2. **Renal Cell Carcinoma.** Approve for 1 year if the patient meets both of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed or stage IV disease.
3. **Thyroid Carcinoma, Differentiated.** Approve for 1 year if the patient meets the following (A, B, C, and D):
 - A) Patient is ≥ 12 years of age; AND
 - B) Patient has differentiated thyroid carcinoma; AND
Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).
 - C) Patient is refractory to radioactive iodine therapy; AND
 - D) Patient has tried Lenvima (lenvatinib capsules) or sorafenib.

Other Uses with Supportive Evidence

4. Bone Cancer. Approve for 1 year if the patient meets the following (A and B):

A) Patient meets ONE of the following (i or ii):

- i. Patient has Ewing sarcoma; OR
- ii. Patient has osteosarcoma; AND

B) Patient has tried at least one previous systemic regimen.

Note: Examples of a systemic regimen include one of the following: vincristine, doxorubicin, cyclophosphamide, topotecan, irinotecan, cisplatin, ifosfamide, Stivarga (regorafenib tablets), sorafenib.

5. Endometrial Carcinoma. Approve for 1 year if the patient meets the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried one systemic regimen.

Note: Examples of a systemic regimen include one of the following: carboplatin, paclitaxel, trastuzumab, docetaxel, doxorubicin, cisplatin, and topotecan.

6. Gastrointestinal Stromal Tumors. Approve for 1 year if the patient meets the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried each of the following (i, ii, iii, and iv):

- i. One of imatinib or Ayvakit (avapritinib tablets); AND
- ii. One of sunitinib or Sprycel (dasatinib tablets); AND
- iii. Stivarga (regorafenib tablets); AND
- iv. Qinlock (ripretinib tablets).

7. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has a *RET* rearrangement positive tumor.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cabometyx is not recommended in the following situations:

- 1. Metastatic Castration-Resistant Prostate Cancer (mCRPC).** Results from the COMET-1 Phase III pivotal study with Cabometyx 60 mg tablets in men with mCRPC are published.¹⁰ Patients included in the study had disease progression after treatment with docetaxel as well as abiraterone acetate and/or Xtandi® (enzalutamide capsules). The study failed to meet its primary endpoint of demonstrating statistically significant increase in overall survival (OS) compared with prednisone. The median OS with Cabometyx was 11.0 months vs. 9.8 months with prednisone, which was not statistically significant. Based on these results, the second Phase III study, COMET-2 has been discontinued.¹¹ In another small phase 1/2 study (n = 13), treatment with cabozantinib + docetaxel + prednisone vs. docetaxel + prednisone alone improved the median time to progression and overall survival.¹³ There is an ongoing Phase III, randomized, open-label study (CONTACT-02) of cabozantinib + Tecentriq (atezolizumab for intravenous injection) in various tumor types, including CRPC.¹²
- 2.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Calquence Prior Authorization Policy

- Calquence® (acalabrutinib tablets – AstraZeneca)

REVIEW DATE: 06/12/2024

OVERVIEW

Calquence, a Bruton tyrosine kinase (BTK) inhibitor, is indicated in adults for the following uses:^{1,2}

- **Chronic lymphocytic leukemia (CLL) or small lymphocytic leukemia (SLL).**
- **Mantle cell lymphoma**, in patients who have received at least one prior therapy. This indication is approved under accelerated approval based on overall response rate. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

Guidelines

Calquence is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **B-Cell Lymphomas:** NCCN guidelines (version 2.2024 – April 30, 2024) address mantle cell lymphoma and marginal zone lymphoma.^{3,6} Calquence is recommended as one of several “preferred” agents as second-line and subsequent therapy for mantle cell lymphoma (category 2A); there is a footnote that states that Calquence has not been shown to be effective for Imbruvica® (ibrutinib tablets, capsules, or oral solution)-refractory mantle cell lymphoma with *BTK* C481S mutations. Patients with Imbruvica intolerance have been successfully treated with Calquence or Brukinsa® (zanubrutinib capsules) without recurrence of symptoms. Calquence can also be used in combination with rituximab as pre-treatment in order to limit the number of cycles of aggressive induction therapy with RHyperCVAD (rituximab, cyclophosphamide, vincristine, doxorubicin, and dexamethasone) regimen (category 2A). Calquence is also recommended as “preferred” aggressive induction therapy (category 2B), “preferred” less aggressive induction therapy in combination with rituximab (category 2A), and maintenance therapy with chemotherapy (category 2B). For marginal zone lymphoma, NCCN guidelines recommend Calquence as a “preferred” regimen for second-line and subsequent therapy including patients who are older or infirm (category 2A).
- **CLL/SLL:** NCCN guidelines (version 3.2024 – March 26, 2024) list Calquence as a “preferred” first-line therapy option as a single agent or in combination with Gazyva® (obinutuzumab intravenous infusion) for patients with deletion(17p)/TP53 mutation (category 2A) or without deletion(17p)/TP53 mutation (category 1).^{4,6} The guidelines also list single-agent Calquence as a “preferred” second-line or third-line therapy for patients with or without deletion(17p)/TP53 mutation (category 1); there is a footnote that states that Calquence has not been shown to be effective for Imbruvica-refractory CLL with *BTK* C481S mutations. Patients with Imbruvica intolerance have been successfully treated with Calquence or Brukinsa without recurrence of symptoms.
- **Waldenström Macroglobulinemia/Lymphoplasmacytic Lymphoma:** NCCN guidelines (version 2.2024 – December 5, 2023) recommend single-agent Calquence as “Other Recommended Regimen” for previously treated disease (category 2A).^{5,6}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Calquence. All approvals are provided for the duration noted below.

06/12/2024

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Calquence is recommended in those who meet one of the following criteria:

FDA-Approved Indications

19. Chronic Lymphocytic Leukemia. Approve for 1 year if the patient is ≥ 18 years of age.

20. Mantle Cell Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i or ii):

i. Patient meets ONE of the following (a or b):

a) Patient has tried at least one systemic regimen; OR

Note: Examples of a systemic regimen contain one or more of the following products: rituximab, dexamethasone, cytarabine, carboplatin, cisplatin, oxaliplatin, cyclophosphamide, doxorubicin, vincristine, prednisone, methotrexate, bendamustine, bortezomib, or lenalidomide.

b) According to the prescriber, patient is not a candidate for a systemic regimen (i.e., an elderly person who is frail); OR

ii. Calquence is used in combination with rituximab.

21. Small Lymphocytic Lymphoma. Approve for 1 year if the patient is ≥ 18 years of age.

Other Uses with Supportive Evidence

22. Marginal Zone Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

Note: Marginal zone lymphoma includes gastric mucosa-associated lymphoid tissue (MALT) lymphoma, non-gastric MALT lymphoma, nodal marginal zone lymphoma, and splenic marginal zone lymphoma.

D) Patient is ≥ 18 years of age; AND

E) Patient has tried at least one systemic regimen.

Note: Examples of a systemic regimen contain one or more of the following products: bendamustine, rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone, lenalidomide, or chlorambucil.

23. Waldenström Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one systemic regimen.

Note: Examples of a systemic regimen contain one or more of the following products: Brukinsa (zanubrutinib capsules), Imbruvica (ibrutinib tablets, capsules, and oral solution), rituximab, bendamustine, cyclophosphamide, dexamethasone, bortezomib, fludarabine, or cladribine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Calquence is not recommended in the following situations:

06/12/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

146. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Capecitabine Prior Authorization

- Xeloda® (capecitabine tablets – Genentech, generic)

REVIEW DATE: 06/19/2024

OVERVIEW

Capecitabine, a nucleoside metabolic inhibitor with antineoplastic activity, is indicated for the following uses:¹

- **Breast cancer**, treatment of advanced or metastatic disease:
 - i. In combination with docetaxel after disease progression on prior anthracycline-containing chemotherapy.
 - ii. As a single agent if an anthracycline- or taxane-containing chemotherapy is not indicated.
- **Colorectal cancer**:
 - i. Adjuvant treatment of patients with Stage III colon cancer as a single agent or as a component of a combination chemotherapy regimen.
 - ii. Perioperative treatment of locally advanced rectal cancer as a component of chemoradiotherapy in adults.
 - iii. Treatment of patients with unresectable or metastatic colorectal cancer as a single agent or as a component of a combination chemotherapy regimen.
- **Gastric, esophageal, or gastroesophageal junction cancer**, treatment of adults with:
 - i. Unresectable or metastatic disease as a component of a combination chemotherapy regimen.
 - ii. HER2-overexpressing metastatic gastric or gastroesophageal junction adenocarcinoma who have not received prior treatment for metastatic disease as a component of a combination regimen.
- **Pancreatic Cancer**, adjuvant treatment of pancreatic adenocarcinoma as a component of a combination chemotherapy regimen in adults.

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium recommends use of capecitabine for the indications listed in the FDA-Approved Indications and Other Uses with Supportive Evidence sections.²

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of capecitabine. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of capecitabine is recommended in those who meet one of the following criteria:

FDA-Approved Indications

42. Breast Cancer. Approve for 1 year if the patient is ≥ 18 years of age.

06/19/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- 43. Colon Cancer.** Approve for 1 year if the patient is ≥ 18 years of age.
- 44. Esophageal and Esophagogastric Junction Cancers.** Approve for 1 year if the patient is ≥ 18 years of age.
- 45. Gastric Cancer.** Approve for 1 year if the patient is ≥ 18 years of age.
- 46. Pancreatic Adenocarcinoma.** Approve for 1 year if the patient is ≥ 18 years of age.

Other Uses with Supportive Evidence

- 47. Ampullary Adenocarcinoma.** Approve for 1 year if the patient is ≥ 18 years of age.
- 48. Anal Carcinoma.** Approve for 1 year if the patient is ≥ 18 years of age.
- 49. Biliary Tract Cancer.** Approve for 1 year if the patient is ≥ 18 years of age.
- 50. Central Nervous System Cancers.** Approve for 1 year if the patient is ≥ 18 years of age.
- 51. Cervical Cancer.** Approve for 1 year if the patient is ≥ 18 years of age.
- 52. Endometrial Carcinoma.** Approve for 1 year if the patient is ≥ 18 years of age.
- 53. Gestational Trophoblastic Neoplasia.** Approve for 1 year if the patient is ≥ 18 years of age.
- 54. Head and Neck Cancers.** Approve for 1 year if the patient is ≥ 18 years of age.
- 55. Neuroendocrine and Adrenal Tumors.** Approve for 1 year if the patient is ≥ 18 years of age.
- 56. Occult Primary Tumors.** Approve for 1 year if the patient is ≥ 18 years of age.
- 57. Ovarian Cancer/Fallopian Tube Cancer/Primary Peritoneal Cancer.** Approve for 1 year if the patient is ≥ 18 years of age.
- 58. Penile Cancer.** Approve for 1 year if the patient is ≥ 18 years of age.
- 59. Rectal Cancer.** Approve for 1 year if the patient is ≥ 18 years of age.
- 60. Small Bowel Adenocarcinoma.** Approve for 1 year if the patient is ≥ 18 years of age.
- 61. Squamous Cell Skin Cancer.** Approve for 1 year if the patient is ≥ 18 years of age.
- 62. Thymomas and Thymic Carcinomas.** Approve for 1 year if the patient is ≥ 18 years of age.
- 63. Vaginal Cancer.** Approve for 1 year if the patient is ≥ 18 years of age.
- 64. Vulvar Cancer.** Approve for 1 year if the patient is ≥ 18 years of age.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Caprelsa Prior Authorization Policy

- Caprelsa® (vandetanib tablets – AstraZeneca)

REVIEW DATE: 06/12/2024

OVERVIEW

Caprelsa, a kinase inhibitor, is indicated for the treatment of symptomatic or progressive **medullary thyroid cancer** in patients with unresectable locally advanced or metastatic disease.¹

GUIDELINES

Caprelsa is discussed in guidelines from the National Comprehensive Cancer Network (NCCN). NCCN thyroid guidelines (version 2.2024 – March 12, 2024) lists surgery as the main treatment option for medullary thyroid cancer.^{2,3} Caprelsa (category 1) or Cometriq® (cabozantinib capsules) [category 1] are the “Preferred Regimens” for recurrent or persistent locoregional or distant metastatic disease. For differentiated thyroid cancer subtypes, the guidelines have changed the naming of Hürthle cell neoplasm to oncocytic carcinoma. The guidelines recommend that Caprelsa can be considered if clinical trials or other systemic therapies are not available or appropriate for the treatment of progressive and/or symptomatic locally recurrent, advanced, and/or metastatic disease that is not amendable to radioactive iodine (RAI) therapy; this recommendation is for differentiated thyroid cancer (e.g. follicular, oncocytic, and papillary cancer subtypes) [all category 2A].^{2,3}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Caprelsa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Caprelsa is recommended in those who meet one of the following criteria:

FDA-Approved Indication

24. Thyroid Carcinoma, Medullary. Approve for 1 year if the patient is ≥ 18 years of age.

Other Uses with Supportive Evidence

25. Thyroid Carcinoma, Differentiated. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has differentiated thyroid carcinoma; AND

Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).

C) The disease is refractory to radioactive iodine therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

06/12/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Coverage of Caprelsa is not recommended in the following situations:

- 147.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Cometriq Prior Authorization Policy

- Cometriq® (cabozantinib capsules – Exelixis)

REVIEW DATE: 06/12/2024

OVERVIEW

Cometriq, a kinase inhibitor, is indicated for the treatment of patients with progressive, metastatic **medullary thyroid cancer**.¹

Guidelines

Cometriq is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Non-Small Cell Lung Cancer:** NCCN guidelines (version 5.2024 – April 23, 2024) recommend the use of Cometriq under “Useful in Certain Circumstances” for *RET* gene rearrangements (category 2A) for first-line and subsequent therapy.²
- **Thyroid Carcinoma:** NCCN guidelines (version 2.2024 – March 12, 2024) list surgery as the main treatment option for medullary thyroid cancer.³ Cometriq or Caprelsa® (vandetanib tablets) (both category 1) are the “preferred” treatments for recurrent or persistent disease that is locoregional or metastatic. The guidelines also state that cabozantinib under “Useful in Certain Circumstances” (category 1 for papillary; category 2A for follicular and oncocytic) can be considered if patient has progression after Lenvima® (lenvatinib capsules) and/or sorafenib for the treatment of locally recurrent, advanced, and/or metastatic disease that is not amendable to radioactive iodine therapy; this recommendation is for follicular, oncocytic, and papillary cancer subtypes.⁴ For differentiated thyroid cancer subtypes, the guidelines have changed the naming of Hürthle cell neoplasm to oncocytic carcinoma.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cometriq. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cometriq is recommended in those who meet one of the following criteria:

FDA-Approved Indication

26. Thyroid Carcinoma, Medullary. Approve for 1 year if the patient is ≥ 18 years of age.

Other Uses with Supportive Evidence

27. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has *RET* gene rearrangements.

06/12/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

28. Thyroid Carcinoma, Differentiated. Approve for 1 year if the patient meets ALL of the following (A, B, C and D):

A) Patient is ≥ 12 years of age; AND

B) Patient has differentiated thyroid carcinoma; AND

Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).

C) The disease is refractory to radioactive iodine therapy; AND

D) Patient has tried Lenvima (lenvatinib capsules) or sorafenib tablets.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cometriq is not recommended in the following situations:

- 1. Metastatic Castration-Resistant Prostate Cancer (mCRPC).** Results from the COMET-1 Phase III pivotal study with cabozantinib 60 mg tablets in men with mCRPC are published.⁵ Patients included in the study had disease progression after treatment with docetaxel as well as abiraterone acetate and/or Xtandi® (enzalutamide capsules). The study failed to meet its primary endpoint of demonstrating statistically significant increase in overall survival (OS) compared with prednisone. The median OS with cabozantinib was 11.0 months vs. 9.8 months with prednisone, which was not statistically significant. Based on these results, the second Phase III study, COMET-2 has been discontinued.⁶
- 2.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Copiktra Prior Authorization Policy

- Copiktra® (duvelisib capsules – Secura Bio)

REVIEW DATE: 06/12/2024

OVERVIEW

Copiktra, a phosphatidylinositol 3-kinase (PI3K) inhibitor, is indicated for the treatment of relapsed or refractory **chronic lymphocytic leukemia (CLL)/small lymphocytic lymphoma (SLL)** after at least two prior therapies in adults.¹

Guidelines

Copiktra is discussed in guidelines from the National Comprehensive Cancer Network (NCCN).

- **CLL/SLL:** NCCN guidelines (version 3.2024 – March 26, 2024) recommend Copiktra as subsequent therapy for relapsed or refractory disease after prior Bruton tyrosine kinase inhibitor and Venclexta®-(venetoclax tablets) based regimen in patients with or without deletion (del)[17p]/TP53 mutation as “other recommended regimens” (category 2A).
- **T-Cell Lymphoma:** NCCN guidelines (version 04.2024 – May 28, 2024) recommend Copiktra as “preferred” initial palliative intent therapy or second-line or and subsequent therapy for peripheral T-cell lymphoma; as second-line and subsequent therapy for relapsed/refractory disease for breast implant-associated anaplastic large cell lymphoma; and for hepatosplenic T-cell lymphoma as a single agent for refractory disease after two first-line therapy regimens (all category 2A).³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Copiktra. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Copiktra is recommended in those who meet one of the following:

FDA-Approved Indications

29. Chronic Lymphocytic Leukemia. Approve for 1 year if the patient meets ALL of the following (A, B and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one Bruton tyrosine kinase inhibitor; AND

Note: Examples of a Bruton tyrosine kinase inhibitor includes: Imbruvica (ibrutinib capsules, tablets, and oral solution); Brukinsa (zanubrutinib capsules), Calquence (acalabrutinib tablets), or Jaypirca (pirtobrutinib tablets).

C) Patient has tried at least one Venclexta-based regimen.

30. Small Lymphocytic Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B and C):

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- A) Patient is ≥ 18 years of age; AND
- B) Patient has tried at least one Bruton tyrosine kinase inhibitor; AND
Note: Examples of a Bruton tyrosine kinase inhibitor includes: Imbruvica (ibrutinib capsules, tablets, and oral solution); Brukinsa (zanubrutinib capsules), Calquence (acalabrutinib tablets), or Jaypirca (pirtobrutinib tablets).
- C) Patient has tried at least one Venclexta-based regimen.

Other Uses with Supportive Evidence

31. T-Cell Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. Patient meets BOTH of the following (a and b):
 - a) Patient has relapsed or refractory disease; AND
 - b) Patient has breast implant-associated anaplastic large cell lymphoma or hepatosplenic T-cell lymphoma; OR
 - ii. Patient has peripheral T-cell lymphoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Copiktra is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Cotellic Prior Authorization Policy

- Cotellic® (cobimetinib tablets – Genentech/Roche)

REVIEW DATE: 08/14/2024

OVERVIEW

Cotellic is a MEK inhibitor indicated for the following uses:

- **Histiocytic neoplasms**, as a single agent in adults.
- **Melanoma**, in combination with Zelboraf® (vemurafenib tablets), for the treatment of unresectable or metastatic disease with the *BRAF V600E* or *V600K* mutation in adults.¹

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use in multiple cancers.⁵

- **Central Nervous System Cancers:** Guidelines (version 2.2024 – July 25, 2024) recommend a BRAF/MEK inhibitor combination (i.e., Tafenlar® [dabrafenib capsules]/Mekinist® [trametinib tablets] or Zelboraf/Cotellic) for treatment of *BRAF V600E* activation mutations in adults in the following situations: adjuvant treatment (category 2A) of pilocytic astrocytoma, pleomorphic xanthoastrocytoma, or circumscribed ganglioglioma/neuroglioma/glioneuronal tumor; recurrent or progressive circumscribed glioma, pleomorphic xanthoastrocytoma/glioneuronal tumors, high-grade glioma, and recurrent glioblastoma (all category 2A).⁴ Zelboraf/Cotellic combination therapy is also recommended for melanoma with brain metastases (category 2B).
- **Melanoma, Cutaneous:** Guidelines (version 2.2024 – April 3, 2024) for cutaneous disease recommend BRAF/MEK inhibitor combinations for first-line (category 1 “Other Recommended Regimen”) and subsequent treatment (category 2A) of metastatic or unresectable melanoma with a *V600*-activating mutation.² The combinations are also recommended for adjuvant treatment (category 2B). While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor is an option, especially in patients who are not appropriate candidates for checkpoint immunotherapy.
- **Histiocytic Neoplasms:** Guidelines (version 2.2024 – July 19, 2024) recommend Cotellic (preferred) or Mekinist (other recommended regimen) for histiocytic neoplasms (if there is a MAP kinase pathway mutation, or no detectable mutation, or testing is not available) for the following types: Langerhans cell histiocytosis (including multisystem, pulmonary or central nervous system lesions), Erdheim-Chester disease, and Rosai-Dorfman disease (all category 2A).³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cotellic. All approvals are provided for the duration noted below.

Automation: None.

08/14/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cotellic is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Histiocytic Neoplasm.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient meets one of the following (i, ii, or iii):
 - i. Patient has Langerhans cell histiocytosis and ONE of the following (a, b, or c):
 - a) Multisystem disease; OR
 - b) Pulmonary disease; OR
 - c) Central nervous system lesions; OR
 - ii. Patient has Erdheim-Chester disease; OR
 - iii. Patient has Rosai-Dorfman disease.
2. **Melanoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has unresectable, advanced, or metastatic melanoma; AND
 - C) Patient has *BRAF V600* mutation-positive disease; AND
 - D) The medication is prescribed in combination with Zelboraf (vemurafenib tablets).

Other Uses with Supportive Evidence

3. **Central Nervous System Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) The medication is being used for ONE of the following (i, ii, or iii):
 - i. Adjuvant treatment of one of the following conditions (a, b, or c):
 - a) Pilocytic astrocytoma; OR
 - b) Pleomorphic xanthoastrocytoma; OR
 - c) Circumscribed ganglioglioma, or neuroglioma, or glioneuronal tumor; OR
 - ii. Recurrent or progressive disease for ONE of the following (a, b, or c):
 - a) High-grade glioma; OR
 - b) Circumscribed glioma; OR
 - c) Glioblastoma; OR
 - iii. Brain metastases due to melanoma; AND
 - C) Patient has *BRAF V600* mutation-positive disease; AND
 - D) The medication is prescribed in combination with Zelboraf (vemurafenib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cotellic is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Dasatinib Prior Authorization Policy

- Sprycel® (dasatinib tablets – Bristol-Myers Squibb; generic)

REVIEW DATE: 05/01/2024; selected revision 10/02/2024

OVERVIEW

Dasatinib, a tyrosine kinase inhibitor (TKI), is indicated for the following uses:¹

- **Philadelphia chromosome positive (Ph+) acute lymphoblastic leukemia (ALL):**
 - A) In adults with resistance or intolerance to prior therapy.
 - B) In newly diagnosed pediatric patients ≥ 1 year of age in combination with chemotherapy.
- **Ph+ chronic myeloid leukemia (CML):**
 - A) Chronic phase in newly diagnosed adults.
 - B) Chronic phase, accelerated, or myeloid or lymphoid blast phase, in adults with resistance or intolerance to prior therapy including imatinib.
 - C) Chronic phase, in pediatric patients ≥ 1 year of age.

Guidelines

Dasatinib is addressed in guidelines from National Comprehensive Cancer Network (NCCN):

- **ALL:** NCCN guidelines for adults and adolescents (version 4.2023 – February 5, 2024) recommend dasatinib for Ph+ disease in many different clinical circumstances (e.g., induction, consolidation therapy, maintenance, or relapsed or refractory disease) [category 2A].² TKIs in combination with other agents (e.g., chemotherapy or corticosteroids) are recommended for induction therapy for Ph+ ALL. TKIs have also been incorporated into consolidation and maintenance therapy, as well as in the relapsed/refractory setting (category 2A). TKI options include: Bosulif® (bosutinib tablets), dasatinib, imatinib, Tasigna (nilotinib capsules), or Iclusig® (ponatinib tablets) [category 2A]. NCCN panel notes that not all TKIs have been directly studied within the context of each specific regimen and there are limited data for Bosulif in Ph+ ALL. Use of a specific TKI should account for anticipated/prior TKI intolerance and disease-related features. For adults and adolescents, Iclusig has activity against T315I mutations and/or in whom no other TKI is indicated (category 2A). NCCN guidelines for pediatric ALL (version 5.2024 – April 3, 2024) feature dasatinib prominently in a variety of clinical scenarios (mainly category 2A recommendations).³
- **Bone Cancer:** NCCN guidelines (version 2.2024 – March 12, 2024) recommend dasatinib for patients with chondrosarcoma as “other recommended regimens” for a patient with metastatic and widespread disease (category 2A).⁴ Dasatinib is also recommended for recurrent conventional or chondroid chordoma as “other recommended regimens” (category 2A).
- **CML:** NCCN guidelines (version 2.2024 – December 5, 2023) recommend dasatinib as a “preferred” primary treatment for newly diagnosed chronic phase Ph+ CML with a low-, intermediate-, or high-risk score (category 1).⁵ Dasatinib is also recommended as an alternative TKI treatment (after primary treatment with imatinib, Bosulif® [bosutinib tablets], or Tasigna® [nilotinib capsules]) (category 2A). Dasatinib is also recommended in a variety of other situations, including post-allogeneic hematopoietic stem cell transplant (category 2A).
- **Gastrointestinal Stromal Tumor:** NCCN guidelines (version 1.2024 – March 8, 2024) recommend dasatinib as a second-line therapy as “other recommended regimens” for unresectable, progressive or metastatic disease in patients with platelet-derived growth factor receptor alpha

[*PDGFRA*] exon 18 mutations that are insensitive to imatinib (including the *PDGFRA* D842V mutation) [category 2A].⁶

- **Melanoma: Cutaneous:** NCCN guidelines (version 2.2024 – April 3, 2024) recommend dasatinib as “useful in certain circumstances” for metastatic or unresectable disease with an activating *KIT* mutation as second-line or subsequent therapy for disease progression, intolerance, and/or projected risk of progression with *BRAF*-targeted therapy (category 2A).⁷
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions:** NCCN guidelines (version 1.2024 – December 21, 2023) list dasatinib as a “preferred” therapy for chronic phase or blast phase disease with an *ABL1* rearrangement (category 2A).^{8,9} It is also recommended as treatment in combination with ALL- or acute myeloid leukemia-type induction chemotherapy followed by allogeneic hematopoietic stem cell transplantation (HCT) (if eligible) for lymphoid, myeloid or mixed lineage neoplasms with eosinophilia and *ABL1* rearrangement in blast phase (category 2A).⁹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of dasatinib. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of dasatinib is recommended in those who meet one of the following criteria:

FDA-Approved Indications

3. **Acute Lymphoblastic Leukemia.** Approve for 1 year if the patient has Philadelphia chromosome-positive acute lymphoblastic leukemia.
4. **Chronic Myeloid Leukemia.** Approve for 1 year if the patient has Philadelphia chromosome-positive chronic myeloid leukemia.

Other Uses with Supportive Evidence

3. **Bone Cancer.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has chondrosarcoma or chordoma.
4. **Gastrointestinal Stromal Tumor.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has tried imatinib or Ayvakit (avapritinib tablets).
5. **Melanoma, Cutaneous.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has metastatic or unresectable disease; AND
 - C) Patient has an activating *KIT* mutation; AND
 - D) Patient has tried at least one systemic regimen.

Note: Examples of a systemic regimen include: Opdivo (nivolumab intravenous infusion) + Yervoy (ipilimumab intravenous infusion), Opdivo + Opdualag (nivolumab/relatlimab-rmbw intravenous infusion), Keytruda (pembrolizumab intravenous infusion), Opdivo, Tafinlar (dabrafenib capsules and oral tablets for suspension) + Mekinist (trametinib tablets), Zelboraf (vemurafenib tablets) + Cotellic (cobimetinib tablets), Braftovi (encorafenib capsules) + Mektovi (binimetinib tablets).

- 6. Myeloid/Lymphoid Neoplasms with Eosinophilia.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A)** Patient is ≥ 18 years of age; AND
 - B)** The tumor has an *ABL1* rearrangement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of dasatinib is not recommended in the following situations:

- 148.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Daurismo Prior Authorization Policy

- Daurismo™ (glasdegib tablets – Pfizer)

REVIEW DATE: 01/17/2024

OVERVIEW

Daurismo, a hedgehog pathway inhibitor, is indicated, in combination with low-dose cytarabine, for the treatment of newly diagnosed **acute myeloid leukemia** in adults who are ≥ 75 years of age or who have comorbidities that preclude use of intensive induction chemotherapy.¹

Guidelines

Daurismo is addressed in the National Comprehensive Cancer Network (NCCN) guidelines:

- **Acute Myeloid Leukemia:** Guidelines (version 6.2023 – October 24, 2023) recommend Daurismo with low-dose cytarabine for newly diagnosed patients ≥ 75 years of age, or who have significant comorbid conditions (i.e., severe cardiac disease, Eastern Cooperative Oncology Group performance status ≥ 2 , baseline creatinine > 1.3 mg/dL).² This recommendation is for treatment induction in patients without actionable mutations who are not candidates for intensive remission induction therapy or who decline intensive therapy as “Other Recommended Regimen” (category 2A).² It is also indicated for follow-up after induction therapy following a response to previous lower intensity therapy with the same regimen (category 2A) and as consolidation therapy as continuation of low-intensity regimen used for induction in select patients (category 2A).² Daurismo is also indicated for relapsed/refractory disease as a component of repeating the initial successful induction regimen if late relapse (≥ 12 months since induction regimen), if it is not administered continuously and not stopped due to development of clinical resistance (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Daurismo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Daurismo is recommended in those who meet the following criteria:

FDA-Approved Indication

65. Acute Myeloid Leukemia. Approve for 1 year if the patient meets the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient is using the medication in combination with cytarabine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Daurismo is not recommended in the following situations:

- 97.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ensacove Prior Authorization Policy

- Ensacove® (ensartinib capsules – Xcovery)

REVIEW DATE: 01/02/2025

OVERVIEW

Ensacove, a kinase inhibitor, is indicated for the treatment of anaplastic lymphoma kinase (**ALK**)-positive, locally advanced or metastatic **Non-Small Cell Lung Cancer (NSCLC)** in adults who have not previously received an ALK inhibitor.¹

An FDA-approved test to detect ALK rearrangements for selecting patients for treatment with Ensacove is not currently available.¹ However, other approved tests are available to detect *ALK* rearrangements.³

GUIDELINES

Ensacove is not addressed in the National Comprehensive Cancer Network (NCCN) guidelines.² The Non-Small Cell Lung Cancer guidelines (version 1.2025 – December 20, 2024) recommend testing for *ALK* rearrangements in eligible patients with NSCLC. If *ALK* rearrangement is discovered prior to first-line systemic therapy for advanced or metastatic disease, Alecensa® (alectinib capsules), Alunbrig® (brigatinib tablets), and Lorbrena® (lorlatinib tablets) are all “Preferred” first-line treatment options (all category 1). Zykadia® (ceritinib capsules and tablets) and Xalkori® (crizotinib capsules and oral pellets) are both “Useful in Certain Circumstances” as first line therapies (both category 1). If *ALK* rearrangement is discovered during first-line systemic therapy, the guidelines recommends to interrupt current therapy and to start ALK inhibitors (all category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ensacove. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ensacove is recommended in those who meet one of the following criteria:

FDA-Approved Indication

2. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

- E) Patient is ≥ 18 years of age; AND
- F) Patient has locally advanced or metastatic disease; AND
- G) Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND
- H) The mutation was detected by an approved test; AND
- I) Patient has not previously received an *ALK* inhibitor.

Note: Examples of *ALK* inhibitors are Alecensa[®] (alectinib capsules), Alunbrig[®] (brigatinib tablets), Lorbrena[®] (lorlatinib tablets), Zykadia[®] (ceritinib capsules and tablets), and Xalkori[®] (crizotinib capsules and oral pellets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ensacove is not recommended in the following situations:

149. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Erivedge Prior Authorization Policy

- Erivedge® (vismodegib capsules – Genentech/Roche)

REVIEW DATE: 01/17/2024

OVERVIEW

Erivedge, an inhibitor of the hedgehog signaling pathway, is indicated for adults for the treatment of metastatic **basal cell carcinoma**, or locally advanced basal cell carcinoma that has recurred following surgery or who are not candidates for surgery and who are not candidates for radiation.¹

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines address Erivedge.

- **Basal Cell Carcinoma:** Guidelines (version 2.2024 – September 14, 2023) note that surgical approaches offer the most effective and efficient means for accomplishing a cure; radiation therapy may be chosen as the primary treatment in order to achieve optimal overall results.² Erivedge is recommended for locally advanced disease where surgery and/or radiation therapy may not result in a cure or would possibly produce a significant functional limitation, nodal disease if surgery is not feasible, metastatic disease, and diffuse basal cell carcinoma formation (e.g. basal cell nevus syndrome [Gorlin syndrome] or other genetic forms of multiple basal cell carcinoma) as “Other Recommended Regimens” (all category 2A). Erivedge is also recommended as neoadjuvant therapy for locally advanced disease as “Other Recommended Regimens” (category 2B).
- **Central Nervous System Cancers:** Guidelines (version 1.2023 – March 24, 2023) list Erivedge as a treatment option for adults with recurrent medulloblastoma, in patients who have received prior systemic therapy and have mutations in the sonic hedgehog pathway.³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Erivedge. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Erivedge is recommended in those who meet one of the following criteria:

FDA-Approved Indications

32. Basal Cell Carcinoma, Locally Advanced. Approve for 1 year if the patients meets ONE of the following conditions (A or B):

A) Initial Therapy. Approve if the patient meets BOTH of the following (i and ii):

- i. Patient is ≥ 18 years of age; AND
- ii. Patient meets one of the following (a or b):
 - a) Patient has recurrent basal cell carcinoma following surgery or radiation therapy; OR
 - b) Patient meets BOTH of the following [(1) and (2)]:
 - (1) Patient is not a candidate for surgery; AND

01/17/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- (2) According to the prescriber, the patient is not a candidate for radiation therapy.
B) Patient is Currently Receiving Erivedge. Approve.

