod 3.75% cream or 5% cream, podofilox 0.5% solution or gel, or Veregen.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Veregen. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Veregen is recommended in those who meet the following criteria:

FDA-Approved Indication

21. Genital or Perianal Warts, External. Approve for 4 months if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient is immunocompetent, according to the prescriber; AND
- **C)** Patient has tried BOTH of the following treatments (i and ii):
  - **i.** Podofilox gel or solution; AND
  - **ii.** Imiquimod cream.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Veregen is not recommended in the following situations:

103. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

124. Veregen® ointment [prescribing information]. Melville, NY: Fougera; November 2022.

PRIOR AUTHORIZATION POLICY

POLICY: Vesicular Monoamine Transporter Type 2 Inhibitors – Austedo Prior Authorization Policy
- Austedo® (deutetrabenazine tablets – Teva)
- Austedo® XR (deutetrabenazine extended-release tablets – Teva)

REVIEW DATE: 04/26/2023

OVERVIEW

Austedo and Austedo XR, vesicular monoamine transporter type 2 inhibitors, are indicated in adults for the following uses:[1]
- **Chorea associated with Huntington's disease**.
- **Tardive dyskinesia**.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Austedo/Austedo XR. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Austedo/Austedo XR as well as the monitoring required for adverse events and long-term efficacy, approval requires Austedo/Austedo XR to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Austedo/Austedo XR is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Chorea Associated with Huntington's Disease.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Diagnosis of Huntington's disease is confirmed by genetic testing (for example, an expanded HTT CAG repeat sequence of at least 36); AND
   - **C)** The medication is prescribed by or in consultation with a neurologist.

2. **Tardive dyskinesia.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** The medication is prescribed by or in consultation with a neurologist or psychiatrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Austedo/Austedo XR is not recommended in the following situations:

25. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vesicular Monoamine Transporter Type 2 Inhibitors – Ingrezza Prior Authorization Policy
- Ingrezza® (valbenazine capsules – Neurocrine Biosciences)

REVIEW DATE: 06/07/2023, selected revision 8/30/2023

OVERVIEW

Ingrezza, a vesicular monoamine transporter type 2 inhibitor, is indicated in adults for the treatment of the following uses:[1]

- **Chorea associated with Huntington's disease.**
- **Tardive dyskinesia.**

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ingrezza. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ingrezza as well as the monitoring required for adverse events and long-term efficacy, approval requires Ingrezza to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ingrezza is recommended in those who meet one of the following criteria:

FDA-Approved Indications

3. Chorea Associated with Huntington's Disease. Approve for 1 year if the patient meets the following (A, B, and C):
- **D)** Patient is ≥ 18 years of age; AND
- **E)** Diagnosis of Huntington's disease is confirmed by genetic testing (for example, an expanded HTT CAG repeat sequence of at least 36); AND
- **F)** The medication is prescribed by or in consultation with a neurologist.

4. Tardive Dyskinesia. Approve for 1 year if the patient meets the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The medication is prescribed by or in consultation with a neurologist or psychiatrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ingrezza is not recommended in the following situations:

26. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vesicular Monoamine Transporter Type 2 Inhibitors – Tetrabenazine Prior Authorization Policy

- Xenazine® (tetrabenazine tablets – Lundbeck, generic)

REVIEW DATE: 06/07/2023

OVERVIEW

Tetrabenazine, a vesicular monoamine transporter type 2 inhibitor, is indicated for the treatment of **chorea associated with Huntington's disease** in adults.[1]

Clinical Efficacy

There are several published studies which have assessed the efficacy and safety of tetrabenazine for the treatment of other hyperkinetic movement disorders (e.g., tics in Tourette syndrome and tardive dyskinesia).[2-4] While most of the data for treatment of Tourette syndrome indicate that antipsychotic medications, both typical and atypical, are most effective, other medications (including tetrabenazine) may be used first to avoid the potential side effects of dopamine blockade.[5]

Guidelines

The American Academy of Neurology (AAN) evidence-based guidelines on pharmacologic treatment of chorea in Huntington's disease (2012) state that if chorea in Huntington's disease requires treatment, clinicians should prescribe tetrabenazine, amantadine, or Rilutek® (riluzole tablets) [Level B].[6]

The AAN published an evidence-based guideline for the treatment of tardive syndromes (2013).[7] The authors found that tetrabenazine possibly reduces tardive syndrome symptoms (based on two consistent Class III studies). Therefore, tetrabenazine may be considered in treating tardive syndromes (Level C).

The AAN published practice guideline recommendations for the treatment of tics in patients with Tourette syndrome and chronic tic disorders (2019).[8] The guidelines state that the dopamine depleters, tetrabenazine, deutetrabenazine, and valbenazine, are lacking published, randomized, controlled trials in the treatment of tics but note that these drugs are increasingly used off-label. When appropriately dosed, these drugs are generally well-tolerated but may be associated with drowsiness, depression, and parkinsonism.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of tetrabenazine. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with tetrabenazine as well as the monitoring required for adverse events and long-term efficacy, approval requires tetrabenazine to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of tetrabenazine is recommended in those who meet one of the following criteria:

FDA-Approved Indication

5. **Chorea Associated with Huntington's Disease.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   C) Patient is ≥ 18 years of age; AND
19. Diagnosis of Huntington's disease is confirmed by genetic testing (for example, an expanded HTT CAG repeat sequence of at least 36); AND
20. The medication is prescribed by or in consultation with a neurologist.

Other Uses with Supportive Evidence

6. **Hyperkinetic Dystonia.** Approve for 1 year if the patient meets the following criteria (A and B):
   1. Patient is ≥ 18 years of age; AND
   2. The medication is prescribed by or in consultation with a neurologist.

7. **Tardive Dyskinesia.** Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) The medication is prescribed by or in consultation with a neurologist or psychiatrist.

8. **Tourette Syndrome and Related Tic Disorders.** Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) The medication is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of tetrabenazine is not recommended in the following situations:

27. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vijoice Prior Authorization Policy
- Vijoice® (alpelisib tablets – Novartis)

REVIEW DATE: 05/10/2023

OVERVIEW
Vijoice, a kinase inhibitor, is indicated for the treatment of adults and pediatric patients ≥ 2 years of age with severe manifestations of phosphatidylinositol- 4,5-bisphosphate 3-kinase catalytic subunit alpha **(PIK3CA)-Related Overgrowth Spectrum** (PROS) who require systemic therapy.[1]

This indication is approved under accelerated approval based on response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial(s).

Disease Overview
PROS is a heterogeneous group of diseases caused by mutations in *PI3KCA* and characterized by a range of clinical features.[2] Examples of PROS include patients with congenital lipomatous overgrowth, vascular malformations, epidermal nevi, scoliosis/skeletal and spinal (CLOVES) syndrome; megalencephaly-capillary malformation (MCAP) syndrome; Klippel-Trenaunay syndrome (KTS); facial infiltrating lipomatosis (FIL); dysplastic megalencephaly (DMEG); hemimegalencephaly (HMEG); focal cortical dysplasia (FCD); or capillary vascular malformation of the lower lip, lymphatic malformations of the head and neck, asymmetry and partial or generalized overgrowth (CLAPO) syndrome.[2,3] The core features are congenital or early-childhood onset of segmental/focal overgrowth, predominantly affecting the brain, limbs (including fingers and toes), trunk (including abdomen and chest), and face, all usually in an asymmetric distribution. PROS-related complications can include hemorrhages; embolisms; vascular or lymphatic anomalies; congenital neurological complications; developmental delays; functional impairments; organ abnormalities, including cardiac and renal; superficial infections; chronic pain; skeletal anomalies; and psychological impact.[3] The diagnosis of PROS is often suspected by clinical features of the syndrome and can be confirmed with genetic testing of the *PI3KCA* gene.[2] Review articles state that management of PROS includes treatment of the manifestations, such as surgery, laser therapy, sclerotherapy, or oral medications such as sirolimus.[2,3,6]

Clinical Efficacy
The efficacy of Vijoice was evaluated in one single-arm pivotal study in patients who were treated as part of an expanded access program for compassionate use.[1,3] Eligible patients with PROS were ≥ 2 years of age, had severe or life-threatening clinical manifestations of PROS necessitating systemic treatment, and had documented evidence of mutation in the *PIK3CA* gene as determined by a local laboratory. The efficacy of Vijoice was evaluated in a total of 37 patients with at least one target lesion identified on imaging. The major efficacy outcome measure for the study was the proportion of patients with radiological response at Week 24, defined as a ≥ 20% reduction from baseline in the sum of measurable target lesion volume (1 to 3 lesions), in the absence of a ≥ 20% increase from baseline in any target lesion, progression of non-target lesions, or appearance of a new lesion. This trial demonstrated that the response rate of Vijoice was 27% (10 out of 37 patients) and the proportion of patients with duration of response ≥ 6 months was 70% (60% of patients had duration of response ≥ 12 months)[1,3] Clinically meaningful improvement in PROS-related signs and symptoms (e.g., pain, fatigue, vascular malformation, limb asymmetry, or disseminated intravascular coagulation) were observed.[3]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Vijoice. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Vijoice is recommended in those who meet the following criteria:

FDA-Approved Indication

21. PIK3CA-Related Overgrowth Spectrum (PROS). Approve for the duration noted if the patient meets ONE of the following criteria (A or B):
Note: Examples of PROS include congenital lipomatous overgrowth, vascular malformations, epidermal nevi, scoliosis/skeletal and spinal (CLOVES) syndrome; megalencephaly-capillary malformation (MCAP) syndrome; Klippel-Trenaunay syndrome (KTS); facial infiltrating lipomatosis (FIL), dysplastic megalencephaly (DMEG); hemimegalencephaly (HMEG); focal cortical dysplasia (FCD); or capillary vascular malformation of the lower lip, lymphatic malformations of the head and neck, asymmetry and partial or generalized overgrowth (CLAPO) syndrome.