33. Basal Cell Carcinoma, Metastatic. Approve for 1 year if the patient is ≥ 18 years of age.
Note: This includes primary or recurrent nodal metastases and distant metastatic disease.

Other Uses with Supportive Evidence

34. Central Nervous System Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

Note: This includes brain and spinal cord tumors.

- A) Patient is ≥ 18 years of age; AND
B) Patient has medulloblastoma; AND
C) Patient has tried at least one chemotherapy agent; AND

Note: Examples of chemotherapy include etoposide, carboplatin, cisplatin.

- D) According to the prescriber, the patient has a mutation of the sonic hedgehog pathway.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Erivedge is not recommended in the following situations:

150. Basal Cell Carcinoma (Locally Advanced or Metastatic), in a Patient with Disease Progression While on Odomzo (sonidegib capsules). Note: This does not apply to a patient already started on Erivedge. Refer to criteria for basal cell carcinoma, Locally Advanced for a Patient Currently Receiving Erivedge. There are no data to support the use of Erivedge in patients who have experienced disease progression on Odomzo, another hedgehog signaling pathway inhibitor. Previous use of a hedgehog inhibitor was not allowed in the pivotal study for Odomzo.¹ Patients who develop resistance to one of the hedgehog pathway inhibitors are not expected to respond to another hedgehog pathway inhibitor. There is an open-label study which evaluated patients (n = 9) with advanced basal cell carcinoma; patients with resistance to Odomzo also progressed on Erivedge.⁴

151. Metastatic Colorectal Cancer. Erivedge is not recognized in the treatment recommendations for colon cancer from the NCCN (version 4.2023 – November 16, 2023).⁵ In combination with standard of care treatment for first-line disease, Erivedge did not confer incremental clinical benefit as measured by progression-free survival (PFS) compared with standard of care therapy alone. A Phase II study was designed to assess whether Erivedge would prolong PFS when combined with standard of care therapy (FOLFOX [leucovorin, fluorouracil, oxaliplatin] or FOLFIRI [leucovorin, fluorouracil, irinotecan] in combination with Avastin® [bevacizumab injection]) in patients requiring first-line treatment for metastatic colorectal cancer.⁶ Adults with histologically confirmed disease were randomized 1:1 to Erivedge or placebo (n = 199). There was not a significant difference in median PFS or 12-month survival with Erivedge vs. placebo.

152. Ovarian Cancer. The NCCN guidelines for Ovarian Cancer (version 2.2023 – June 2, 2023) do not address the use of Erivedge for the management of ovarian cancer.⁷ The prespecified magnitude of PFS was not achieved in a Phase II, randomized, double-blind, placebo-controlled trial in adults with histologically confirmed epithelial ovarian carcinoma, primary peritoneal carcinoma, or fallopian tube carcinoma. The study was conducted to determine an estimate of clinical benefit of maintenance therapy with Erivedge in the setting of second or third complete remission as measured by PFS using radiographic assessment.⁸ Eligible patients had received chemotherapy (platinum based and/or non-

platinum based) for recurrent disease and had achieved complete response after their most recent chemotherapy regimen. PFS was not statistically different with Erivedge vs. placebo.

153. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Erleada Prior Authorization Policy

- Erleada® (apalutamide tablets – Janssen)

REVIEW DATE: 04/10/2024

OVERVIEW

Erleada, an androgen receptor inhibitor, is indicated for the treatment of patients with **non-metastatic, castration-resistant prostate cancer (nmCRPC)** and **metastatic castration-sensitive prostate cancer (mCSPC)**.¹ Patients should also receive a gonadotropin-releasing hormone (GnRH) analog concurrently or the patient should have had a bilateral orchiectomy.

GUIDELINES

According to the National Comprehensive Cancer Network (NCCN) guidelines for prostate cancer (version 3.2024 – March 8, 2024)²:

- For nmCRPC, Erleada, Xtandi® (enzalutamide capsules or tablets), and Nubeqa® (darolutamide tablets) are all preferred category 1 recommended options, if the prostate specific antigen doubling time is ≤ 10 months.
- For mCSPC, androgen deprivation therapy in combination with abiraterone + steroid, Erleada, docetaxel, and Xtandi are all preferred category 1 recommended options. Yonsa® (abiraterone acetate tablets) with methylprednisolone is a category 2B recommendation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Erleada. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Erleada is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. Prostate Cancer – Non-Metastatic, Castration-Resistant. Approve for 1 year if the patient meets the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i or ii):

i. The medication is used in combination with a gonadotropin-releasing hormone (GnRH) analog; OR

Note: Examples are leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix subcutaneous injection), Orgovyx (relugolix tablets).

ii. Patient has had a bilateral orchiectomy.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

2. Prostate Cancer – Metastatic, Castration-Sensitive. Approve for 1 year if the patient meets the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i or ii):

i. The medication is used in combination with a gonadotropin-releasing hormone (GnRH) analog; OR

Note: Examples are leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix subcutaneous injection), Orgovyx (relugolix tablets).

ii. Patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Erleada is not recommended in the following situations:

154. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Erlotinib Prior Authorization Policy

- Tarceva® (erlotinib tablets – Genentech, generic)

REVIEW DATE: 02/07/2024

OVERVIEW

Erlotinib, a tyrosine kinase inhibitor, is indicated for the following uses:¹

- **Non-Small Cell Lung Cancer (NSCLC)**, treatment of patients whose tumors have epidermal growth factor receptor (**EGFR**) **exon 19 deletions** or **exon 21 (L858R) substitution mutations** as detected by an FDA-approved test, receiving first-line, maintenance, or second or greater line treatment after progression following at least one prior chemotherapy regimen. Limitations of use: The safety and efficacy of erlotinib have not been established in patients with NSCLC whose tumors have other *EGFR* mutations. Erlotinib is not recommended for use in combination with platinum-based chemotherapy.
- **Pancreatic Cancer**, in combination with gemcitabine as first-line treatment of patients with locally advanced, unresectable, or metastatic pancreatic cancer.

Guidelines

Erlotinib has been addressed in National Comprehensive Cancer Network (NCCN) guidelines.²⁻⁷

- **Bone Cancer:** Guidelines (version 1.2024 – August 7, 2023) note erlotinib (category 2A) as a treatment option under “Useful in Certain Circumstances” for patients with chordoma.³ The efficacy of erlotinib was demonstrated in patients with advanced chordoma resistant to imatinib.
- **Kidney Cancer:** Guidelines (version 2.2024 – January 3, 2024) note erlotinib monotherapy as a treatment option for patients with recurrent or advanced renal cell carcinoma of non-clear cell histology (category 2A) under “Useful in Certain Circumstances”.⁶ The combination of bevacizumab with erlotinib is a treatment option (category 2A) for selected patients with non-clear cell and papillary cell histology, including hereditary leiomyomatosis and renal cell carcinoma under “Useful in Certain Circumstances”.
- **Non-Small Cell Lung Cancer:** Guidelines (version 1.2024 – December 21, 2023) recommend erlotinib and other *EGFR* tyrosine kinase inhibitors as first-line treatment for patients with advanced or metastatic NSCLC with *EGFR* exon 19 deletions, exon 21 (L858R) substitution mutations (category 1 for both exon 19 and exon 21), L861Q, G719X, and S768I (category 2A for these three mutations).
- **Pancreatic Adenocarcinoma:** Guidelines (version 1.2024 – December 13, 2023) recommend the combination of gemcitabine and erlotinib as first-line treatment option (category 2A) for patients with locally advanced or metastatic disease under “Other Recommended Regimens”.⁵ In addition, the combination is recommended as a subsequent therapy option (category 2A) for locally advanced, metastatic, or recurrent disease under “Other Recommended Regimens”.
- **Vulvar Cancer:** Guidelines (version 3.2024 – December 21, 2023) recommend erlotinib (category 2B) as a second-line or subsequent treatment option for patients with advanced, recurrent, or metastatic vulvar cancer under “Other Recommended Regimens”.⁷

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of erlotinib. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of erlotinib is recommended in those who meet one of the following criteria:

FDA-Approved Indications

35. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following (A, B, and C):

- C) Patient is ≥ 18 years of age; AND
- D) Patient has advanced or metastatic disease; AND
- E) Patient has *EGFR* mutation-positive non-small cell lung cancer as detected by an approved test.
Note: Examples of *EGFR* mutation-positive non-small cell lung cancer include the following: exon 19 deletions, exon 21 (L858R) substitution mutations, L861Q, G719X, and S768I.

36. Pancreatic Cancer. Approve for 1 year if the patient meets the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has locally advanced, metastatic, or recurrent disease; AND
- C) The medication is used in combination with gemcitabine.

Other Uses with Supportive Evidence

3. Bone Cancer. Approve for 1 year if the patient meets the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has chordoma; AND
- C) Patient has tried at least one previous therapy.

4. Renal Cell Carcinoma. Approve for 1 year if the patient meets the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets one of the following (i or ii):
 - i. Patient has recurrent or advanced renal cell carcinoma of non-clear cell histology; OR
 - ii. Patient meets both of the following (a and b):
 - a) Patient has hereditary leiomyomatosis and renal cell carcinoma; AND
 - b) The medication is used in combination with bevacizumab.

5. Vulvar Cancer. Approve for 1 year if the patient meets the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has advanced, recurrent, or metastatic disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of erlotinib is not recommended in the following situations:

- 1. Breast Cancer.** One Phase II, non-randomized, open-label, bi-institutional trial did not demonstrate a beneficial effect of erlotinib plus bevacizumab in patients with metastatic breast cancer with stage IV disease that was stable or had progressed after treatment with one or two chemotherapy regimens. If the patient's tumor was human epidermal growth factor receptor-2 (HER-2) positive, prior therapy with trastuzumab was required (n = 38).⁸ As single-agent therapy, erlotinib had minimal activity in unselected, previously treated women with locally advanced or metastatic breast cancer in one multicenter, Phase II study (n = 69).⁹ Metronomic (frequent low-dose) capecitabine tablets and cyclophosphamide plus bevacizumab and erlotinib was effective in patients with untreated advanced metastatic HER-2 negative, estrogen receptor-negative, and progesterone receptor-poor advanced breast cancer (n = 26).¹⁰ Among 24 patients assessable for response, 4% of patients had a complete response (CR) [n = 1], 58% of patients had partial response (PR) [n = 14], 21% of patients had stable disease (SD) > 9 weeks duration (n = 5) and 4% of patients (n = 1) had early progression of disease. The overall clinical benefit (CR + PR + SD > 24 weeks) was 75% (95% confidence interval [CI]: 53, 90). Median time to progression was 43 weeks (95% CI: 21, 69). Overall survival was 108 months (95% CI: 70, 110). NCCN Breast Cancer guidelines (version 1.2024 – January 25, 2024) do not mention erlotinib.¹¹
- 2. Colon Cancer, Advanced.** NCCN Colon Cancer guidelines (version 1.2024 – January 29, 2024) note several drug combinations, including bevacizumab plus erlotinib, produced negative results in phase III trials involving patients with advanced colorectal cancer and these regimens are not recommended.¹² In addition, the panel recommends against the use of several medications, including erlotinib, for the treatment of patients who progressed after treatment with standard therapies.
- 3. Glioblastoma Multiforme (GBM).** In one Phase II study, concurrent radiation therapy (RT) and temozolomide in combination with erlotinib in patients newly diagnosed with glioblastoma (n = 27) was not efficacious.¹³ In two Phase II studies, erlotinib plus temozolomide given during and after RT produced favorable median survival, and progression free survival (PFS), as well as 12- or 14-month survival rates in patients with newly diagnosed GBM or gliosarcoma.^{14,15} In patients with newly diagnosed (untreated; could have had resection) GBM or gliosarcoma who received erlotinib plus temozolomide during and after radiation, median survival was longer with erlotinib plus temozolomide vs. historical controls (19.3 months vs. 14.1 months, respectively; hazard ratio for survival 0.64; 95% confidence interval [CI]: 0.45, 0.91; P = 0.01) in one open-label, single-center, Phase II trial (n = 65).¹⁴ The historical controls were comparable in patients from two prospective, Phase II trials (n = 128); the first trial included the use of Thalomid® (thalidomide capsules) in combination with temozolomide during and after radiotherapy; the second included the use of *cis*-retinoic acid with temozolomide during and after radiotherapy. In one open-label, Phase I/II trial, treatment with erlotinib plus temozolomide during and after RT resulted in favorable survival rate (61% of patients were alive at 1 year) and median PFS (7.2 months) in patients with newly diagnosed GBM (following resection); however, there was no significant difference in overall survival with the addition of erlotinib compared with the temozolomide/RT arm of a historical control trial (15.3 months vs. 15 months, respectively).²⁴ Erlotinib has failed to demonstrate benefit in recurrent glioblastomas.¹⁶⁻¹⁹ In a recent study involving patients with recurrent glioblastoma, the combination regimen of sorafenib and erlotinib failed to meet the predetermined efficacy endpoint and the study was terminated.²⁰ NCCN Central Nervous System guidelines (version 1.2023 – March 24, 2023) do not mention erlotinib as a treatment option for patients with glioblastoma.²¹

4. **Head and Neck Cancer, Squamous Cell, Recurrent and/or Metastatic.** Two Phase II studies assessed the use of erlotinib and bevacizumab in different settings and showed promising results.^{22,23} One multicenter, Phase II trial assessed the addition of bevacizumab and erlotinib to chemoradiation as first-line treatment for previously untreated patients with locally advanced squamous cell carcinoma of the head and neck (SCCHN) [n = 60].²² After a median follow-up of 32 months the estimated 3-year progression free survival (PFS) and overall survival rates were 71% and 82%, respectively. After induction therapy, 65% of patients had major responses; after completion of therapy, 95% of patients had either partial or complete radiographic responses. One multi-institutional Phase I/II study enrolled patients with recurrent or metastatic SCCHN (previously treated with ≤ 1 prior regimen for recurrent disease) to receive erlotinib and bevacizumab (n = 56).²³ The median overall survival and PFS durations were 7.1 months (95% confidence interval [CI]: 5.7, 9.0) and 4.1 months (95% CI: 2.8, 4.4), respectively. Treatment with erlotinib monotherapy produced few partial responses in unselected (*EGFR* status not known at baseline) patients with locally recurrent and/or metastatic SCCHN in one open-label, Phase II clinical trial (n = 115); 38.3% of patients achieved stable disease for a median of 16.1 weeks.²⁴ In one Phase II study, 204 patients with locally advanced SCCHN were randomized to receive cisplatin in combination with radiation therapy (RT) with or without erlotinib.²⁵ Complete response rates evaluated by central review were reported in 40% of patients (n = 42/105) on cisplatin/RT vs. 52% of patients (n = 51/99) on cisplatin/RT/erlotinib (P = 0.08). At a median follow-up of 26 months and 54 progression events, there was no difference in PFS between the two treatment arms (hazard ratio 0.0; P = 0.71). In a Phase II study, patients with recurrent SCCHN were treated with erlotinib for 12 months (n = 31). The overall survival was 61% at 1 year and 56% at 2 years.²⁶ Disease-free survival was 54% at 1 year and 45% at 2 years. The mean time to recurrence (n = 16) was 8.7 months. Only 8 patients completed the full 12-month course of erlotinib; the median duration of erlotinib therapy was 5 months. NCCN Head and Neck Cancer guidelines (version 2.2024 – December 8, 2023) do not mention erlotinib.²⁷
5. **Hepatocellular Carcinoma, Advanced.** NCCN Hepatocellular Carcinoma guidelines (version 2.2023 – September 14, 2023) note the combination regimen of sorafenib and erlotinib did not significantly improve survival compared with sorafenib monotherapy in the treatment of patients with advanced hepatocellular carcinoma (sorafenib is one of several agents recommended for first-line treatment).²⁸ In addition, the disease control rate was significantly lower for patients who received the combination vs. those who received sorafenib monotherapy; treatment duration was also shorter for those received sorafenib and erlotinib. .
6. **Renal Cell Carcinoma, Advanced – Clear Cell Histology.** NCCN Kidney Cancer guidelines (version 2.2024 – January 3, 2024) do not note erlotinib as a treatment option for advanced clear-cell renal cell carcinoma.⁶
7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Oncology – Everolimus Products Prior Authorization Policy
- Afinitor® (everolimus tablets – Novartis, generic)
 - Afinitor Disperz® (everolimus tablets for oral suspension – Novartis)
 - Torpenz™ (everolimus tablets – Upsher-Smith)

REVIEW DATE: 03/06/2024; selected revision 07/03/2024

OVERVIEW

Afinitor, a kinase inhibitor, is indicated for the following uses:¹

- **Breast cancer**, treatment of advanced hormone receptor-positive (HR+), human epidermal growth factor receptor 2 (HER2)-negative disease in combination with exemestane, after failure of treatment with letrozole or anastrozole in postmenopausal women.
- **Neuroendocrine tumors (NET)**, treatment of progressive disease of pancreatic origin and progressive, well-differentiated, non-functional NET of gastrointestinal or lung origin that are unresectable, locally advanced, or metastatic in adults. Limitation of Use: Afinitor is not indicated for the treatment of patients with functional carcinoid tumors.
- **Renal cell carcinoma**, treatment of advanced disease after failure of treatment with sunitinib or sorafenib in adults.
- **Tuberous sclerosis complex (TSC)-associated renal angiomyolipoma**, treatment of adults not requiring immediate surgery.
- **TSC-associated subependymal giant cell astrocytoma (SEGA)**, treatment of patients $\geq$ 1 year of age who require therapeutic intervention but cannot be curatively resected.

Afinitor Disperz, a kinase inhibitor, is indicated for the following uses:¹

- **TSC-associated SEGA**, treatment of patients $\geq$ 1 year of age who require therapeutic intervention but cannot be curatively resected.
- **TSC-associated partial-onset seizures**, adjunctive treatment of patients $\geq$ 2 years of age.

Torpenz, a kinase inhibitor, is indicated for the following uses:²

- **Breast cancer**, treatment of advanced HR+, HER2-negative disease in combination with exemestane, after failure of treatment with letrozole or anastrozole in postmenopausal women.
- **TSC-associated renal angiomyolipoma**, treatment of adults not requiring immediate surgery.
- **TSC-associated SEGA**, treatment of patients $\geq$ 1 year of age who require therapeutic intervention but cannot be curatively resected.

Of note, Zortress® (everolimus tablets) is indicated in combination with other drugs for prophylaxis of organ rejection in adults undergoing kidney or liver transplant.³ The tablet strengths and dosing are different for Zortress and Afinitor. Zortress is not targeted in this policy.

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium recommends use of everolimus for the indications listed in the FDA-Approved Indications and Other Uses with Supportive Evidence sections.⁴

03/06/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of everolimus products. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of everolimus products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

37. Breast Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, F, and G):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has recurrent or metastatic, hormone receptor positive (HR+) [i.e., estrogen receptor-positive {ER+} and/or progesterone receptor-positive {PR+}] disease; AND
- C) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- D) Patient has tried at least one prior endocrine therapy (e.g., anastrozole, letrozole, or tamoxifen); AND
- E) Patient meets ONE of the following conditions (i or ii):
 - i. Patient is a postmenopausal woman* or a man*; OR
 - ii. Patient is a pre/perimenopausal woman* and meets ONE of the following (a or b):
 - a) Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR
Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant).
 - b) Patient has had surgical bilateral oophorectomy or ovarian irradiation; AND
- F) Patient meets ONE of the following conditions (i or ii):
 - i. The medication will be used in combination with exemestane and the patient meets ONE of the following (a or b):
 - a) Patient is a man* and the patient is receiving a gonadotropin-releasing hormone (GnRH) analog; OR
Note: Examples of a GnRH analog include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), and Orgovyx (relugolix tablet).
 - b) Patient is a woman*; OR
 - ii. The medication will be used in combination with fulvestrant or tamoxifen; AND
- G) Patient has not had disease progression while on everolimus.

*Refer to the Policy Statement.

38. Neuroendocrine Tumors of the Pancreas, Gastrointestinal Tract, Lung, and Thymus (Carcinoid Tumors). Approve for 1 year if the patient is ≥ 18 years of age.

- 39. Renal Cell Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed or Stage IV disease; AND
 - C) Patient meets ONE of the following (i or ii):
 - i. Patient has non-clear cell disease; OR
 - ii. Patient meets both of the following (a and b):
 - a) Patient has clear cell disease; AND
 - b) Patient has tried at least one prior systemic therapy.
- Note: Examples of prior systemic therapy include the following products: Inlyta (axitinib tablets), Lenvima (lenvatinib capsules), Cabometyx (cabozantinib tablets), Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion), pazopanib, sunitinib.
- 4. Tuberous Sclerosis Complex-Associated Renal Angiomyolipoma.** Approve for 1 year.
- 5. Tuberous Sclerosis Complex-Associated Subependymal Giant Cell Astrocytoma (SEGA).** Approve for 1 year if therapeutic intervention is required but SEGA cannot be curatively resected.
- 6. Tuberous Sclerosis Complex-Associated Partial Onset Seizures.** Approve for 1 year.

Other Uses with Supportive Evidence

- 7. Endometrial Carcinoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) The medication will be used in combination with letrozole.
- 8. Gastrointestinal Stromal Tumors.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has tried each of the following (i, ii, iii, and iv):
 - i. One of imatinib or Ayvakit (avapritinib tablets); AND
 - ii. One of sunitinib or Sprycel (dasatinib tablets); AND
 - iii. Stivarga (regorafenib tablets); AND
 - iv. Qinlock (ripretinib tablets); AND
 - C) The medication will be used in combination with imatinib, sunitinib, or Stivarga (regorafenib tablets).
- 9. Histiocytic Neoplasm.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i, ii, or iii):
 - i. Patient has Langerhans cell histiocytosis; OR
 - ii. Patient has Erdheim-Chester disease; OR
 - iii. Patient has Rosai-Dorfman disease; AND
 - C) Patient has a *PIK3CA* mutation.
- 10. Classic Hodgkin Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed or refractory disease; AND
 - C) Patient has tried at least three prior lines of chemotherapy.

Note: Examples of therapy include one or more of the following drugs: bendamustine, carboplatin, cisplatin, cytarabine, etoposide, doxorubicin, gemcitabine, ifosfamide, vinorelbine, Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion).

11. Meningioma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has recurrent or progressive disease; AND
- C) Patient meets BOTH of the following: (i and ii):
 - i. Patient has surgically inaccessible disease; AND
 - ii. Radiation therapy is not possible.
- D) The medication will be used in combination with a somatostatin analogue.

Note: Example of somatostatin analogue includes: octreotide.

12. Soft Tissue Sarcoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has ONE of the following conditions (i or ii):
 - i. Perivascular epithelioid cell tumor (PEComa); OR
 - ii. Recurrent angiomyolipoma/lymphangioleiomyomatosis.

13. Thymomas and Thymic Carcinomas. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. Patient has tried chemotherapy; OR
Note: Examples are cisplatin, doxorubicin, and cyclophosphamide; cisplatin plus etoposide; carboplatin plus paclitaxel.
 - ii. Patient cannot tolerate chemotherapy.

14. Thyroid Carcinoma, Differentiated. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has differentiated thyroid carcinoma; AND
Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic thyroid carcinoma.
- C) The disease is refractory to radioactive iodine therapy.

15. Uterine Sarcoma. Approve for 1 year if the patient meets ALL of the following (A, B, C and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has advanced, recurrent, metastatic, or inoperable disease; AND
- C) Patient has a perivascular epithelioid cell tumor (PEComa); AND
- D) Patient has tried at least one systemic regimen.
Note: Examples of systemic regimen include doxorubicin, docetaxel, gemcitabine, ifosfamide, dacarbazine.

16. Waldenström's Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. Patient has not responded to primary therapy; OR

- Note: Examples of primary therapy are bortezomib, dexamethasone, and rituximab; bendamustine and rituximab; cyclophosphamide, rituximab and dexamethasone; Imbruvica (ibrutinib capsules, tablets, and oral solution); and Brukinsa (zanubrutinib capsules).
- ii. Patient has progressive or relapsed disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of everolimus products is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Exkivity Prior Authorization Policy

- Exkivity™ (mobocertinib capsules – Takeda)

REVIEW DATE: 09/11/2024

OVERVIEW

Exkivity, an epidermal growth factor receptor (*EGFR*) inhibitor, is indicated for the treatment of adults with locally advanced or metastatic **non-small cell lung cancer (NSCLC)** with *EGFR* exon 20 insertion mutation, as determined by an FDA-approved test, whose disease has progressed on or after platinum-based chemotherapy.

Exkivity received accelerated approval for this indication in 2021; however, the drug has failed to meet its primary endpoint in its Phase III confirmatory study. Exkivity was withdrawn from the US market in April 2024.³ Patients who were initiated on Exkivity therapy prior to April 1, 2024 will continue to have access to the drug through the Takeda Compassionate Use program.

Guidelines

The National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 9.2024 – September 9, 2024) no longer recommends Exkivity as a subsequent treatment option for patients with *EGFR* exon 20 insertion-positive metastatic NSCLC and disease progression on or after initial systemic therapy (category 2A recommendation).² Rybrevant™ (amivantamab-vmjw intravenous infusion) is the “Preferred” first-line therapy [category 1] for *EGFR* exon 20 insertion mutation.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Exkivity. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Exkivity is recommended in those who meet the following criteria:

FDA-Approved Indication

5. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):

- A) Patient is currently receiving Exkivity; AND
- B) Patient is ≥ 18 years of age; AND
- C) Patient has locally advanced or metastatic disease; AND
- D) Patient has epidermal growth factor receptor (*EGFR*) exon 20 insertion-positive disease; AND
- E) The mutation was determined by an approved test; AND
- F) Patient has previously tried at least one platinum-based chemotherapy.

Note: Examples of platinum-based chemotherapy include carboplatin, cisplatin, and oxaliplatin.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Farydak Prior Authorization Policy

- Farydak® (panobinostat capsules – Novartis)

REVIEW DATE: 06/12/2024

OVERVIEW

Farydak, a histone deacetylase inhibitor, was approved in combination with bortezomib injection and dexamethasone for the treatment of patients with **multiple myeloma** who have received at least two prior regimens, including bortezomib injection and an immunomodulatory drug (i.e., Thalomid® [thalidomide capsules], Revlimid® [lenalidomide capsules], Pomalyst® [pomalidomide capsules]).¹

The FDA granted accelerated approval to Farydak in February 2015, based on progression free survival from a randomized, double-blind, placebo-controlled, multicenter, Phase III study. In December 2021, the manufacturer removed Farydak from the market because the required post-approval clinical studies were not feasible.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for multiple myeloma (version 3.2023 – December 8, 2022) note that due to market withdrawal, regimens containing Farydak were removed from the guideline.²

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Farydak. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Farydak is recommended in those who meet the following criteria:

FDA-Approved Indication

40. Multiple Myeloma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- F)** Patient is currently receiving Farydak; AND
- G)** Patient has previously tried bortezomib injection; AND
- H)** Patient has tried one immunomodulatory drug (i.e., Thalomid [thalidomide capsules], lenalidomide capsules, or Pomalyst [pomalidomide capsules]); AND
- I)** The medication will be taken in combination with bortezomib injection and dexamethasone.

06/12/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Farydak is not recommended in the following situations:

- 155. Pancreatic Cancer.** A Phase II study evaluating Farydak + bortezomib injection in patients with pancreatic cancer who were progressing on gemcitabine-based therapy was discontinued early due to toxicity and a lack of response.³
- 156.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Fotivda Prior Authorization Policy

- Fotivda® (tivozanib tablets – AVEO)

REVIEW DATE: 05/08/2024

OVERVIEW

Fotivda, a kinase inhibitor, is indicated for the treatment of relapsed or refractory advanced **renal cell carcinoma (RCC)** following two or more prior systemic therapies in adults.¹

Guidelines

In the National Comprehensive Cancer Network (NCCN) clinical practice guidelines for kidney cancer (version 3.2024 – March 11, 2024), Fotivda is given a category 2A recommendation as “useful in certain circumstances” for subsequent therapy for clear cell histology in immune-oncology therapy naïve patients, with a footnote that states this recommendation applies to patients who have received $\geq$ two systemic therapies. It is also recommended under “Other recommended regimens” for subsequent therapy for clear cell histology in patients who have had prior immune-oncology therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Fotivda. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Fotivda is recommended in those who meet the following criteria:

FDA-Approved Indication

A) Renal Cell Carcinoma. Approve for 1 year if the patient meets the following (A, B, and C):

- i. Patient is $\geq$ 18 years of age; AND
- ii. Patient has relapsed or Stage IV disease; AND
- iii. Patient has tried at least two other systemic regimens.

Note: Examples of systemic regimens for renal cell carcinoma include Inlyta (axitinib tablets) + Keytruda (pembrolizumab intravenous infusion), Cabometyx (cabozantinib tablets) + Opdivo (nivolumab intravenous infusion), Lenvima (lenvatinib capsules) + Keytruda, Yervoy (ipilimumab intravenous infusion) + Opdivo, sunitinib, pazopanib, and Lenvima+ everolimus.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Fruzaqla Prior Authorization Policy

- Fruzaqla™ (fruquintinib capsules – Takeda)

REVIEW DATE: 11/15/2023; selected revision 12/13/2023

OVERVIEW

Fruzaqla; a kinase inhibitor of vascular endothelial growth factor receptors (VEGFR)-1, -2, and -3; is indicated for the treatment of **metastatic colorectal cancer** in adults who have been previously treated with fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapy, an anti-vascular endothelial growth factor (VEGF) therapy, and if *RAS* wild-type and medically appropriate an anti-epidermal growth factor receptor (EGFR) therapy.

Guidelines

The National Comprehensive Cancer Network colon (version 4.2023 – November 16, 2023) and rectal (version 6.2023 – November 16, 2023) cancer treatment guidelines recommend Fruzaqla for the subsequent treatment of advanced or metastatic colon, rectal, or appendiceal cancer as a single agent.²⁻⁴ Patients should have progressed through all available regimens except Fruzaqla, Lonsurf® (trifluridine, tipiracil tablet), and Stivarga® (regorafenib tablet).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Fruzaqla. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Fruzaqla is recommended in those who meet the following criteria:

FDA-Approved Indication

66. Colon, Rectal, or Appendiceal Cancer. Approve for 1 year if the patient meets the following (A, B, and C):

- A)** Patient is ≥ 18 years of age; AND
- B)** Patient has advanced or metastatic disease; AND
- C)** Patient has previously been treated with the following (i, ii, and iii)
 - i.** Fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapy; AND
Note: Examples of fluoropyrimidine agents include 5-fluorouracil (5-FU) and capecitabine.
 - ii.** An anti-vascular endothelial growth factor (VEGF) agent; AND
Note: Examples of anti-VEGF agents include bevacizumab.
 - iii.** If the tumor is *RAS* wild-type (*KRAS* wild-type and *NRAS* wild-type) [that is, the tumor or metastases are *KRAS* and *NRAS* mutation negative], the patient meets ONE of the following (a or b):
 - a)** According to the prescriber, anti-epidermal growth factor receptor (EGFR) therapy is NOT medically appropriate; OR

11/15/2023

© 2023. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- b) The patient has received an anti-EGFR therapy.
Note: Examples of anti-EGFR therapy includes Erbitux (cetuximab intravenous infusion) and Vectibix (panitumumab intravenous infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Fruzaqla is not recommended in the following situations:

- 98.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Gavreto Prior Authorization Policy

- Gavreto® (pralsetinib capsules – Blueprint Medicines)

REVIEW DATE: 09/18/2024

OVERVIEW

Gavreto, a kinase inhibitor, is indicated for the following uses:¹

- **Non-small cell lung cancer**, with metastatic *RET* fusion-positive disease in adults, as detected by an FDA approved test.
- **Thyroid cancer**, with advanced or metastatic *RET* fusion-positive disease in adults and pediatric patients ≥ 12 years of age who require systemic therapy and who are radioactive iodine-refractory (if radioactive iodine is appropriate).

This thyroid cancer indication was approved under accelerated approval based on overall response rate and duration of response. Continued approval may be contingent upon verification and description of clinical benefit in confirmatory trial(s).

Guidelines

Gavreto is addressed in the National Comprehensive Cancer Network (NCCN) guidelines:

- **Non-Small Cell Lung Cancer:** Guidelines (version 9.2024 – September 9, 2024) recommend Gavreto and Retevmo® (selpercatinib capsules) as “preferred” first-line therapies for *RET* rearrangement-positive recurrent, advanced, or metastatic disease (both category 2A).² For patients who were started on other systemic therapy options and had disease progression, Gavreto and Retevmo are recommended as “preferred” subsequent therapies (category 2A). The NCCN compendium recommend Gavreto for locoregional recurrence or symptomatic local disease with *RET* rearrangement with no evidence of disseminated disease (both category 2B).⁴
- **Thyroid Carcinoma:** Guidelines (version 4.2024 – August 19, 2024) recommend the use of Gavreto and Retevmo in a variety of therapy settings.³ The guidelines recommend Gavreto and Retevmo for differentiated thyroid carcinoma (papillary, follicular, oncocytic carcinoma) with *RET* fusion-positive tumors for unresectable locoregional recurrent or persistent disease, or distant metastatic disease that is not amenable to radioactive therapy as “useful in certain circumstances” (category 2A). For recurrent, persistent, locoregional or metastatic medullary thyroid cancer, Gavreto (category 2B) or Retevmo (category 2A) are listed as “preferred” options for positive *RET* pathogenic variant. For anaplastic carcinoma, Gavreto or Retevmo can be used for *RET*-fusion positive tumors as neoadjuvant therapy for locoregional disease (category 2A). For metastatic anaplastic carcinoma, molecular testing for actionable mutations is recommended; if positive for *RET* fusion, Gavreto or Retevmo can be considered (category 2A).³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Gavreto. All approvals are provided for the duration noted below.

Automation: None.

09/18/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gavreto is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Differentiated Thyroid Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C and D):
Note: Differentiated thyroid cancer includes papillary, follicular, and oncocytic thyroid cancer; see below for other types of thyroid cancer.
 - A) Patient is ≥ 12 years of age; AND
 - B) Patient has unresectable, recurrent, or metastatic disease; AND
 - C) Patient has rearranged during transfection (*RET*) fusion-positive or *RET*-mutation-positive disease; AND
 - D) Patient meets both of the following (i and ii):
 - i. The disease requires treatment with systemic therapy; AND
 - ii. The disease is radioactive iodine-refractory.
2. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - D) Patient is ≥ 18 years of age; AND
 - E) Patient has recurrent, advanced, or metastatic disease; AND
 - F) Patient has rearranged during transfection (*RET*) fusion-positive disease as detected by an approved test.

Other Uses with Supportive Evidence

3. **Anaplastic Thyroid Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B and C):
 - A) Patient is ≥ 12 years of age; AND
 - B) Patient has unresectable, recurrent, or metastatic disease; AND
 - C) Patient has rearranged during transfection (*RET*) fusion-positive or *RET*-mutation-positive disease.
4. **Medullary Thyroid Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C and D):
 - A) Patient is ≥ 12 years of age; AND
 - B) Patient has unresectable, recurrent, or metastatic disease; AND
 - C) The disease is positive for rearranged during transfection (*RET*) pathogenic variant; AND
 - D) Patient is continuing therapy with Gavreto.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Gavreto is not recommended in the following situations:

99. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Gefitinib Prior Authorization Policy

- Iressa® (gefitinib tablets – AstraZeneca, generics)

REVIEW DATE: 09/11/2024

OVERVIEW

Gefitinib, a tyrosine kinase inhibitor, is indicated for the first-line treatment of metastatic **non-small cell lung cancer (NSCLC)** in patients whose tumors have epidermal growth factor receptor (*EGFR*) exon 19 deletions or exon 21 (L858R) substitution mutations as detected by an FDA-approved test.¹

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 9.2024 – September 9, 2024) recommend testing for sensitizing *EGFR* mutations in patients with metastatic disease.² Patients with sensitizing *EGFR* mutations have a significantly better response to the *EGFR* tyrosine kinase inhibitors (TKIs). The most common *EGFR* mutations are exon 19 deletions and exon 21 (L858R) substitution mutations. Other less common mutations that are also sensitive to *EGFR* TKIs include L861Q, G719X, and S768I; these mutations cumulatively account for approximately 10% of all *EGFR* mutations. NCCN recommends Tagrisso® (osimertinib tablets) as the “Preferred” first-line therapy (category 1). Gefitinib and the other *EGFR* TKIs are listed under “Useful in Certain Circumstances” for this setting (category 1). Gefitinib is recommended under “Other Recommended” therapies (category 2A) for *EGFR* L861Q, G719X, and S768I mutations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of gefitinib. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of gefitinib is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 41. Patient is ≥ 18 years of age; AND
 42. Patient has advanced or metastatic disease; AND
 43. Patient has sensitizing *EGFR* mutation-positive disease; AND
Note: Examples of sensitizing *EGFR* mutation-positive non-small cell lung cancer include the following: exon 19 deletions, exon 21 (L858R) substitution mutations, L861Q, G719X, and S768I.
 44. The mutation was detected by an approved test.

09/11/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of gefitinib is not recommended in the following situations:

- 157.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Gilotrif Prior Authorization Policy

- Gilotrif® (afatinib tablets – Boehringer Ingelheim)

REVIEW DATE: 12/11/2024

OVERVIEW

Gilotrif, a tyrosine kinase inhibitor (TKI), is indicated for the following uses:¹

- **Non-small cell lung cancer (NSCLC)**, first-line treatment of patients with metastatic disease whose tumors have non-resistant epidermal growth factor receptor (*EGFR*) mutations as detected by an FDA-approved test.
Limitations of use: The safety and efficacy of Gilotrif have not been established in patients whose tumors have resistant *EGFR* mutations.
- **NSCLC, squamous cell**, for the treatment of patients with metastatic disease progressing after platinum-based chemotherapy.

Guidelines

Gilotrif has been addressed in National Comprehensive Cancer Network (NCCN) guidelines.²⁻⁴

- **Head and Neck Cancer:** Guidelines (version 1.2025 – November 26, 2024) recommend Gilotrif as a single agent for the treatment of recurrent, unresectable, or metastatic non-nasopharyngeal cancers (lip, oral cavity, oropharynx, hypopharynx, glottis, larynx, supraglottic, larynx, ethmoid sinus, maxillary sinus, occult primary) in patients with disease progression or after platinum-based therapy (category 2B).³
- **Non-Small Cell Lung Cancer (NSCLC):** Guidelines (version 11.2024 – October 15, 2024) recommend testing for sensitizing *EGFR* mutations in patients with metastatic disease.⁴ Patients with sensitizing *EGFR* mutations have a significantly better response to the *EGFR* TKIs (erlotinib, Gilotrif, Iressa®, Tagrisso®, and Vizimpro). The most common *EGFR* mutations are exon 19 deletions and exon 21 (L858R) substitution mutations. Other less common mutations that are also sensitive to *EGFR* TKIs include L861Q, G719X, and S768I; these mutations cumulatively account for approximately 10% of all *EGFR* mutations. NCCN recommends the *EGFR* TKIs as first-line treatment for patients with advanced or metastatic NSCLC with *EGFR* exon 19 deletions, exon 21 (L858R) substitution mutations, S768I, L861Q, G719X, and S768I. Gilotrif is a category 1 recommendation under “Useful in Certain Circumstances” for *EGFR* exon 19 deletions and exon 21 substitutions. It is a “Preferred” first-line therapy (category 2A) for *EGFR* S768I, L861Q, and/or G719X mutations. NCCN does not recommend Gilotrif monotherapy for use as second-line treatment for patients with squamous cell NSCLC (without *EGFR* mutations); Gilotrif + Erbitux® (cetuximab injection) may be considered in patients with disease progression on *EGFR* TKI therapy. Gilotrif is not recommended in the guidelines for squamous cell NSCLC. However, it remains FDA-approved for this indication.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Gilotrif. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

12/11/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Coverage of Gilotrif is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. Non-Small Cell Lung Cancer – Epidermal Growth Factor Receptor (EGFR) Mutation-Positive.

Approve for 1 year if the patient meets ALL of the following (A, B, and C):

J) Patient is ≥ 18 years of age; AND

~~**K)**~~ Patient has advanced or metastatic disease; AND

~~**L)**~~ Patient has sensitizing EGFR mutation-positive non-small cell lung cancer as detected by an approved test.

Note: Examples of sensitizing EGFR mutation-positive non-small cell lung cancer include the following: exon 19 deletions, exon 21 (L858R) substitution mutations, L861Q, G719X, and S768I.

2. Non-Small Cell Lung Cancer – Squamous Cell Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has metastatic squamous cell carcinoma; AND

C) Patient has disease progression after treatment with platinum-based chemotherapy.

Other Uses with Supportive Evidence

3. Head and Neck Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has non-nasopharyngeal head and neck cancer; AND

Note: Examples of non-nasopharyngeal head and neck cancer are lip, oral cavity, oropharynx, hypopharynx, glottis, larynx, supraglottic larynx, ethmoid sinus, maxillary sinus, and occult primary.

C) Patient has disease progression on or after platinum-based chemotherapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Gilotrif is not recommended in the following situations:

- 158.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ibrance Prior Authorization Policy

- Ibrance® (palbociclib capsules and tablets – Pfizer)

REVIEW DATE: 02/21/2024

OVERVIEW

Ibrance, a cyclin-dependent kinase (CDK) 4/6 inhibitor, is indicated for the treatment of hormone receptor positive (HR+), human epidermal growth factor receptor 2 (HER2)-negative **advanced or metastatic breast cancer** in adults, in combination with:¹

- An aromatase inhibitor (AI) as initial endocrine-based therapy.
- Fulvestrant in patients with disease progression following endocrine therapy.

Guidelines

Ibrance is discussed in in guidelines from National Comprehensive Cancer Network (NCCN):

- **Breast Cancer:** NCCN guidelines (version 1.2024 – January 25, 2024) recommend Ibrance + AI or fulvestrant (category 2A) as a first-line “Preferred Regimen”.^{2,3} CDK4/6 inhibitor + fulvestrant is recommended for second- and subsequent-line therapy as a “Preferred Regimen”, if CDK4/6 inhibitor was not previously used (category 1). However, the guidelines state in a footnote that if there is disease progression on Ibrance, there are limited phase II data to support the use of Kisqali® (ribociclib tablets) in the second-line setting.^{2,3} The guidelines state that in Phase III randomized controlled trials, fulvestrant in combination with a CDK4/6 inhibitor has shown overall survival benefit in the second-line setting. The compendium recommends that men with breast cancer be treated similarly to postmenopausal women, except that the use of an AI is ineffective without concomitant suppression of testicular steroidogenesis.³
- **Liposarcoma:** NCCN guidelines on soft tissue sarcoma (version 3.2023 – December 12, 2023) recommend Ibrance as single-agent therapy for the treatment of unresectable retroperitoneal well-differentiated or dedifferentiated liposarcoma as “Useful In Certain Circumstances” (category 2A).⁴

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ibrance. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual’s gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual’s gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ibrance is recommended in those who meet one of the following criteria:

02/21/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indications

45. Breast Cancer in a Woman*. Approve for 1 year if the patient meets the following (A, B, C, D, E, and F):

- M)** Patient is ≥ 18 years of age; AND
- N)** Patient has recurrent or metastatic disease; AND
- O)** Patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
- P)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- Q)** Patient meets ONE of the following (i or ii):
 - i.** Patient is postmenopausal; OR
 - ii.** Patient is pre/perimenopausal and meets one of the following (a or b):
 - a)** Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR
Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous injection).
 - b)** Patient has had surgical bilateral oophorectomy or ovarian irradiation; AND
- R)** Patient meets ONE of the following (i or ii):
 - i.** Ibrance will be used in combination with anastrozole, exemestane, or letrozole; OR
 - ii.** Ibrance will be used in combination with fulvestrant.

* Refer to the Policy Statement.

2. Breast Cancer in a Man*. Approve for 1 year if the patient meets the following (A, B, C, D, and E):

- A)** Patient is ≥ 18 years of age; AND
- B)** Patient has recurrent or metastatic disease; AND
- C)** Patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
- D)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- E)** Patient meets ONE of the following (i or ii):
 - i.** Patient meets BOTH of the following (a and b):
 - a)** Patient is receiving a gonadotropin-releasing hormone (GnRH) analog; AND
Note: Examples of a GnRH analog include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), Orgovyx (relugolix tablet).
 - b)** Ibrance will be used in combination with anastrozole, exemestane, or letrozole; OR
 - ii.** Ibrance will be used in combination with fulvestrant.

* Refer to the Policy Statement.

Other Uses with Supportive Evidence

3. Liposarcoma. Approve for 1 year if the patient meets the following (A and B):

- A)** Patient is ≥ 18 years of age; AND
- B)** Patient has well-differentiated/dedifferentiated liposarcoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ibrance is not recommended in the following situations:

02/21/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- 159.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Iclusig Prior Authorization Policy

- Iclusig® (ponatinib tablets – ARIAD/Takeda)

REVIEW DATE: 03/27/2024; selected revision 06/05/2024

OVERVIEW

Iclusig, a tyrosine kinase inhibitor (TKI), is indicated for the following uses in adults:¹

- **Philadelphia chromosome-positive (Ph+) acute lymphoblastic leukemia (ALL):**
 - A) Newly diagnosed in combination with chemotherapy.
 - B) For whom no other TKIs are indicated as monotherapy.
 - C) T315I-positive as monotherapy.
- **Chronic myeloid leukemia (CML):**
 - A) Chronic phase, with resistance or intolerance to at least two prior TKIs.
 - B) Accelerated phase or blast phase for whom no other kinase inhibitors are indicated.
 - C) T315I-positive (chronic phase, accelerated phase, or blast phase).

A limitation of use is that Iclusig is not indicated and is not recommended for the treatment of patients with newly diagnosed chronic phase CML.¹

The indication of Ph+ ALL in newly diagnosed patients in combination with chemotherapy is approved under accelerated approval based on minimal residual disease (MRD)-negative complete remission (CR) at the end of induction. Continued approval for this indication may be contingent upon verification of clinical benefit in a confirmatory trial(s).¹

Guidelines

Iclusig is addressed in guidelines from National Comprehensive Cancer Network (NCCN):²⁻⁴

- **ALL:** NCCN guidelines (version 4.2023 – February 5, 2024) [adults and adolescent young adults] recommend Iclusig as a treatment option for patients with the T315I mutation and/or for patients for whom no other TKI is indicated (category 2A).² Iclusig is also recommended in combination with various regimens used for induction or consolidation therapy for Ph+ ALL during frontline therapy or for relapsed/refractory therapy if not previously given (category 2A).
- **CML:** NCCN guidelines (version 2.2024 – December 5, 2023) recommend Iclusig as an option for patients with a T315I mutation and/or chronic phase CML with resistance or intolerance to at least two prior TKIs or for patients with accelerated-phase CML or blast-phase CML for whom no other TKI is indicated (category 2A).³
- **Gastrointestinal Stromal Tumor (GIST):** NCCN guidelines (version 1.2024 – March 8, 2024) recommend Iclusig as “Useful in Certain Circumstances” after failure on approved therapies (category 2A); the guidelines state that Iclusig has demonstrated activity in advanced GIST, particularly in patients with *KIT* exon 11 mutant disease.⁴ Imatinib is a preferred regimen for first-line therapy (category 1) for sensitive mutations (excluding platelet-derived growth factor receptor alpha [*PDGFRA*] exon 18 mutations that are insensitive to imatinib including D842V mutation). Ayvakit® (avapritinib tablets) is also a preferred regimen (category 2A) for GIST with *PDGFRA* exon 18 mutations that are insensitive to imatinib, including the *PDGFRA* D842V mutation. Second-line therapies include sunitinib as “preferred” (category 1) and Sprycel as “other recommended regimen” (category 2A). Stivarga® (regorafenib tablets) is a “preferred” third-line therapy (category 1). Qinlock® (ripretinib tablets) is a “preferred” fourth-line therapy (category 1).

03/27/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions:** NCCN guidelines (version 1.2024 – December 21, 2023) recommend Iclusig for *ABL1* and *FGFR1* rearrangements in chronic phase or blast phase as “Other Recommended Regimens” (category 2A).⁵ It is also recommended as treatment in combination with ALL- or acute myeloid leukemia-type induction chemotherapy followed by allogeneic hematopoietic stem cell transplantation (HSCT) [if eligible] for lymphoid, myeloid or mixed lineage neoplasms with eosinophilia and *ABL1* and *FGFR1* rearrangements in blast phase (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Iclusig. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Iclusig is recommended in those who meet one of the following criteria:

FDA-Approved Indications

46. Acute Lymphoblastic Leukemia. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 15 years of age; AND

B) Patient has Philadelphia chromosome-positive acute lymphoblastic leukemia; AND

C) Patient meets ONE of the following (i, ii, or iii):

i. The medication will be used in combination with chemotherapy; OR

ii. The acute lymphoblastic leukemia is T315I-positive; OR

iii. Patient has tried at least one other tyrosine kinase inhibitor that is used for Philadelphia chromosome-positive acute lymphoblastic leukemia.

Note: Examples include imatinib and dasatinib products (Sprycel or Phyrago).

47. Chronic Myeloid Leukemia (CML). Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has Philadelphia chromosome-positive chronic myeloid leukemia; AND

C) Patient meets ONE of the following (i, ii or iii):

i. The chronic myeloid leukemia is T315I-positive, OR

ii. Patient has tried at least two other tyrosine kinase inhibitors indicated for use in Philadelphia chromosome-positive chronic myeloid leukemia; OR

Note: Examples include imatinib, dasatinib products (Sprycel or Phyrago), and Tasigna (nilotinib capsules).

iii. Patient meets BOTH of the following (a and b):

a) Patient has accelerated-phase CML or blast-phase CML; AND

b) No other tyrosine kinase inhibitor is indicated.

Other Uses with Supportive Evidence

3. **Gastrointestinal Stromal Tumor.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has tried each of the following (i, ii, iii, and iv):
 - i. One of imatinib or Ayvakit (avapritinib tablets); AND
 - ii. One of sunitinib or Sprycel (dasatinib tablets); AND
 - iii. Stivarga (regorafenib tablets); AND
 - iv. Qinlock (ripretinib tablets).
4. **Myeloid/Lymphoid Neoplasms with Eosinophilia.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - C) Patient is ≥ 18 years of age; AND
 - D) Patient meets ONE of the following (i or ii):
 - i. The tumor has an *ABL1* rearrangement; OR
 - ii. The tumor has an *FGFR1* rearrangement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Iclusig is not recommended in the following situations:

160. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Idhifa Prior Authorization Policy

- Idhifa® (enasidenib tablets – Celgene/Servier/Bristol-Myers Squibb)

REVIEW DATE: 03/06/2024

OVERVIEW

Idhifa, an isocitrate dehydrogenase-2 (*IDH2*) inhibitor, is indicated for the treatment of relapsed or refractory **acute myeloid leukemia** in adults with an *IDH2* mutation as detected by an FDA-approved test.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on acute myeloid leukemia (version 1.2024 – February 28, 2024) recommend Idhifa for *IDH2* mutated AML in a variety of clinical scenarios, such as treatment induction, follow-up after induction therapy, consolidation therapy, or relapsed or refractory disease (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Idhifa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Idhifa is recommended in those who meet the following criteria:

FDA-Approved Indication

48. Acute Myeloid Leukemia. Approve for 1 year if the patient meets the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has isocitrate dehydrogenase-2 (*IDH2*) mutation-positive disease as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Idhifa is not recommended in the following situations:

161. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Imatinib Prior Authorization Policy

- Gleevec® (imatinib tablets– Novartis, generic)

REVIEW DATE: 05/01/2024

OVERVIEW

Imatinib, a tyrosine kinase inhibitor (TKI), is indicated for the following uses:^{1,2}

- **Acute lymphoblastic leukemia (ALL)**, Philadelphia chromosome positive (Ph+), in adults with relapsed or refractory disease.
- **ALL**, newly diagnosed and Ph+, in combination with chemotherapy in pediatric patients.
- **Aggressive systemic mastocytosis**, without the D816V c-Kit mutation or with unknown c-Kit mutational status, in adults.
- **Chronic myeloid leukemia (CML)**, newly diagnosed and Ph+, chronic phase in adult and pediatric patients.
- **CML**, Ph+, in blast phase, accelerated phase, or in chronic phase in patients after failure of interferon alfa therapy.
- **Dermatofibrosarcoma protuberans** in adults with unresectable, current, and/or metastatic disease.
- **Gastrointestinal stromal tumors (GIST)**, in patients with KIT (CD117) positive unresectable and/or metastatic malignant disease.
- **GIST**, Kit (CD117) positive, as adjuvant treatment of adults following resection.
- **Hypereosinophilic syndrome and/or chronic eosinophilic leukemia**, in adults who have the *FIP1L1-PDGFR* alpha fusion kinase (mutation analysis or fluorescence in situ hybridization demonstration of CICH2 allele deletion) and for patients with hypereosinophilic syndrome and/or chronic eosinophilic leukemia who are *FIP111-PDGFR* alpha fusion kinase negative or unknown.
- **Myelodysplastic/myeloproliferative diseases**, associated with platelet-derived growth factor receptor (*PDGFR*) gene rearrangements in adults.

Guidelines

Imatinib is addressed in guidelines from National Comprehensive Cancer Network (NCCN):

- **ALL:** NCCN guidelines for adults and adolescents (version 4.2023 – February 5, 2024) recommend imatinib for Ph+ disease in many different clinical circumstances (e.g., induction, consolidation therapy, maintenance, or relapsed or refractory disease) [category 2A].³ NCCN guidelines for pediatric ALL (version 5.2024 – April 3, 2024) feature imatinib prominently (category 2A) in a variety of clinical scenarios.⁴
- **Bone Cancer:** NCCN guidelines (version 2.2024 – March 12, 2024) recommend imatinib either as monotherapy or as “other recommended regimens” or in combination with cisplatin or Rapamune® (sirolimus tablets) for chordoma as “useful in certain circumstances” (both category 2A).⁵
- **CML:** NCCN guidelines (version 2.2024 – December 5, 2023) state that for patients with chronic phase CML with a low-risk score, the primary “preferred” treatment recommendations includes a first-generation TKI (imatinib) or a second-generation TKI (Bosulif® [bosutinib tablets], Sprycel® [dasatinib tablets], or Tassigna® [nilotinib capsules] {all category 1}).⁶ For patients with chronic phase CML with an intermediate- or high-risk score, a second-generation TKI is preferred (Bosulif, Sprycel, or Tassigna [all category 1]); imatinib is listed as “other recommended regimen” (category 2A); imatinib is also recommended for other clinical scenarios (category 2A).

05/01/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Dermatofibrosarcoma Protuberans:** NCCN guidelines (version 1.2024 – November 9, 2023) state to consider neoadjuvant imatinib for unresectable disease, borderline resectable disease, and in patients whom resection with negative margins may result in unacceptable functional or cosmetic outcomes (category 2A) and for recurrent disease in cases where the disease is unresectable, or unacceptable functional or adverse cosmetic outcomes may occur with resection (category 2A).⁷
- **GIST:** NCCN guidelines (version 1.2024 – March 8, 2024) recommend imatinib as a “preferred regimen” for first-line therapy (category 1) in various scenarios (e.g., for sensitive mutations or for *PDGFRA* exon 18 mutations [excluding the D842V mutation] and is recommended in other clinical scenarios (e.g., neoadjuvant and adjuvant therapy)[category 2A].⁸
- **Graft-Versus-Host Disease (GVHD):** NCCN guidelines for hematopoietic cell transplantation (version 1.2024 – April 26, 2024) address GVHD.⁹ Imatinib is cited as one of many therapies recommended for steroid-refractory, chronic GVHD (category 2A).
- **Kaposi Sarcoma:** NCCN guidelines (version 1.2024 – November 7, 2023) recommend imatinib for subsequent systemic therapy for relapsed/refractory therapy as “useful in certain circumstances.”¹⁰ First-line systemic therapy options are liposomal doxorubicin as “preferred regimen” and paclitaxel.
- **Melanoma: Cutaneous:** NCCN guidelines (version 2.2024 – April 3, 2024) recommend imatinib as second-line or subsequent therapy for metastatic or unresectable disease for tumors with activating mutations of *KIT* as “useful in certain circumstances” (category 2A).¹¹
- **Myelodysplastic Syndromes:** NCCN guidelines (version 1.2024 – February 12, 2024) note that data have demonstrated that patients with chronic myelomonocytic leukemia who have *PDGFRβ* may respond well to imatinib.¹²
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions:** NCCN guidelines (version 1.2024 – December 21, 2023) recommend imatinib for patients with *ABL1* rearrangements in the chronic phase or blast phase (category 2A).¹³ Imatinib is also recommended for certain situations where the tumor has an *FIP1L1-PDGFRα* or *PDGFRB* rearrangement (category 2A). Imatinib is also recommended for treatment in combination with ALL- or acute myeloid leukemia-type induction chemotherapy followed by allogeneic hematopoietic stem cell transplantation (if eligible) for lymphoid, myeloid or mixed lineage neoplasms with eosinophilia and *ABL1* rearrangement in blast phase (category 2A).
- **Soft Tissue Sarcomas:** NCCN guidelines (version 1.2024 – April 26, 2024) recommend imatinib for desmoid tumors (aggressive fibromatosis) as a “preferred regimen” (category 2A). For dermatofibrosarcoma protuberans with fibrosarcomatous transformation, imatinib is recommended as a “preferred regimen” (category 2A). For pigmented villonodular synovitis/tenosynovial giant cell tumor, imatinib is recommended as “useful in certain circumstances” (category 2A).¹⁴
- **Systemic Mastocytosis:** NCCN guidelines (version 1.2023 – May 24, 2023,) recommend imatinib for aggressive systemic mastocytosis (for *KIT* D816V mutation negative or unknown; well differentiated systemic mastocytosis; eosinophilia is present with *FIP1L1-PDGFRα* fusion gene) as “useful in certain circumstances” (category 2A).¹⁵

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of imatinib tablets. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of imatinib is recommended in those who meet one of the following criteria:

05/01/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indications

5. **Acute Lymphoblastic Leukemia.** Approve for 1 year if the patient has Philadelphia chromosome-positive acute lymphoblastic leukemia.
6. **Aggressive Systemic Mastocytosis.** Approve for 1 year if the patient is ≥ 18 years of age.
7. **Chronic Myeloid Leukemia.** Approve for 1 year if the patient has Philadelphia chromosome-positive chronic myeloid leukemia.
8. **Dermatofibrosarcoma Protuberans.** Approve for 1 year if the patient is ≥ 18 years of age.
9. **Gastrointestinal Stromal Tumors.** Approve for 1 year.
10. **Hypereosinophilic Syndrome and/or Chronic Eosinophilic Leukemia.** Approve for 1 year if the patient is ≥ 18 years of age.
11. **Myelodysplastic/Myeloproliferative Disease.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) The condition is associated with platelet-derived growth factor receptor (*PDGFR*) gene rearrangements.

Other Uses with Supportive Evidence

12. **Chordoma.** Approve for 1 year.
13. **Desmoid Tumors (Aggressive Fibromatosis).** Approve for 1 year
14. **Graft-Versus-Host Disease, Chronic.** Approve for 1 year if the patient has tried at least one conventional systemic treatment for graft-versus-host disease.

Note: Examples include corticosteroids (methylprednisolone, prednisone); cyclosporine; tacrolimus; mycophenolate mofetil; Imbruvica (ibrutinib capsules, tablets, and oral suspension); low-dose methotrexate; sirolimus; Rezurock (belumosudil tablets); and Jakafi (ruxolitinib tablets).
15. **Kaposi Sarcoma.** Approve for 1 year if the patient meets ALL of the following (A, B and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has tried at least one medication; AND

Note: Examples include liposomal doxorubicin, paclitaxel, Pomalyst (pomalidomide capsules), lenalidomide, etoposide, and Thalomid (thalidomide capsules).

 - C) Patient has relapsed or refractory disease.
16. **Melanoma, Cutaneous.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has metastatic or unresectable disease; AND
 - C) Patient has an activating *KIT* mutation; AND
 - D) Patient has tried at least one systemic regimen.

Note: Examples of a systemic regimen include: Opdivo (nivolumab intravenous infusion) + Yervoy (ipilimumab intravenous infusion), Opdivo + Opdualag (nivolumab/relatlimab-rmbw intravenous infusion), Keytruda (pembrolizumab intravenous infusion), Opdivo, Tafinlar (dabrafenib capsules and tablets for suspension) + Mekinist (trametinib tablets), Zelboraf (vemurafenib tablets) + Cotellic (cobimetinib tablets), Braftovi (encorafenib capsules) + Mektovi (binimetinib tablets).

17. Myeloid/Lymphoid Neoplasms with Eosinophilia. Approve for 1 year if the patient meets BOTH of the following (A and B):

C) Patient is ≥ 18 years of age; AND

D) Patient meets ONE of the following (i or ii):

i. The tumor has an *ABL1* rearrangement; OR

ii. The tumor has an *FIP1L1-PDGFR*A or *PDGFR*B rearrangement.

18. Pigmented Villonodular Synovitis/Tenosynovial Giant Cell Tumor. Approve for 1 year if the patient meets ONE of the following (A or B):

A) Patient has tried Turalio (pexidartinib capsules); OR

B) Patient cannot take Turalio, according to the prescriber.

Note: Examples of reasons for not being able to take Turalio include patients with elevated liver enzymes or concomitant use of medications that are associated with hepatotoxicity.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of imatinib is not recommend in the following situations:

162. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Imbruvica Prior Authorization Policy

- Imbruvica® (ibrutinib tablets, capsules, and oral suspension – Pharmacyclics/Janssen)

REVIEW DATE: 06/12/2024

OVERVIEW

Imbruvica, a Bruton's tyrosine kinase inhibitor, is indicated for the following uses:¹

- **Chronic lymphocytic leukemia (CLL) or small lymphocytic lymphoma (SLL)**, in adults.
- **CLL or SLL**, with 17p deletion, in adults.
- **Graft-versus-host disease, chronic**, after failure of one or more lines of systemic therapy in adults and pediatric patients ≥ 1 year old.
- **Waldenström macroglobulinemia**, in adults.

Guidelines

Imbruvica is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **B-Cell Lymphomas:** NCCN guidelines (version 2.2024 – April 30, 2024) address mantle cell lymphoma, marginal zone lymphoma, gastric mucosa-associated lymphoid tissue (MALT) lymphoma, non-gastric MALT lymphoma, diffuse large B-cell lymphomas, Acquired Immune Deficiency Syndrome (AIDS)-related B-Cell lymphomas, and post-transplant lymphoproliferative disorders.² For mantle cell lymphoma, Imbruvica + rituximab can be used as pretreatment in order to limit the number of cycles of aggressive induction therapy with RHyperCVAD (rituximab, cyclophosphamide, vincristine, doxorubicin, and dexamethasone) regimen (category 2A); Imbruvica ± rituximab is recommended as second-line and subsequent therapy as “other recommended regimen” and Imbruvica + venetoclax as “useful in certain circumstances” (both category 2A).² Imbruvica is recommended as a preferred aggressive induction therapy as a component of TRIANGLE regimen: alternating RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, and prednisone) + covalent Bruton tyrosine kinase inhibitor (Imbruvica)/RDHAP (rituximab, dexamethasone, and cytarabine) + carboplatin regimen (category 2A). Imbruvica can also be used in combination with rituximab as maintenance therapy (category 2A). For marginal zone lymphoma, Imbruvica is recommended as second-line and subsequent therapy as “other recommended regimens” (category 2A). For mantle cell and marginal zone lymphoma, there is a footnote that states head-to-head clinical trials in other B-cell malignancies have demonstrated a more favorable toxicity profile for Calquence and Brukinsa compared to Imbruvica without compromising efficacy. The NCCN compendium recommends Imbruvica as a second-line and subsequent therapy for diffuse large B-cell lymphomas, human immunodeficiency virus (HIV)-related B-Cell lymphomas, post-transplant lymphoproliferative disorders, and high-grade B-cell lymphoma (category 2A).³
- **Central Nervous System (CNS) Cancers:** NCCN guidelines (version 1.2024 – May 31, 2024) recommend Imbruvica as one of the options for patients with relapsed or refractory disease for primary CNS lymphoma as “other recommended regimens” (category 2A).⁴ The guidelines also recommend Imbruvica for induction therapy as a single agent as “useful in certain circumstances” if the patient is unsuitable for or intolerant to high-dose methotrexate (category 2A).⁴ Imbruvica is used with high-dose methotrexate and rituximab in some clinical scenarios (category 2A).⁴ Imbruvica is also recommended as treatment for brain metastases in lymphoma (category 2A).

06/12/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **CLL/SLL:** NCCN guidelines (version 3.2024 – March 26, 2024) recommend Imbruvica as a treatment option in various scenarios (e.g., first-line therapy for patients with or without 17p deletion/TP53 mutation and as second-line and third therapy [category 1 recommendations for many scenarios]) as “other recommended regimens”.⁵ Imbruvica plays a vital role in the management of CLL/SLL and many trials describe its efficacy.⁵
- **Hairy Cell Leukemia:** NCCN guidelines (version 2.2024 – April 22, 2024) recommend Imbruvica as one of the options for treatment of progressive disease after therapy for relapsed or refractory disease as “other recommended regimens” (category 2A).⁶
- **Graft-Versus-Host Disease:** NCCN guidelines for hematopoietic stem cell transplantation (version 1.2024 – April 26, 2024) recommend Imbruvica as a systemic agent for steroid-refractory chronic graft-versus-host disease after failure of one or more lines of systemic therapy in patients ≥ 1 years of age (category 2A).⁷ The guidelines note that Imbruvica should be used with caution in patients with heart arrhythmias or heightened risk of bleeding.
- **Waldenström Macroglobulinemia/Lymphoplasmacytic Lymphomas:** NCCN guidelines (version 2.2024 – December 5, 2023) recommend Imbruvica, with or without rituximab, as a primary therapy option as one of several “preferred” regimens (category 1).⁸ For previously treated patients, Imbruvica, with or without rituximab, is also cited as a “preferred” regimen (category 1). Imbruvica is also a “preferred” regimen for symptomatic management of Bing Neel Syndrome (category 2A).⁸

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Imbruvica. All approvals are provided for the duration noted below.

Automation: When available, the ICD-9/ICD-10 codes for patients ≥ 18 years of age with chronic lymphocytic leukemia (ICD-9: 204.1* [lymphoid leukemia chronic] and ICD-10: C91.1* [chronic lymphocytic leukemia of B-cell type]), small lymphocytic lymphoma (ICD-10: C83.0* [small cell B-cell lymphoma]) and Waldenström macroglobulinemia (ICD-9: 273.3* [macroglobulinemia] and ICD-10: C88.0* [Waldenström macroglobulinemia]) will be used as part of automation to allow approval of the requested medication.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Imbruvica is recommended in those who meet one of the following criteria:

FDA-Approved Indications

49. Chronic Lymphocytic Leukemia. Approve for 1 year if the patient is ≥ 18 years of age.

50. Graft-Versus-Host Disease, Chronic: Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 1 year of age; AND

B) Patient has tried at least one conventional systemic treatment for graft-versus-host disease.