H) Initial Therapy. Approve for 6 months if the patient meets the following criteria (i, ii, iii, and iv):
- **i.** Patient is ≥ 2 years of age; AND
- **ii.** Patient has at least one severe clinical manifestation of PROS, as determined by the prescriber; AND
  Note: Examples of severe clinical manifestations include excessive tissue growth, blood vessel malformations, scoliosis, vascular tumors, cardiac or renal manifestations, and those who require systemic treatment.
- **iii.** Patient has a *PIK3CA* mutation as confirmed by genetic testing; AND
- **iv.** The medication is being prescribed by or in consultation with a physician that specializes in treatment of genetic disorders.

I) Patient is Currently Receiving Vijoice. Approve for 1 year if the patient meets the following criteria (i, ii and ii):
- **i.** Patient has been established on Vijoice for at least 6 months; AND
  Note: A patient who has received < 6 months of therapy or who is restarting therapy with Vijoice is reviewed under criterion A (Initial Therapy).
- **ii.** Patient has experienced a reduction in volume from baseline (prior to initiating Vijoice) in at least one lesion, as confirmed by measurement; AND
- **iii.** Patient has experienced an improvement in at least one sign or symptom of PROS from baseline (prior to initiating Vijoice).
  Note: Examples of signs or symptoms of PROS include pain, fatigue, vascular malformation, limb asymmetry, or disseminated intravascular coagulation.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vijoice is not recommended in the following situations:

10. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION WITH STEP THERAPY POLICY

POLICY: Wakefulness-Promoting Agents – Armodafinil, Modafinil Prior Authorization with Step Therapy Policy
- Nuvigil® (armodafinil tablets – Cephalon, generic)
- Provigil® (modafinil tablets – Cephalon, generic)

REVIEW DATE: 09/20/2023

OVERVIEW

Armodafinil and modafinil, agents with wake-promoting actions that are similar to sympathomimetic agents (e.g., amphetamine and methylphenidate), are indicated to improve wakefulness in adults with **excessive sleepiness** associated with the following conditions:[1,2]
- **Narcolepsy**.
- **Obstructive sleep apnea/hypoapnea syndrome** (approved as adjunctive therapy).
- **Shift work sleep disorder**.

Armodafinil and modafinil are Schedule IV controlled substances.[1,2] Review of the medical literature notes many other uses of modafinil that are considered off-label or investigational. While armodafinil has not been studied off-label to the same extent as modafinil, it is expected that armodafinil will have similar clinical efficacy for these uses. Additionally, in the pivotal trials for shift work sleep disorder, enrolled patients were required to work a minimum of five night shifts per month.

Two specialized tests, which can be performed in a sleep disorders clinic, are required to establish a diagnosis of narcolepsy.[3] Polysomnogram (PSG) is an overnight recording of brain and muscle activity, breathing, and eye movements. The multiple sleep latency test assesses daytime sleepiness by measuring how quickly a person falls asleep and whether they enter rapid eye movement (REM) sleep. On the day after PSG, the patient is asked to take five short naps separated by two hours over the course of a day. If an individual falls asleep in < 8 minutes on average over the five naps, this indicates excessive daytime sleepiness. However, patients with narcolepsy also have an abnormally quick start to REM sleep. If REM sleep happens within 15 minutes at least two times out of the five naps and the sleep study the night before, this is likely an abnormality caused by narcolepsy.

Guidelines

Pertinent medical guidelines related to modafinil and armodafinil are summarized below.

Narcolepsy and Cataplexy

The American Academy of Sleep Medicine (AASM) practice parameters for the treatment of central disorders of hypersomnolence were updated in 2021.[4,5]
- Modafinil, Wakix® (pitolisant tablets), Xyrem® (sodium oxybate oral solution), and Sunosi™ (solriamfetol tablets) are recommended as effective treatments for daytime sleepiness due to narcolepsy and reducing disease severity in adults (Strong Recommendation for each).
- Wakix and Xyrem have also demonstrated efficacy for the treatment of cataplexy in patients with narcolepsy (Strong Recommendation for each).
- Xyrem and armodafinil have Conditional Recommendations for the treatment of narcolepsy, showing efficacy for daytime sleepiness due to narcolepsy and reducing disease severity.
- Dextroamphetamine has a Conditional Recommendation for the treatment of narcolepsy, showing efficacy for excessive daytime sleepiness and cataplexy.

- Methylphenidate has a Conditional Recommendation for the treatment of narcolepsy, showing efficacy in reducing disease severity.
- There was insufficient and inconclusive evidence to make recommendations for l-carnitine, scheduled naps, selegiline, triazolam, selective serotonin reuptake inhibitors (SSRIs), and serotonin-norepinephrine reuptake inhibitors (SNRIs).
- Modafinil and Xyrem have Conditional Recommendations for the treatment of narcolepsy in pediatric patients.
- A Strong Recommendation should be followed by clinicians under most circumstances. A Conditional Recommendation requires that the clinician use clinical knowledge and experience and strongly consider the individual patient's values and preferences to determine the best course of action.

Excessive Daytime Sleepiness Associated with Obstructive Sleep Apnea/Hypoapnea Syndrome

- According to the AASM guideline on medical therapy for obstructive sleep apnea (OSA) [2006], continuous positive airway pressure (CPAP) is the most uniformly effective therapy, and, to date, this is the only intervention for OSA shown to have favorable impacts on both cardiovascular and neurobehavioral morbidities.[6]
- Modafinil, in patients compliant with nasal CPAP, consistently improved subjective and objective sleepiness, quality of life, and vigilance compared with placebo.

Adjunctive/Augmentation Treatment for Major Depressive Disorder

- According to the American Psychiatric Association (APA) practice guideline for the treatment of patients with major depressive disorder (2010), modafinil (or methylphenidate) are potential treatments for sedation associated with antidepressant medications.[7]
- The APA guidelines state that modafinil has shown benefit when combined with an SSRI, related to specific effects on residual symptoms such as fatigue and hypersomnolence.
- The guidelines note that there is no clear guidance regarding the length of time modafinil should be co-administered.
- While armodafinil has not been studied for this use, it is considered to be interchangeable with modafinil for this condition.

Excessive Daytime Sleepiness Associated with Myotonic Dystrophy

- Practice parameters from the AASM, last updated in 2021, suggest that clinicians use modafinil for the treatment of hypersomnia secondary to myotonic dystrophy in adults (Conditional Recommendation).[4,5]
- While armodafinil has not been studied for this use, it is considered to be interchangeable with modafinil for this condition.

Excessive Daytime Sleepiness Associated with Parkinson's Disease

- Practice parameters from the AASM (2021) suggest that clinicians use modafinil for the treatment of hypersomnia secondary to Parkinson's disease in adults (Conditional Recommendation).[4,5]
- While armodafinil has not been studied for this use, it is considered to be interchangeable with modafinil for this condition.

Fatigue Associated with Multiple Sclerosis

- Practice parameters from the AASM (2021) suggest that clinicians use modafinil for the treatment of hypersomnia secondary to multiple sclerosis in adults (Conditional Recommendation).[4,5]
- While armodafinil has not been studied for this use, expert opinion considers it to be interchangeable with modafinil for this condition.

Idiopathic Hypersomnia
Idiopathic hypersomnia, a condition similar to narcolepsy, is characterized by constant or recurrent daytime sleepiness with no other cause of sleepiness, prolonged nocturnal sleep, difficulty awakening with sleep drunkenness, and long unrefreshing naps with no of cataplexy.[8-10] The AASM practice parameters for the treatment of central disorders of hypersomnolence (2021) include recommendations for the treatment of idiopathic hypersomnia.[4,5]

- Only modafinil has a Strong Recommendation for use.
- Clarithromycin, methylphenidate, Wakix, and Xyrem have Conditional Recommendations for the treatment of idiopathic hypersomnia in adults.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of modafinil (brand and generic) and armodafinil (brand and generic). This Prior Authorization Policy also contains a Step Therapy component. When clinically appropriate, the patient is directed to try one Step 1 Product (generic modafinil or generic armodafinil) prior to brand Nuvigil or brand Provigil (Step 2). All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of modafinil (brand and generic) and armodafinil (brand and generic) is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Excessive Daytime Sleepiness Associated with Narcolepsy.** Approve for 1 year if the patient meets the following (A, B, C, D, and E):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has been evaluated using polysomnography and a multiple sleep latency test; AND
   - **C)** Diagnosis of narcolepsy has been confirmed, according to the prescriber; AND
   - **D)** The medication is prescribed by or in consultation with a sleep specialist physician or a neurologist; AND
   - **E)** If brand Provigil or Nuvigil is being requested, the patient meets both of the following (i and ii):
   - **iii.** Patient has tried generic modafinil or generic armodafinil; AND
   - **iv.** Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

2. **Excessive Daytime Sleepiness Associated with Obstructive Sleep Apnea/Hypoapnea Syndrome.** Approve for 1 year if the patient meets the following (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient meets one of the following (i or ii):
   - **i.** Armodafinil/modafinil will be used in conjunction with continuous positive airway pressure therapy; OR
   - **ii.** Patient is unable to initiate or tolerate continuous positive airway pressure therapy; AND
   - **C)** If brand Provigil or Nuvigil is being requested, the patient meets both of the following (i and ii):

i. Patient has tried generic modafinil or generic armodafinil; AND

ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

3. **Excessive Sleepiness Associated with Shift Work Sleep Disorder.** Approve for 1 year if the patient meets the following (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) Patient works at least five overnight shifts per month; AND
   C) If brand Provigil or Nuvigil is being requested, the patient meets both of the following (i and ii):
      i. Patient has tried generic modafinil or generic armodafinil; AND
      ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

Other Uses with Supportive Evidence

4. **Adjunctive/Augmentation Treatment for Depression in Adults.** Approve for 1 year if the patient meets the following (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) Patient is concurrently receiving other medication therapy for depression; AND
   Note: Examples of other medications for the treatment of depression include selective serotonin reuptake inhibitors (SSRIs) and serotonin norepinephrine reuptake inhibitors (SNRIs).
   C) If brand Provigil or Nuvigil is being requested, the patient meets both of the following (i and ii):
   i. Patient has tried generic modafinil or generic armodafinil; AND
   ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