Note: Examples of conventional systemic treatments include: corticosteroids (methylprednisolone, prednisone), imatinib, low-dose methotrexate, sirolimus, mycophenolate mofetil, and Jakafi (ruxolitinib tablets).

51. Small Lymphocytic Lymphoma. Approve for 1 year if the patient is ≥ 18 years of age.

52. Waldenström Macroglobulinemia. Approve for 1 year if the patient is ≥ 18 years of age.

Note: This includes lymphoplasmacytic lymphoma and Bing-Neel syndrome.

Other Uses with Supportive Evidence

53. B-Cell Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

Note: Examples of B-cell lymphomas include: diffuse large B-cell lymphomas, Human immunodeficiency virus (HIV)-related B-cell lymphomas, post-transplant lymphoproliferative disorders, and high-grade B-cell lymphoma.

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one systemic regimen.

Note: Examples of a systemic regimen include one or more of the following products: cisplatin, cytarabine, rituximab, oxaliplatin, gemcitabine, ifosfamide, carboplatin, etoposide, or rituximab.

54. Central Nervous System Lymphoma (Primary). Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient ≥ 18 years of age; AND

B) Patient meets ONE of the following (i or ii):

i. According to the prescriber, the patient is not a candidate for or is intolerant to high-dose methotrexate; OR

ii. Patient has tried at least one therapy.

Note: Examples of therapies include methotrexate, rituximab, vincristine, procarbazine, cytarabine, thiotepe, carmustine, intrathecal methotrexate, cytarabine, or rituximab.

55. Hairy Cell Leukemia. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least two systemic regimens.

Note: Examples of a systemic regimen include one or more of the following products: cladribine, Nipent (pentostatin injection), rituximab, or Pegasys (peginterferon alfa-2a subcutaneous injection).

56. Mantle Cell Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i, ii, or iii):

i. Patient is continuing therapy with Imbruvica and meets ONE of the following (a or b):

a) Patient has tried at least one systemic regimen; OR

Note: Examples of a systemic regimen include one or more of the following products: bendamustine, rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone, cytarabine, carboplatin, cisplatin, oxaliplatin, or lenalidomide.

b) According to the prescriber, patient is not a candidate for a systemic regimen (i.e., an elderly person who is frail); OR

ii. Imbruvica is used in combination with rituximab prior to induction therapy; OR

Note: Examples of induction therapy include: rituximab, cyclophosphamide, vincristine, doxorubicin, and dexamethasone.

iii. Imbruvica is used as induction or maintenance therapy in combination with chemotherapy.

57. Marginal Zone Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B and C):

Note: Marginal zone lymphoma includes gastric mucosa-associated lymphoid tissue (MALT) lymphoma, non-gastric MALT lymphoma, nodal marginal zone lymphoma, and splenic marginal zone lymphoma.

A) Patient is ≥ 18 years of age; AND

B) Patient is continuing therapy with Imbruvica; AND

C) Patient has tried at least one systemic regimen.

Note: Examples of a systemic regimen include one or more of the following products: bendamustine, rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone, or lenalidomide.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Imbruvica is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Inlyta Prior Authorization Policy

- Inlyta® (axitinib tablets – Pfizer)

REVIEW DATE: 06/19/2024

OVERVIEW

Inlyta, a kinase inhibitor, is indicated for **advanced renal cell carcinoma**, in combination with Bavencio® (avelumab intravenous infusion) as first-line treatment; in combination with Keytruda® (pembrolizumab intravenous infusion) as first-line treatment; and as a single agent after failure of one prior systemic therapy.¹

Guidelines

Inlyta is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Kidney Cancer:** NCCN guidelines (version 4.2024 – May 30, 2024) for relapse or stage IV disease with clear cell histology recommend the following: Inlyta + Keytruda as a “preferred regimen” (category 1), Inlyta + Bavencio as one of the “other recommended regimens” (category 2A), and single agent Inlyta as “useful in certain circumstances” (category 2B). For subsequent therapy for clear cell histology, Inlyta monotherapy and Inlyta + Keytruda are category 2A options; Inlyta + Bavencio is a category 3 option. Single agent Inlyta is one of the systemic therapy options listed under “useful under certain circumstances” for relapse or Stage IV renal cell carcinoma with non-clear cell histology (category 2A).²
- **Soft Tissue Sarcoma:** NCCN guidelines (version 1.2024 – April 26, 2024) recommend Inlyta in combination with Keytruda as a “preferred” regimen for alveolar soft part sarcoma (category 2A).³
- **Thyroid Carcinoma:** For differentiated thyroid cancer subtypes, NCCN guidelines (version 2.2024 – March 12, 2024) have changed the naming of Hürthle cell neoplasm to oncocytic carcinoma.⁴ The guidelines recommend Inlyta as one of the kinase inhibitors to be considered if clinical trials or other systemic therapies are not available or appropriate for the treatment of progressive and/or symptomatic iodine refractory thyroid cancer. This recommendation is for all differentiated thyroid cancer subtypes (follicular, oncocytic, and papillary cancer) [all category 2A].

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Inlyta. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inlyta is recommended in those who meet one of the following criteria:

06/19/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indication

58. Renal Cell Cancer. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has relapsed or advanced disease.

Other Uses with Supportive Evidence

59. Soft Tissue Sarcoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has alveolar soft part sarcoma; AND
- C) The medication will be used in combination with Keytruda (pembrolizumab intravenous infusion).

60. Thyroid Carcinoma, Differentiated. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has differentiated thyroid carcinoma; AND
Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).
- C) The disease is refractory to radioactive iodine therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Inlyta is not recommended in the following situations:

163. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Inqovi Prior Authorization Policy

- Inqovi® (decitabine and cedazuridine tablets – Taiho Oncology/Otsuka)

REVIEW DATE: 06/19/2024

OVERVIEW

Inqovi, a combination of decitabine (a nucleoside metabolic inhibitor) and cedazuridine (a cytidine deaminase inhibitor), is indicated for the treatment of **myelodysplastic syndrome** (MDS), including previously treated and untreated, de novo and secondary MDS with the following French-American-British subtypes (refractory anemia, refractory anemia with ringed sideroblasts, refractory anemia with excess blasts, and chronic myelomonocytic leukemia [CMML]) and intermediate-1, intermediate-2, and high-risk International Prognostic Scoring System (IPSS) groups in adults.¹

Decitabine is available as a parenteral product (Dacogen® [decitabine intravenous infusion]; generic) and possesses the same FDA-approved indication as Inqovi.² The oral bioavailability of decitabine is limited due to rapid degradation by cytidine deaminase in the gut and liver.¹ As a cytidine deaminase inhibitor, cedazuridine increases decitabine concentrations to therapeutic levels. Oral decitabine has systemic exposure equivalent to the intravenous form with similar clinical response rates in the population in which Inqovi is approved.^{1,2} The recommended dose of Inqovi is one tablet taken orally once daily on Days 1 through 5 of each 28-day cycle for a minimum of four cycles until disease progression or unacceptable toxicity. A complete or partial response may take longer than four cycles. In the two pivotal trials, the median treatment duration was up to 8 months. Do not substitute Inqovi for the intravenous decitabine product within a cycle.

Guidelines

Inqovi is discussed in guidelines from the National Comprehensive Cancer Network (NCCN) for MDS. These guidelines (version 2.2024 – May 22, 2024) state that Inqovi can be considered as a substitute for intravenous decitabine. The guidelines recommend intravenous decitabine in patients with IPSS intermediate-1 and above, CMML, and MDS/myeloproliferative neoplasm overlap neoplasms.³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Inqovi. All approvals are provided for the duration noted below.

Automation: None.

06/19/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inqovi is recommended in those who meet one of the following criteria:

FDA-Approved Indications

67. Chronic Myelomonocytic Leukemia. Approve for 1 year if the patient is ≥ 18 years of age.

68. Myelodysplastic Syndrome. Approve for 1 year if the patient is ≥ 18 years of age.

Note: Examples of myelodysplastic syndromes include: refractory anemia, refractory anemia with ringed sideroblasts, and refractory anemia with excess blasts.

Other Uses with Supportive Evidence

69. Myelodysplastic Syndrome With Myeloproliferative Neoplasm Overlap Syndrome. Approve for 1 year if the patient is ≥ 18 years of age.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Inqovi is not recommended in the following situations:

100. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Inrebic Prior Authorization Policy

- Inrebic® (fedratinib capsules – Celgene)

REVIEW DATE: 06/26/2024

OVERVIEW

Inrebic, a Janus Associated Kinase 2 (JAK2)-selective kinase inhibitor, is indicated for the treatment of **intermediate-2 or high-risk primary or secondary (post-polycythemia vera or post-essential thrombocythemia) myelofibrosis** in adults.¹

Guidelines

Inrebic is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions:** NCCN guidelines (version 2.2024 – June 19, 2024) recommend Inrebic for treatment of myeloid/lymphoid neoplasms with eosinophilia and JAK2 rearrangement in chronic phase or blast phase (category 2A).² The guidelines also recommend Inrebic for treatment in combination with acute lymphocytic leukemia or acute myeloid leukemia-type induction chemotherapy followed by allogeneic hematopoietic stem cell transplantation (if eligible) for lymphoid, myeloid, or mixed phenotype neoplasms with eosinophilia and JAK2 rearrangement in blast phase (category 2A).²
- **Myeloproliferative Neoplasms:** NCCN guidelines (version 1.2024 – December 21, 2023) recommend Inrebic for higher-risk patients with myelofibrosis and a platelet count $\geq 50 \times 10^9/L$ (category 1) who are not transplant candidates or transplant is not currently feasible and for patients who did not have a response or lost response to Jakafi® (ruxolitinib tablets), Ojjaara (momelotinib tablets), or Vonjo® (pacritinib capsule) [category 2A].^{3,4} Inrebic is also recommended for accelerated or blast phase myeloproliferative neoplasms as bridging therapy followed by allogeneic hematopoietic stem cell transplant in combination with hypomethylating agents or patients who are not a candidate for a transplant. There is a footnote which states that JAK inhibitors can be used in combination with azacitidine or decitabine for the palliation of splenomegaly or other disease-related symptoms. There are very limited data regarding the use of Inrebic, Ojjaara, or Vonjo with hypomethylating agents.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Inrebic. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inrebic is recommended in those who meet one of the following criteria:

06/26/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indication

A) Myelofibrosis. Approve for 1 year if the patient meets BOTH of the following (A and B):

Note: Examples of myelofibrosis include primary myelofibrosis, post-polycythemia vera myelofibrosis, and post-essential thrombocythemia myelofibrosis.

- a. Patient is ≥ 18 years of age; AND
- b. Patient has intermediate-2 or high-risk disease.

Other Uses with Supportive Evidence

B) Myeloid or Lymphoid Neoplasms. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- E) Patient is ≥ 18 years of age; AND
- F) Patient has eosinophilia; AND
- G) The tumor has a Janus Associated Kinase 2 (*JAK2*) rearrangement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Inrebic is not recommended in the following situations:

- 101.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

POLICY: Oncology – Itovebi Prior Authorization Policy

- Itovebi® (inavolisib tablets – Genentech)

REVIEW DATE: 10/23/2024; selected revision 11/20/2024

OVERVIEW

Itovebi, a kinase inhibitor, is indicated in combination with Ibrance® (palbociclib capsules and tablets) and fulvestrant for the treatment of hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative, phosphatidylinositol-3-kinase (*PIK3CA*)-mutated, endocrine-resistant **locally advanced or metastatic breast cancer** in adults, as detected by an FDA-approved test following recurrence on or after completing adjuvant endocrine therapy.¹

Fasting plasma glucose/blood glucose and hemoglobin A1c (HbA1C) should be evaluated before initiating therapy. Blood glucose should be optimized prior to therapy initiation and at regular intervals during treatment.

Guidelines

The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 6.2024 – November 11, 2024) recommend Itovebi in combination with Ibrance and fulvestrant (category 1) for first-line therapy under “Useful in Certain Circumstances” for HR+, HER2-negative tumors with *PIK3CA* activating mutations and disease progression on adjuvant endocrine therapy or relapse within 12 months of adjuvant endocrine therapy completion.³ The guidelines recommend Piqray® (alpelisib tablets), in combination with fulvestrant, as a “preferred” second-line regimen or subsequent-line therapy for *PIK3CA*-activating mutation in HR+/HER2-negative, recurrent unresectable (local or regional) or Stage IV disease (category 1). “Preferred” first-line regimens for HR+/HER2-negative disease, without a *PIK3CA* activating mutation, include the following: aromatase inhibitor (i.e., letrozole, anastrozole, exemestane) + CDK4/6 inhibitor (i.e., Ibrance, Kisqali® [ribociclib tablets], Verzenio® [abemaciclib tablets]) or fulvestrant + CDK4/6 inhibitor.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Itovebi. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual’s gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual’s gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Itovebi is recommended in those who meet the following criteria:

FDA-Approved Indication

- 19. Breast Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, F, and G):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient meets ONE of the following (i or ii):
 - i.** Patient is a postmenopausal female*; OR
 - ii.** Patient is a pre/perimenopausal female* or a male* and meets ONE of the following (a or b):
 - a)** Patient is receiving a gonadotropin-releasing hormone (GnRH) agonist; OR
Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous injection).
 - b)** Patient has had surgical bilateral oophorectomy or ovarian irradiation (female*) or orchiectomy (male*); AND
 - C)** Patient has locally advanced or metastatic hormone receptor (HR)-positive disease; AND
 - D)** Patient has human epidermal growth factor receptor 2 (HER2)-negative disease; AND
 - E)** Patient has *PIK3CA*-mutated breast cancer as detected by an approved test; AND
 - F)** Patient meets ONE of the following (i or ii):
 - i.** Patient has disease progression while on adjuvant endocrine therapy; OR
 - ii.** Patient has had disease recurrence within 12 months after completing adjuvant endocrine therapy; AND
Note: Examples of endocrine therapy include tamoxifen, anastrozole, letrozole, exemestane, toremifene.
 - G)** The medication will be used in combination with Ibrance® (palbociclib capsules and tablets) and fulvestrant injection.

* Refer to Policy Statement

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Itovebi is not recommended in the following situations:

- 5.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Iwilfin Prior Authorization Policy

- Iwilfin™ (eflornithine tablets – US WorldMeds)

REVIEW DATE: 01/03/2024

OVERVIEW

Iwilfin, an ornithine decarboxylase inhibitor, is indicated to reduce the risk of relapse in high-risk neuroblastoma in adults and pediatric patients with who have demonstrated at least a partial response to prior multiagent, multimodality therapy including anti-glycolipid disialoganglioside (GD2) immunotherapy.¹

Guidelines

Iwilfin is not addressed in the National Comprehensive Cancer Network (NCCN) guidelines. NCCN does not have neuroblastoma clinical practice guidelines. The treatment of high risk neuroblastoma is divided into three phases: induction, consolidation, and post-consolidation.² In the induction phase, treatment includes multiagent chemotherapy, peripheral blood stem cell harvest, and surgical resection of the primary site. In the consolidation phase, treatment includes high-dose chemotherapy, autologous stem cell transplantation (ASCT), and radiation or radiotherapy. In the post-consolidation phase, treatment includes anti-GD2 immunotherapy (Unituxin® [dinutuximab intravenous infusion]) in combination with isotretinoin, interleukin-2, and granulocyte-macrophage colony-stimulating factor. For patients who have recurrent or refractory neuroblastoma, treatment options include clinical trial, chemotherapy combined with immunotherapy (e.g. temozolomide, irinotecan, and Unituxin), iodine-131 meta-iodobenzylguanidine alone or in combination with other therapy, or followed by stem cell rescue, novel therapies, chemotherapy, or immunotherapy (e.g. Danyelza® [naxitamab-gqgk intravenous infusion]).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Iwilfin. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Iwilfin is recommended in those who meet the following criteria:

FDA-Approved Indication

70. Neuroblastoma Approve for 1 year if the patient meets the following (A, B and C):

- A)** Patient has high-risk disease; AND
- B)** The medication is being used to reduce the risk of relapse; AND
- C)** Patient has had at least a partial response to prior multiagent, multimodality therapy including anti-GD2 immunotherapy.

Note: Examples of anti-glycolipid disialoganglioside (GD2) immunotherapy includes Unituxin® (dinutuximab intravenous infusion).

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Jakafi Prior Authorization Policy

- Jakafi® (ruxolitinib tablets – Incyte)

REVIEW DATE: 03/20/2024

OVERVIEW

Jakafi, an inhibitor of Janus Associated Kinases (*JAKs*) *JAK1* and *JAK2*, is indicated for the following uses:¹

- **Graft versus host disease**, acute treatment of steroid-refractory disease, in patients ≥ 12 years of age.
- **Graft versus host disease**, chronic treatment, after failure of one or two lines of systemic therapy in patients ≥ 12 years of age.
- **Myelofibrosis**, intermediate or high risk, including primary myelofibrosis, post-polycythemia vera myelofibrosis, and post-essential thrombocythemia myelofibrosis in adults.
- **Polycythemia vera**, in adults who have had an inadequate response to or are intolerant of hydroxyurea.

Guidelines

Jakafi is discussed in guidelines by the National Comprehensive Cancer Network (NCCN):²

- **Graft Versus Host Disease:** NCCN has guidelines regarding hematopoietic cell transplantation that discuss graft versus host disease (version 3.2023 – October 9, 2023) that include Jakafi.³ Jakafi is recommended among patients with steroid-refractory acute graft versus host disease, or chronic graft versus host disease, after failure of one or two lines of systemic therapy (both category 1).³
- **Myelodysplastic Syndromes:** NCCN guidelines (version 1.2024 – February 12, 2024) recommend Jakafi for patients with chronic myelomonocytic leukemia-2, with hypomethylating agents (HMA) and/or allogeneic hematopoietic stem cell transplant (category 2A).⁴ Jakafi $\pm$ HMA is also recommended for myelodysplastic syndrome/myeloproliferative neoplasm with neutrophilia (atypical chronic myeloid leukemia); there is a footnote, which states that rare patients with *CSF3R* or *JAK2* mutations may respond to Jakafi due to their JAK-STAT pathway activation (category 2A).
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions:** NCCN guidelines (version 1.2024 – December 21, 2023) recommend Jakafi for treatment of myeloid/lymphoid neoplasms with eosinophilia and *JAK2* rearrangement in chronic or blast phase (category 2A).⁵ The guidelines also recommend Jakafi for treatment in combination with acute lymphocytic leukemia or acute myeloid leukemia type induction chemotherapy followed by allogeneic hematopoietic stem cell transplantation (if eligible) for lymphoid, myeloid, or mixed phenotype neoplasms with eosinophilia and *JAK2* rearrangement in blast phase (category 2A).
- **Myeloproliferative Neoplasms:** NCCN guidelines (version 1.2024 – December 21, 2023) recommend Jakafi among patients with lower- or higher-risk myelofibrosis (category 2A; category 1 for the initial treatment of higher-risk myelofibrosis).⁶ It is also recommended as “Other Recommended Regimens” for the management of myelofibrosis associated anemia with the presence of symptomatic splenomegaly and/or constitutional symptoms in combination with other medications (category 2A). It is also recommended as “Other Recommended Regimens” for high-risk polycythemia vera as initial treatment (category 2A) and as “Preferred” therapy for patients with hydroxyurea resistance or intolerance (category 1). The guidelines also recommend Jakafi for treatment of essential thrombocythemia for inadequate response or loss of response to hydroxyurea, Pegasys® (peginterferon alfa-2a subcutaneous injection) therapy, or anagrelide as “Useful in Certain Circumstances” (category 2A).

03/20/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Pediatric Acute Lymphoblastic Leukemia:** NCCN guidelines (version 4.2024 – February 7, 2024) recommend Jakafi in a variety of regimens for pediatric patients and young adults with acute lymphoblastic leukemia (category 2A).⁷ The utility of Jakafi is described primarily in patients in which the mutation/pathway is *JAK*-related.
- **T-Cell Lymphoma:** NCCN guidelines (version 2.2024 – March 14, 2024) recommend Jakafi as a single-agent for symptomatic disease as second-line or subsequent therapy for T-cell prolymphocytic leukemia (category 2A).⁸ It is also recommended for T-cell large granular lymphocytic leukemia if the patient had no response to first-line therapy, or if patient had progressive or refractory disease after first-line therapy (category 2A).⁸

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Jakafi. All approvals are provided for the duration noted below.

Automation: The ICD-9/ICD-10 codes for myelofibrosis (ICD-9: 289.83 and ICD-10: D75.81) will be used as part of automation to allow approval of the requested medication.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Jakafi is recommended in those who meet one of the following criteria:

FDA-Approved Indications

61. **Graft versus Host Disease, Acute.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 12 years of age; AND
 - B) Patient has tried one systemic corticosteroid.
62. **Graft versus Host Disease, Chronic.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 12 years of age; AND
 - B) Patient has tried one conventional systemic treatment for graft versus host disease.
Note: Examples include systemic corticosteroids (methylprednisolone, prednisone), cyclosporine, tacrolimus, mycophenolate mofetil, Imbruvica (ibrutinib capsules, tablets, and oral solution), and imatinib.
63. **Myelofibrosis (MF), including Primary MF, Post-Polycythemia Vera MF, and Post-Essential Thrombocythemia MF.** Approve for 1 year if the patient is ≥ 18 years of age.
64. **Polycythemia Vera.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has tried hydroxyurea, Pegasys (peginterferon alfa-2a subcutaneous injection), or Besremi (ropeginterferon alfa-2b-njft subcutaneous injection).

Other Uses with Supportive Evidence

65. **Acute Lymphoblastic Leukemia.** Approve for 1 year if the patient meets BOTH of the following (A and B)
 - A) Patient is < 21 years of age; AND

03/20/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- B) The mutation/pathway is Janus Associated Kinase (*JAK*)-related.
- 66. Atypical Chronic Myeloid Leukemia.** Approve for 1 year if the patient meets one of following (A or B):
- A) Patient has a *CSF3R* mutation; OR
 - B) Patient has a Janus Associated Kinase 2 (*JAK2*) mutation.
- 67. Chronic Myelomonocytic Leukemia-2.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient is also receiving a hypomethylating agent.
- Note: Examples of hypomethylating agents include azacitidine and decitabine.
- 68. Essential Thrombocythemia.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has tried hydroxyurea, Pegasys (peginterferon alfa-2a subcutaneous injection), or anagrelide.
- 69. Myeloid or Lymphoid Neoplasms.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- H) Patient is ≥ 18 years of age; AND
 - I) Patient has eosinophilia; AND
 - J) The tumor has a Janus Associated Kinase 2 (*JAK2*) rearrangement.
- 70. T-Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has one of the following (i or ii):
 - i. T-cell prolymphocytic leukemia; OR
 - ii. T-cell large granular lymphocytic leukemia; AND
 - C) Patient has tried at least one systemic regimen.
- Note: Examples of a systemic regimen include one or more of the following products: methotrexate, corticosteroids, cyclosporine, Lemtrada (alemtuzumab intravenous infusion), fludarabine, mitoxantrone, or cyclophosphamide.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Jakafi is not recommended in the following situations:

- 164.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Jaypirca Prior Authorization Policy

- Jaypirca® (pirtobrutinib tablets – Eli Lilly)

REVIEW DATE: 06/19/2024; selected revision 06/26/2024

OVERVIEW

Jaypirca, a Bruton tyrosine kinase (BTK) inhibitor, is indicated for the treatment of:

- Chronic lymphocytic leukemia (CLL) or small lymphocytic leukemia (SLL), in adults who have received at least two prior lines of therapy, including a BTK inhibitor and B-cell lymphoma-2 (BCL-2) inhibitor.
- Mantle cell lymphoma, relapsed or refractory in adults after at least two lines of systemic therapy, including a BTK inhibitor.¹

Both indications are approved under accelerated approval based on response rate. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

Guidelines

Jaypirca is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **B-Cell Lymphoma:** NCCN guidelines (version 2.2024 – April 30, 2024) discuss mantle cell lymphoma and marginal zone lymphoma.^{2,4}
 - **Mantle cell lymphoma:** Brukinsa® (zanubrutinib capsules) and Calquence® (acalabrutinib tablets) [both covalent BTK inhibitors] are cited as “preferred regimens” for second-line and subsequent therapy (both category 2A). Imbruvica® (ibrutinib capsules, tablets and oral suspension) [also a covalent BTK inhibitor], given with or without rituximab, is cited as an “Other Recommended Regimen” for second-line and subsequent therapy (category 2A). Jaypirca, a non-covalent BTK inhibitor, is recommended as a second-line and subsequent therapy for progressive disease after prior covalent BTK inhibitor as “useful in certain circumstances” (category 2A). It is noted that head-to-head clinical trials in other B-cell malignancies have demonstrated a more favorable toxicity profile for Brukinsa and Calquence compared with Imbruvica without compromising efficacy. Imbruvica + Venclexta® (venetoclax tablets) is cited as “useful in certain circumstances” for second-line and subsequent therapy (category 2A).
 - **Marginal zone lymphoma:** Jaypirca is recommended as a “preferred” non-covalent BTK inhibitor after prior covalent BTK inhibitor as second-line and subsequent therapy for relapsed, refractory, or progressive disease in patients with indications for treatment, including for older or infirm patients with tolerability of combination chemoimmunotherapy is a concern (category 2A).
- **Chronic Lymphocytic Leukemia (CLL):** NCCN guidelines (version 3.2024 – March 26, 2024) recommend Jaypirca for CLL or SLL with or without del(17p)/TP53 mutation as second-line or third-line therapy as “Useful in Certain Circumstances” for resistance or intolerance to prior covalent BTK inhibitor (category 2A). Jaypirca is also listed as “Other Recommended Regimens” for relapsed or refractory disease after prior BTK inhibitor and Venclexta-based regimens (if not previously used) [category 2A]. Jaypirca is also recommended as additional therapy for histologic (Richter) transformation to diffuse large B-cell lymphoma

06/19/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

(clonally related or unknown clonal status) as a single agent in patients with del(17p)/TP53 mutation or who are chemotherapy refractory or unable to receive chemoimmunotherapy (category 2A).^{3,4}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Jaypirca. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Jaypirca is recommended in those who meet one of the following criteria:

FDA-Approved Indication

71. Chronic Lymphocytic Leukemia. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. Patient has resistance or intolerance to Imbruvica (ibrutinib tablets, capsules, or oral solution), Calquence (acalabrutinib tablets), or Brukinsa (zanubrutinib capsules); OR
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient has relapsed or refractory disease; AND
 - b) Patient meets BOTH of the following [(1) and (2)]:
 - (1) Patient has tried a Bruton tyrosine kinase (BTK) inhibitor; AND
Note: Examples of Bruton tyrosine kinase inhibitor include: Imbruvica (ibrutinib tablets, capsules, or oral solution), Calquence (acalabrutinib tablets), or Brukinsa (zanubrutinib capsules).
 - (2) Patient has tried Venclexta (venetoclax tablet).

72. Mantle Cell Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. Patient has tried at least one systemic chemotherapy regimen; OR
Note: Examples of a systemic regimen contain one or more of the following products: rituximab, cytarabine, carboplatin, cisplatin, oxaliplatin, cyclophosphamide, doxorubicin, vincristine, methotrexate, bendamustine, Velcade (bortezomib intravenous or subcutaneous injection), and lenalidomide.
 - ii. According to the prescriber, patient is not a candidate for a systemic regimen (i.e., an elderly patient who is frail); AND
- C) Patient has tried one Bruton tyrosine kinase inhibitor (BTK) for mantle cell lymphoma.
Note: Examples of BTK inhibitors indicated for mantle cell lymphoma include Brukinsa (zanubrutinib capsules), Calquence (acalabrutinib tablets), and Imbruvica (ibrutinib capsules, tablets, and oral suspension).

73. Small Lymphocytic Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND

06/19/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- B)** Patient meets ONE of the following (i or ii):
- i.** Patient has resistance or intolerance to Imbruvica (ibrutinib tablets, capsules, or oral solution), Calquence (acalabrutinib tablets), or Brukinsa (zanubrutinib capsules); OR
 - ii.** Patient meets BOTH of the following (a and b):
 - a)** Patient has relapsed or refractory disease; AND
 - b)** Patient meets BOTH of the following [(1) and (2)]:
 - (1)** Patient has tried a Bruton tyrosine kinase (BTK) inhibitor; AND
Note: Examples of Bruton tyrosine kinase inhibitor include: Imbruvica (ibrutinib tablets, capsules, or oral solution), Calquence (acalabrutinib tablets), or Brukinsa (zanubrutinib capsules).
 - (2)** Patient has tried Venclexta (venetoclax tablet).

Other Uses with Supportive Evidence

- 74. Marginal Zone Lymphoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):

Note: Marginal zone lymphoma includes gastric mucosa-associated lymphoid tissue (MALT) lymphoma, non-gastric MALT lymphoma, nodal marginal zone lymphoma, and splenic marginal zone lymphoma.

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one Bruton tyrosine kinase inhibitor.

Note: Examples of a Bruton tyrosine kinase inhibitor include: Calquence (acalabrutinib tablets), Brukinsa (zanubrutinib capsules), and Imbruvica (ibrutinib tablets, capsules, and oral solution).

- 75. Richter's Transformation to Diffuse Large B-Cell Lymphoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i or ii):

i. Patient has tried at least one chemotherapy regimen; OR

Note: Examples of a chemotherapy regimen include: EPOCH-R (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin, rituximab); HyperCVAD (cyclophosphamide, vincristine, doxorubicin, and dexamethasone) alternating with high-dose methotrexate and cytarabine + rituximab, oxaliplatin; OFAR (oxaliplatin, fludarabine, cytarabine, rituximab); RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone); and venetoclax + RCHOP

ii. Patient is not a candidate for a chemotherapy regimen.

Note: Examples of a chemotherapy regimen include: EPOCH-R (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin, rituximab); HyperCVAD (cyclophosphamide, vincristine, doxorubicin, and dexamethasone) alternating with high-dose methotrexate and cytarabine + rituximab, oxaliplatin; OFAR (oxaliplatin, fludarabine, cytarabine, rituximab); RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone); and venetoclax + RCHOP

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Jaypirca is not recommended in the following situations:

- 103.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Kisqali and Kisqali Femara Co-Pack Prior Authorization Policy

- Kisqali® (ribociclib tablets – Novartis)
- Kisqali® Femara® Co-Pack (ribociclib tablets; letrozole tablets – Novartis)

REVIEW DATE: 02/21/2024; selected revision 10/16/2024

OVERVIEW

Kisqali, a cyclin-dependent kinase (CDK) 4/6 inhibitor, is indicated for the treatment of hormone receptor-positive (HR+), human epidermal growth factor receptor 2 (HER2)-negative breast cancer in adults in the following settings:¹⁻³

- **Early Breast Cancer:** Kisqali, in combination with an aromatase inhibitor, and Kisqali Femara Co-Pack are indicated for the adjuvant treatment of stage II and III early breast cancer at high risk of recurrence.
- **Advanced or Metastatic Breast Cancer:** In combination with an aromatase inhibitor (AI) as initial endocrine-based therapy;
- **Advanced or Metastatic Breast Cancer:** Kisqali (not Co-Pack) in combination with fulvestrant as initial endocrine based therapy or following disease progression on endocrine therapy;
- Kisqali Femara Co-Pack has the same indications with AI, letrozole, included.

According to the prescribing information, in pre/perimenopausal women or men treated with the combination of Kisqali and an aromatase inhibitor or fulvestrant, a concurrent gonadotropin-releasing hormone (GnRH) agonist should be administered according to current clinical practice standards.¹

Guidelines

Kisqali is discussed in in guidelines from National Comprehensive Cancer Network (NCCN):

- **Breast Cancer:** NCCN guidelines (version 1.2024 – January 25, 2024) recommends Kisqali + AI or fulvestrant as a first-line “Preferred Regimen” for HR+ and HER2-negative recurrent unresectable (local or regional) or Stage IV disease in postmenopausal women or premenopausal patient receiving ovarian ablation or suppression (category 1).^{3,4} The guidelines state in a footnote that in phase III randomized controlled trials, Kisqali + endocrine therapy has shown overall survival benefit in the first-line setting. CDK4/6 inhibitor + fulvestrant is recommended as a “Preferred Regimen” for second- and subsequent-line therapy, if CDK4/6 inhibitor was not previously used (category 1). However, the guidelines also state in a footnote that if there is disease progression on Ibrance® (palbociclib tablets or capsules), there are limited data to support the use of Kisqali in the second-line setting.^{3,4} The guidelines state that in phase III randomized controlled trials, fulvestrant in combination with a CDK4/6 inhibitor has shown overall survival benefit in the second-line setting. For men with breast cancer, the compendium recommends they be treated similarly to postmenopausal women, except that the use of an AI is ineffective without concomitant suppression of testicular steroidogenesis.⁴
- **Endometrial Cancer:** NCCN uterine neoplasms guidelines (version 1.2024 – September 20, 2023) recommend Kisqali in combination with letrozole for recurrent or metastatic endometrial carcinoma for estrogen receptor (ER)-positive tumors (category 2A).⁵

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Kisqali and Kisqali Femara Co-Pack. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kisqali is recommended in those who meet one of the following criteria:

FDA-Approved Indications

71. Breast Cancer in Women*. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):

S) Patient is ≥ 18 years of age; AND

T) Patient meets ONE of the following (i or ii):

i. As per the prescriber, medication is used as adjuvant treatment for early breast cancer (stage II or III) at high risk of recurrence; OR

ii. Patient has recurrent or metastatic disease; AND

U) Patient has hormone receptor-positive (HR+) [i.e., estrogen receptor-positive {ER+} and/or progesterone receptor-positive {PR+}] disease; AND

V) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND

W) Patient meets ONE of the following (i or ii):

i. Patient is postmenopausal; OR

ii. Patient is pre/perimenopausal and meets ONE of the following (a or b):

a) Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR

Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant).

b) Patient has had surgical bilateral oophorectomy or ovarian irradiation; AND

X) Patient meets ONE of the following (i or ii):

i. Kisqali will be used in combination with anastrozole, exemestane, or letrozole; OR

ii. Kisqali will be used in combination with fulvestrant.