5. **Excessive Daytime Sleepiness Associated with Myotonic Dystrophy.** Approve for 1 year if the patient meets both of the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) If brand Provigil or Nuvigil is being requested, the patient meets both of the following (i and ii):
   i. Patient has tried generic modafinil or generic armodafinil; AND
   ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

6. **Excessive Daytime Sleepiness Associated with Parkinson's Disease.** Approve for 1 year if the patient meets both of the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) If brand Provigil or Nuvigil is being requested, the patient meets both of the following (i and ii):
   i. Patient has tried generic modafinil or generic armodafinil; AND
   ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the

corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

7. **Fatigue Associated with Multiple Sclerosis.** Approve for 1 year if the patient meets both of the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) If brand Provigil or Nuvigil is being requested, the patient meets both of the following (i and ii):
      i. Patient has tried generic modafinil or generic armodafinil; AND
      ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

8. **Idiopathic Hypersomnia.** Approve for 1 year if the patient meets the following (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) The diagnosis is confirmed by a sleep specialist physician or at an institution that specializes in sleep disorders (i.e., sleep center); AND
   C) If brand Provigil or Nuvigil is being requested, the patient meets both of the following (i and ii):
      i. Patient has tried generic modafinil or generic armodafinil; AND
      ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of modafinil (brand and generic) and armodafinil (brand and generic) is not recommended in the following situations:

4. **Attention Deficit Hyperactivity Disorder (ADHD).** The American Academy of Pediatrics clinical practice guidelines for the treatment of ADHD in children and adolescents (2011 and 2019) do not address the use of modafinil/armodafinil.[11,12] These guidelines note that with the greater availability of approved medications for children/adolescents with ADHD, it has become increasingly unlikely that clinicians need to consider the off-label use of other medications. Many options exist for the treatment of ADHD in adults (e.g., methylphenidate, dextroamphetamine) and further large scale trials that demonstrate benefit for modafinil in adults with ADHD are needed.

5. **Bipolar Disorder, including Bipolar Depression.** Limited data (one small study [n = 85] and case reports [n = 2]) are available that describe the use of modafinil for bipolar disorder and bipolar depression.[13-15] In one study (n = 257), armodafinil was not more effective than placebo in treating bipolar depression.[16] Only limited data support modafinil for this condition and more data are needed.

6. **Cancer-Related Fatigue.** The National Comprehensive Cancer Network guidelines on cancer-related fatigue (version 2.2023 – January 30, 2023) no longer consider modafinil or armodafinil to be effective for the treatment of cancer-related fatigue and recommend against its use.[17]

7. **Chronic Fatigue Syndrome.** Limited data characterize modafinil therapy in those with chronic fatigue syndrome.[18] In a randomized, double-blind, crossover study in 14 patients with chronic fatigue syndrome, use of modafinil for 20 days had minimal effects on cognitive function and no significant

effects on fatigue, health-related quality of life, or mood.[19] More data are required to assess efficacy in this patient population.

8. **Excessive Daytime Sleepiness Associated with Primary Insomnia.** One randomized, placebo-controlled study found that neither combination therapy with modafinil and cognitive behavioral therapy nor modafinil as monotherapy significantly decreased daytime sleepiness associated with primary insomnia.[20]

9. **Enhancement of Performance in Situations of Induced Sleep Deprivation.** Studies are needed to define the role/appropriateness of modafinil in these situations for the general population (as opposed to military personnel, etc.). Studies have shown that modafinil may enhance performance and sustain alertness in individuals subjected to situations that deprive sleep (e.g., military aviation, emergency physicians).[21-24] Further studies are needed before its use in the general population in these types of situations can be promoted.

10. **Fibromyalgia.** Limited data are available regarding the use of modafinil in fibromyalgia with most of the data being observational.[25-27] Larger-sized, randomized, placebo-controlled trials are required to better assess and validate the efficacy of modafinil in patients with fibromyalgia before it can be recommended as a therapeutic modality.

11. **Hypersomnia, Fatigue or Sleepiness Due to Other Conditions (not Idiopathic Hypersomnia, see Other Uses with Supportive Evidence).** More data are needed in specific conditions to define the role of modafinil and armodafinil.

12. **Post-Stroke Sleep-Wake Disorders or Sleep Disorders.** Sleep-wake disorders occur in approximately 20% to 40% of patients who have experienced a stroke, which includes hypersomnia and excessive daytime sleepiness. Very limited data (i.e., case reports and one small study) have explored the use of modafinil in these patients to improve alertness.[28,29] More data are needed to determine effectiveness in this condition.

13. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION WITH STEP THERAPY POLICY

POLICY: Wakefulness-Promoting Agents – Sunosi Prior Authorization with Step Therapy Policy
- Sunosi® (solriamfetol tablets – Jazz)

REVIEW DATE: 09/20/2023

OVERVIEW

Sunosi, a dopamine and norepinephrine reuptake inhibitor, is indicated to improve wakefulness in adults with **excessive daytime sleepiness** associated with the following conditions:[1]

- **Narcolepsy**.
- **Obstructive sleep apnea** (OSA).
  Limitations of Use: Sunosi is not indicated to treat the underlying airway obstruction in OSA.[1] The underlying airway obstruction should be treated (e.g., with continuous positive airway pressure [CPAP]) for at least 1 month prior to initiating Sunosi for excessive daytime sleepiness. Modalities to treat the underlying airway obstruction should be continued during treatment with Sunosi.

Sunosi is a Schedule IV controlled substance.[1]

Armodafinil and modafinil are wakefulness-promoting agents with actions similar to sympathomimetic agents (e.g., amphetamine and methylphenidate).[2,3] They are indicated to improve wakefulness in adults with excessive sleepiness associated with narcolepsy, OSA, or shift work disorder. Armodafinil and modafinil are Schedule IV controlled substances. Stimulant medications (e.g., amphetamine, methamphetamine, dextroamphetamine, and methylphenidate) are used off-label for the treatment of daytime sleepiness due to narcolepsy and OSA and are mentioned in guidelines.[4-7]

Two specialized tests, which can be performed in a sleep disorders clinic, are required to establish a diagnosis of narcolepsy.[8] Polysomnogram (PSG) is an overnight recording of brain and muscle activity, breathing, and eye movements. The multiple sleep latency test assesses daytime sleepiness by measuring how quickly a person falls asleep and whether they enter rapid eye movement (REM) sleep. On the day after PSG, the patient is asked to take five short naps separated by two hours over the course of a day. If an individual falls asleep in < 8 minutes on average over the five naps, this indicates excessive daytime sleepiness. However, patients with narcolepsy also have an abnormally quick start to REM sleep. If REM sleep happens within 15 minutes at least two times out of the five naps and the sleep study the night before, this is likely an abnormality caused by narcolepsy.

Guidelines

Narcolepsy and Cataplexy

The American Academy of Sleep Medicine (AASM) practice parameters for the treatment of central disorders of hypersomnolence were updated in 2021.[4,5]

- Modafinil, Wakix® (pitolisant tablet), Xyrem® (sodium oxybate oral solution), and Sunosi are recommended as effective treatments for daytime sleepiness due to narcolepsy and reducing disease severity in adults (Strong Recommendation for each).
- Wakix and Xyrem have also demonstrated efficacy for the treatment of cataplexy in patients with narcolepsy (Strong Recommendation for each).
- Xyrem and armodafinil have Conditional Recommendations for the treatment of narcolepsy, showing efficacy for daytime sleepiness due to narcolepsy and reducing disease severity.

- Dextroamphetamine has a Conditional Recommendation for the treatment of narcolepsy, showing efficacy for excessive daytime sleepiness and cataplexy.
- Methylphenidate has a Conditional Recommendation for the treatment of narcolepsy, showing efficacy in reducing disease severity.
- There was insufficient and inconclusive evidence to make recommendations for l-carnitine, scheduled naps, selegiline, triazolam, selective serotonin reuptake inhibitors (SSRIs), and serotonin-norepinephrine reuptake inhibitors (SNRIs).
- Modafinil and Xyrem have Conditional Recommendations for the treatment of narcolepsy in pediatric patients.
- A Strong Recommendation should be followed by clinicians under most circumstances. A Conditional Recommendation requires that the clinician use clinical knowledge and experience and strongly consider the individual patient's values and preferences to determine the best course of action.

Excessive Daytime Sleepiness Associated with Obstructive Sleep Apnea/Hypoapnea Syndrome

- According to the AASM guideline on medical therapy for OSA (2006), CPAP is the most uniformly effective therapy, and, to date, this is the only intervention for OSA shown to have favorable impacts on both cardiovascular and neurobehavioral morbidities.[6,7]
- Modafinil, in patients compliant with nasal CPAP, consistently improved subjective and objective sleepiness, quality of life, and vigilance compared with placebo.
- Sunosi is not addressed in these guidelines.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Sunosi. This Prior Authorization Policy also contains a Step Therapy component. When clinically appropriate, the patient is directed to try one Step 1 Product (modafinil or armodafinil) prior to Sunosi (Step 2). All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sunosi is recommended in those who meet one of the following criteria:

FDA-Approved Indications

22. Excessive Daytime Sleepiness Associated with Narcolepsy. Approve for 1 year if the patient meets the following (A, B, C, D, and E):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has been evaluated using polysomnography and a multiple sleep latency test; AND
- **C)** Diagnosis of narcolepsy has been confirmed, according to the prescriber; AND
- **D)** The medication is prescribed by or in consultation with a sleep specialist physician or a neurologist; AND
- **E)** Patient has tried generic modafinil or generic armodafinil.
  Note: An exception to this requirement is allowed if the patient has previously tried brand Provigil or brand Nuvigil.