* Refer to the Policy Statement.

2. Breast Cancer in Men*. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):

F) Patient is ≥ 18 years of age; AND

G) Patient meets ONE of the following (i or ii):

i. As per the prescriber, the medication is used as adjuvant treatment for early breast cancer (stage II or III) at high risk of recurrence; OR

ii. Patient has recurrent or metastatic disease; AND

02/21/2024

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- H) Patient has hormone receptor-positive (HR+) [i.e., estrogen receptor-positive {ER+} and/or progesterone receptor-positive {PR+}] disease; AND
- I) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- J) Patient is receiving a gonadotropin-releasing hormone (GnRH) analog; AND
Note: Examples of GnRH analog include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), Orgovyx (relugolix tablet).
- F) Patient meets ONE of the following (i or ii):
 - i. Kisqali will be used in combination with anastrozole, exemestane, or letrozole; OR
 - ii. Kisqali will be used in combination with fulvestrant.

* Refer to the Policy Statement.

Other Uses with Supportive Evidence

- 3. **Endometrial Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has recurrent or metastatic disease; AND
 - C) Patient has estrogen receptor (ER)-positive tumors; AND
 - D) Kisqali will be used in combination with letrozole.

II. Coverage of Kisqali Femara Co-Pack is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1. **Breast Cancer in Women*.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
 - 72. Patient is ≥ 18 years of age; AND
 - 73. Patient meets ONE of the following (i or ii):
 - i. As per the prescriber, medication is used as adjuvant treatment for early breast cancer (stage II or III) at high risk of recurrence; OR
 - ii. Patient has recurrent or metastatic disease; AND
 - 74. Patient has hormone receptor-positive (HR+) [i.e., estrogen receptor-positive {ER+} and/or progesterone receptor-positive {PR+}] disease; AND
 - 75. Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
 - 76. Patient meets ONE of the following (i or ii):
 - i. Patient is postmenopausal OR
 - ii. Patient is pre/perimenopausal and meets ONE of the following (a or b):
 - a) Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR
Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant).
 - b) Patient has had surgical bilateral oophorectomy or ovarian irradiation.

* Refer to the Policy Statement.

- 2 **Breast Cancer in Men***. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. As per the prescriber, medication is used as adjuvant treatment for early breast cancer (stage II or III) at high risk of recurrence; OR
 - ii. Patient has recurrent or metastatic disease; AND
 - C) Patient has hormone receptor-positive (HR+) [i.e., estrogen receptor-positive {ER+} and/or progesterone receptor-positive {PR+}] disease; AND
 - D) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
 - E) Patient is receiving a gonadotropin-releasing hormone (GnRH) analog.

Note: Examples of a GnRH analog include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), Orgovyx (relugolix tablet).

* Refer to the Policy Statement.

Other Uses with Supportive Evidence

3. **Endometrial Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has recurrent or metastatic disease; AND
- C) Patient has estrogen receptor (ER)-positive tumors.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kisqali or Kisqali Femara Co-Pack is not recommended in the following situations:

165. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Koselugo Prior Authorization Policy

- Koselugo™ (selumetinib capsules – AstraZeneca)

REVIEW DATE: 04/10/2024

OVERVIEW

Koselugo, a kinase inhibitor, is indicated for the treatment of **neurofibromatosis type 1** (NF1) in patients ≥ 2 years of age with who have symptomatic, inoperable plexiform neurofibromas.¹

Koselugo is a mitogen-activated protein kinase kinases 1 and 2 (MEK1/2) inhibitor.¹

Disease Overview

Neurofibromatoses are a group of tumor suppressor syndromes that predisposes patients to an increased risk of nervous system tumors including neurofibromas, malignant peripheral nerve sheath tumors, and gliomas.^{5,6} NF1 is the most common of the neurofibromatoses, occurring in approximately one in 2,500 to 3,000 individuals worldwide.^{7,8} NF1 is an autosomal dominant disorder, with 50% of children of affected parents inheriting the mutated NF1 tumor-suppressor gene.^{5,7} However, up to 50% of the cases occur spontaneously in patients without a family of NF1.⁵⁻⁹

Plexiform neurofibromas are benign nerve sheath tumors that can occur anywhere in the body,⁸ affect up to 50% of patients with NF1,⁵ and are often present at birth.^{7,8} These tumors tend to grow the fastest in the first decade of life,^{7,8} and can continue to grow into adolescence and early adulthood.⁷ Plexiform neurofibromas may be asymptomatic and only detected with MRI,^{5,8} or may cause significant pain,^{5,7} disfigurement,⁵ bone destruction,⁷ and loss of nerve function.⁵ Due to the risk of transformation to malignant peripheral nerve sheath tumors, patients with any change in the signs or symptoms of plexiform neurofibromas should be assessed for malignant transformation.^{5,8}

Other Uses with Supportive Evidence

In a Phase II, open-label trial, the efficacy of Koselugo was assessed in patients 3 to 21 years of age with recurrent, refractory, or progressive pilocytic astrocytoma with either *KIAA1549-BRAF* fusion or *BRAF V600E* mutation.² Koselugo 25 mg/m²/dose was administered twice daily for up to 2 years if the patient did not have progressive disease or unacceptable adverse events. A total of 25 patients were enrolled with a median age of 9.2 years, and 52% were female. A partial response was achieved in 36% of patients, 36% of patients had stable disease, and 28% had disease progression. The 2 year progression-free survival was 70% and 44% of patients have not progressed after a median of 36.4 months of follow-up.

Guidelines

Koselugo is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **Central nervous system cancers:** Clinical practice guidelines (version 1.2023 – March 24, 2023) recommend Koselugo for the treatment of recurrent or progressive circumscribed glioma with *BRAF* fusion or *BRAF V600E* activating mutation positive; or neurofibromatosis type 1 mutated glioma, as a single agent.^{3,4}
- **Histiocytic Neoplasms:** Clinical practice guidelines (version 1.2024 – March 15, 2024) recommend Koselugo as a single agent for the first-line or subsequent treatment of mitogen-activated protein kinase pathway mutation, no detectable mutation, or testing not available for

multisystem Langerhans cell histiocytosis (LCH), single-system lung LCH, multifocal (> 2 lesions) single system bone LCH not responsive to a bisphosphonate, and central nervous system LCH.¹⁰

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Koselugo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Koselugo is recommended in those who meet the following criteria:

FDA-Approved Indication

76. Neurofibromatosis Type 1. Approve for 1 year if the patient meets ALL of the following (A and B):

- A) Patient meets ONE of the following (i or ii):
 - i. Patient is 2 to 18 years of age; OR
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient is ≥ 19 years of age; AND
 - b) Patient has been previously started on therapy with Koselugo prior to becoming 19 years of age; AND
- B) Prior to starting Koselugo, the patient had symptomatic, inoperable plexiform neurofibromas, according to the prescriber.

Other Uses with Supportive Evidence

77. Circumscribed Glioma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient meets ONE of the following (i or ii):
 - i. Patient is 3 to 21 years of age; OR
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient is > 21 years of age; AND
 - b) Patient has been previously started on therapy with Koselugo prior to becoming 21 years of age; AND
- B) Patient has recurrent, refractory, or progressive disease; AND
- C) Tumor meets ONE of the following (i, ii, or iii):
 - i. Tumor is *BRAF* fusion positive; OR
 - ii. Tumor is *BRAF V600E* activating mutation positive; OR
 - iii. Patient has neurofibromatosis type 1 mutated glioma; AND
- D) The medication will be used as a single agent.

78. Langerhans Cell Histiocytosis. Approve for 1 year if the patient meets ALL of the following (A and B):

- A) Patient meets ONE of the following (i, ii, iii, or iv):
 - i. Patient meets BOTH of the following (a and b):
 - a) Patient has multisystem Langerhans cell histiocytosis; AND
 - b) Patient has symptomatic disease or impending organ dysfunction; OR
 - ii. Patient has single system lung Langerhans cell histiocytosis; OR

- iii. Patient meets ALL of the following (a, b, and c):
 - a) Patient has single system bone disease; AND
 - b) Patient has not responded to treatment with a bisphosphonate; AND
Note: Examples of bisphosphonates include pamidronate and zoledronic acid.
 - c) Patient has more than 2 bone lesions; OR
- iv. Patient has central nervous system disease; AND
- B) The medication is used as a single agent.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Koselugo is not recommended in the following situations:

- 104. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Krazati Prior Authorization Policy

- Krazati™ (adagrasib tablets – Mirati Therapeutics)

REVIEW DATE: 12/20/2023

OVERVIEW

Krazati, a Kirsten RAS Sarcoma virus (KRAS) inhibitor, is indicated for the following uses¹:

- **Non-small cell lung cancer (NSCLC):** Treatment of *KRAS G12C*-mutated locally advanced or metastatic disease, as determined by an FDA-approved test, in adults who have received at least one prior systemic therapy.
- **Colorectal cancer:** Krazati in combination with Erbitux® (cetuximab intravenous infusion) is indicated for the treatment of *KRAS G12C*-mutated locally advanced or metastatic disease, as determined by an FDA-approved test, in adults who have received prior treatment with fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapy.

Both the NSCLC and colorectal cancer indications were approved under accelerated approval based on objective response rate and duration of response. Continued approval for these indications may be contingent upon verification and description of a clinical benefit in confirmatory trials.

Mutations in the *KRAS* gene most commonly occur at codon 12.² Data suggest that approximately 30% of patients with NSCLC have *KRAS* mutations. The prognosis of survival of patients with tumors with *KRAS* mutation is poorer compared with that of patients with tumors without *KRAS* mutation.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines recommend Krazati for the following cancer types:

- **Non-Small Cell Lung Cancer:** Guidelines (version 5.2023 – November 8, 2023) recommend Krazati as a subsequent treatment option, for use after at least one prior systemic treatment (i.e., second-line and beyond) if the patient has not received previous *KRAS G12C*-targeted therapy (category 2A). Patients who progressed on Lumakras™ (sotorasib tablets), another *KRAS* inhibitor directed at *KRAS G12C*-mutated NSCLC, should not be treated with Krazati; and vice-versa. The NCCN Central Nervous System Cancers guidelines (version 1.2023 – March 24, 2023) recommend use of Krazati for *KRAS G12C* mutation-positive NSCLC that has metastasized to the brain (category 2A).³
- **Colon and Rectal Cancer:** Guidelines for colon cancer (version 4.2024 – July 3, 2024) and rectal cancer (version 3.2024 – July 3, 2024) recommend Krazati for some situations in patients with *KRAS G12C*-mutated disease.^{4,5} For initial treatment in combination with Erbitux or Vectibix® (panitumumab intravenous infusion) or as monotherapy if patient is unable to tolerate Erbitux or Vectibix due to toxicity (category 2A). Krazati is also recommended as subsequent therapy (category 2A) after previous therapy with oxaliplatin, irinotecan, FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Krazati. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Krazati is recommended in those who meet the following criteria:

FDA-Approved Indication

20. Non-Small Cell Lung Cancer (NSCLC). Approve for 1 year if the patient meets the following (A, B, and C):

G) Patient is ≥ 18 years of age; AND

H) Patient has *KRAS G12C*-mutated locally advanced or metastatic NSCLC, as determined by an approved test; AND

I) Patient has been previously treated with at least one systemic regimen.

Note: Examples of systemic regimens include those containing one or more of the following products: Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion), Tecentriq (atezolizumab intravenous infusion), Alimta (pemetrexed intravenous infusion), Yervoy (ipilimumab intravenous infusion), Abraxane (albumin-bound paclitaxel intravenous infusion), bevacizumab, cisplatin, carboplatin, docetaxel, gemcitabine, paclitaxel, vinorelbine.

21. Colon or Rectal Cancer. Approve for 1 year if the patient meets the following (A, B, C, D, and E):

A) Patient is ≥ 18 years of age; AND

B) Patient has unresectable, advanced, or metastatic disease; AND

C) Patient has *KRAS G12C* mutation-positive disease; AND

D) Patient meets one of the following (i or ii):

i. The medication is prescribed as part of a combination regimen for colon or rectal cancer;
OR

Note: Examples of combination regimens included Krazati + Erbitux (cetuximab intravenous infusion), Krazati + Vectibix (panitumumab intravenous infusion).

ii. As per the prescriber, the patient is unable to tolerate combination therapy; AND

E) Patient has previously received a chemotherapy regimen for colon or rectal cancer.

Note: Examples of chemotherapy regimens include a fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine; oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Krazati is not recommended in the following situations:

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lapatinib Prior Authorization Policy

- Tykerb® (lapatinib ditosylate tablets – Novartis, generic)

REVIEW DATE: 02/28/2024

OVERVIEW

Lapatinib, a tyrosine kinase inhibitor, is indicated for the following uses:¹

- **Breast cancer**, in combination with capecitabine tablets for the treatment of patients with **advanced or metastatic disease** whose tumors overexpress human epidermal growth factor receptor 2 (HER2) and who have received prior therapy including an anthracycline, a taxane, and trastuzumab.
Limitation of Use: Patients should have disease progression on trastuzumab prior to initiation of treatment with lapatinib in combination with capecitabine tablets.
- **Breast cancer**, in combination with letrozole for the treatment of postmenopausal women with **hormone receptor (HR)-positive metastatic disease** that overexpresses HER2 for whom hormonal therapy is indicated. Lapatinib in combination with an aromatase inhibitor (AI) has not been compared with a trastuzumab-containing chemotherapy regimen for the treatment of metastatic breast cancer.

Guidelines

Lapatinib is discussed in guidelines from National Comprehensive Cancer Network (NCCN):

- **Breast Cancer:** NCCN guidelines (version 1.2024 – January 25, 2024) recommend lapatinib in combination with trastuzumab (without cytotoxic therapy) or capecitabine for HER2-positive recurrent unresectable (local or regional) or stage IV disease that is HR-negative or HR positive with or without endocrine therapy as fourth-line therapy or beyond (category 2A).² Lapatinib is also recommended in combination with an AI with or without trastuzumab for the treatment of recurrent unresectable (local or regional) or Stage IV HR+, HER2+ disease in postmenopausal women or premenopausal women receiving ovarian ablation or suppression (category 2A).² Men with breast cancer should be treated similarly to postmenopausal women except that using an AI is ineffective without suppression of testicular steroidogenesis (category 2A). NCCN central nervous system cancers guidelines (version 1.2023 – March 24, 2023) recommend treatments for patients with brain metastases from breast cancer.^{3,4} Capecitabine with lapatinib is recommended as initial treatment in select patients (e.g. patients with small asymptomatic brain metastases), as treatment for recurrent disease or relapsed disease with stable systemic disease or reasonable systemic treatment options (category 2A).
- **Bone Cancer:** NCCN guidelines (version 1.2024 – August 7, 2023) recommend the use of lapatinib for epidermal growth factor receptor (*EGFR*)-positive recurrent conventional or chondroid chordoma as “Useful In Certain Circumstances” (category 2A).^{3,5}
- **Colon or Rectal Cancer:** The NCCN Compendium supports the use of lapatinib in colon or rectal cancer for HER2-amplified and *RAS* and *BRAF* wild-type disease, in combination with trastuzumab, if not previously treated with a HER2 inhibitor.³

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of lapatinib. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; a man is defined as an individual with the biological traits of a man, regardless of the individual's gender identity or expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of lapatinib is recommended in those who meet one of the following criteria:

FDA-Approved Indications

22. Breast Cancer. Approve for 1 year if the patient meets the following (A, B, C, and D):

- A)** Patient is ≥ 18 years of age; AND
- B)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- C)** Patient has recurrent or metastatic breast cancer; AND
- D)** Patient meets one of the following (i or ii):
 - i.** Patient meets both of the following (a and b):
 - a)** The medication will be used in combination with capecitabine or trastuzumab; AND
 - b)** Patient has tried at least three prior anti-HER2 based regimens; OR
Note: Examples of anti-HER2 regimens include: Perjeta (pertuzumab intravenous infusion) + trastuzumab + docetaxel, Perjeta + trastuzumab + paclitaxel; Enhertu (fam-trastuzumab deruxtecan-nxki intravenous infusion); Kadcyla (ado-trastuzumab emtansine intravenous infusion); Tukyssa (tucatinib tablet) + trastuzumab + capecitabine.
 - ii.** The medication will be used in combination with an aromatase inhibitor (that is, letrozole, anastrozole, or exemestane) AND patient meets the following (a and b):
 - a)** Patient has hormone receptor-positive (HR+) [i.e., estrogen receptor positive {ER+}-and/or progesterone receptor positive {PR+}]disease; AND
 - b)** One of the following [(1) (2) or (3)] applies:
 - (1)** Patient is a postmenopausal woman*; OR
 - (2)** Patient is a premenopausal or perimenopausal woman* and is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist, surgical bilateral oophorectomy, or ovarian irradiation; OR
Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous injection).
 - (3)** Patient is a man* and is receiving a gonadotropin-releasing hormone (GnRH) analog.
Note: Examples of a GnRH analog include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), Orgovyx (relugolix tablet).

* Refer to the Policy Statement.

Other Uses with Supportive Evidence

2. **Bone Cancer.** Approve for 1 year if the patient meets the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has recurrent chordoma; AND
 - C) Patient has epidermal growth-factor receptor (*EGFR*)-positive disease.
3. **Colon or Rectal Cancer.** Approve for 1 year if the patient meets the following (A, B, C, D, E, F, and G)
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has unresectable, advanced, or metastatic disease; AND
 - C) Patient has human epidermal receptor 2 (HER2)-amplified disease; AND
 - D) Patient has wild-type *RAS* and *BRAF* disease; AND
 - E) Patient meets ONE of the following (i or ii):
 - i. Patient has tried at least one chemotherapy regimen; OR
Note: Examples of chemotherapy are fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine; oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).
 - ii. Patient is not a candidate for intensive therapy, according to the prescriber; AND
 - F) The medication is used in combination with trastuzumab; AND
 - G) Patient has not been previously treated with a HER2-inhibitor.
Note: Examples of HER2-inhibitors are trastuzumab products, Nerlynx (neratinib tablets), Kadcyla (ado-trastuzumab emtansine intravenous infusion) Perjeta (pertuzumab intravenous infusion), Enhertu (fam-trastuzumab deruxtecan-nxki intravenous infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of lapatinib is not recommended in the following situations:

166. **Head and Neck, Squamous Cell Carcinoma.** In one Phase III study in 688 patients with squamous cell carcinoma of the head and neck, adding lapatinib to chemoradiotherapy and as maintenance monotherapy was not more effective than placebo in improving disease-free survival or overall survival.⁶
167. **Urothelial Carcinoma.** In one Phase III trial, 232 patients with HER1/HER2 metastatic urothelial bladder cancer who did not have progressive disease during chemotherapy were randomized to receive lapatinib or placebo after completing first-line or initial chemotherapy.⁷ Median progression-free survival was the primary endpoint, for lapatinib and placebo was 4.5 months and 5.1 months respectively; no statistically significant difference was detected between the two group.
168. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HER2 - Human epidermal growth factor receptor 2

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lazcluze Prior Authorization Policy

- Lazcluze™ (lazertinib tablets – Janssen)

REVIEW DATE: 08/26/2024

OVERVIEW

Lazcluze, in combination with Rybrevant™ (amivantamab-vmjw infusion), is indicated for the first-line treatment of locally advanced or metastatic non-small cell lung cancer (NSCLC) with epidermal growth factor receptor (*EGFR*) exon 19 deletions or exon 21 L858R substitution mutations, as detected by an FDA-approved test, in adults.¹

Guidelines

Lazcluze is not addressed in the National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 8.2024 – August 23, 2024).² NCCN recommends Tagrisso® (osimertinib tablets) as the “Preferred” first-line treatment (category 1) for patients with *EGFR* exon 19 deletion or exon 21 L858R substitution mutations. Several other *EGFR* tyrosine kinase inhibitors with or without chemotherapy or bevacizumab are recommended under “Other Recommended” regimens (most are category 1).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lazcluze. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lazcluze is recommended in those who meet the following criteria:

FDA-Approved Indication

79. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has locally advanced or metastatic disease; AND
- C) Patient has epidermal growth factor receptor (*EGFR*) exon 19 deletions or exon 21 L858R substitution mutations, as detected by an approved test; AND
- D) The medication is used in combination with Rybrevant™ (amivantamab-vmjw infusion); AND
- E) The medication will be used as first-line treatment.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lenalidomide Prior Authorization Policy

- Revlimid® (lenalidomide capsules – Celgene, generic)

REVIEW DATE: 05/29/2024

OVERVIEW

Lenalidomide, a thalidomide analog, is indicated for the following uses in adults:¹

- **Follicular lymphoma**, previously treated, in combination with a rituximab product.
- **Mantle cell lymphoma**, in patients whose disease has relapsed or progressed after two prior therapies, one of which included bortezomib subcutaneous or intravenous bolus injection.
- **Marginal zone lymphoma**, previously treated, in combination with a rituximab product.
- **Multiple myeloma**, as maintenance following autologous hematopoietic stem cell transplantation.
- **Multiple myeloma**, treatment, in combination with dexamethasone.
- **Myelodysplastic syndrome**, for transfusion-dependent anemia due to low- or intermediate-risk disease, associated with a deletion 5q abnormality with or without cytogenetic abnormalities.

A limitation of use with lenalidomide is that it is not indicated and is not recommended for the treatment of patients with chronic lymphocytic leukemia outside of controlled clinical trials.¹

Guidelines

Lenalidomide is incorporated into various guidelines by the National Comprehensive Cancer Network (NCCN).²⁻¹¹

- **B-Cell Lymphomas:** NCCN guidelines for B-Cell lymphomas (version 2.2024 – April 30, 2024) discuss therapeutic options for diffuse large B-cell lymphoma (DLBCL), the most common type of other B-cell lymphoma.² Lenalidomide, with or without rituximab, is mentioned as a second-line therapy as “useful in certain circumstances” (category 2A). Monjuvi® (tafasitamab-cxix intravenous infusion) plus lenalidomide is recommended as a “preferred” regimen as second-line therapy (category 2A). Many examples of first-line therapies are recommended (e.g., RCHOP [rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone] {category 1}, dose-adjusted EPOCH [etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin] + rituximab [category 2A]). One example of a first-line therapy for patients with poor left ventricular function or in those who are frail is RGCVP (rituximab, gemcitabine, cyclophosphamide, vincristine, prednisone). NCCN also recommends optional first-line consolidation therapy of lenalidomide maintenance (category 2B) for patients 60 to 80 years of age. Other types of B-cell lymphomas (high grade B-cell lymphomas [not otherwise specified], post-transplant lymphoproliferative disorders, acquired immunodeficiency [AIDS]-related B-cell lymphomas, high-grade B-cell lymphomas with translocations of MYC and BCL2 and/or BCL6 [double/triple hit lymphoma]) are also cited in the guidelines and note a place in therapy of lenalidomide. Regimens recommended in these clinical scenarios are similar to those used in DLBCL.
 - **Follicular Lymphomas:** Lenalidomide plus rituximab is a first-line recommended therapy (category 2A). Many second-line and subsequent therapies are listed, usually with or without rituximab. Lenalidomide with Gazyva® (obinutuzumab intravenous infusion) is an “other recommended regimen” in this setting (category 2A).
 - **Mantle Cell Lymphoma:** Lenalidomide, in combination with rituximab, is recommended as a preferred, less aggressive induction therapy (category 2A). Lenalidomide with rituximab is recommended as a preferred second-line and subsequent therapy (category

05/29/2024

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

2A). The regimen of lenalidomide, rituximab, and Imbruvica is cited as and second-line and subsequent therapy that is “useful in certain circumstances” (category 2A).

- **Marginal Zone Lymphoma:** Lenalidomide plus rituximab has a category 2B recommendation for first-line therapy as an “other recommended regimen” and a category 2A recommendation for second-line and subsequent therapy as a “preferred regimen”. Lenalidomide + Gazyva is also recommended under “other recommended regimens” for second-line/subsequent therapy (category 2A).
- **Castleman’s Disease:** NCCN guidelines (version 1.2024 – January 18, 2024) recommend lenalidomide as an option (category 2A) as second-line and subsequent therapy, with or without rituximab, for multi-centric Castleman’s disease that is relapsed/refractory or progressive disease.²
- **Central Nervous System (CNS) Cancers:** NCCN guidelines for CNS cancers (version 1.2023 – March 24, 2023) recommend lenalidomide, with or without rituximab (category 2A), as one of the options for patients with relapsed or refractory disease.³
- **Histiocytic Neoplasms:** NCCN guidelines for histiocytic neoplasms (version 1.2024 – March 15, 2024) recommend lenalidomide for Langerhans cell histiocytosis as first-line or as subsequent therapy for single system multifocal skin disease (including mucosa) and for Rosai-Dorfman disease (both category 2A).⁴
- **Hodgkin Lymphoma:** NCCN Hodgkin lymphoma guidelines (version 3.2024 – March 18, 2024) recommend lenalidomide as a subsequent option for treatment of classical Hodgkin lymphoma as a single agent for refractory or relapsed disease in patients ≥ 18 years of age (category 2A) who have tried at least three prior lines of therapy. Many other therapies are recommended as primary systemic therapy regimens before lenalidomide is recommended.⁵
- **Kaposi Sarcoma:** NCCN guidelines for Kaposi sarcoma (version 1.2024 – November 7, 2023) recommended lenalidomide as an agent “Other recommended regimens” for subsequent systemic therapy options for relapsed/refractory advanced cutaneous, oral, visceral or nodal disease that has progressed on or not responded to first-line systemic therapy and progressed on alternative first-line systemic therapy (category 2A).⁹ This includes use when given alone (in patients without human immunodeficiency virus [HIV]) or with antiretroviral therapy for patients with HIV. First-line systemic therapy options include liposomal doxorubicin (preferred) and paclitaxel. Other subsequent systemic therapy options for relapsed/refractory therapy are also cited (e.g., Pomalyst® [pomalidomide capsules] {preferred}, Thalomid® [thalidomide capsules], imatinib).
- **Multiple Myeloma:** NCCN guidelines for multiple myeloma (version 4.2024 – April 26, 2024) feature lenalidomide prominently in a variety of scenarios with several category 1 recommendations (e.g., lenalidomide with dexamethasone for other recommended regimens for primary therapy, monotherapy for maintenance therapy).⁶ The agent is also cited in other regimens with category 2A and 2B recommendations. Lenalidomide is also indicated for treatment in combination with dexamethasone for the management of POEMS (polyneuropathy, organomegaly, endocrinopathy, monoclonal protein, skin changes) syndrome as induction therapy for transplant eligible patients and for transplant ineligible patients (category 2A).
- **Myelodysplastic Syndrome (MDS):** NCCN guidelines for MDS (version 2.2024 – May 22, 2024) recommend lenalidomide in a variety of clinical scenarios among patients with symptomatic anemia both with and without 5q deletion abnormalities (category 2A).⁷
- **Myeloproliferative Neoplasms:** NCCN has guidelines regarding myeloproliferative neoplasms (version 1.2024 – December 21, 2023) discuss myelofibrosis with related anemia.⁸ Lenalidomide is recommended under “Useful in certain circumstances” in (category 2B) combination with prednisone taper for del(5q), if no symptomatic splenomegaly and/or constitutional symptoms. .
- **Systemic Light Chain Amyloidosis:** NCCN guidelines for systemic light chain amyloidosis (version 2.2024 – December 12, 2023) cite lenalidomide as a therapeutic option used in combination dexamethasone, and in some circumstances with additional medications, in several clinical scenarios, including as primary therapy (category 2A).¹⁰ Also, lenalidomide in

combination with dexamethasone, and an additional medication recommended in some situations, is also recommended in patients with previously treated disease (category 2A).

- **T-Cell Lymphomas:** NCCN guidelines for T-cell lymphomas (version 4.2024 – May 28, 2024) make several recommendations that include lenalidomide.¹¹ Lenalidomide is recommended as a second-line and subsequent therapy for adult T-cell leukemia/lymphoma (category 2A). For peripheral T-cell lymphomas, lenalidomide is recommended as initial palliative-intent therapy as “other recommended regimen” (category 2A) and for second-line and subsequent therapy as “other recommended regimens” as a monotherapy (category 2A). Indications regarding peripheral T-cell lymphomas include the following: peripheral T-cell lymphoma not otherwise specified, adult T-cell leukemia/lymphoma, angioimmunoblastic T-cell lymphoma; enteropathy-associated T-cell lymphoma; monomorphic epitheliotropic intestinal T-cell lymphoma; nodal peripheral T-cell lymphoma with T-follicular helper (TFH) phenotype; follicular T-cell lymphoma; and hepatosplenic gamma-delta T-cell lymphomas. Other regimens are recommended as first-line or preferred in both of these clinical scenarios.

Safety

In a prospective randomized clinical study in the first-line treatment of patients with CLL, use of lenalidomide as a single agent increased the risk of death compared with chlorambucil given as a single agent.¹ Lenalidomide is only available through the lenalidomide Risk Evaluation Mitigation Strategy program. Males and females must follow the required reproductive precautions.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of lenalidomide. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of lenalidomide is recommended in those who meet the one of following criteria:

FDA-Approved Indications

77. Follicular Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i or ii)

i. Patient is using lenalidomide in combination with rituximab; OR

ii. Patient has tried at least one other regimen.

Note: Examples include bendamustine plus Gazyva (obinutuzumab intravenous infusion) or rituximab; bendamustine plus Gazyva; CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) plus Gazyva or rituximab; CVP (cyclophosphamide, vincristine, prednisone) plus Gazyva or rituximab; chlorambucil with or without rituximab; cyclophosphamide with or without rituximab; rituximab; Gazyva; or Aliqopa (copanlisib intravenous infusion).

78. Mantle Cell Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i or ii).

i. Patient is using lenalidomide in combination with rituximab; OR

ii. Patient has tried at least two other regimens.

Note: Examples include HyperCVAD (cyclophosphamide, vincristine, doxorubicin, and dexamethasone alternating with high-dose methotrexate and cytarabine) + rituximab; the NORDIC regimen (dose-intensified induction immunochemotherapy with rituximab + cyclophosphamide, vincristine, doxorubicin, prednisone alternating with rituximab and high-dose cytarabine); RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone); bendamustine injection plus rituximab; RDHA (rituximab, dexamethasone, cytarabine) + platinum (carboplatin, cisplatin, or oxaliplatin); Imbruvica (ibrutinib capsules, tablets, and oral suspension) with or without rituximab; Calquence (acalabrutinib tablets and capsules); or Brukinsa (zanubrutinib capsules).

79. Marginal Zone Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i or ii).

i. Patient is using lenalidomide in combination with rituximab; OR

ii. Patient has tried least one other regimen.

Note: Examples include CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) + rituximab; bendamustine + rituximab; CVP (cyclophosphamide, vincristine, prednisone) + rituximab; rituximab; chlorambucil with or without rituximab; cyclophosphamide with or without rituximab; bendamustine + Gazyva (obinutuzumab intravenous infusion); Copiktra (duvelisib capsules); Aliqopa (copanlisib intravenous infusion); or Zydelig (idelalisib capsules).

80. Multiple Myeloma. Approve for 1 year if the patient is ≥ 18 years of age.

81. Myelodysplastic Syndrome. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i, ii, or iii):

i. Patient has symptomatic anemia; OR

ii. Patient has transfusion-dependent anemia; OR

iii. Patient has anemia that is not controlled with an erythropoiesis-stimulating agent

Note: Examples include Epogen/Procrit (epoetin alfa injection), Aranesp (darbepoetin alfa injection).

Other Uses with Supportive Evidence

82. B-Cell-Lymphomas (Other): Approve for 1 year if the patient meets BOTH of the following (A and B):

Note: Examples include diffuse large B-cell lymphoma (DLBCL); high grade B-cell lymphomas (not otherwise specified), post-transplant lymphoproliferative disorders, AIDS-related B-cell lymphomas, high-grade B-cell lymphomas with translocations of MYC and BCL2 and/or BCL6 (double/triple hit lymphoma).

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one other regimen.

Note: Examples include RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone); dose-adjusted EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin) + rituximab; RCEPP (rituximab, cyclophosphamide, etoposide, prednisone, procarbazine); DHA (dexamethasone, cytarabine) plus platinum (carboplatin, cisplatin, oxaliplatin) $\pm$ rituximab; ICE (Ifex, carboplatin, etoposide) $\pm$ rituximab; RGCVP (rituximab, gemcitabine,

cyclophosphamide, vincristine, prednisone); GDP (gemcitabine, dexamethasone, cisplatin) ± rituximab or gemcitabine, dexamethasone, carboplatin) ± rituximab; R-HyperCVAD (rituximab, cyclophosphamide, vincristine, doxorubicin, and dexamethasone alternating with high-dose methotrexate and cytarabine); or bendamustine ± rituximab.