2. **Excessive Daytime Sleepiness Associated with Obstructive Sleep Apnea.** Approve for 1 year if the patient meets the following (A, B, and C):
   - **D)** Patient is ≥ 18 years of age; AND
   - **E)** Patient meets one of the following (i or ii):
   - **i.** Sunosi will be used in conjunction with continuous positive airway pressure (CPAP) therapy; OR
   - **ii.** Patient is unable to initiate or tolerate CPAP therapy; AND
   - **F)** Patient has tried generic modafinil or generic armodafinil.

   Note: An exception to this requirement is allowed if the patient has previously tried brand Provigil or brand Nuvigil.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sunosi is not recommended in the following situations:

104. Concomitant Use of Sunosi with an Oxybate Product and/or Wakix (pitolisant tablets). Sunosi, a dopamine and norepinephrine reuptake inhibitor, is indicated to improve wakefulness in adults with excessive daytime sleepiness due to narcolepsy or obstructive sleep apnea.[1] Oxybate products include Xyrem (sodium oxybate oral solution), Lumryz (sodium oxybate extended-release oral suspension), and Xywav (calcium, magnesium, potassium, and sodium oxybates oral solution).[10-12] These have the same active ingredient (oxybate, a central nervous system depressant) and have not been studied for use in combination or as alternating treatments. Wakix, an antagonist/inverse agonist of the histamine-3 receptor, is indicated for excessive daytime sleepiness and cataplexy in adults with narcolepsy.[13] Currently, there are no published studies evaluating combination use of these medications.

105. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION WITH STEP THERAPY POLICY

POLICY: Wakefulness-Promoting Agents – Wakix Prior Authorization with Step Therapy Policy
- Wakix® (pitolisant tablets – Harmony)

REVIEW DATE: 09/20/2023

OVERVIEW

Wakix, an antagonist/inverse agonist of the histamine-3 receptor, is indicated for the following uses:[1]
- **Excessive daytime sleepiness in adults with narcolepsy**.
- **Cataplexy in adults with narcolepsy**.

Wakix is the only wakefulness-promoting agent that is not a controlled substance.[1-4]

Armodafinil and modafinil are wakefulness-promoting agents with actions similar to sympathomimetic agents (e.g., amphetamine and methylphenidate).[2,3] They are indicated to improve wakefulness in adults with excessive sleepiness associated with narcolepsy, obstructive sleep apnea (OSA), or shift work disorder. Sunosi® (solriamfetol tablets), a dopamine and norepinephrine reuptake inhibitor, is indicated to improve wakefulness in adults with excessive daytime sleepiness associated with narcolepsy or OSA.[4] Armodafinil, modafinil, and Sunosi are Schedule IV controlled substances.[2-4] Armodafinil, modafinil, and Sunosi are not indicated for the treatment of cataplexy.

Two specialized tests, which can be performed in a sleep disorders clinic, are required to establish a diagnosis of narcolepsy.[7] Polysomnogram is an overnight recording of brain and muscle activity, breathing, and eye movements. The multiple sleep latency test assesses daytime sleepiness by measuring how quickly a person falls asleep and whether they enter rapid eye movement (REM) sleep. On the day after polysomnogram, the patient is asked to take five short naps separated by two hours over the course of a day. If an individual falls asleep in < 8 minutes on average over the five naps, this indicates excessive daytime sleepiness. However, patients with narcolepsy also have an abnormally quick start to REM sleep. If REM sleep happens within 15 minutes at least two times out of the five naps and the sleep study the night before, this is likely an abnormality caused by narcolepsy.

Guidelines

Narcolepsy and Cataplexy

The American Academy of Sleep Medicine (AASM) practice parameters for the treatment of central disorders of hypersomnolence were updated in 2021.[5,6]
- Modafinil, Wakix, Xyrem® (sodium oxybate oral solution), and Sunosi are recommended as effective treatments for daytime sleepiness due to narcolepsy and reducing disease severity in adults (Strong Recommendation for each).
- Wakix and Xyrem have also demonstrated efficacy for the treatment of cataplexy in patients with narcolepsy (Strong Recommendation for each).
- Xyrem and armodafinil have Conditional Recommendations for the treatment of narcolepsy, showing efficacy for daytime sleepiness due to narcolepsy and reducing disease severity.
- Dextroamphetamine has a Conditional Recommendation for the treatment of narcolepsy, showing efficacy for excessive daytime sleepiness and cataplexy.
- Methylphenidate has a Conditional Recommendation for the treatment of narcolepsy, showing efficacy in reducing disease severity.

- There was insufficient and inconclusive evidence to make recommendations for l-carnitine, scheduled naps, selegiline, triazolam, selective serotonin reuptake inhibitors, and serotonin-norepinephrine reuptake inhibitors.
- Modafinil and Xyrem have Conditional Recommendations for the treatment of narcolepsy in pediatric patients.
- A Strong Recommendation should be followed by clinicians under most circumstances. A Conditional Recommendation requires that the clinician use clinical knowledge and experience and strongly consider the individual patient's values and preferences to determine the best course of action.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Wakix. This Prior Authorization Policy also contains a Step Therapy component. When clinically appropriate, the patient is directed to try one Step 1 Product (dextroamphetamine for cataplexy in narcolepsy; modafinil or armodafinil for excessive daytime sleepiness in narcolepsy) prior to Wakix (Step 2). All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Wakix is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Cataplexy Treatment in a Patient with Narcolepsy**. Approve for 1 year if the patient meets the following (A, B, C, D, and E):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has been evaluated using polysomnography and a multiple sleep latency test; AND
   - **C)** Diagnosis of narcolepsy has been confirmed, according to the prescriber; AND
   - **D)** The medication is prescribed by or in consultation with a sleep specialist physician or a neurologist; AND
   - **E)** Patient meets ONE of the following (i or ii):
     - **i.** Patient has tried dextroamphetamine; OR
     - **ii.** Patient has a contraindication or intolerance to dextroamphetamine, according to the prescriber. Note: Contraindications to dextroamphetamine include a history of substance use disorder; advanced arteriosclerosis, symptomatic cardiovascular disease, and/or moderate to severe hypertension; hyperthyroidism; known hypersensitivity to sympathomimetic amines; glaucoma; agitated states; concomitant administration with monoamine oxidase inhibitors (MAOIs), or within 14 days of stopping MAOIs.

2. **Excessive Daytime Sleepiness Associated with Narcolepsy.** Approve for 1 year if the patient meets the following (A, B, C, D, and E):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has been evaluated using polysomnography and a multiple sleep latency test; AND
   - **C)** Diagnosis of narcolepsy has been confirmed, according to the prescriber; AND
   - **D)** The medication is prescribed by or in consultation with a sleep specialist physician or a neurologist; AND
   - **E)** Patient meets one of the following (i or ii):
     - **i.** Patient has tried generic modafinil or generic armodafinil; OR

Note: An exception to this requirement is allowed if the patient has previously tried brand Provigil or brand Nuvigil.

ii. Patient has a of substance use disorder and a wakefulness-promoting agent that is not a controlled substance is necessary, per the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Wakix is not recommended in the following situations:

106. Concomitant Use of Wakix with an Oxybate Product and/or Sunosi (solriamfetol tablets). Wakix, an antagonist/inverse agonist of the histamine-3 receptor, is indicated for excessive daytime sleepiness and cataplexy in adults with narcolepsy.[1] Oxybate products include Xyrem (sodium oxybate oral solution), Lumryz (sodium oxybate extended-release oral suspension), and Xywav (calcium, magnesium, potassium, and sodium oxybates oral solution).[8-10] These products have the same active ingredient (oxybate, a central nervous system depressant) and have not been studied for use in combination or as alternating treatments. Sunosi, a dopamine and norepinephrine reuptake inhibitor, is indicated to improve wakefulness in adults with excessive daytime sleepiness due to narcolepsy or obstructive sleep apnea.[2] Currently, there are no published studies evaluating combination use of these medications.

107. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Weight Loss – Glucagon-Like Peptide-1 Agonists Prior Authorization Policy
- Saxenda® (liraglutide subcutaneous injection – Novo Nordisk)
- Wegovy® (semaglutide subcutaneous injection – Novo Nordisk)
- Zepbound™ (tirzepatide subcutaneous injection – Eli Lilly)

REVIEW DATE: 07/12/2023; selected revision 07/26/2023, 09/13/0223, and 11/15/2023

OVERVIEW

Saxenda, Wegovy, and Zepbound, are glucagon-like peptide-1 (GLP-1) receptor agonists; Zepbound is also a glucose-dependent insulinotropic polypeptide (GIP) receptor agonist.[1,2,9] These agents are indicated as an adjunct to a reduced-calorie diet and increased physical activity for **chronic weight management** in the following settings:[1,2,9]

- **Saxenda, Wegovy, and Zepbound:** Adults with an initial body mass index (BMI) ≥ 30 kg/m^2 (obese), or ≥ 27 kg/m^2 (overweight) in the presence of at least one weight-related comorbid condition (e.g., hypertension[1,2,9], dyslipidemia[1,2,9], type 2 diabetes[1,2,9], obstructive sleep apnea[9], or cardiovascular disease[9]).
- **Saxenda:** Pediatric patients ≥ 12 years of age with body weight > 60 kg and an initial BMI corresponding to 30 kg/m^2 for adults (obese) by international cutoffs.[2]
- **Wegovy:** Pediatric patients ≥ 12 years of age with an initial BMI at the 95th percentile or greater for age and sex (obesity).[1]

Dosing

In the prescribing information for Saxenda, a recommended dose escalation schedule of 4 weeks is outlined.[2] If a patient does not tolerate an increased dose during dose escalation, consider delaying dose escalation for approximately one additional week. For adults, the recommended maintenance dose of Saxenda is 3 mg once daily (QD); discontinue Saxenda if the patient cannot tolerate the 3 mg dose. Additionally, for adults, the prescribing information states to evaluate the change in body weight 16 weeks after initiating Saxenda and discontinue Saxenda if the patient has not lost at least 4% of baseline body weight, since it is unlikely the patient will achieve and sustain clinically meaningful weight loss with continued treatment. For pediatric patients, the recommended maintenance dose of Saxenda is 3 mg QD. However, pediatric patients who do not tolerate 3 mg QD may have their maintenance dose reduced to 2.4 mg QD. Discontinue Saxenda if the patient cannot tolerate the 2.4 mg dose. Additionally, for pediatric patients, the prescribing information states to evaluate the change in BMI after 12 weeks on the maintenance dose and discontinue Saxenda if the patient has not had a reduction in BMI of at least 1% from baseline, since it is unlikely that the patient will achieve and sustain clinically meaningful weight loss with continued treatment.