- 83. Castleman's Disease.** Approve for 1 year in patients with relapsed/refractory or progressive disease.
- 84. Central Nervous System Lymphoma.** Approve for 1 year if according to the prescriber the patient has relapsed or refractory disease.
- 85. Histiocytic Neoplasms.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient has Langerhans cell histiocytosis with single-system multifocal skin disease; OR
 - ii. Patient has Rosai-Dorfman disease.
- 86. Hodgkin Lymphoma, Classical.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has tried at least three other regimens.
Note: Examples include ABVD (doxorubicin, bleomycin, vinblastine, and dacarbazine); BEACOPP (bleomycin, etoposide, doxorubicin, cyclophosphamide, vincristine, procarbazine, and prednisone); Adcetris (brentuximab vedotin intravenous infusion); Adcetris + AVD (doxorubicin, vinblastine, and dacarbazine); DHAP (dexamethasone, cisplatin, high-dose cytarabine); ICE (ifosfamide, carboplatin, etoposide); or GVD (gemcitabine, vinorelbine, liposomal doxorubicin).
- 87. Kaposi Sarcoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient has relapsed or refractory disease; AND
 - B) Patient has tried at least one other medication; AND
Note: Examples include liposomal doxorubicin, paclitaxel, Pomalyst (pomalidomide capsules), Thalomid (thalidomide capsules), and imatinib.
- 88. Myelofibrosis.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) According to the prescriber the patient has anemia with presence of del(5q); AND
 - C) The medication is used in combination with prednisone.
- 89. Peripheral T-Cell Lymphomas.** Approve for 1 year if the patient is ≥ 18 years of age.
Note: Indications regarding peripheral T-cell lymphomas include peripheral T-cell lymphoma not otherwise specified (PTCL-NOS), angioimmunoblastic T-cell lymphoma (AITL); enteropathy-associated T-cell lymphoma (EATL); monomorphic epitheliotropic intestinal T-cell lymphoma (MEITL); nodal peripheral T-cell lymphoma (nodal PTCL) with T-follicular helper (TFH) phenotype; follicular T-cell lymphoma (FTCL); and hepatosplenic gamma-delta T-cell lymphomas.

- 90. POEMS (polyneuropathy, organomegaly, endocrinopathy, monoclonal protein, skin changes) Syndrome.** Approve for 1 year if the patient meets BOTH of the following (A and B):
A) Patient is ≥ 18 years of age; AND
B) Use of lenalidomide is in combination with dexamethasone.
- 91. Systemic Light Chain Amyloidosis.** Approve for 1 year if the patient meets BOTH of the following (A and B):
A) Patient is ≥ 18 years of age; AND
B) Use of lenalidomide is in combination with dexamethasone.
- 92. T-Cell Leukemia/Lymphoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient has tried at least one other regimen.
Note: Examples include Adcetris (brentuximab vedotin intravenous infusion) plus CHP (cyclophosphamide, doxorubicin, and prednisone); CHOP (cyclophosphamide, doxorubicin, vincristine, and prednisone); CHOEP (cyclophosphamide, doxorubicin, vincristine, etoposide, and prednisone); dose-adjusted EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, and doxorubicin); HyperCVAD (cyclophosphamide, vincristine, doxorubicin, and dexamethasone) alternating with high-dose methotrexate and cytarabine; or Beleodaq (belinostat intravenous infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of lenalidomide is not recommended in the following situations:

- 169.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lenvima Prior Authorization Policy

- Lenvima® (lenvatinib capsules – Eisai)

REVIEW DATE: 06/19/2024

OVERVIEW

Lenvima, a kinase inhibitor, is indicated for the following uses:¹

- **Differentiated thyroid cancer** for treatment of locally recurrent or metastatic, progressive, radioactive iodine refractory disease.
- **Endometrial cancer**, in combination with Keytruda® (pembrolizumab intravenous infusion), for advanced disease that is mismatch repair proficient (pMMR), as determined by an FDA-approved test, or not microsatellite instability-high (MSI-H) who have disease progression following prior systemic therapy in any setting and are not candidates for curative surgery or radiation.
- **Hepatocellular carcinoma** for first-line treatment of patients with unresectable disease.
- **Renal cell carcinoma**, advanced in combination with everolimus tablets, following one prior anti-angiogenic therapy.
- **Renal cell carcinoma**, advanced, for first-line treatment of adult patients in combination with Keytruda.

Guidelines

Lenvima is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):²

- **Hepatocellular Carcinoma:** NCCN guidelines (version 1.2024 – April 9, 2024) recommend Lenvima as “other recommended regimen” for first-line systemic therapy (Child-Pugh Class A only) for hepatocellular carcinoma (category 1). It is also recommended as subsequent-line therapy upon disease progression (Child-Pugh Class A only) [category 2A].³
- **Kidney Cancer:** NCCN guidelines (version 4.2024 – May 30, 2024) recommend Lenvima + everolimus as one of the “Other Recommended Regimens” as subsequent therapy for relapse or stage IV disease with clear cell histology (category 2A); this combination is also listed as systemic therapy, “other recommended regimens”, for relapsed or stage IV disease for non-clear cell histology (category 2A). Lenvima + Keytruda is listed as a “preferred regimen” for first-line therapy for relapsed or stage IV disease for clear cell histology (category 1); this combination is also listed as “other recommended regimen” for subsequent therapy for relapsed or stage IV with clear cell histology (category 2A).⁴
- **Melanoma: Cutaneous:** NCCN guidelines (version 2.2024 – April 3, 2024) recommend use of Lenvima + Keytruda (category 2A) for metastatic or unresectable disease, as second-line or subsequent therapy after treatment with anti-programmed death-1 (PD-1)/programmed death-ligand 1 (PD-L1) -based therapy, including in combination with anti-CTL antigen 4 (CTLA-4) for at least two doses.⁸
- **Thymomas and Thymic Carcinomas:** NCCN guidelines (version 1.2024 – November 21, 2023) recommend single-agent Lenvima (category 2A) as one of the “Preferred” second-line systemic therapy for thymic carcinoma.⁵ Lenvima can also be considered as a “preferred” first-line therapy in patients who cannot tolerate first-line combination regimens (category 2A).
- **Thyroid Carcinoma:** NCCN guidelines (version 2.2024 – March 12, 2024) indicate that first-line treatment for differentiated thyroid cancer is surgery, whenever possible, followed by radioactive iodine therapy in selected patients, and levothyroxine therapy in all patients.² Systemic therapy options include cytotoxic chemotherapy and kinase inhibitors. The guidelines state that for

progressive and/or symptomatic disease, Lenvima is a “preferred” systemic therapy regimen (category 1) for locally recurrent, advanced, and/or metastatic disease not amenable to radioactive iodine therapy. There is a footnote that states that kinase inhibitor therapy may not be appropriate for patients with stable or slowly progressive indolent disease. Lenvima can be considered for treatment of progressive or symptomatic medullary thyroid disease if clinical trials or preferred systemic therapy options are not available or appropriate, or if there is progression on preferred systemic therapy options (category 2A).⁶ Lenvima, in combination with Keytruda, is recommended as “Useful in Certain Circumstances” (category 2A) for first-line or second-line therapy in anaplastic carcinoma.

- **Uterine Neoplasms:** NCCN guidelines (version 2.2024– March 6, 2024) recommends Lenvima with Keytruda combination therapy as “Useful in Certain Circumstances” for biomarker directed systemic therapy for first-line or second-line treatment for recurrent endometrial carcinoma for pMMR tumors. This combination is a category 1 recommendation as “preferred” therapy.⁷

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lenvima. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lenvima is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1. Endometrial Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced endometrial carcinoma that is mismatch repair proficient (pMMR); AND
 - C) The medication is used in combination with Keytruda (pembrolizumab intravenous injection); AND
 - D) Patient has tried at least one systemic therapy; AND
Note: Examples of systemic therapy include carboplatin, paclitaxel, docetaxel, cisplatin, doxorubicin, or ifosfamide.
 - E) Patient is not a candidate for curative surgery or radiation.
- 2. Hepatocellular Cancer.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has unresectable or metastatic disease.
- 3. Renal Cell Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced disease; AND
 - C) Patient meets ONE of the following (i or ii):
 - i. Lenvima is being used in combination with Keytruda (pembrolizumab intravenous infusion); OR
 - ii. Lenvima is being used in combination with everolimus tablets/Afinitor Disperz (everolimus tablets for oral suspension) AND patient meets one of the following (a or b):

06/19/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- a) Patient has clear cell histology and patient has tried one antiangiogenic therapy; OR
Note: Examples of antiangiogenic therapy include Inlyta (axitinib tablets), pazopanib, sunitinib, or Cabometyx (cabozantinib tablets).
 - b) Patient has non-clear cell histology.
4. **Thyroid Carcinoma, Differentiated.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has differentiated thyroid carcinoma; AND
Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).
 - C) The disease is refractory to radioactive iodine therapy.

Other Uses with Supportive Evidence

5. **Melanoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has unresectable or metastatic melanoma; AND
 - C) The medication is used in combination with Keytruda (pembrolizumab intravenous injection); AND
 - D) Patient has disease progression on anti-programmed death receptor-1 (PD-1)/programmed death-ligand 1 (PD-L1)-based therapy.
Note: Examples of anti-PD-1/PD-L1 therapies include Opdivo (nivolumab intravenous infusion) + Yervoy (ipilimumab intravenous infusion), Opdualag (nivolumab and relatlimab-rmbw intravenous infusion), Keytruda, Opdivo.
6. **Thymic Carcinoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has tried at least one chemotherapy regimen.
Note: Examples of a chemotherapy regimen include carboplatin plus paclitaxel, cisplatin, doxorubicin plus cyclophosphamide, cisplatin plus etoposide.
7. **Thyroid Carcinoma, Medullary.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has tried at least one systemic therapy.
Note: Examples of systemic therapy include Caprelsa (vandetanib tablets), Cometriq (cabozantinib capsules), Retevmo (selpercatinib capsules), and Gavreto (pralsetinib capsules).
8. **Thyroid Carcinoma, Anaplastic.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) The medication is used in combination with Keytruda (pembrolizumab intravenous injection).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lenvima is not recommended in the following situations:

- 170.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lonsurf Prior Authorization Policy

- Lonsurf® (trifluridine and tipiracil tablets – Taiho Oncology)

REVIEW DATE: 02/07/2024

OVERVIEW

Lonsurf, a combination of trifluridine, a nucleoside metabolic inhibitor, and tipiracil, a thymidine phosphorylase inhibitor, is indicated for the following uses:¹

- **Colorectal cancer**, metastatic, in adults who have been previously treated with oxaliplatin-, fluoropyrimidine-, and irinotecan-based chemotherapy, an anti-vascular endothelial growth factor (VEGF) biological therapy, and if *RAS* wild-type, an anti-epidermal growth factor receptor (EGFR) therapy, as a single agent or in combination with bevacizumab.
- **Gastric or gastroesophageal junction adenocarcinoma**, metastatic, in adults previously treated with at least two lines of chemotherapy that included a fluoropyrimidine, a platinum, either a taxane or irinotecan, and if appropriate, human epidermal growth factor receptor 2 (HER2)/neu-targeted therapy.

Guidelines

Lonsurf is addressed in National Comprehensive Cancer Network guidelines:

- **Colon cancer** (version 1.2024 – January 29, 2024) and **rectal cancer** (version 1.2024 – January 29, 2024) guidelines recommend Lonsurf as subsequent therapy as a single agent or in combination with bevacizumab for advanced or metastatic disease not previously treated with Lonsurf. This recommendation is for patients who have progressed through all available regimens, besides Lonsurf with or without bevacizumab, Fruzaqla (fruquintinib capsules), or Stivarga® (regorafenib tablets).^{2,3,6}
- **Gastric cancer** (version 3.2023 – January 26, 2024), and **esophageal and esophagogastric junction cancers** (version 4.2023 – January 26, 2024) guidelines recommend Lonsurf as a single agent for third line or subsequent therapy for locoregional disease in patients who are not surgical candidates or have unresectable locally advanced, recurrent, or metastatic gastric and esophagogastric junction adenocarcinoma and Karnofsky performance score $\geq 60\%$ or Eastern Cooperative Oncology Group performance status of ≤ 2 (category 1).^{4,6}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lonsurf. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lonsurf is recommended in those who meet one of the following criteria:

FDA-Approved Indications

02/07/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

93. Colon, Rectal, or Appendiceal Cancer. Approve for 1 year if the patient meets the following (A, B, C, and D):

A) Patient has been previously treated with a fluoropyrimidine; AND

Note: Examples of fluoropyrimidines include capecitabine and 5-fluorouracil (5-FU).

B) Patient has been previously treated with oxaliplatin; AND

C) Patient has been previously treated with irinotecan; AND

D) If the patient's tumor or metastases are wild-type *RAS* (*KRAS* wild-type and *NRAS* wild-type) [that is, the tumors or metastases are *KRAS* and *NRAS* mutation negative], Erbitux (cetuximab intravenous infusion) or Vectibix (panitumumab intravenous infusion) has been tried.

2. Gastric or Gastroesophageal Junction Adenocarcinoma. Approve for 1 year if the patient has been previously treated with at least two chemotherapy regimens for gastric or gastroesophageal junction adenocarcinoma.

Note: Example chemotherapy regimens containing one or more of the following agents: capecitabine, 5-fluorouracil [5-FU], oxaliplatin, paclitaxel, docetaxel, and irinotecan.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lonsurf is not recommended in the following situations:

171. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lorbrena Prior Authorization Policy

- Lorbrena® (lorlatinib tablets – Pfizer)

REVIEW DATE: 12/11/2024

OVERVIEW

Lorbrena, a kinase inhibitor, is indicated for the treatment of metastatic **non-small cell lung cancer** (NSCLC) in adults whose tumors are anaplastic lymphoma kinase (*ALK*)-positive as detected by an FDA-approved test.¹

GUIDELINES

Lorbrena is addressed in National Comprehensive Cancer Network (NCCN) guidelines:²⁻⁵

- **B-Cell Lymphomas:** Guidelines (version 3.2024 – August 26, 2024) recommend Lorbrena (category 2A) for relapsed or refractory *ALK*-positive large B-cell lymphomas.⁷
- **Histiocytic Neoplasms:** Guidelines (version 1.2023 – August 11, 2023) recommend Lorbrena as a “useful in certain circumstances” treatment option for *ALK*-positive Erdheim-Chester disease (category 2A).³
- **Inflammatory Myofibroblastic Tumor (IMT):** NCCN Soft Tissue Sarcoma guidelines (version 2.2023 – April 25, 2023) and NCCN Uterine Neoplasms guidelines (version 1.2023 – December 22, 2022) recommend Lorbrena as a treatment option for IMT with *ALK* translocation.^{5,6}
- **NSCLC:** Guidelines (version 11.2024 – October 15, 2024) recommend testing for biomarkers (e.g., *ALK* rearrangement, *ROS* proto-oncogene 1 (*ROS1*) gene rearrangement) in eligible patients with NSCLC.⁴
 - *ALK*-rearrangement-positive NSCLC: If *ALK* rearrangement is discovered prior to first-line systemic therapy, Lorbrena is a “Preferred” first-line treatment option (category 1). If *ALK* rearrangement is discovered during first-line systemic therapy, options are to complete the planned systemic therapy (including maintenance therapy) or to interrupt the systemic therapy and treat with Lorbrena (“Preferred”, category 2A) or another *ALK* inhibitor. Lorbrena is also recommended for patients who progress on other *ALK* inhibitors (category 2A). A footnote mentions that Lorbrena is an option for resistant mutations, such as *ALK* G1202R and L1196M (except compound L1196M/G1202R).
 - *ROS* proto-oncogene 1 (*ROS1*) rearrangement-positive NSCLC: Lorbrena is a recommended subsequent therapy (category 2A) for patients who progress on Zykadia® (ceritinib capsules and tablets), Xalkori® (crizotinib capsules), or Rozlytrek™ (entrectinib capsules). Lorbrena is not a recommended first-line treatment option for *ROS1* rearrangement-positive NSCLC.
- **Pediatric Central Nervous System Cancers:** Guidelines (version 1.2025 – November 8, 2024) recommend Lorbrena as adjuvant therapy and for recurrent or progressive disease (category 2A for both), for *ALK*-rearrangement positive pediatric diffuse high-grade gliomas.⁸

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lorbrena. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lorbrena is recommended in those who meet one of the following criteria:

FDA-Approved Indication

2. **Non-Small Cell Lung Cancer – Anaplastic Lymphoma Kinase (ALK)-Positive.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced or metastatic disease; AND
 - C) Patient has anaplastic lymphoma kinase (ALK)-positive disease; AND
 - D) The mutation was detected by an approved test.

Other Uses With Supportive Evidence

3. **Erdheim-Chester Disease.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has anaplastic lymphoma kinase (ALK) rearrangement/fusion-positive disease.
4. **Inflammatory Myofibroblastic Tumor.** Approve for 1 year if the patients meets ALL of the following (A, B, and C):
 - D) Patient is ≥ 18 years of age; AND
 - E) Patient has anaplastic lymphoma kinase (ALK)-positive disease; AND.
 - F) Patient meets ONE of the following criteria (i or ii):
 - iii. Patient has advanced, recurrent, or metastatic disease; OR
 - iv. The tumor is inoperable.
5. **Large B-Cell Lymphoma.** Approve for 1 year if the patients meets ALL of the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has anaplastic lymphoma kinase (ALK)-positive disease; AND
 - C) Patient has relapsed or refractory disease.
6. **Non-Small Cell Lung Cancer – ROS1 Rearrangement-Positive.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced or metastatic disease; AND
 - C) Patient has ROS1 rearrangement-positive disease; AND
 - D) Patient has tried at least one of Xalkori (crizotinib capsules), Zykadia (ceritinib capsules or tablets), or Rozlytrek (entrectinib capsules).

7. **Pediatric Diffuse High-Grade Gliomas.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is < 18 years of age; AND
 - B) The tumor is positive for anaplastic lymphoma kinase (ALK)-positive disease; AND
 - C) Patient meets ONE of the following (i or ii):
 - i. The medication is used as adjuvant therapy; OR
 - ii. The medication is used for recurrent or progressive disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lorbrina is not recommended in the following situations:

172. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lumakras Prior Authorization Policy

- Lumakras™ (sotorasib tablets – Amgen)

REVIEW DATE: 06/26/2024

OVERVIEW

Lumakras, a Kirsten rat sarcoma (KRAS) inhibitor, is indicated for the treatment of adults with **KRAS G12C-mutated locally advanced or metastatic non-small cell lung cancer (NSCLC)**, as determined by an FDA-approved test, who have received at least one prior systemic therapy.¹

This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trial(s).

Mutations in the *KRAS* gene most commonly occur at codon 12.² Data suggest that approximately 25% of patients with adenocarcinomas in a North American population have *KRAS* mutations. The prognosis of survival of patients with tumors with *KRAS* mutation is poorer compared with that of patients with tumors without *KRAS* mutation.

Guidelines

Lumakras is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Ampullary Adenocarcinoma:** NCCN guidelines (version 1.2024 – December 13, 2023) recommend Lumakras as an option for disease progression after first line therapy in *KRAS G12C* mutation-positive tumors (category 2A).
- **Colon and Rectal Cancer:** Guidelines for colon cancer (version 3.2024 – May 24, 2024) and rectal cancer (version 2.2024 – April 30, 2024) recommend Lumakras for some situations in patients with *KRAS G12C*-mutated disease.^{4,5} For initial treatment in combination with Erbitux® (cetuximab intravenous infusion) or Vectibix® (panitumumab intravenous infusion) or as monotherapy if patient is unable to tolerate Erbitux or Vectibix due to toxicity (category 2A). Lumakras is also recommended as subsequent therapy after previous therapy with oxaliplatin, irinotecan, FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin) [category 2A].
- **Non-Small Cell Lung Cancer:** NCCN guidelines (version 3.2023 – April 13, 2023) recommend Lumakras as a subsequent therapy for patients with metastatic NSCLC with the *KRAS G12C* mutation (category 2A) who have been previously treated with combination chemotherapy regimens (± immunotherapy).²
- **Pancreatic Adenocarcinoma:** NCCN guidelines (version 1.2023 – May 4, 2023) recommend Lumakras as a subsequent therapy (category 2A) under “useful in certain circumstances” for locally advanced or metastatic disease. It is also recommended therapy for local recurrence in the pancreatic operative bed after resection (category 2A).³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lumakras. All approvals are provided for the duration noted below.

06/26/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lumakras is recommended in those who meet the following criteria:

FDA-Approved Indication

23. Non-Small Cell Lung Cancer (NSCLC). Approve for 1 year if the patient meets ALL of the following (A, B, and C):

J) Patient is ≥ 18 years of age; AND

K) Patient has *KRAS G12C*-mutated locally advanced or metastatic NSCLC, as determined by an approved test; AND

L) Patient has been previously treated with at least one systemic regimen.

Note: Examples of systemic regimens include those containing one or more of the following products: Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion), Tecentriq (atezolizumab intravenous infusion), Alimta (pemetrexed intravenous infusion), Yervoy (ipilimumab intravenous infusion), Abraxane (albumin-bound paclitaxel intravenous infusion), bevacizumab, cisplatin, carboplatin, docetaxel, gemcitabine, paclitaxel, vinorelbine.

Other Uses with Supportive Evidence

24. Ampullary Adenocarcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has *KRAS G12C*-mutated disease, as determined by an approved test; AND

C) The medication is used as subsequent therapy.

25. Colon or Rectal Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

A) Patient is ≥ 18 years of age; AND

B) Patient has unresectable, advanced, or metastatic disease; AND

C) Patient has *KRAS G12C* mutation-positive disease; AND

D) Patient meets ONE of the following (i or ii):

i. The medication is prescribed as part of a combination regimen for colon or rectal cancer; OR

Note: Examples of combination regimens include Lumakras + Erbitux (cetuximab intravenous infusion), Lumakras + Vectibix (panitumumab intravenous infusion).

ii. As per the prescriber, the patient is unable to tolerate combination therapy; AND

E) Patient has previously received a chemotherapy regimen for colon or rectal cancer.

Note: Examples of chemotherapy regimens include a fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine; oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).

26. Pancreatic Adenocarcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has *KRAS G12C*-mutated disease, as determined by an approved test; AND

C) Patient meets ONE of the following (i or ii):

i. Patient meets BOTH of the following (a and b):

- a) Patient has locally advanced or metastatic disease; AND
 - b) Patient has been previously treated with at least one systemic regimen; OR
- Note: Examples of systemic regimens include one or more of the following: gemcitabine, albumin-bound paclitaxel, capecitabine, Keytruda (pembrolizumab intravenous infusion), FOLFIRINOX (5-fluoruracil + leucovorin + irinotecan + oxaliplatin).
- ii. Patient has recurrent disease after resection.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lumakras is not recommended in the following situations:

- 7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lynparza Prior Authorization Policy

- Lynparza® (olaparib tablets – AstraZeneca)

REVIEW DATE: 02/28/2024; selected revision 06/05/2024

OVERVIEW

Lynparza, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicated for the following uses:¹

- **Breast cancer**, with deleterious or suspected deleterious germline *BRCA* mutated, human epidermal growth factor 2 (HER2)-negative metastatic disease, in adults who have been treated with chemotherapy in the neoadjuvant, adjuvant, or metastatic setting. Patients with hormone receptor-positive (HR+) breast cancer should have been treated with a prior endocrine therapy or be considered inappropriate for endocrine therapy.
- **Breast cancer**, for the adjuvant treatment of deleterious or suspected deleterious *gBRCA* mutated HER2-negative high-risk early breast cancer in adults who have been treated with neoadjuvant or adjuvant chemotherapy.
- **Ovarian cancer, maintenance** treatment of deleterious or suspected deleterious germline or somatic *BRCA* mutated recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer, in adults who are in a complete or partial response to platinum-based chemotherapy.
- **Ovarian cancer, maintenance** treatment of deleterious or suspected deleterious germline or somatic *BRCA*-mutated advanced epithelial ovarian, fallopian tube, or primary peritoneal cancer in adults who are in complete or partial response to first-line platinum-based chemotherapy.
- **Ovarian cancer, maintenance treatment in combination** with bevacizumab for advanced epithelial ovarian, fallopian tube or primary peritoneal cancer in adults who are in complete or partial response to first-line platinum-based chemotherapy and whose cancer is associated with homologous recombination deficiency (HRD)-positive status defined by either: a deleterious or suspected deleterious *BRCA* mutation, and/or genomic instability.
- **Pancreatic adenocarcinoma**, maintenance treatment of deleterious or suspected deleterious *gBRCA* mutated metastatic disease, in adults whose disease has not progressed on at least 16 weeks of a first-line platinum-based chemotherapy regimen.
- **Prostate cancer**, for the treatment of deleterious or suspected deleterious germline or somatic homologous recombination repair (HRR) gene-mutated metastatic castration resistant prostate cancer (mCRPC) in adults who have progressed following prior treatment with Xtandi® (enzalutamide tablets) or abiraterone.
- **Prostate cancer**, for the treatment of deleterious or suspected deleterious *BRCA*-mutated (*BRCAm*) mCRPC, in combination with abiraterone and prednisone or prednisolone in adults.

Guidelines

Lynparza is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):⁷

- **Breast Cancer:** NCCN guidelines (version 1.2024 – January 25, 2024) list single-agent Lynparza as a “Preferred Regimen” for first-line therapy for patients with a germline *BRCA* 1/2 mutation for recurrent, unresectable, or stage IV HR-positive, HER2-negative disease, with visceral crisis or that is endocrine therapy-refractory (category 1).² For triple negative breast cancer with germline *BRCA* 1/2 mutation, Lynparza is listed as a “Preferred Regimen” as first-line for patients with programmed cell death ligand 1 combined positive score (PD-L1 CPS) < 10 (category 1) and as second-line therapy (category 1). Lynparza is also recommended as a single-agent for recurrent, unresectable, or stage IV disease with a germline *BRCA* 1/2 mutation (category 1). It is noted that

02/28/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

although Lynparza is FDA-approved for HER2-negative disease, the NCCN panel supports use in any breast cancer subtype associated with a germline mutation. The guidelines also state that addition of 1 year of adjuvant Lynparza is an “Preferred Regimen” option for select patients with germline *BRCA1/2* mutation after completion of adjuvant chemotherapy for the following scenarios: triple negative disease if patient has $\geq$ primary tumor (pT2) or $\geq$ pathologic lymph nodes (pN1) disease after adjuvant chemotherapy or patient has residual disease after preoperative chemotherapy (category 1); HR+, HER2-negative tumors if 1) $\geq$ 4 positive lymph nodes after adjuvant chemotherapy (category 2A) or 2) residual disease after preoperative therapy and a clinical stage, pathologic stage, estrogen receptor status, and tumor grade (CPS+EG) score $\geq$ 3 (category 1). The guidelines state that adjuvant Lynparza therapy can be given with endocrine therapy.

- **Ovarian Cancer:** NCCN guidelines (version 2.2024 – May 13, 2024) recommend Lynparza for maintenance therapy after primary treatment in patients who have had a complete or partial response in the following situations: single-agent Lynparza for *BRCA1/2* mutations (category 1 if bevacizumab was not used during primary therapy and category 2A if bevacizumab was used during primary therapy); Lynparza + bevacizumab if bevacizumab was used as part of primary therapy (*BRCA1/2* wild-type or unknown and homologous recombination deficient [category 1]; germline/somatic *BRCA1/2* mutation [category 1]).³ The guidelines recommend use of Zejula® (niraparib capsules), Rubraca® (rucaparib tablets), or Lynparza as single-agent maintenance therapy options in patients with platinum-sensitive persistent or recurrent disease who have completed two or more lines of platinum-based therapy and are in complete or partial response for *BRCA* mutation (category 1 if not previously used; category 2A for all others).
- **Pancreatic Cancer:** NCCN guidelines (version 1.2024 – December 13, 2023) recommend Lynparza as a “Preferred Regimen” maintenance therapy for metastatic disease after the patient has tried first-line platinum-based chemotherapy.⁴ It is specifically recommended in patients who have germline *BRCA1/2* mutations and who have not had disease progression after at least 4 to 6 months of chemotherapy (category 2A).
- **Prostate Cancer:** NCCN guidelines (version 4.2023 – September 7, 2023) recommend Lynparza for mCRPC in the following scenarios as “Useful in Certain Circumstances”: Lynparza + abiraterone for patients with *BRCA* mutation as first-line therapy (category 1) and for patients who have received prior docetaxel therapy and no prior novel hormone therapy (category 2A); single-agent Lynparza for patients with an HRR mutation who have received prior novel hormone therapy, (category 1; category 2B if the patient has visceral metastases and has tried docetaxel). Prior novel hormone therapy includes abiraterone, Xtandi® [enzalutamide capsule or tablet], Nubeqa® [darolutamide tablet], or Erleada® [apalutamide tablet]). A footnote notes that Lynparza is a treatment option for patients with mCRPC and a pathogenic mutation (germline and/or somatic) in a HRR gene (*BRCA1*, *BRCA2*, *ATM*, *BARD1*, *BRIP1*, *CDK12*, *CHEK1*, *CHEK2*, *FANCL*, *PALB2*, *RAD51B*, *RAD51C*, *RAD51D*, or *RAD54L*), who have been previously treated with androgen receptor-directed therapy. However, efficacy appears to be driven by the cohort of patients with at least one alteration in *BRCA2*, *BRCA1*, or *ATM*, and in particular by patients with *BRCA2* or *BRCA1* mutations based on exploratory gene-by-gene analysis. There may be heterogeneity of response to Lynparza for non-*BRCA* mutations based on the specific gene mutation.
- **Uterine Neoplasms:** NCCN guidelines (version 1.2024 – September 20, 2023) state that Lynparza may be considered as a single-agent second-line therapy as “Useful in Certain Circumstances”, for *BRCA2*-altered uterine leiomyosarcoma (category 2A).⁶

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lynparza. All approvals are provided for the duration noted below.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lynparza is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1. Breast Cancer – Adjuvant Therapy.** Approve for 1 year (total) if the patient meets ALL of the following (A, B, C, and D):
 - F)** Patient is ≥ 18 years of age; AND
 - G)** Patient has germline *BRCA* mutation-positive breast cancer; AND
 - H)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
 - I)** Patient has tried neoadjuvant or adjuvant therapy.
- 80. Breast Cancer – Recurrent or Metastatic Disease.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has recurrent or metastatic disease; AND
 - C)** Patient has germline *BRCA* mutation-positive breast cancer.
- 3. Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Maintenance, Monotherapy.** Approve for 1 year if the patient meets ALL of the following (A, B and C):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has a germline or somatic *BRCA* mutation positive disease as confirmed by an approved test; AND
 - C)** Patient is in complete or partial response to at least one platinum-based chemotherapy regimen.
Note: Examples of platinum-based chemotherapy are carboplatin with gemcitabine, carboplatin with paclitaxel, cisplatin with gemcitabine.
- 4. Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Maintenance, Combination Therapy.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** The medication is used in combination with bevacizumab; AND
 - C)** Patient has homologous recombination deficiency (HRD)-positive disease as confirmed by an approved test; AND
Note: HRD-positive disease includes patients with *BRCA* mutation-positive disease.
 - D)** Patient is in complete or partial response to first-line platinum-based chemotherapy regimen.
Note: Examples of chemotherapy regimens are carboplatin with paclitaxel, carboplatin with doxorubicin, docetaxel with carboplatin.
- 5. Pancreatic Cancer – Maintenance Therapy.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has a germline *BRCA* mutation-positive metastatic disease; AND
 - C)** The disease has not progressed on at least 16 weeks of treatment with a first-line platinum-based chemotherapy regimen.
- 6. Prostate Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A)** Patient is ≥ 18 years of age; AND

02/28/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- B) Patient has metastatic castration resistant prostate cancer; AND
- C) Patient meets ONE of the following (i or ii):
 - i. The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog; OR

Note: Examples are leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), and Orgovyx (relugolix tablets).
 - ii. Patient has had a bilateral orchiectomy; AND
- D) Patient meets ONE of the following (i or ii):
 - i. Patient meets BOTH of the following (a and b):
 - a) Patient has germline or somatic homologous recombination repair (HRR) gene-mutated disease, as confirmed by an approved test; AND

Note: HRR gene mutations include *BRCA1*, *BRCA2*, *ATM*, *BARD1*, *BRIP1*, *CDK12*, *CHEK1*, *CHEK2*, *FANCL*, *PALB2*, *RAD51B*, *RAD51C*, *RAD51D*, or *RAD54L*.
 - b) Patient has been previously treated with at least one androgen receptor-directed therapy; OR

Note: Androgen-receptor-directed therapy includes: abiraterone, Xtandi (enzalutamide capsules and tablets), Nubeqa (darolutamide tablets), or Erleada (apalutamide tablets).
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient has a *BRCA* mutation; AND
 - b) The medication is used in combination with abiraterone plus one of prednisone or prednisolone.

Other Uses With Supportive Evidence:

- 7. **Uterine Leiomyosarcoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has *BRCA2*-altered disease; AND
 - C) Patient has tried one systemic regimen.

Note: Examples of a systemic regimen include one or more of the following products: dacarbazine, docetaxel, doxorubicin, epirubicin, gemcitabine, ifosfamide Yondelis (trabectedin intravenous infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lynparza is not recommended in the following situations:

- 173. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HER2 – Human epidermal growth factor receptor 2; *BRCA* – BReast CAncer; *BRCAm* – *BRCA* mutated

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lytgobi Prior Authorization Policy

- Lytgobi® (futibatinib tablets – Taiho Oncology)

REVIEW DATE: 11/13/2024

OVERVIEW

Lytgobi, a fibroblast growth factor receptor 2 (*FGFR2*) inhibitor, is indicated for the treatment of previously treated, unresectable, locally advanced or metastatic intrahepatic **cholangiocarcinoma** harboring *FGFR2* gene fusions or other rearrangements in adults.

Guidelines

Lytgobi is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **Biliary Tract Cancers:** NCCN guidelines (version 4.2024 – August 29, 2024) recommend Lytgobi for disease progression on or following systemic therapy for patients with unresectable, resected gross residual, or metastatic intrahepatic or extrahepatic cholangiocarcinoma with *FGFR2* fusions or rearrangements.^{2,3} NCCN guidelines also recommend Pemazyre® (pemigatinib tablets) for the same indication.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lytgobi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lytgobi is recommended in those who meet the following criteria:

FDA-Approved Indication

94. Cholangiocarcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has unresectable locally advanced or metastatic disease; AND
- C) Tumor has fibroblast growth factor receptor 2 (*FGFR2*) gene fusions or other rearrangements, as detected by an approved test; AND
- D) Patient has been previously treated with at least one systemic regimen.