In the prescribing information for Wegovy, a recommended dose escalation schedule of 16 weeks is outlined.[1] If a patient does not tolerate an increased dose during dose escalation, consider delaying dose escalation for 4 weeks. The maintenance dose of Wegovy is 2.4 mg (recommended) or 1.7 mg injected subcutaneously (SC) once weekly; consider treatment response and tolerability when selecting the maintenance dose. The 0.25 mg, 0.5 mg, and 1 mg once weekly doses are initiation and escalation doses and are not approved doses for chronic weight management. If a pediatric patient ≥ 12 to < 18 years of age does not tolerate the maintenance dose of 2.4 mg once weekly, the dose can be reduced to 1.7 mg once weekly. Discontinue Wegovy if the patient cannot tolerate the 1.7 mg dose.

In the prescribing information for Zepbound, the recommended starting dose is 2.5 mg injected SC once weekly.[9] The 2.5 mg dose is for treatment initiation and is not intended for chronic weight management. After 4 weeks, the dose can be increased to 5 mg SC once weekly. The dose can then be increased in 2.5 mg increments, after at least 4 weeks on the current dose. The recommended maintenance doses are 5 mg, 10 mg, or 15 mg SC once weekly. The treatment response and tolerability should be considered when selecting the maintenance dose. If a patient does not tolerate a maintenance dose, consider a lower maintenance dose. The maximum dose is 15 mg SC once weekly. The 5 mg, 10 mg, and 15 mg maintenance doses would be reached after Week 4, Week 12, and Week 20, respectively.

Guidelines

Guidelines from the American Gastroenterological Association on pharmacological interventions for adults with obesity (2022) state that in adults with obesity or overweight with weight-related complications, who have had an inadequate response to lifestyle interventions, it is recommended to add pharmacological agents to lifestyle interventions over continuing lifestyle interventions alone (strong recommendation, moderate quality evidence).[6] Wegovy and Saxenda are listed among the therapeutic options. It is also noted that given the magnitude of net benefit, Wegovy may be prioritized over other approved anti-obesity medications for the long-term treatment of obesity for most patients.

Guidelines from the Endocrine Society regarding pharmacological management of obesity (2015) recommend pharmacotherapy as adjunct to behavioral modification to reduce food intake and increase physical activity for patients with BMI ≥ 30 kg/m^2 or ≥ 27 kg/m^2 in the presence of at least one comorbidity, such as hypertension, dyslipidemia, type 2 diabetes, or obstructive sleep apnea.[3] If a patient's response to a weight loss medication is deemed effective (weight loss $\geq 5\%$ of body weight at 3 months) and safe, it is recommended that the medication be continued. In clinical studies of Saxenda and semaglutide, eligible patients were required to have a prior unsuccessful dietary weight loss attempt. The American Diabetes Association also cites weight loss $\geq 5\%$ of body weight at 3 months as "effective"; when early response is insufficient (typically $< 5\%$ weight loss after 3 months), other therapies should be evaluated.[8]

Per American Association of Clinical Endocrinologists/American College of Endocrinology obesity guidelines (2016), pharmacotherapy for overweight and obesity should be used only as an adjunct to lifestyle therapy and not alone.[4] The addition of pharmacotherapy produces greater weight loss and weight-loss maintenance compared with lifestyle therapy alone. The concurrent initiation of lifestyle therapy and pharmacotherapy should be considered in patients with weight-related complications that can be ameliorated by weight loss. Pharmacotherapy should be offered to patients with obesity, when potential benefits outweigh the risks, for the chronic treatment of the disease. Short-term treatment (3 to 6 months) using weight-loss medications has not been demonstrated to produce longer-term health benefits and cannot be generally recommended based on scientific evidence.

Guidelines in Pediatric Obesity

Guidelines from the American Academy of Pediatrics on evaluation and treatment of children and adolescents with obesity (2023) note that pediatricians and other primary health care providers should offer adolescents ≥ 12 years of age with obesity (BMI $\geq 95^{th}$ percentile) weight loss pharmacotherapy, according to medication indications, risks, and benefits, as an adjunct to health behavior and lifestyle treatment.[7]

A 2017 Endocrine Society clinical practice guideline on pediatric obesity recommends that pharmacotherapy in combination with lifestyle modification be considered in obese children or adolescents only after failure of a formal program of intensive lifestyle (dietary, physical activity and behavioral) modification to limit weight gain or to ameliorate comorbidities.[5] The Endocrine Society recommends pharmacotherapy in overweight children and adolescents < 16 years of age only in the context of a clinical trial. Pharmacotherapy should be provided only by clinicians who are experienced in the use of anti-obesity

agents and aware of the potential for adverse events. These guidelines recommend limited use of pharmacotherapy because pediatric obesity should be managed preferably as a serious lifestyle condition with important lifelong consequences. The Endocrine Society defines overweight as BMI in at least the 85th percentile but less than the 95th percentile, and obesity as BMI in at least the 95th percentile for age and sex against routine endocrine studies, unless the height velocity is attenuated or inappropriate for the family background or stage of puberty.[5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Saxenda, Wegovy, and Zepbound. Of note, this policy targets Saxenda, Wegovy, and Zepbound; other glucagon-like peptide-1 agonists which do not carry an FDA-approved indication for weight loss are not targeted in this policy. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Saxenda is recommended in those who meet the following criteria:

FDA-Approved Indications

1. Weight Loss, Adult. Approve for the duration noted if the patient meets one of the following (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets the following (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND

ii. Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months; AND

iii. Patient meets one of the following (a or b):

a) At baseline patient had a BMI ≥ 30 kg/m^2; OR
Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

b) At baseline, patient had a BMI ≥ 27 kg/m^2 and at least one of the following weight-related comorbidities: hypertension, type 2 diabetes, dyslipidemia, obstructive sleep apnea, or cardiovascular disease; AND
Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

iv. Saxenda will be used concomitantly with behavioral modification and a reduced-calorie diet.

B) Patient is Continuing Therapy with Saxenda. Approve for 1 year if the patient meets the following (i, ii, iii, iv, and v):
Note: For a patient who has not completed 4 months of initial therapy, refer to Initial Therapy criteria above.

i. Patient is ≥ 18 years of age; AND

ii. Patient meets one of the following (a or b):

a) At baseline, patient had a BMI ≥ 30 kg/m^2; OR

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

b) At baseline, patient had a BMI ≥ 27 kg/m^2 and at least one of the following weight-related comorbidities: hypertension, type 2 diabetes, dyslipidemia, obstructive sleep apnea, or cardiovascular disease; AND

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

iii. Patient has lost ≥ 4% of baseline body weight; AND

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

iv. Patient is able to tolerate a Saxenda maintenance dose of 3 mg once daily; AND

v. Saxenda will be used concomitantly with behavioral modification and a reduced-calorie diet.

2. Weight Loss, Pediatric. Approve for the duration noted if the patient meets one of the following (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets the following (i, ii, iii, and iv):

i. Patient is ≥ 12 years of age and < 18 years of age; AND

ii. Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months; AND

iii. At baseline, patient had a BMI ≥ 95th percentile for age and sex; AND

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

iv. Saxenda will be used concomitantly with behavioral modification and a reduced-calorie diet.

B) Patient is Continuing Therapy with Saxenda. Approve for 1 year if the patient meets the following (i, ii, iii, iv, and v):

Note: For a patient who has not completed 4 months of initial therapy, refer to Initial Therapy criteria above.

i. Patient is ≥ 12 years of age and < 18 years of age; AND

ii. At baseline), patient had a BMI ≥ 95th percentile for age and sex; AND

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

iii. Patient has had a reduction in BMI of ≥ 1% from baseline; AND

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

iv. Patient is able to tolerate a Saxenda maintenance dose of 2.4 mg once daily or 3 mg once daily; AND

v. Saxenda will be used concomitantly with behavioral modification and a reduced-calorie diet.

II. Coverage of Wegovy is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Weight Loss, Adult.** Approve for the duration noted if the patient meets one of the following (A or B):
   - **A)** Initial Therapy. Approve for 7 months if the patient meets the following (i, ii, iii, and iv):
     - **i.** Patient is ≥ 18 years of age; AND
     - **ii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months; AND
     - **iii.** Patient meets one of the following (a or b):
       - **a)** At baseline, patient had a BMI ≥ 30 kg/m^2; OR
         Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
       - **b)** At baseline, patient had a BMI ≥ 27 kg/m^2 and at least one of the following weight-related comorbidities: hypertension, type 2 diabetes, dyslipidemia, obstructive sleep apnea, or cardiovascular disease; AND
         Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
     - **iv.** Wegovy will be used concomitantly with behavioral modification and a reduced-calorie diet.
   - **B)** Patient is Continuing Therapy with Wegovy. Approve for the duration noted below if the patient meets the following (i, ii, iii, iv, and v):
     Note: For a patient who has not completed 7 months of initial therapy, refer to Initial Therapy criteria above.
     - **i.** Patient is ≥ 18 years of age; AND
     - **ii.** Patient meets one of the following (a or b):
       - **a)** At baseline, patient had a BMI ≥ 30 kg/m^2; OR
         Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
       - **b)** At baseline, patient had a BMI ≥ 27 kg/m^2 and at least one of the following weight-related comorbidities: hypertension, type 2 diabetes, dyslipidemia, obstructive sleep apnea, or cardiovascular disease; AND
         Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
     - **iii.** Patient has lost ≥ 5% of baseline body weight; AND
       Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
     - **iv.** Wegovy will be used concomitantly with behavioral modification and a reduced-calorie diet; AND
     - **v.** Patient meets one of the following (a or b):
       - **a)** Patient is able to tolerate a Wegovy maintenance dose of 1.7 mg once weekly or 2.4 mg once weekly: Approve for 1 year; OR
       - **b)** Approve for up to 5 months if the patient meets both of the following [(1) and (2)]:
         Note: Approve a sufficient duration for 12 consecutive months of therapy (for example, if the patient has completed 8 months of Wegovy therapy, approve for 4 additional months).

(1) Patient has received < 12 consecutive months of Wegovy; AND
(2) According to the prescriber, the patient is continuing to titrate the Wegovy dose to a target of 1.7 mg once weekly or 2.4 mg once weekly.

2. Weight Loss, Pediatric. Approve for the duration noted if the patient meets one of the following (A or B):

A) Initial Therapy. Approve for 7 months if the patient meets the following (i, ii, iii, and iv):
- **i.** Patient is ≥ 12 years of age and < 18 years of age; AND
- **ii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months; AND
- **iii.** At baseline, patient had a BMI ≥ 95th percentile for age and sex; AND
  Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
- **iv.** Wegovy will be used concomitantly with behavioral modification and a reduced-calorie diet.

B) Patient is Continuing Therapy with Wegovy. Approve for the duration noted below if the patient meets the following (i, ii, iii, iv, and v):
Note: For a patient who has not completed 7 months of initial therapy, refer to Initial Therapy criteria above.
- **i.** Patient is ≥ 12 years of age and < 18 years of age; AND
- **ii.** At baseline, patient had a BMI ≥ 95th percentile for age and sex; AND
  Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
- **iii.** Patient has had a reduction in BMI of ≥ 1% from baseline; AND
  Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
- **iv.** Wegovy will be used concomitantly with behavioral modification and a reduced-calorie diet; AND
- **v.** Patient meets one of the following (a or b):
  i. Patient is able to tolerate a Wegovy maintenance dose of 1.7 mg once weekly or 2.4 mg once weekly: Approve for 1 year; OR
  ii. Approve for up to 5 months if the patient meets both of the following [(1) and (2)]:
  Note: Approve a sufficient duration for 12 consecutive months of therapy (for example, if the patient has completed 8 months of Wegovy therapy, approve for 4 additional months).
  i. Patient has received < 12 consecutive months of Wegovy; AND
  ii. According to the prescriber, the patient is continuing to titrate the Wegovy dose to a target of 1.7 mg once weekly or 2.4 mg once weekly.

III. Coverage of Zepbound is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Weight Loss, Adult.** Approve for the duration noted if the patient meets one of the following (A or B):
   - **A)** Initial Therapy. Approve for 8 months if the patient meets the following (i, ii, iii, and iv):
     - **i.** Patient is ≥ 18 years of age; AND
     - **ii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months; AND
     - **iii.** Patient meets one of the following (a or b):
       - **a)** At baseline, patient had a BMI ≥ 30 kg/m^2; OR
         Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
       - **b)** At baseline, patient had a BMI ≥ 27 kg/m^2 and at least one of the following weight-related comorbidities: hypertension, type 2 diabetes, dyslipidemia, obstructive sleep apnea, or cardiovascular disease; AND
         Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
     - **iv.** Zepbound will be used concomitantly with behavioral modification and a reduced-calorie diet.
   - **B)** Patient is Continuing Therapy with Zepbound. Approve for the duration noted below if the patient meets the following (i, ii, iii, iv, and v):
     Note: For a patient who has not completed 8 months of initial therapy, refer to Initial Therapy criteria above.
     - **i.** Patient is ≥ 18 years of age; AND
     - **ii.** Patient meets one of the following (a or b):
       - **a)** At baseline, patient had a BMI ≥ 30 kg/m^2; OR
         Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
       - **b)** At baseline, patient had a BMI ≥ 27 kg/m^2 and at least one of the following weight-related comorbidities: hypertension, type 2 diabetes, dyslipidemia, obstructive sleep apnea, or cardiovascular disease; AND
         Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
     - **iii.** Patient has lost ≥ 5% of baseline body weight; AND
       Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
     - **iv.** Zepbound will be used concomitantly with behavioral modification and a reduced-calorie diet; AND
     - **v.** Patient meets one of the following (a or b):
       - **a)** Patient is able to tolerate a Zepbound maintenance dose of 5 mg, 10 mg, or 15 mg once weekly: Approve for 1 year; OR
       - **b)** Approve for up to 4 months if the patient meets both of the following [(1) and (2)]:
         Note: Approve a sufficient duration for 12 consecutive months of therapy (for example, if the patient has completed 8 months of Zepbound therapy, approve for 4 additional months).

(1) Patient has received < 12 consecutive months of Zepbound; AND
(2) According to the prescriber, the patient is continuing to titrate the Zepbound dose to a target of 10 mg once weekly or 15 mg once weekly.
Note: Although 5 mg once weekly is an acceptable maintenance dose, the patient should be able to achieve the 5 mg once weekly maintenance dose within the 8 months of initial therapy provided above.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Saxenda, Wegovy, and Zepbound is not recommended in the following situations:

108. Concomitant Use with Other Weight Loss Medications. Concomitant use with other medications intended for weight loss is not recommended.[1,2,9] Note: Examples of other medications FDA-approved for weight loss include but are not limited to phentermine (Lomaira, generic), benzphetamine, diethylpropion, phendimetrazine, Contrave (naltrexone/bupropion extended-release tablets), Qsymia (phentermine/topiramate extended-release capsules), and Xenical (orlistat 120 mg capsules). Additionally, Alli (orlistat 60 mg capsules) is available over-the-counter.

109. Concomitant Use with other Glucagon-Like Peptide-1 (GLP-1) Agonists or GLP-1/ Glucose-Dependent Insulinotropic Polypeptide (GIP) Receptor Agonists. Saxenda, Wegovy, and Zepbound should not be combined with each other or with any other GLP-1 agonists.[1,2,9] Other GLP-1 and GLP-1/GIP products are FDA-approved for type 2 diabetes and are not indicated for chronic weight management. Note: Examples of other GLP-1 agonists include but are not limited to Adlyxin (lixisenatide subcutaneous [SC] injection), Byetta (exenatide SC injection), Bydureon (exenatide extended-release SC injectable suspension), Bydureon BCise (exenatide extended-release SC injectable suspension), Ozempic (semaglutide SC injection), Rybelsus (semaglutide tablets), Trulicity (dulaglutide SC injection), and Victoza (liraglutide SC injection). An example of a GLP-1/GIP agonist is Mounjaro (tirzepatide SC injection).

110. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Weight Loss – Other Appetite Suppressants and Orlistat Prior Authorization Policy

- Adipex-P® (phentermine hydrochloride capsules and tablets – Teva, generic [brand capsules obsolete 07/12/2023])
- benzphetamine 50 mg tablets (generic only)
- Contrave® (naltrexone HCl/buproprion HCl extended-release tablets – Nalpropion/Currax)
- diethylpropion hydrochloride immediate-release and controlled-release tablets (generic only)
- Lomaira™ (phentermine hydrochloride tablets – KVK-Tech)
- phendimetrazine tartrate tablets and extended-release capsules (generic only)
- phentermine hydrochloride orally disintegrating tablets (generic only)
- benzphetamine 25 mg tablets (generic only)
- Qsymia™ (phentermine and topiramate extended-release capsules – Vivus)
- Xenical® (orlistat 120 mg capsules, authorized generic – Roche, generic)

REVIEW DATE 01/03/2024

OVERVIEW

The appetite suppressant products vary slightly in the wording of their FDA-approved indications.

- **Benzphetamine**, **diethylpropion**, and **phendimetrazine** are indicated for the management of exogenous obesity as a short-term adjunct (a few weeks) to a regimen of weight reduction based on caloric restriction in patients with an initial body mass index (BMI) of ≥ 30 kg/m^2 who have not responded to a weight reducing regimen (diet and/or exercise) alone.[1-3]
- **Phentermine** hydrochloride is indicated for short-term (a few weeks) adjunctive therapy in a regimen of weight reduction based on exercise, behavioral modification, and caloric restriction in the management of exogenous obesity in those with an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 when other risk factors are present (e.g., controlled hypertension, diabetes mellitus, or dyslipidemia).[4-6]
- **Qsymia** is indicated as an adjunct to reduced-calorie diet and increased physical activity for chronic weight management in:[7]
    - Adults with an initial BMI of ≥ 30 kg/m^2 (obese), or ≥ 27 kg/m^2 (overweight) in the presence of at least one weight-related comorbid condition (e.g., hypertension, dyslipidemia, type 2 diabetes).
    - Pediatric patients ≥ 12 years of age with BMI in the 95th percentile or greater standardized for age and sex.
- **Contrave** is indicated as an adjunct to a reduced-calorie diet and increased physical activity for chronic weight management in adults with an initial BMI of ≥ 30 kg/m^2 (obese), or ≥ 27 kg/m^2 (overweight) in the presence of at least one weight-related comorbid condition (e.g., hypertension, dyslipidemia, type 2 diabetes).[8]
- **Orlistat 120 mg** (Xenical, authorized generic) is indicated for obesity management including weight loss and weight maintenance when used in conjunction with a reduced-calorie diet in patients with an initial body mass index ≥ 30 kg/m^2, or ≥ 27 kg/m^2 in the presence of at least one weight-related comorbidity (e.g., hypertension, diabetes, dyslipidemia), and to reduce the risk for weight gain after prior weight loss.[9]

Contrave

The recommended maintenance dose of Contrave is achieved at Week 4.[8] Response to therapy should be evaluated after 12 weeks at the maintenance dosage (Week 16, if dosed according to the prescribing information). If a patient has not lost ≥ 5% of baseline body weight, discontinue Contrave, as it is unlikely that the patient will achieve and sustain clinically meaningful weight loss with continued treatment.

Qsymia

The recommended starting dose of Qsymia is 3.75 mg/23 mg once daily for 14 days.[7] After 14 days, increase to 7.5 mg/46 mg once daily. Response to therapy should be evaluated by Week 12 of the 7.5 mg/46 mg dose. If an adult patient has not lost ≥ 3% of baseline body weight or pediatric patient has not lost ≥ 3% BMI, escalate the dose to 11.25 mg/69 mg once daily for 14 days, followed by an increase to 15 mg/92 mg once daily. If an adult patient has not lost ≥ 5% of baseline body weight (or a pediatric patient has not lost ≥ 5% baseline BMI) after an additional 12 weeks of treatment on Qsymia 15 mg/92 mg, discontinue Qsymia as directed as it is unlikely the patient will achieve and sustain clinically meaningful weight loss with continued treatment.

Guidelines

Guidelines from the Endocrine Society regarding pharmacological management of obesity (2015) recommend pharmacotherapy as adjunct to behavioral modification to reduce food intake and increase physical activity for patients with BMI ≥ 30 kg/m^2 or ≥ 27 kg/m^2 in the presence of at least one comorbidity, such as hypertension, dyslipidemia, type 2 diabetes, or obstructive sleep apnea.[10] If a patient's response to a weight loss medication is deemed effective (weight loss ≥ 5% of body weight at 3 months) and safe, it is recommended that the medication be continued. Although the noradrenergic weight loss medications are only labeled for short-term use, the Endocrine Society notes that off-label, long-term prescribing of phentermine is reasonable for most patients, as long as the patient has been informed that other medications for weight loss are FDA-approved for long-term use.

Per American Association of Clinical Endocrinologists/American College of Endocrinology obesity guidelines (2016), pharmacotherapy for overweight and obesity should be used only as an adjunct to lifestyle therapy and not alone.[11] The addition of pharmacotherapy produces greater weight loss and weight-loss maintenance compared with lifestyle therapy alone. The concurrent initiation of lifestyle therapy and pharmacotherapy should be considered in patients with weight-related complications that can be ameliorated by weight loss. Pharmacotherapy should be offered to patients with obesity, when potential benefits outweigh the risks, for the chronic treatment of the disease. Short-term treatment (3 to 6 months) using weight-loss medications has not been demonstrated to produce longer-term health benefits and cannot be generally recommended based on scientific evidence.

According to the American Gastroenterological Association (AGA) guideline on pharmacological interventions for adults with obesity (2022), in adults with obesity or overweight with weight-related complications who have had an inadequate response to lifestyle interventions, pharmacological agents are recommended to be added to lifestyle rather than continuing lifestyle interventions alone.[12] Wegovy® (semaglutide 2.4 mg subcutaneous injection), Saxenda® (liraglutide 3.0 mg subcutaneous injection), Qsymia, Contrave, phentermine, and diethylpropion are all listed among the suggested treatment options. Of note, although the AGA guideline suggests against the use of orlistat, it is noted that for patients who place a high value on the potential small weight loss benefit and low value on gastrointestinal adverse events, orlistat may reasonably be considered. Regarding phentermine and diethylpropion, it is noted that these are only approved as monotherapy for short-term use (12 weeks); however, given the chronic nature of weight management, many practitioners use these agents off-label for longer than 12 weeks.

Guidelines in Pediatric Obesity

Guidelines from the American Academy of Pediatrics on evaluation and treatment of children and adolescents with obesity (2023) note that pediatricians and other primary health care providers should offer adolescents ≥ 12 years of age with obesity (BMI ≥ 95th percentile) weight loss pharmacotherapy, according to medication indications, risks, and benefits, as an adjunct to health behavior and lifestyle treatment.[14]

A 2017 Endocrine Society clinical practice guideline on pediatric obesity recommends pharmacotherapy in combination with lifestyle modification be considered in obese children or adolescents only after failure of a formal program of intensive lifestyle (dietary, physical activity and behavioral) modification to limit weight gain or to ameliorate comorbidities.[13] The Endocrine Society recommends pharmacotherapy in overweight children and adolescents < 16 years only in the context of a clinical trial. Pharmacotherapy should be provided only by clinicians who are experienced in the use of anti-obesity agents and aware of the potential for adverse events. These guidelines recommend limited use of pharmacotherapy because pediatric obesity should be managed preferably as a serious lifestyle condition with important lifelong consequences.

The Endocrine Society defines overweight as BMI in at least the 85th percentile but less than the 95th percentile, and obesity as BMI in at least the 95th percentile for age and sex against routine endocrine studies, unless the height velocity is attenuated or inappropriate for the family background or stage of puberty.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of benzphetamine, diethylpropion, phendimetrazine tartrate, phentermine hydrochloride, Qsymia, Contrave, and orlistat 120 mg (Xenical, authorized generic). All approvals are provided for the durations noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Prior Authorization and prescription benefit coverage is not recommended for Alli® (orlistat 60 mg capsules).

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of benzphetamine, diethylpropion, phendimetrazine tartrate, or phentermine hydrochloride is recommended in those who meet the following:

FDA-Approved Indication

4. Weight Loss. Approve for the duration noted if the patient meets one of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets all of the following (i, ii, iii, and iv):

- Patient is ≥ 16 years of age; AND
- Patient currently has a body mass index (BMI) ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity; AND

Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.

- Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
- Patient is currently engaged in behavioral modification and on a reduced calorie diet.

- Patient is Continuing Therapy. Approve for 1 year if the patient meets all of the following (i, ii, iii, and iv):

Note: For a patient who has not completed 3 months of initial therapy, criterion (1A) must be met (do not use continuation criteria if the initial 3 months were not completed).

- Patient is ≥ 16 years of age; AND
- Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity: AND

Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.

- Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
- Patient has lost ≥ 5% of baseline body weight.

II. Coverage of Contrave is recommended in those who meet the following:

FDA-Approved Indication

1. **Weight Loss.** Approve for the duration noted if the patient meets one of the following (A or B):
   - Initial Therapy. Approve for 4 months if the patient meets the following (i, ii, iii, and iv):
     - Patient is ≥ 18 years of age; AND
     - Patient currently has a body mass index (BMI) ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity; AND

     Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.

     - Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
     - Patient is currently engaged in behavioral modification and on a reduced calorie diet.
   - Patient is Continuing Therapy. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):

     Note: For a patient who has not completed 4 months of initial therapy, criterion (1A) must be met (do not use continuation criteria if the initial 4 months were not completed).

     - Patient is ≥ 18 years of age; AND
     - Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity: AND

     Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.

     - Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
     - Patient has lost ≥ 5% of baseline body weight.

III. Coverage of Qsymia is recommended in those who meet one of the following:

FDA-Approved Indications

1. **Weight Loss, Adult.** Approve for the duration noted if the patient meets one of the following (A or B):

   A) Initial Therapy. Approve for 6 months if the patient meets the following (i, ii, iii, and iv):
   - Patient is ≥ 18 years of age; AND
   - Patient currently has a BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity; AND

   Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.

   - Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND

- Patient is currently engaged in behavioral modification and on a reduced calorie diet.

- Patient is Continuing Therapy. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):
  Note: For a patient who has not completed 6 months of initial therapy, criterion (1A) must be met (do not use continuation criteria if the initial 6 months were not completed).
  - Patient is ≥ 18 years of age; AND
  - Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity; AND
    Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
  - Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
  - Patient has lost ≥ 5% of baseline body weight.

2. Weight Loss, Pediatric. Approve for the duration noted if the patient meets one of the following (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets the following (i, ii, iii, and iv):
- **i.** Patient is ≥ 12 years of age and < 18 years of age; AND
- **ii.** Patient currently has a body mass index (BMI) of ≥ 95th percentile for age and sex; AND
- **iii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to limit weight gain or to modify comorbidities; AND
- **iv.** Patient is currently engaged in behavioral modification and on a reduced calorie diet.

B) Patient is Continuing Therapy. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):
Note: For a patient who has not completed 6 months of initial therapy, criterion (2A) must be met (do not use continuation criteria if the initial 6 months were not completed).
- **i.** Patient is ≥ 12 years of age and < 18 years of age; AND
- **ii.** Patient had an initial BMI of ≥ 95th percentile for age and sex; AND
- **iii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
- **iv.** Patient has had a reduction in BMI of ≥ 5% from baseline (prior to the initiation of Qsymia).

IV. Coverage of orlistat 120 mg (Xenical, authorized generic) is recommended in those who meet one of the following:

FDA-Approved Indications

1. Weight Loss, Adult. Approve for the duration noted if the patient meets one of the following (A or B):

- Initial Therapy. Approve for 3 months if the patient meets the following (i, ii, iii, and iv):
  - Patient is ≥ 18 years of age; AND
  - Patient meets ONE of the following (a or b):
    - Patient currently has a BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity; OR

    Note: Examples of comorbidities include diabetes, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
    - Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity if maintaining weight loss after using a low calorie diet; AND

    Note: Examples of comorbidities include diabetes, dyslipidemia, hypertension, coronary heart disease, sleep apnea.

- Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
- Patient is currently engaged in behavioral modification and on a reduced calorie diet.

- Patient is Continuing Therapy. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):

  Note: For a patient who has not completed 3 months of initial therapy, criterion (1A) must be met (do not use continuation criteria if the initial 3 months were not completed).
  - Patient is ≥ 18 years of age; AND
  - Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity: AND

  Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
  - Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
  - Patient has lost ≥ 5% of baseline body weight.

2. **Weight Loss, Pediatric.** Approve for the duration noted if the patient meets one of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following (i, ii, iii, and iv):
- **i.** Patient is ≥ 12 years of age and < 18 years of age; AND
- **ii.** Patient currently has a body mass index (BMI) of ≥ 95th percentile for age and sex; AND
- **iii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to limit weight gain or to modify comorbidities; AND
- **iv.** Patient is currently engaged in behavioral modification and on a reduced calorie diet.

B) Patient is Continuing Therapy. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):

Note: For a patient who has not completed 3 months of initial therapy, criterion (2A) must be met (do not use continuation criteria if the initial 3 months were not completed).
- **i.** Patient is ≥ 12 years of age and < 18 years of age; AND
- **ii.** Patient had an initial BMI of ≥ 95th percentile for age and sex; AND
- **iii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
- **iv.** Patient's current BMI percentile has decreased for age and weight (taking into account that the patient is increasing in height and will have a different normative BMI from when orlistat 120 mg [Xenical, authorized generic] was started).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of benzphetamine, diethylpropion, phendimetrazine tartrate, phentermine hydrochloride, Qsymia, Contrave, and orlistat 120 mg (Xenical, authorized generic) is not recommended in the following situations:

111. **Concomitant Use with Other Weight Loss Medications.** Concomitant use with other medications intended for weight loss is not recommended. Of note, examples of medications FDA-approved for weight loss include phentermine, benzphetamine, diethylpropion, phendimetrazine, Contrave, Qsymia, orlistat 120 mg (Xenical, authorized generic), Saxenda (liraglutide subcutaneous injection), and Wegovy (semaglutide subcutaneous injection). Additionally, Alli (orlistat 60 mg capsules) is available over-the-counter.

112. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Xiaflex Prior Authorization Policy
- Xiaflex® (collagenase clostridium histolyticum intralesional injection – Endo)

REVIEW DATE: 09/06/2023

OVERVIEW

Xiaflex, a combination of bacterial collagenases, is indicated for the following uses:[1]
- **Dupuytren's contracture** with a palpable cord in adults.
- **Peyronie's disease** in adult men with a palpable plaque and curvature deformity of at least 30 degrees at the start of therapy.

Disease Overview

Dupuytren's contracture is a disorder of the palmar and digital fascia of the hand.[2] Abnormal deposition of collagen initially causes nodules in the palm of the hand, which may thicken and lead to formation of cords. As the disease progresses, the cords gradually contract, leading to flexion deformities of the fingers. Joint contractures are typically painless but are associated with significant functional impairment. In clinical studies of Dupuytren's contracture, patients were eligible to participate if they had a finger contraction of 20 degrees to 100 degrees in a metacarpophalangeal joint or 20 degrees to 80 degrees in a proximal interphalangeal joint.[1]

Peyronie's disease is an acquired penile abnormality caused by fibrosis of the tunica albuginea, which may lead to pain, deformity, erectile dysfunction, and/or distress.[3] Peyronie's disease has a variable course; for most patients, pain will resolve over time without intervention, but curvature deformities are less likely to resolve without treatment. Intralesional therapy with Xiaflex may be used to treat curvature associated with Peyronie's disease and is supported by American Urological Association guidelines (2015).

Dosing Considerations

For treatment of Dupuytren's contracture, the dose of Xiaflex is 0.58 mg per injection into a palpable cord with a contracture of an metacarpophalangeal or proximal interphalangeal joint.[1] Two palpable cords affecting two joints or one palpable cord affecting two joints in the same finger may be injected per treatment visit. Injections may be administered up to three times per cord at approximately 4-week intervals.

For treatment of Peyronie's disease, one treatment course consists of four cycles.[1] Each cycle consists of two Xiaflex injection procedures (1 to 3 days apart). Up to four cycles of Xiaflex may be administered, given at approximately 6-week intervals. The safety of more than one treatment course (8 total injections) is unknown. If the curvature deformity is less than 15 degrees after the first, second, or third treatment cycle, or if further treatment is not clinically indicated, then subsequent treatment cycles should not be administered.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xiaflex. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated

with Xiaflex, approval requires it to be administered by a healthcare provider with expertise in the condition being treated.

Prescription benefit coverage is not recommended for Xiaflex for cosmetic uses.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xiaflex is recommended in those who meet one of the following criteria:

FDA-Approved Indications

3. Dupuytren's Contracture. Approve Xiaflex for 3 months if the patient meets all of the following (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** At baseline (prior to initial injection of Xiaflex), the patient had contracture of a metacarpophalangeal or proximal interphalangeal joint of at least 20 degrees; AND
- **C)** As part of the current treatment course, the patient will be treated with up to three injections (maximum) per affected cord; AND
- **D)** Xiaflex is administered by a healthcare provider experienced in injection procedures of the hand and in the treatment of Dupuytren's contracture.

4. Peyronie's Disease. Approve Xiaflex for 6 months if the patient meets all of the following (A, B, C, and D):
- **A)** Patient is ≥18 years of age; AND
- **B)** Patient meets one of the following (i or ii):
  - **i.** At baseline (prior to use of Xiaflex), the patient has a penile curvature deformity of at least 30 degrees; OR
  - **ii.** In a patient who has received prior treatment with Xiaflex, the patient has a penile curvature deformity of at least 15 degrees; AND
- **C)** Patient has not previously been treated with a complete course (8 injections) of Xiaflex for Peyronie's disease; AND
- **D)** Xiaflex is being administered by a healthcare provider experienced in the treatment of male urological diseases.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xiaflex is not recommended in the following situations:

113. Cosmetic Uses (e.g., cellulite of buttocks). Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.

114. Retreatment for Peyronie's Disease. For Peyronie's disease, the safety of more than one treatment course (8 injections) is unknown.[1]

115. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Zokinvy Prior Authorization Policy
- Zokinvy™ (lonafarnib capsules – Eiger Biopharmaceuticals)

REVIEW DATE: 01/11/2023

OVERVIEW

Zokinvy, a protein farnesyltransferase inhibitor, is indicated in patients ≥ 12 months of age with a body surface area ≥ 0.39 m^2 for the following conditions:

- **Hutchinson-Gilford Progeria Syndrome** (HGPS), to reduce risk of mortality.
- **Progeroid laminopathies** that are processing-deficient, with either:
  - Heterozygous *LMNA* mutation with progerin-like protein accumulation; or
  - Homozygous or compound heterozygous *ZMPSTE24* mutations.[1]

Disease Overview

Hutchinson-Gilford Progeria Syndrome (HGPS)

HGPS is an ultra-rare, fatal, autosomal dominant genetic disorder with an estimated incidence of 1:4,000,000 live births and prevalence of 1:20,000,000 living individuals.[2] As of September 30, 2022, there were 18 patients identified with HGPS in the US.[3] HGPS results from a heterozygous mutation in *LMNA*, the gene encoding lamin A, a nuclear membrane protein.[4] "Classic" HGPS is caused by a single point mutation in *LMNA* involving c.1824C>T (G608G mutation) and accounts for 90% of HGPS cases.[4,5] Other *LMNA* mutations have also been identified in either the exon 11 splice junction or intron 11; these increase activation of the cryptic splice site, thus producing progerin. These are referred to as "non-classic" HGPS and comprise the remaining 10% of HGPS cases (refer to Appendix). The mutated prelamin A is referred to as progerin. Accumulation of progerin causes stiffening of the nuclear membrane and disorganized nuclear pores and chromatin, leading to hallmark symptoms including rapidly progressive atherosclerosis. Severe, rapidly progressing atherosclerosis results in an average mortality at 14.6 years of age due to myocardial infarction or stroke.[4] It is estimated that 50% of affected children have had a radiographically detectable stroke by 8 years of age.

Progeroid Laminopathies

To date, over 400 mutations in the LMNA gene have been identified, giving rise to different laminopathies which encompass a range of phenotypes including muscular dystrophy, peripheral neuropathy, lipodystrophy, and premature aging diseases.[4] Some of these may have phenotypic overlap with HGPS ("progeroid" laminopathies).[5,6] In addition, pathogenic variants in *ZMPSTE24* can result in excess prelamin A proteins and a related phenotype. As September 30, 2022, there were 13 patients identified with progeroid laminopathies in the US.[3] Of note; clinical data are not available regarding effect of Zokinvy in patients with progeroid laminopathies; the pivotal study only included patients with HGPS.

Guidelines

Formal guidelines for progeria are not in place. The Progeria Research Foundation provides a Progeria Handbook (updated March 2019) with information about the disease for patients and families, as well as for healthcare providers.[6] Clinical data with Zokinvy are acknowledged in the handbook as having positive results with regard to cardiovascular, bone, and survival outcomes. Diagnosis is made on the basis of clinical examination and genetic testing. It is noted that other progeroid laminopathies are closely related genetic diseases about which less is known. These conditions may be more or less severe than HGPS.

Applying knowledge from classic progeria (i.e., HGPS) to other progeroid syndromes may be helpful, but good judgment must be applied since patients with other progeroid syndromes will have different needs.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zokinvy. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zokinvy as well as the monitoring required for adverse events and long-term efficacy, approval requires Zokinvy to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zokinvy is recommended in those who meet the following criteria:

FDA-Approved Indication

23. Hutchinson-Gilford Progeria Syndrome. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 12 months of age; AND
- **B)** Patient has a body surface area of ≥ 0.39 m^2; AND
- **C)** Genetic testing demonstrates a confirmed pathogenic mutation in the *LMNA* gene consistent with Hutchinson-Gilford Progeria Syndrome; AND
  Note: Refer to Appendix for listing of genetic mutations associated with Hutchinson-Gilford Progeria Syndrome.
- **D)** The medication is prescribed by or in consultation with a geneticist or pediatric cardiologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zokinvy is not recommended in the following situations:

116. Progeroid Laminopathies. The efficacy of Zokinvy has not been established for patients with genetic disorders other than Hutchinson-Gilford Progeria Syndrome.[2] Although FDA labeling includes processing-deficient progeroid laminopathies, there are no clinical data demonstrating a treatment effect of Zokinvy in this population. Zokinvy is not indicated for use in processing-proficient progeroid laminopathies; based on its mechanism of action, Zokinvy would not be expected to be effective in this population.[1]

117. Other Progeroid Syndromes. Zokinvy is not indicated for use in other progeroid syndromes.[1] Based on its mechanism of action, Zokinvy would not be expected to be effective in this population.

118. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX

Genetic mutations consistent with a diagnosis of Hutchinson-Gilford Progeria Syndrome are outlined below.[2,3] Of note, all of the following mutations are heterozygous; only one affected gene copy is required for confirmation of the diagnosis.

Appendix Table 1. Genetic Mutations Associated with Hutchinson-Gilford Progeria Syndrome.