Note: Examples of systemic regimens include gemcitabine + cisplatin, 5-fluorouracil + oxaliplatin or cisplatin, capecitabine + cisplatin or oxaliplatin, gemcitabine + Abraxane (albumin-bound paclitaxel) or capecitabine or oxaliplatin, and gemcitabine + cisplatin + Abraxane.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lytgobi is not recommended in the following situations:

11/13/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- 174.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Mekinist Prior Authorization Policy

- Mekinist® (trametinib tablets and oral solution – Novartis)

REVIEW DATE: 04/24/2024

OVERVIEW

Mekinist, a kinase inhibitor, is indicated for the treatment of patients with the following conditions:¹

- **Low-grade glioma**, in combination with Tafenlar® (dabrafenib capsules and tablets for oral suspension), for the treatment of pediatric patients ≥ 1 year of age with a *BRAF V600E* mutation who require systemic therapy.
- **Melanoma**, in the following situations:
 - As a single agent for unresectable or metastatic disease with a *BRAF V600E* or *V600K* mutation as detected by an FDA-approved test.
 - In combination with Tafenlar, for unresectable or metastatic disease with a *BRAF V600E* or *V600K* mutation as detected by an FDA-approved test.
 - In combination with Tafenlar, as adjuvant treatment of *BRAF V600E* or *V600K* mutation-positive disease as detected by an FDA-approved test, with involvement of lymph nodes, following complete resection.
- **Non-small cell lung cancer**, in combination with Tafenlar, for disease that has the *BRAF V600E* mutation as detected by an FDA-approved test.
- **Solid tumors – unresectable or metastatic**, in combination with Tafenlar, for *BRAF V600E* mutation-positive disease, as determined by an FDA-approved test, in patients ≥ 1 year of age who have no satisfactory alternative treatment options.
- **Thyroid cancer**, in combination with Tafenlar, for locally advanced or metastatic anaplastic disease with *BRAF V600E* mutation and with no satisfactory locoregional treatment options.

Limitations of Use: Mekinist is not indicated for treatment of patients with colorectal cancer because of known intrinsic resistance to BRAF inhibition.

Dosing: For the tablet dosage form, Mekinist has dosing for patients who are adults and for patients who are between 6 and 17 years of age and weigh ≥ 26 kg. The oral solution dosage form also has weight-based dosing for patients ≥ 8 kg.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of Mekinist in multiple cancers.

- **Central Nervous System Cancers:** Guidelines (version 1.2023 – March 24, 2023) recommend a BRAF/MEK inhibitor combination (i.e., Tafenlar/Mekinist or Zelboraf® [vemurafenib tablets]/Cotellic® [cobimetinib tablets]) for treatment of *BRAF V600E* activation mutations in adults in the following situations: adjuvant treatment of pilocytic astrocytoma, pleomorphic xanthoastrocytoma, or ganglioglioma; recurrent or progressive low-grade glioma, oligodendroglioma, or isocitrate dehydrogenase-2 (*IDH2*)-mutant astrocytoma; and recurrent glioblastoma.⁷ BRAF/MEK combination therapy is also recommended for melanoma with brain metastases. Guidelines for pediatric central nervous system (CNS) cancers (version 1.2024 – February 26, 2024) include targeted therapy with Tafenlar + Mekinist as adjuvant therapy or for recurrent or progressive disease, if the cancer has a *BRAF V600E* mutation.⁹

04/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Histiocytic Neoplasms:** Guidelines (version 1.2024 – March 15, 2024) recommend Cotellic as “preferred” or Mekinist as “other recommended regimen” for histiocytic neoplasms (if there is a MAP kinase pathway mutation, or no detectable mutation, or testing is not available) for the following types: Langerhans cell histiocytosis (including multisystem, pulmonary or central nervous system lesions), Erdheim-Chester disease, and Rosai-Dorfman disease.⁶
- **Melanoma, Cutaneous:** Guidelines (version 2.2024 – April 3, 2024) recommend BRAF/MEK inhibitor combinations among the “preferred” therapies for first-line and subsequent treatment of metastatic or unresectable melanoma with a *V600*-activating mutation.² While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor is an option. Tafenlar + Mekinist is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafenlar/Mekinist, other BRAF/MEK combinations can be considered.
- **Non-Small Cell Lung Cancer:** Guidelines (version 5.2024 – April 23, 2024) list Tafenlar + Mekinist among the first-line therapy and subsequent therapy options for tumors with a *BRAF* mutation.³ NCCN also notes that monotherapy with a BRAF inhibitor (Tafenlar or Zelboraf) is a treatment option when combination therapy is not tolerated.

The NCCN Compendium⁸ recommends use of Mekinist, in combination with Tafenlar, for the following *BRAF V600* positive tumors (all category 2A): High-grade gliomas, ampullary adenocarcinoma, neuroendocrine tumors, occult primary, pancreatic adenocarcinoma, salivary gland tumors, esophageal and esophagogastric junction cancers, gastric cancer, hairy cell leukemia, biliary tract cancers, gastrointestinal stromal tumors, brain metastases due to melanoma, ovarian cancer, small bowel adenocarcinoma, and differentiated thyroid carcinoma. NCCN Compendium also recommends use of Tafenlar as monotherapy for low-grade serous ovarian cancer.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Mekinist. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mekinist is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Low Grade Glioma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 1 year of age; AND
 - B) Patient has *BRAF V600* mutation-positive disease; AND
 - C) The medication will be taken in combination with Tafenlar (dabrafenib capsules or tablets for oral suspension); AND
 - D) Patient requires systemic therapy.

2. **Melanoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient has unresectable, advanced (including Stage III or Stage IV disease), or metastatic melanoma; AND
Note: This includes adjuvant treatment in patients with Stage III disease with no evidence of disease post-surgery.
 - B) Patient has *BRAF V600* mutation-positive disease.
3. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient has *BRAF V600* mutation-positive disease; AND
 - B) The medication is prescribed in combination with Tafenlar (dabrafenib capsules or tablets for oral suspension).
4. **Solid Tumors – Unresectable or Metastatic.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- Note: Examples of solid tumors are: biliary tract cancer, brain metastases due to melanoma, high-grade gliomas, differentiated thyroid carcinoma, gastrointestinal stromal tumors, gastric cancer, esophageal and esophagogastric junction cancers, salivary gland tumors, pancreatic adenocarcinoma, neuroendocrine tumors, occult primary, and ampullary adenocarcinoma.
- A) Patient is ≥ 1 year of age; AND
 - B) Patient has *BRAF V600* mutation-positive disease; AND
 - C) The medication will be taken in combination with Tafenlar (dabrafenib capsules or tablets for oral suspension); AND
 - D) According to the prescriber, the patient has no satisfactory alternative treatment options.
5. **Thyroid Carcinoma, Anaplastic.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient has locally advanced or metastatic anaplastic disease; AND
 - B) Patient has *BRAF V600* mutation-positive disease; AND
 - C) The medication is prescribed in combination with Tafenlar (dabrafenib capsules or tablets for oral suspension), unless intolerant.

Other Uses with Supportive Evidence

6. **Hairy Cell Leukemia.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient has not been previously treated with a BRAF inhibitor therapy; AND
 - B) The medication will be used for relapsed/refractory disease; AND
 - C) The medication will be taken in combination with Tafenlar (dabrafenib capsules or tablets for oral suspension).
7. **Histiocytic Neoplasm.** Approve for 1 year if the patient meets ONE of the following (A, B, or C):
- D) Patient has Langerhans cell histiocytosis and one of the following (i, ii, or iii):
 - i. Multisystem disease; OR
 - ii. Pulmonary disease; OR
 - iii. Central nervous system lesions; OR
 - B) Patient has Erdheim-Chester disease; OR
 - C) Patient has Rosai-Dorfman disease.

8. **Ovarian, Fallopian Tube, or Primary Peritoneal Cancer.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient has recurrent disease; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. The medication is used for low-grade serous carcinoma; OR
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient has *BRAF V600* mutation-positive disease; AND
 - b) The medication will be taken in combination with Tafenlar (dabrafenib capsules or tablets for oral suspension).
9. **Small Bowel Adenocarcinoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient meets BOTH of the following (i and ii):
 - i. Patient has *BRAF V600E* mutation-positive advanced or metastatic disease; AND
 - ii. The medication will be taken in combination with Tafenlar (dabrafenib capsules or tablets for oral suspension); AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient meets BOTH of the following (a and b):
 - a) The medication will be used as initial therapy; AND
 - b) Patient has received previous FOLFOX/CAPEOX therapy in the adjuvant setting within the past 12 months or has a contraindication; OR
 - ii. The medication will be used as second-line and subsequent therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mekinist is not recommended in the following situations:

1. **Colon or Rectal Cancer.** Mekinist is not indicated for treatment of patients with colorectal cancer because of known intrinsic resistance to BRAF inhibition.¹
2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Mektovi Prior Authorization Policy

- Mektovi® (binimetinib tablets – Array BioPharma)

REVIEW DATE: 08/14/2024

OVERVIEW

Mektovi, a kinase inhibitor, is indicated for the following uses: ¹

- **Melanoma**, in combination with Braftovi® (encorafenib capsules) for the treatment of patients with unresectable or metastatic disease with a *BRAF V600E* or *V600K* mutation as detected by an FDA-approved test.
- **Non-small cell lung cancer (NSCLC)**, in combination with Braftovi, for the treatment of adult patients with metastatic NSCLC with a *BRAF V600E* mutation, as detected by an FDA-approved test.

Guidelines

National Comprehensive Cancer Network guidelines support use of Mektovi in the following cancers.

- **Histiocytic Neoplasms:** Guidelines (version 2.2024 – July 19, 2024) recommend Cotellic® (cobimetinib tablets) “Preferred” or Mektovi as one of the “Other Recommended Regimens” (category 2A) for histiocytic neoplasms (if there is a MAP kinase pathway mutation, or no detectable mutation, or testing is not available) for the following types: Langerhans cell histiocytosis (including multisystem, pulmonary, or central nervous system lesions).³
- **Melanoma, Cutaneous:** Guidelines (version 2.2024 – April 3, 2024) recommend BRAF/MEK inhibitor combinations among the “Preferred” therapies for first-line (category 1) and subsequent treatment (category 2A) of metastatic or unresectable melanoma with a *V600* activating mutation.² This combination is also recommended for adjuvant treatment (category 2B). Mektovi as a single agent is a category 2B recommendation for NRAS-mutated tumors (for progression following immune checkpoint inhibitor therapy). While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor is an option, especially in patients who are not appropriate candidates for checkpoint immunotherapy.
- **Non-Small Cell Lung Cancer:** Guidelines (version 7.2024 – June 26, 2024) recommend Braftovi + Mektovi and Tafinlar® (dabrafenib capsules) + Mekinist® (trametinib tablets) for first-line “Preferred” regimens and as subsequent therapies (both category 2A) for *BRAF V600E* mutation-positive disease.⁴ Zelboraf® (vemurafenib tablets) or Tafinlar monotherapy is also recommended under “Useful in Certain Circumstances” (both category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Mektovi. All approvals are provided the duration noted below.

Automation: None.

08/14/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mektovi is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Melanoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - C) Patient is ≥ 18 years of age; AND
 - D) Patient has unresectable, advanced, or metastatic melanoma; AND
 - E) Patient has *BRAF V600* mutation-positive disease; AND
 - F) The medication will be used in combination with Braftovi (encorafenib capsules).
2. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has *BRAF V600E* mutation-positive metastatic disease; AND
 - C) The medication will be taken in combination with Braftovi (encorafenib capsules).

Other Uses with Supportive Evidence

3. **Histiocytic Neoplasm.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - E) Patient is ≥ 18 years of age; AND
 - F) Patient has Langerhans cell histiocytosis and meets ONE of the following (i, ii, or iii):
 - ii. Multisystem disease; OR
 - iii. Pulmonary disease; OR
 - iv. Central nervous system lesions.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mektovi is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Nerlynx Prior Authorization Policy

- Nerlynx® (neratinib tablets – Puma)

REVIEW DATE: 06/26/2024

OVERVIEW

Nerlynx, a kinase inhibitor, is indicated in adults for the following uses:¹

- Early-stage human epidermal growth factor receptor 2 (HER2)-positive **breast cancer**, as a single agent for extended adjuvant therapy to follow adjuvant trastuzumab-based therapy.
- Advanced or metastatic HER2-positive **breast cancer**, in combination with capecitabine, for patients who have received two or more prior anti-HER2-based regimens in the metastatic setting.

Guidelines

Nerlynx is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Breast Cancer:** NCCN guidelines (version 3.2024 – June 17, 2024) note that Nerlynx can be considered as extended adjuvant therapy following adjuvant trastuzumab-containing therapy in patients with hormone receptor (HR)-positive, HER2-positive disease with a perceived high risk of recurrence and node positive (category 2A).² The benefits or toxicities associated with extended Nerlynx in patients who have received Perjeta® (pertuzumab intravenous infusion) or Kadcyla® (ado-trastuzumab emtansine intravenous infusion) are unknown. For the treatment of recurrent unresectable (local or regional) or Stage IV or metastatic HER2 positive disease, Nerlynx + capecitabine is recommended for fourth-line and beyond setting (category 2A).
- **Central Nervous System Cancers:** NCCN guidelines (version 1.2024 – May 31, 2024) list Nerlynx + capecitabine (category 2A) and Nerlynx + paclitaxel (category 2B) for brain metastases for patients with HER2 positive breast cancer.³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nerlynx. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nerlynx is recommended in those who meet one of the following criteria:

FDA-Approved Indications

95. Breast Cancer – Adjuvant Therapy. Approve for 1 year (total) if the patient meets ALL of the following (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Patient will not be using this medication in combination with human epidermal growth factor 2 (HER2) antagonists.

Note: Examples of HER2 antagonists are trastuzumab and Perjeta (pertuzumab intravenous infusion).

06/26/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- C) Patient has HER2-positive breast cancer; AND
- D) Patient meets ONE of the following (i or ii):
 - ii. The medication is requested for extended adjuvant therapy after the patient has completed 1 year of adjuvant therapy with a trastuzumab intravenous product; OR
 - iii. Patient has tried adjuvant therapy with a trastuzumab intravenous product and could not tolerate 1 year of therapy, according to the prescriber.

2. Breast Cancer – Recurrent or Metastatic Disease. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
 - B) Patient has human epidermal growth factor receptor 2 (HER2)-positive breast cancer; AND
 - C) The medication is used in combination with capecitabine; AND
 - D) Patient has tried at least two prior anti-HER2 based regimens.
- Note: Examples include Perjeta (pertuzumab intravenous infusion) + trastuzumab + docetaxel, Perjeta + trastuzumab + paclitaxel; Enhertu (fam-trastuzumab deruxtecan-nxki intravenous infusion), Kadcyla (ado-trastuzumab emtansine intravenous infusion), Tukysa (tucatinib tablets) + trastuzumab + capecitabine, trastuzumab + capecitabine, lapatinib + capecitabine, trastuzumab + lapatinib.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nerlynx is not recommended in the following situations:

- 175.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Nilotinib Products Prior Authorization Policy

- Danziten (nilotinib tablets – Azurity)
- Tassigna® (nilotinib capsules – Novartis)

REVIEW DATE: 05/01/2024; selected revision 06/12/2024, 12/04/2024

OVERVIEW

Nilotinib products, such as Tassigna and Danziten, are tyrosine kinase inhibitors (TKIs) indicated for the following uses:^{1,9}

- **Chronic myeloid leukemia (CML)**, Philadelphia chromosome positive (Ph+), that is newly diagnosed, in chronic phase: Tassigna is approved for use in adults and pediatric patients ≥ 1 year of age. Danziten is approved for use in adults.
- **CML**, Ph+, chronic phase and accelerated phase: Tassigna and Danziten are approved for use **in adults** with resistance or intolerance to prior therapy that included imatinib.
- **CML**, Ph+, chronic phase and accelerated phase: Tassigna is approved for use in **pediatric patients** ≥ 1 year of age with resistance or intolerance to prior TKI therapy.

The prescribing information for Danziten notes that Novartis, the manufacturer of Tassigna, has marketing exclusivity rights in pediatric patients.⁹ This is the reason why Danziten is only FDA-approved in adults.

Dosing and Administration

Danziten may not be substitutable with other nilotinib products on a milligram per milligram basis.⁹ Table 1 presents the Danziten and Tassigna dosage equivalence when switching between products. Danziten can be taken without regard to the timing of food intake. For Tassigna administration, no food should be taken for at least 2 hours before the dose is taken and for at least 1 hour after the dose is taken.

Table 1. Recommendations for Switching Between Danziten and Tassigna.⁹

Ph+ - Philadelphia chromosome positive; CML – Chronic myeloid leukemia; CP – Chronic phase; BID – Twice daily; AP – Accelerated phase.

Guidelines

Nilotinib products are addressed in guidelines/compendium from National Comprehensive Cancer Network (NCCN).²⁻⁸ Other than the FDA-approved indication of CML, the NCCN compendium recommends Danziten for acute lymphoblastic leukemia and soft tissue sarcoma. Other off-label uses in the compendium for Tassigna do not yet include Danziten.

- **Acute Lymphoblastic Leukemia (ALL):** NCCN guidelines for adults and adolescents (version 4.2023 – February 5, 2024) recommend nilotinib for Ph+ disease in many different clinical circumstances (e.g., induction, consolidation therapy, maintenance, or relapsed or refractory disease) [category 2A].^{2,8} The guidelines state that the ALL panel considers adolescents to be within the age range of 15 to 39 years. TKIs in combination with other agents (e.g., chemotherapy or corticosteroids) are recommended for induction therapy for Ph+ ALL. TKIs have also been incorporated into consolidation and maintenance therapy, as well as in the relapsed/refractory setting (category 2A). TKI options include: Bosulif® (bosutinib tablets), Sprycel® (dasatinib tablets), imatinib, nilotinib (Tassigna and Danziten), and Iclusig® (ponatinib tablets) [category 2A]. NCCN panel notes that not all TKIs have been directly studied within the context of each specific regimen and there are limited data for Bosulif in Ph+ ALL. Use of a specific TKI should account for anticipated/prior TKI intolerance and disease-related features. For adults and adolescents,

05/01/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Iclusig has activity against T315I mutations and/or in whom no other TKI is indicated (category 2A).

- **CML:** NCCN guidelines (version 3.2025 – November 27, 2024) mention in a footnote that TKIs (e.g., nilotinib) are available in different approved formulations, dosage forms, and strengths that are subject to different administration instructions. These products are noted not to be interchangeable. The guidelines recommend nilotinib as a “preferred” primary treatment for newly diagnosed chronic phase Ph+ CML patients with a low-, intermediate-, or high-risk score (category 1).^{3,8} Nilotinib is also recommended as an alternative TKI treatment (after primary treatment with imatinib, Bosulif® [bosutinib tablets], or Sprycel® [dasatinib tablets]) [category 2A]. Nilotinib is also recommended in a variety of other situations, including post-allogeneic hematopoietic stem cell transplant (HSCT) [category 2A].
- **Gastrointestinal Stromal Tumor (GIST):** NCCN guidelines (version 1.2024 – March 8, 2024) recommend Tasigna as “useful in certain circumstances” after failure on approved therapies (category 2A).⁴ Imatinib is a “preferred” regimen for first-line therapy (category 1) for sensitive mutations (excluding platelet-derived growth factor receptor alpha (*PDGFRA*) exon 18 mutations that are insensitive to imatinib including D842V mutation). Ayvakit® (avapritinib tablets) is also a “preferred” regimen (category 2A) for GIST with *PDGFRA* exon 18 mutations that are insensitive to imatinib, including the *PDGFRA* D842V mutation. Second-line therapies include sunitinib as “preferred” (category 1) or Qinlock® (ripretinib tablets) [for patients intolerant or sunitinib] and Sprycel as “other recommended regimen” (category 2A). Stivarga® (regorafenib tablets) is a “preferred” third-line therapy (category 1). Qinlock® (ripretinib tablets) is a “preferred” fourth-line therapy (category 1).
- **Melanoma: Cutaneous:** NCCN guidelines (version 2.2024 – April 3, 2024) recommend Tasigna as “useful in certain circumstances” for metastatic or unresectable disease with an activating *KIT* mutation as second-line or subsequent therapy for disease progression, intolerance, and/or projected risk of progression with *BRAF*-targeted therapy (category 2A).⁵
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions:** NCCN guidelines (version 1.2024 – December 21, 2023) recommend Tasigna as a “preferred” agent for *ABL1* rearrangements in chronic or blast phase (category 2A).⁶ It is also recommended as treatment in combination with ALL- or acute myeloid leukemia-type induction chemotherapy followed by allogeneic HSCT (if eligible) for lymphoid, myeloid, or mixed lineage neoplasms with eosinophilia and *ABL1* rearrangement in blast phase (category 2A).⁸
- **Soft Tissue Sarcomas:** NCCN guidelines (version 1.2024 – April 26, 2024) recommend nilotinib as “useful in certain circumstances” as single-agent therapy for the treatment of pigmented villonodular synovitis/tenosynovial giant cell tumor (category 2A).⁷ Turalio® (pexidartinib capsules) is the preferred regimen (category 1) and imatinib is also cited as “useful in certain circumstances” (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of nilotinib products. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of nilotinib products is recommended in those who meet one of the following criteria. The condition of approval for each product is specified for the indications:

FDA-Approved Indication

05/01/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

27. Chronic Myeloid Leukemia. Approve Tasigna or Danziten for 1 year if the patient has Philadelphia chromosome-positive chronic myeloid leukemia.

Other Uses with Supportive Evidence

28. Acute Lymphoblastic Leukemia. Approve Tasigna or Danziten for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 15 years of age; AND

B) Patient has Philadelphia chromosome-positive acute lymphoblastic leukemia.

29. Gastrointestinal Stromal Tumor. Approve Tasigna for 1 year if the patient meets BOTH of the following (A and B):

C) Patient is ≥ 18 years of age; AND

D) Patient has tried ALL of the following (i, ii, iii, and iv):

v. Imatinib or Ayvakit (avapritinib tablets); AND

vi. Sunitinib or Sprycel (dasatinib tablets); AND

vii. Stivarga (regorafenib tablets); AND

viii. Qinlock (ripretinib tablets).

30. Melanoma, Cutaneous. Approve Tasigna for 1 year if the patient meets ALL of the following (A, B, C, and D):

E) Patient is ≥ 18 years of age; AND

F) Patient has metastatic or unresectable disease; AND

G) Patient has an activating *KIT* mutation; AND

H) Patient has tried at least one systemic regimen.

Note: Examples of a systemic regimen include: Opdivo (nivolumab intravenous infusion) + Yervoy (ipilimumab intravenous infusion), Opdivo + Opdualag (nivolumab/relatlimab-rmbw intravenous infusion), Keytruda (pembrolizumab intravenous infusion), Opdivo, Tafinlar (dabrafenib capsules and tablets for suspension) + Mekinist (trametinib tablets), Zelboraf (vemurafenib tablets) + Cotellic (cobimetinib tablets), Braftovi (encorafenib capsules) + Mektovi (binimetinib tablets).

31. Myeloid/Lymphoid Neoplasms with Eosinophilia. Approve Tasigna for 1 year if the patient meets BOTH of the following (A and B):

K) Patient is ≥ 18 years of age; AND

L) The tumor has an *ABL1* rearrangement.

32. Pigmented Villonodular Synovitis/Tenosynovial Giant Cell Tumor. Approve Tasigna or Danziten for 1 year if the patient meets ONE of the following (A or B):

C) Patient has tried Turalio (pexidartinib capsules); OR

D) According to the prescriber, patient cannot take Turalio.

Note: Examples of reasons for not being able to take Turalio include patients with elevated liver enzymes or concomitant use of medications that are associated with hepatotoxicity.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of nilotinib products is not recommended in the following situations:

176. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Nilutamide Prior Authorization Policy

- Nilandron[®] (nilutamide tablets – Concordia, generic)

REVIEW DATE: 01/17/2024

OVERVIEW

Nilutamide, in combination with surgical castration, is indicated for the treatment of **metastatic prostate cancer (Stage D₂)**.¹ For maximum benefit, nilutamide treatment must begin on the same day as or on the day after surgical castration.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for **prostate cancer** (version 4.2023 – September 7, 2023) recommend nilutamide in combination with luteinizing hormone-releasing hormone agonists [Lupron[®] (leuprolide subcutaneous injection), Lupron Depot[®] (leuprolide acetate intramuscular injection), Trelstar[®] (triptorelin pamoate intramuscular injection), Zoladex[®] (goserelin acetate subcutaneous implant), Vantas[®] (histrelin acetate subcutaneous implant)] with or without external beam radiation therapy for androgen deprivation therapy.^{2,3}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of nilutamide. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of nilutamide is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Prostate Cancer.** Approve for 1 year if nilutamide is used concurrently with a luteinizing hormone-releasing hormone (LHRH) agonist.

Note: Examples are Lupron (leuprolide subcutaneous injection), Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of nilutamide is not recommended in the following situations:

177. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ninlaro Prior Authorization Policy

- Ninlaro® (ixazomib capsules – Takeda)

REVIEW DATE: 04/24/2024

OVERVIEW

Ninlaro, an oral proteasome inhibitor, is indicated in combination with lenalidomide and dexamethasone for treatment of patients with **multiple myeloma** who have received at least one prior therapy.¹

Limitations of Use: Ninlaro is not recommended for use in the maintenance setting or in newly diagnosed multiple myeloma in combination with lenalidomide and dexamethasone outside of controlled clinical trials.

Ninlaro should be taken once a week on the same day and at approximately the same time for the first 3 weeks of a 4-week cycle. There are dose modification guidelines which are recommended to manage treatment-related adverse events, including platelet count, absolute neutrophil count (ANC), and other toxicities (e.g., rash, peripheral neuropathy). Treatment should be continued until disease progression or unacceptable toxicity. Safety and efficacy are not established in patients < 18 years of age.

Guidelines

Ninlaro is discussed in various guidelines from the National Comprehensive Cancer Network (NCCN).

- **Multiple Myeloma:** NCCN guidelines (version 3.2024 – March 8, 2024) list multiple therapeutic regimens that may be used for primary therapy and previously treated multiple myeloma.² For primary therapy, in transplant candidates, Ninlaro/cyclophosphamide/dexamethasone (category 2A) and Ninlaro/lenalidomide/dexamethasone (category 2B) are listed under “Useful in certain circumstances”. Ninlaro/lenalidomide/dexamethasone is a category 2A recommendation for non-transplant candidates under “Other recommended regimens”. Ninlaro may be substituted for Kyprolis (carfilzomib intravenous infusion). Maintenance with Ninlaro is also listed among the alternatives for transplant and non-transplant candidates (category 2B for both settings). For previously treated disease, multiple regimens are listed, including Ninlaro/lenalidomide/dexamethasone (preferred, category 1), Ninlaro/Pomalyst (pomalidomide capsules)/dexamethasone (preferred for “Bortezomib-refractory” group), and Ninlaro/cyclophosphamide/dexamethasone under “Other recommended regimens for early relapses (1-3 prior therapies).
- **Systemic Light Chain Amyloidosis:** NCCN guidelines (version 2.2024 – December 12, 2023) list Ninlaro/cyclophosphamide/dexamethasone, Ninlaro ± dexamethasone and Ninlaro/lenalidomide/dexamethasone among the treatment options for patients with previously treated disease (both category 2A).³
- **Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma:** NCCN guidelines (version 2.2024 – December 5, 2023) list Ninlaro/rituximab/dexamethasone (category 2A) among the treatment options for primary therapy and for previously treated disease.⁴

04/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ninlaro. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ninlaro is recommended in those who meet the following criteria:

FDA-Approved Indication

96. Multiple Myeloma. Approve for 1 year if the patient meets BOTH of the following (A and B):

Y) Patient is ≥ 18 years of age; AND

Z) Patient meets ONE of the following (i, ii, or iii):

i. Ninlaro will be taken in combination with lenalidomide or cyclophosphamide and dexamethasone; OR

ii. Patient has received at least ONE prior regimen for multiple myeloma; OR

Note: Examples include regimens containing bortezomib, cyclophosphamide, Kyprolis (carfilzomib intravenous infusion), lenalidomide, Darzalex (daratumumab intravenous infusion).

iii. The medication will be used following autologous stem cell transplantation (ASCT).

Other Uses with Supportive Evidence

97. Systemic Light Chain Amyloidosis. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one other regimen for this condition.

Note: Examples of agents used in other regimens include bortezomib, lenalidomide, cyclophosphamide, and melphalan.

98. Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) The medication is used in combination with a rituximab product and dexamethasone.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ninlaro is not recommended in the following situations:

178. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Nubeqa Prior Authorization Policy

- Nubeqa® (darolutamide tablets – Bayer)

REVIEW DATE: 08/14/2024

OVERVIEW

Nubeqa, an androgen receptor inhibitor, is indicated for the treatment of adults for the following uses:¹

- **Prostate cancer, metastatic, hormone-sensitive**, in combination with docetaxel.
- **Prostate cancer, non-metastatic, castration-resistant**.

Guidelines

According to the National Comprehensive Cancer Network guidelines for **prostate cancer** (version 4.2024 – May 17, 2024), for non-metastatic, castration-resistant prostate cancer, androgen deprivation therapy is continued to maintain castrate serum levels of testosterone (< 50 ng/dL).² Nubeqa, Erleada™ (apalutamide tablets) and Xtandi® (enzalutamide tablets and capsules) are all category 1 preferred regimens if the prostate specific antigen doubling time is ≤ 10 months. For metastatic castration naïve prostate cancer, the guidelines recommend abiraterone, Xtandi, Erleada, and docetaxel as preferred agents (category 1).

Dosing

For patients with hormone-sensitive metastatic prostate cancer, treated with Nubeqa in combination with docetaxel, the first of the 6 cycles of docetaxel should be administered within 6 weeks after the start of Nubeqa.¹ Treatment with Nubeqa may be continued until disease progression or unacceptable toxicity, even if a cycle of docetaxel is delayed, interrupted, or discontinued. Patients receiving Nubeqa should also receive a gonadotropin-releasing hormone (GnRH) analog concurrently or have had a bilateral orchiectomy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nubeqa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nubeqa is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1. Prostate Cancer – Metastatic, Castration-Sensitive.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - C) Patient is ≥ 18 years of age; AND
 - D) Patient meets ONE of the following (i or ii):
 - i. The medication is used concurrently with docetaxel; OR
 - ii. Patient has completed docetaxel therapy; AND
 - E) Patient meets ONE of the following (i or ii):

08/14/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- iii. The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog; OR

Note: Examples are leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix subcutaneous injection), Orgovyx (relugolix tablets).

- iv. Patient has had a bilateral orchiectomy.

2. Prostate Cancer – Non-Metastatic, Castration-Resistant. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i or ii):

- i. The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog; OR

Note: Examples are leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix subcutaneous injection), Orgovyx (relugolix tablets).

- ii. Patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nubeqa is not recommended in the following situations:

179. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Odomzo Prior Authorization Policy

- Odomzo® (sonidegib capsules – Novartis)

REVIEW DATE: 01/17/2024

OVERVIEW

Odomzo, a hedgehog pathway inhibitor, is indicated for the treatment of locally advanced **basal cell carcinoma** in adults whose disease has recurred following surgery or radiation therapy, or who are not candidates for surgery or radiation therapy.¹

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for basal cell skin cancer (version 2.2024 – September 14, 2023) note that surgical approaches offer the most effective and efficient means for accomplishing a cure; radiation therapy may be chosen as the primary treatment in order to achieve optimal overall results.² Odomzo is recommended for locally advanced (extensive) disease where surgery and/or radiation therapy may not result in a cure or would possibly produce a significant functional limitation (category 2A). Odomzo is recommended for diffuse basal cell carcinoma formation (e.g. basal cell nevus syndrome [Gorlin syndrome]) or other genetic forms of multiple basal cell carcinoma (category 2A). Odomzo is also recommended for nodal disease if surgery is not feasible (category 2B).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Odomzo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Odomzo is recommended in those who meet one of the following criteria:

FDA-Approved Indication

99. Basal Cell Carcinoma, Locally Advanced. Approve for 1 year if the patient meets ONE of the following (A or B):

- AA)** Initial Therapy. Approve if the patient meets BOTH of the following (i and ii):
- i.** Patient is ≥ 18 years of age; AND
 - ii.** Patient meets one of the following (a or b):
 - a)** Patient has recurrent basal cell carcinoma following surgery or radiation therapy;
OR
 - b)** Patient meets BOTH of the following [(1) and (2)]:
 - (1)** Patient is not a candidate for surgery; AND
 - (2)** According to the prescriber, the patient is not a candidate for radiation therapy.
- BB)** Patient is Currently Receiving Odomzo. Approve.

01/17/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Other Uses with Supportive Evidence

100. Basal Cell Carcinoma, Metastatic. Approve for 1 year if the patient meets both of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Disease is limited to nodal metastases.

Note: This includes primary or recurrent nodal metastases. A patient with distant metastases does not meet this requirement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Odomzo is not recommended in the following situations:

180. Basal Cell Carcinoma (Locally Advanced or Metastatic), in a Patient with Disease Progression While on Erivedge (vismodegib capsules). Note: This does not apply to a patient already started on Odomzo. Refer to criteria for Basal Cell Carcinoma, Locally Advanced for a Patient Currently Receiving Odomzo. Results from an open-label study (n = 9) showed resistance to Odomzo in patients with advanced basal cell carcinoma who had progressed while taking Erivedge, another hedgehog pathway inhibitor.⁵ There are no data to support the use of Odomzo in patients who have experienced disease progression on Erivedge. Previous use of a hedgehog inhibitor was not allowed in the pivotal study for Odomzo.³ Patients who develop resistance to one of the hedgehog pathway inhibitors are not expected to respond to another hedgehog pathway inhibitor.

181. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ogsiveo Prior Authorization Policy

- Ogsiveo™ (nirogacestat tablets – SpringWorks Therapeutics)

REVIEW DATE: 12/11/2024

OVERVIEW

Ogsiveo, a gamma secretase inhibitor, is indicated for **progressing desmoid tumors** that require systemic treatment in adults.¹

Disease Overview

Desmoid tumors, or aggressive fibromatosis, are rare soft-tissue tumors.² These types of tumors are locally aggressive and invasive, leading to morbidity, but rarely mortality. Desmoid tumors are not metastatic tumors. The enlarged size of some of the tumors can lead to compression of vital structures, resulting in severe pain, functional impairment, nerve damage, and bowel obstruction or perforation. Pain is associated with disease progression and can lead to opioid dependence or suboptimal pain management due to the concern for opioid dependence. Surgery used to be the mainstay of treatment; however, due to high morbidity and postsurgical recurrence rates of up to 50% to 88%, it is used less frequently. Other treatments include cytotoxic chemotherapy, tyrosine kinase inhibitors, local ablation, or radiation therapy.

Clinical Efficacy

The efficacy of Ogsiveo was assessed in a Phase III, double-blind, randomized, placebo-controlled trial in adults with progressing desmoid tumors not amenable to surgery.^{1,2} Eligible patients (n = 142) were ≥ 18 years of age with a histologically confirmed diagnosis of progressing desmoid tumors, defined as ≥ 20% progression (according to Response Evaluation Criteria in Solid Tumors [RECIST], version 1.1) within 12 months before screening. Patients were randomized to receive Ogsiveo 150 mg or placebo orally twice daily until disease progression or unacceptable toxicity. Patients treated with Ogsiveo had a significant progression-free survival benefit over placebo. In the Ogsiveo group, 17% of patients had a progression event compared with 51% of patients in the placebo group (hazard ratio 0.29; 95% confidence interval: 0.15, 0.55; P < 0.001). The objective response rate was also significantly better in the Ogsiveo group compared with placebo: 41% vs. 8%, respectively (P < 0.001).

Guidelines

The National Comprehensive Cancer Network (NCCN) soft tissue sarcoma guidelines (version 4.2024 – November 21, 2024) recommend the following therapies as “Preferred” regimens for desmoid tumors (aggressive fibromatosis):³ Ogsiveo (category 1), sorafenib (category 1), methotrexate and vinorelbine, methotrexate and vinblastine, imatinib, pazopanib, doxorubicin ± dacarbazine, and Doxil® (liposomal doxorubicin for intravenous injection) [except for Ogsiveo and sorafenib, all other agents listed are category 2A recommendations]. Sulindac or other nonsteroidal anti-inflammatory drugs, including celecoxib, are recommended for pain under “Useful in Certain Circumstances” (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ogsiveo. All approvals are provided for the duration noted below.

Automation: None.

12/11/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ogsiveo is recommended in those who meet the following criteria:

FDA-Approved Indication

81. Desmoid Tumors (Aggressive Fibromatosis). Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) According to the prescriber, the patient has progressing desmoid tumors; AND
Note: Progressing desmoid tumors are defined as $\geq 20\%$ progression within 12 months.
- C) The desmoid tumors are not amenable to surgery or radiotherapy; AND
- D) According to the prescriber, the patient requires systemic treatment.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ogsiveo is not recommended in the following situations:

106. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ojemda Prior Authorization Policy

- Ojemda® (tovorafenib tablets and oral suspension – Day One Biopharmaceuticals)

REVIEW DATE: 05/03/2024

OVERVIEW

Ojemda, a kinase inhibitor, is indicated for the treatment of **relapsed or refractory pediatric low-grade glioma** in patients 6 months of age and older, harboring a *BRAF* fusion or rearrangement, or *BRAF* V600 mutation.¹

This indication is approved under accelerated approval based on response rate and duration of response.¹ Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial(s).

Guidelines

Ojemda is not addressed in the National Comprehensive Cancer Network (NCCN) guidelines for Central Nervous System Cancers (version 1.2023 – March 24, 2023) or the Pediatric Central Nervous System Cancers (version 1.2024 – February 26, 2024).^{2,3}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ojemda. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ojemda is recommended in those who meet one of the following criteria:

FDA-Approved Indication

3. **Pediatric Low-Grade Glioma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 6 months of age; AND
 - B) Patient has relapsed or refractory disease; AND
 - C) The tumor is positive for ONE of the following (i, ii, or iii):
 - i. *BRAF* fusion; OR
 - ii. *BRAF* rearrangement; OR
 - iii. *BRAF* V600 mutation.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ojjaara Prior Authorization Policy

- Ojjaara™ (momelotinib tablets – GlaxoSmithKline)

REVIEW DATE: 02/14/2024

OVERVIEW

Ojjaara, a Janus Kinase (JAK1/JAK2) inhibitor and activin A receptor type 1 (ACVR1) inhibitor (also known as activin receptor like kinase 2 [ALK2]), is indicated for the treatment of intermediate or high-risk myelofibrosis (MF), including primary MF or secondary MF (post-polycythemia vera and post-essential thrombocythemia), in adults with anemia.¹

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for myeloproliferative neoplasms (version 1.2024 – December 21, 2023) have recommendations for MF.² Ojjaara is recommended for the management of MF-associated anemia in patients with symptomatic splenomegaly and/or constitutional symptoms which is not controlled as “preferred” (category 2A) or currently controlled on a JAK inhibitor as “useful in certain circumstances” (category 2A). For patients with MF-associated anemia with no symptomatic splenomegaly and/or constitutional symptoms, Ojjaara is recommended as “other recommended regimens” (category 2B). For patients with higher-risk MF with platelet count $\geq 50 \times 10^9/L$ who are not transplant candidates, Jakafi® (ruxolitinib tablets) [category 1], Inrebic® (fedratinib capsules) [category 1], Ojjaara (category 2A), or Vonjo® (pacritinib capsules) [category 2B] are recommended; for patients who had no response or loss of response to initial therapy, Jakafi, Inrebic, Ojjaara (all category 2A), or Vonjo (category 2B) are recommended if they were not previously used. For patients with higher-risk MF with platelet count $< 50 \times 10^9/L$ who are not candidates for transplant, NCCN recommends Vonjo as a “preferred” therapy (category 1) and Ojjaara as “other recommended regimens” (category 2B). For lower-risk symptomatic patients with MF, Ojjaara (category 2B) is considered “useful in certain circumstances” for first-line therapy or for patients who had no response or loss of response to first-line therapy. JAK inhibitors are also recommended for accelerated or blast phase myeloproliferative neoplasms in combination with hypomethylating agents (azacitidine or decitabine) for the palliation of splenomegaly or other disease-related symptoms. There is a footnote which states that there are very limited data regarding the use of Inrebic, Ojjaara, or Vonjo with hypomethylating agents.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ojjaara. All approvals are provided for the duration noted below.

Automation: none

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ojjaara is recommended in those who meet the following criteria:

FDA-Approved Indication

101. Myelofibrosis. Approve for 1 year if the patient meets the following (A, B, and C):

02/14/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Note: Examples of myelofibrosis include primary myelofibrosis, post-polycythemia vera myelofibrosis, and post-essential thrombocythemia myelofibrosis.

- A) Patient is ≥ 18 years of age; AND
- B) Patient has intermediate-risk or high-risk disease; AND
- C) Patient meets one of the following (i or ii):
 - i. Patient has anemia and meets both of the following (a and b):
 - a) Patient has hemoglobin < 10 g/dL AND
 - b) Patient has symptomatic splenomegaly and/or constitutional symptoms; OR

Note: Examples of constitutional symptoms include weight loss, night sweats, and fever.
 - ii. Patient has platelet count $\geq 50 \times 10^9/L$.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ojjaara is not recommended in the following situations:

- 182.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Onureg Prior Authorization Policy

- Onureg® (azacitidine tablets – Celgene)

REVIEW DATE: 09/11/2024

OVERVIEW

Onureg, a nucleoside metabolic inhibitor, is indicated for the continued treatment of **acute myeloid leukemia** (AML) in adults who achieve first complete remission or complete remission with incomplete blood count recovery following intensive induction chemotherapy and are unable to complete intensive curative therapy.¹

Guidelines

Onureg has been addressed by the National Comprehensive Cancer Network:

- **AML** guidelines (version 3.2024 – May 17, 2024) recommend Onureg for the post-remission maintenance treatment of AML in patients who completed no consolidation, some consolidation, or are recommended to receive a course of consolidation; and with no allogeneic stem cell transplantation planned (category 1).^{2,3}
- **T-cell lymphoma** guidelines (version 4.2024 – May 28, 2024) recommended Onureg as a single agent for the initial palliative therapy (category 2B) or for second-line and subsequent treatment (category 2A) of relapsed/refractory peripheral T-cell lymphoma including angioimmunoblastic T-cell lymphoma, nodal peripheral T-cell lymphoma with T-follicular helper (TFH) phenotype, and follicular T-cell lymphoma.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Onureg. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Onureg is recommended in those who meet one of the following criteria:

FDA-Approved Indication

- 82. Acute Myeloid Leukemia.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) The medication is used for post-remission maintenance therapy; AND
 - C) According to the prescriber, allogeneic hematopoietic stem cell transplant is not planned.

Other Uses with Supportive Evidence

09/11/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- 83. Peripheral T-cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed or refractory disease; AND
 - C) Patient has ONE of the following (i, ii, or iii):
 - i. Angioimmunoblastic T-cell lymphoma; OR
 - ii. Nodal peripheral T-cell lymphoma with T-follicular helper (TFH) phenotype; OR
 - iii. Follicular T-cell lymphoma; AND
 - D) The medication is used as a single agent.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Onureg is not recommended in the following situations:

- 107.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Orgovyx Prior Authorization Policy

- Orgovyx® (relugolix tablets – Myovant Sciences/Pfizer)

REVIEW DATE: 02/07/2024

OVERVIEW

Orgovyx, a gonadotropin-releasing hormone (GnRH) receptor antagonist, is indicated for the treatment of **advanced prostate cancer** in adults.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) prostate cancer guidelines (version 4.2023 – September 7, 2023) recommend the use of androgen deprivation therapy (ADT) for various stages of prostate cancer. Orgovyx is listed as an option for ADT for clinically localized (regional node 0 [N0], distant metastases 0 [M0]), regional (N1, M0) disease, or M0 or M1 castration-naïve disease (category 2A).^{2,3} The guidelines note that Orgovyx has not been adequately studied in combination with potent androgen receptor inhibitors, such as abiraterone acetate, Xtandi® (enzalutamide capsules and tablets), Erleada® (apalutamide tablets), Nubeqa® (darolutamide tablets), nor has it be studied in combination with docetaxel or cabazitaxel chemotherapy.²

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Orgovyx. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Orgovyx is recommended in those who meet the following criteria:

FDA-Approved Indication

5. Prostate Cancer. Approve for 1 year if the patient is ≥ 18 years of age.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Orgovyx is not recommended in the following situations:

108. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Orserdu Prior Authorization Policy

- Orserdu™ (elacestrant tablets – Stemline/Menarini)

REVIEW DATE: 02/07/2024

OVERVIEW

Orserdu, an estrogen receptor antagonist, is indicated for the treatment of estrogen receptor-positive (ER+), human epidermal growth factor receptor 2 (HER2)-negative, estrogen receptor 1 gene (*ESR1*)-mutated advanced or metastatic breast cancer with disease progression following at least one line of endocrine therapy in postmenopausal women or adult men.¹

Guidelines

National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 1.2024 – January 25, 2024) recommend Orserdu for ER+, HER2-negative, *ESR1*-mutated recurrent, unresectable or metastatic breast cancer after progression on one or two prior lines of endocrine therapy, including one line containing a cyclin-dependent kinase (CDK) 4/6 inhibitor as “Other Recommended Regimen” (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Orserdu. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual’s gender identity or gender expression; a man is defined as an individual with the biological traits of a man, regardless of the individual’s gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Orserdu is recommended in those who meet the following criteria:

FDA-Approved Indication

84. Breast Cancer in Postmenopausal Women or Men*. Approve for 1 year if the patient meets the following (A, B, C, D, E, and F):

CC) Patient is ≥ 18 years of age; AND

DD) Patient has recurrent or metastatic disease; AND

EE) Patient has estrogen receptor positive (ER+) disease; AND

FF) Patient has human epidermal growth factor receptor 2 (HER2)-negative disease; AND

GG) Patient has estrogen receptor 1 gene (*ESR1*)-mutated disease; AND

HH) Patient has tried at least one endocrine therapy.

Note: Examples of endocrine therapy include fulvestrant, anastrozole, exemestane, letrozole, and tamoxifen.

* Refer to the Policy Statement.

02/07/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Orserdu is not recommended in the following situations:

- 109.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Pazopanib Prior Authorization Policy

- Votrient® (pazopanib tablets – Novartis; generic)

REVIEW DATE: 06/26/2024

OVERVIEW

Pazopanib, a multi-tyrosine kinase inhibitor, is indicated in adults for the following uses:¹

- **Renal cell carcinoma**, advanced.
- **Soft tissue sarcoma**, advanced, for patients who have received prior chemotherapy.

Guidelines

Pazopanib is discussed in guidelines from the National Comprehensive Cancer Network (NCCN)²:

- **Bone Cancer:** NCCN guidelines (version 2.2024 – March 12, 2024) recommend pazopanib as a systemic therapy agent as “other recommended” regimens for chondrosarcoma for metastatic and widespread disease (category 2A).³
- **Gastrointestinal Stromal Tumor (GIST):** NCCN guidelines (version 1.2024 – March 8, 2024) recommend pazopanib as an additional option after failure on approved therapies as “useful in certain circumstances” (category 2A).⁴ The first line therapies are imatinib or Ayvakit™ (avapritinib tablets; for patients with *PDGFRA* exon 18 mutation, including the *PDGFRA* D842V mutation); second-line therapy is sunitinib or Sprycel® (dasatinib tablets; for *PDGFRA* exon 18 mutations that are insensitive to imatinib [including the *PDGFRA* D842V mutation]); third-line therapy is Stivarga® (regorafenib tablets); fourth-line therapy is Qinlock® (ripretinib tablets). The guidelines also state in a footnote that for unresectable disease, sunitinib, Stivarga, and pazopanib are special considerations for succinate dehydrogenase (SDH)-deficient GIST (category 2A).⁴
- **Kidney Cancer:** NCCN guidelines (version 4.2024 – May 30, 2024) recommend pazopanib as first-line and subsequent therapy for relapsed or stage IV disease for clear cell histology and as systemic therapy for non-clear cell histology as “useful in certain circumstances” (category 2A).⁵ Pazopanib is also recommended as a single-agent therapy for von Hippel-Lindau-associated renal cell carcinoma as useful in certain circumstances (category 2A).
- **Ovarian Cancer Including Fallopian Tube Cancer and Primary Peritoneal Cancer:** NCCN guidelines (version 2.2024 – May 13, 2024) recommend pazopanib (category 2B) as single-agent therapy for persistent disease or recurrence.⁶
- **Soft Tissue Sarcoma:** NCCN guidelines (version 1.2024 – April 26, 2024) recommend pazopanib as single agent therapy for alveolar soft part sarcoma, angiosarcoma, desmoid tumors (aggressive fibromatosis), and solitary fibrous tumor/hemangiopericytoma.⁷ Pazopanib is also recommended for dermatofibrosarcoma protuberans with fibrosarcomatous transformation for patients who are ineligible for intravenous systemic therapy or patients who are not candidates for anthracyclines-based regimens. For soft tissue sarcoma subtypes with non-specific histology, the guidelines recommend pazopanib as first-line therapy for advanced and metastatic for patients who are ineligible for intravenous systemic therapy or patients who are not candidates for anthracyclines-based regimens and as a subsequent line of therapy for advanced or metastatic disease as palliative therapy as a single-agent (category 2A) or in combination with gemcitabine (category 2B).
- **Thyroid Carcinoma:** NCCN guidelines (version 3.2024 – June 18, 2024) for differentiated thyroid carcinoma recommend pazopanib (category 2A) for progressive and/or symptomatic disease for unresectable locoregional recurrent or persistent disease not amenable to radioactive iodine therapy or distant metastatic disease not amenable to radioactive iodine therapy.⁸ For differentiated

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

thyroid cancer subtypes, the guidelines have changed the naming of Hürthle cell neoplasm to oncocytic carcinoma. Pazopanib can be considered for treatment of progressive or symptomatic medullary thyroid disease if clinical trials or preferred systemic therapy options are not available or appropriate, or if there is progression on preferred systemic therapy options.

- **Uterine Neoplasms:** NCCN guidelines (version 2.2024 – March 6, 2024) recommend pazopanib as a systemic therapy option for uterine sarcoma as “other recommended regimen” for patients with recurrent or metastatic disease that have progressed on prior cytotoxic chemotherapy (category 2A).⁹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of pazopanib. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of pazopanib is recommended in those who meet one of the following criteria:

FDA-Approved Indications

102. Renal Cell Cancer. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. Patient has relapsed or advanced disease; OR
 - ii. Patient has von Hippel-Lindau disease.

2. Soft Tissue Sarcoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient does not have gastrointestinal stromal tumor; AND
Note: If patient has gastrointestinal stromal tumor, see criteria 4 for gastrointestinal stromal tumor.
- C) Patient has advanced or metastatic disease; AND
- D) Patient has ONE of the following (i, ii, iii, iv, v, vi, or vii):
 - i. Alveolar soft part sarcoma; OR
 - ii. Angiosarcoma; OR
 - iii. Desmoid tumors (aggressive fibromatosis); OR
 - iv. Dermatofibrosarcoma protuberans with fibrosarcomatous transformation; OR
 - v. Non-adipocytic sarcoma; OR
 - vi. Pleomorphic rhabdomyosarcoma; OR
 - vii. Solitary fibrous tumor/hemangiopericytoma.

Other Uses with Supportive Evidence

3. Bone Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has chondrosarcoma; AND
- C) Patient meets BOTH of the following (i and ii):
 - i. Patient has metastatic disease; AND
 - ii. According to the prescriber, patient has widespread disease.

06/26/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

4. **Gastrointestinal Stromal Tumor.** Approve for 1 year if the patient meets BOTH of the following (A and B):
C) Patient is ≥ 18 years of age; AND
D) Patient meets ONE of the following (i or ii):
i. Patient has succinate dehydrogenase (SDH)-deficient gastrointestinal stromal tumor; OR
ii. Patient has tried each of the following (a, b, c, and d):
a) One of imatinib or Ayvakit (avapritinib tablets); AND
b) One of sunitinib or Sprycel (dasatinib tablets); AND
c) Stivarga (regorafenib tablets); AND
d) Qinlock (ripretinib tablets).
5. **Ovarian Cancer, Fallopian Tube, or Primary Peritoneal Cancer.** Approve for 1 year if the patient meets BOTH of the following (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient has persistent or recurrent disease.
6. **Thyroid Carcinoma, Differentiated.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
A) Patient is ≥ 18 years of age; AND
B) Patient has differentiated thyroid carcinoma; AND
Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).
C) Patient is refractory to radioactive iodine therapy.
7. **Thyroid Carcinoma, Medullary.** Approve for 1 year if the patient meets BOTH of the following (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient has tried at least one systemic therapy.
Note: Examples of systemic therapy include Caprelsa (vandetanib tablets), Cometriq (cabozantinib capsules), Retevmo (selpercatinib capsules), and Gavreto (pralsetinib capsules).
8. **Uterine Sarcoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
Note: Examples of uterine sarcoma include endometrial stromal sarcoma, undifferentiated uterine sarcoma, or uterine leiomyosarcomas.
A) Patient is ≥ 18 years of age; AND
B) Patient has recurrent or metastatic disease; AND
C) Patient has tried at least one systemic regimen.
Note: Examples of a systemic regimen include one or more of the following: doxorubicin, docetaxel, gemcitabine, ifosfamide, dacarbazine, epirubicin, or vinorelbine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of pazopanib is not recommended in the following situations:

183. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Pemazyre Prior Authorization Policy

- Pemazyre® (pemigatinib tablets – Incyte)

REVIEW DATE: 05/08/2024

OVERVIEW

Pemazyre, a kinase inhibitor, is indicated in adults for the following uses:¹

- Previously treated, unresectable locally advanced or metastatic **cholangiocarcinoma** with a fibroblast growth factor receptor 2 (*FGFR2*) fusion or other rearrangement as detected by an FDA-approved test.
- Relapsed or refractory **myeloid/lymphoid neoplasms** with fibroblast growth factor receptor 1 (*FGFR1*) rearrangement.

Guidelines

Pemazyre is addressed in National Comprehensive Cancer Network (NCCN) guidelines:²

- **Biliary tract cancers:** Guidelines (version 2.2024 – April 19, 2024) recommend Pemazyre for disease progression on or following systemic treatment for patients with unresectable or metastatic cholangiocarcinoma with *FGFR2* fusion or rearrangement, as a single agent (category 2A).³
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Fusion Genes:** Guidelines (version 1.2024 – December 21, 2023) recommend Pemazyre for the treatment of myeloid/lymphoid neoplasms with eosinophilia and *FGFR1* rearrangement in chronic phase or blast phase (category 2A).^{2,4}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Pemazyre. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Pemazyre is recommended in those who meet one of the following criteria:

FDA-Approved Indications

33. Cholangiocarcinoma. Approve for 1 year if the patient meets ALL of the following criteria (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has unresectable locally advanced or metastatic disease; AND
- C) Tumor has fibroblast growth factor receptor 2 (*FGFR2*) fusion or other rearrangement, as detected by an approved test; AND
- D) Patient has been previously treated with at least one systemic regimen.

Note: Examples of systemic regimens are gemcitabine + cisplatin, 5-fluorouracil + oxaliplatin or cisplatin, capecitabine + cisplatin or oxaliplatin, gemcitabine + Abraxane (albumin-bound

05/08/2024

paclitaxel) or capecitabine or oxaliplatin, gemcitabine + Abraxane + cisplatin, FOLFOX (5-fluorouracil, leucovorin, and oxaliplatin), FOLFIRI (5-fluorouracil, leucovorin, irinotecan), Stivarga (regorafenib tablets).

34. Myeloid/Lymphoid Neoplasms. Approve for 1 year if the patient meets ALL of the following criteria (A, B, C, and D):

- A)** Patient is ≥ 18 years of age; AND
- B)** Patient has eosinophilia; AND
- C)** The cancer has fibroblast growth factor receptor 1 (*FGFR1*) rearrangement, as detected by an approved test; AND
- D)** The cancer is in chronic phase or blast phase.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Pemazyre is not recommended in the following situations:

- 8.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Piqray Prior Authorization Policy

- Piqray® (alpelisib tablets – Novartis)

REVIEW DATE: 06/12/2024

OVERVIEW

Piqray, a kinase inhibitor, is indicated in combination with fulvestrant injection for the treatment of hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative, phosphatidylinositol-3-kinase (*PIK3CA*)-mutated, **advanced or metastatic breast cancer** as detected by an FDA-approved test following progression on or after an endocrine-based regimen in adults.¹

Patients treated with Piqray should have one or more *PIK3CA* mutations in tumor tissue or plasma specimens. If no mutation is detected in a plasma specimen, tumor tissue should be tested. Information on FDA-approved tests for the detection of *PIK3CA* mutations in breast cancer is available on the FDA website.²

Guidelines

Piqray is discussed in the guidelines from National Comprehensive Cancer Network (NCCN).^{3,4} NCCN breast cancer guidelines (version 2.2024 – March 11, 2024) recommend Piqray, in combination with fulvestrant, as a “preferred” second-line regimen or subsequent-line therapy for *PIK3CA*-activating mutation in postmenopausal or premenopausal patients (receiving ovarian ablation or suppression, if premenopausal) with HR+/HER2-negative, recurrent unresectable (local or regional) or Stage IV disease (category 1).³ It is noted that men with breast cancer should be treated similarly to postmenopausal women, except that use of an aromatase inhibitor is ineffective without concomitant suppression of testicular steroidogenesis. It is noted that the safety of Piqray in patients with type 1 or uncontrolled type 2 diabetes has not been established. “Preferred” first-line regimens for HR+/HER2-negative disease include the following: aromatase inhibitor (i.e., letrozole, anastrozole, exemestane) + CDK4/6 inhibitor (i.e., Ibrance® [palbociclib capsules], Kisqali® [ribociclib tablets], Verzenio® [abemaciclib tablets]) or fulvestrant + CDK4/6 inhibitor. Of note, men with breast cancer are treated similarly to postmenopausal women.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Piqray. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual’s gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual’s gender identity or gender expression.

Automation: None.

06/12/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Piqray is recommended in those who meet the following criteria:

FDA-Approved Indication

35. Breast Cancer. Approve for 1 year if the patient meets the following (A, B, C, D, E, F, and G):

H) Patient is ≥ 18 years of age; AND

I) Patient meets ONE of the following (i or ii):

iii. Patient is a postmenopausal female* or a male*; OR

iv. Patient is pre/perimenopausal and meets ONE of the following (a or b):

c) Patient is receiving ovarian suppression with a gonadotropin-releasing hormone (GnRH) agonist; OR

Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous injection).

d) Patient has had surgical bilateral oophorectomy or ovarian irradiation; AND

J) Patient has advanced or metastatic hormone receptor (HR)-positive disease; AND

K) Patient has human epidermal growth factor receptor 2 (HER2)-negative disease; AND

L) Patient has *PIK3CA*-mutated breast cancer as detected by an approved test; AND

M) Patient has progressed on or after at least one prior endocrine-based regimen; AND

Note: Examples of an endocrine-based regimen contains one of the following products: anastrozole, letrozole, exemestane, tamoxifen, toremifene, or fulvestrant.

N) Piqray will be used in combination with fulvestrant injection.

* Refer to Policy Statement

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Piqray is not recommended in the following situations:

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Pomalyst Prior Authorization Policy

- Pomalyst® (pomalidomide capsules – Celgene)

REVIEW DATE: 05/29/2024

OVERVIEW

Pomalyst, a thalidomide analog, is indicated for the following uses:¹

- **Kaposi sarcoma**, Acquired Immune Deficiency Syndrome (AIDS)-related Kaposi sarcoma in adults after failure of highly active antiretroviral therapy (HAART) or Kaposi sarcoma in adults who are human immunodeficiency virus (HIV)-negative.
- **Multiple myeloma**, in combination with dexamethasone, in adults who have received at least two prior therapies including lenalidomide capsules and a proteasome inhibitor and have demonstrated disease progression on or within 60 days of completion of the last therapy.

Guidelines

Pomalyst is addressed in guidelines from National Comprehensive Cancer Network (NCCN):^{3,5-7}

- **Central Nervous System (CNS) Cancers:** NCCN guidelines (version 1.2023 – March 24, 2023) list Pomalyst as a recommended regimen (category 2A) for patients with relapsed or refractory disease for primary CNS lymphoma.⁵
- **Kaposi Sarcoma:** NCCN guidelines (version 1.2024 – November 7, 2023) cites Pomalyst as the “preferred” subsequent system therapy (category 2A) option given alone (in patients without HIV) or with antiretroviral therapy for patients with HIV for relapsed/refractory advanced cutaneous, oral, visceral, or nodal disease that has not progressed on or not responded for first-line systemic therapy and progressed on alternate first-line systemic therapy.³ First-line systemic therapy options include liposomal doxorubicin (preferred) and paclitaxel.
- **Multiple Myeloma:** NCCN guidelines (version 4.2024 – April 26, 2024) recommend Pomalyst in various clinical regimens after use of previous therapies in varying scenarios and with different agents among patients with multiple myeloma that has been previously treated (including as a category 1 and category 2A recommendation).⁶ It can be used as a monotherapy for patients who are steroid intolerant. Pomalyst is also indicated for treatment in combination with dexamethasone for the management of POEMS (polyneuropathy, organomegaly, endocrinopathy, monoclonal protein, skin changes) syndrome as induction therapy for transplant eligible patients and for transplant ineligible patients.
- **Systemic Light Chain Amyloidosis:** NCCN guidelines (version 2.2024 – December 12, 2023) list Pomalyst plus dexamethasone as one of several treatment options for patients with previously treated disease (category 2A).⁷ Many other regimens are cited as primary therapy for transplant candidates and non-transplant candidates.

05/29/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Pomalyst. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Pomalyst is recommended in those who meet one of the following criteria:

FDA-Approved Indications

103. Kaposi Sarcoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. Patient is Human Immunodeficiency Virus (HIV)-negative; OR
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient is HIV-positive; AND
 - b) Patient continues to receive highly active antiretroviral therapy.

104. Multiple Myeloma. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has received at least one other lenalidomide containing regimen.

Other Uses with Supportive Evidence

105. Central Nervous System Lymphoma. Approve for 1 year if the patient has relapsed or refractory disease.

106. POEMS (polyneuropathy, organomegaly, endocrinopathy, monoclonal protein, skin changes) Syndrome. Approve for 1 year if the patient meets BOTH of the following (A and B):

- C) Patient is ≥ 18 years of age; AND
- D) Use of Pomalyst is in combination with dexamethasone.

107. Systemic Light Chain Amyloidosis. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Use of Pomalyst is in combination with dexamethasone; AND
- C) Patient has tried at least one other regimen.

Note: Examples of regimens include lenalidomide plus dexamethasone; bortezomib, lenalidomide, cyclophosphamide, and dexamethasone; bortezomib with or without dexamethasone; bortezomib, lenalidomide, and dexamethasone; melphalan and dexamethasone; bortezomib, cyclophosphamide, and dexamethasone; and Darzalex (daratumumab intravenous infusion)/Darzalex Faspro (daratumumab and hyaluronidase-fihj subcutaneous injection).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Pomalyst is not recommended in the following situations:

- 184.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Qinlock Prior Authorization Policy

- Qinlock® (ripretinib tablets – Deciphera Pharmaceuticals)

REVIEW DATE: 04/19/2024

OVERVIEW

Qinlock, a kinase inhibitor, is indicated for the treatment of advanced **gastrointestinal stromal tumor** in adults who have received prior treatment with three or more kinase inhibitors, including imatinib.¹

Guidelines

Qinlock is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Gastrointestinal Stromal Tumor:** NCCN guidelines (version 1.2024 – March 8, 2024) recommend Qinlock for unresectable, progressive, or metastatic disease in the following situations: Qinlock 150 mg daily as second-line therapy for patients who are intolerant of second-line sunitinib as a “Preferred Regimen” (category 2A); Qinlock 150 mg daily as fourth-line therapy after therapy with imatinib, sunitinib, and Stivarga® (regorafenib tablets) if not previously received as a “Preferred Regimen” (category 1); Qinlock dose escalation to 150 mg twice daily if patient has previously treated with Qinlock 150 mg daily as additional options after progression on approved therapies as “Useful in Certain Circumstances”(category 2A); and Qinlock 150 mg daily or Qinlock 150 mg twice daily (if previously treated with Qinlock 150 mg daily) after progression with Ayvakit® (avapritinib tablets) and Sprycel® (dasatinib tablets).^{2,3}
- **Melanoma: Cutaneous:** NCCN guidelines (version 2.2024 –April 3, 2024) recommend Qinlock as “Useful in Certain Circumstances” for metastatic or unresectable disease with an activating *KIT* mutation as second-line or subsequent therapy for disease progression, intolerance, and/or projected risk of progression with *BRAF*-targeted therapy (category 2A).^{2,4}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Qinlock. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Qinlock is recommended in those who meet the following criteria:

FDA-Approved Indication

- 36. Gastrointestinal Stromal Tumor.** Approve for 1 year if the patient meets ALL of the following (A, B and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has tried imatinib or Ayvakit (avapritinib tablets); AND

04/19/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- C) Patient meets ONE of the following (i, ii, or iii):
- i. Patient has tried sunitinib and Stivarga (regorafenib tablets); OR
 - ii. Patient has tried Sprycel (dasatinib tablets); OR
 - iii. Patient is intolerant of sunitinib.

Other Uses with Supportive Evidence

37. Melanoma, Cutaneous. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- I) Patient is ≥ 18 years of age; AND
- J) Patient has metastatic or unresectable disease; AND
- K) Patient has an activating *KIT* mutation; AND
- L) Patient has tried at least ONE systemic regimen.

Note: Examples of a systemic regimen include: Opdivo (nivolumab intravenous infusion) + Yervoy (ipilimumab intravenous infusion), Opdivo + Opdualag (nivolumab/relatlimab-rmbw intravenous infusion), Keytruda (pembrolizumab intravenous infusion), Opdivo, Tafinlar (dabrafenib capsules and oral tablets for suspension) + Mekinist (trametinib tablets), Zelboraf (vemurafenib tablets) + Cotellic (cobimetinib tablets), Braftovi (encorafenib capsules) + Mektovi (binimetinib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Qinlock is not recommended in the following situations:

- 10.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Retevmo Prior Authorization Policy

- Retevmo® (selpercatinib capsules and tablets– Eli Lilly)

REVIEW DATE: 06/05/2024

OVERVIEW

Retevmo, a kinase inhibitor, is indicated for the following uses:¹

- **Non-small cell lung cancer**, locally advanced or metastatic with a rearranged during transfection (*RET*) gene fusion, as detected by an FDA-approved test in adults.
- **Solid tumors**, locally advanced or metastatic solid tumors with a *RET* gene fusion in patients ≥ 2 years of age who have progressed on or following prior systemic treatment or who have no satisfactory alternative treatment options.
- **Thyroid cancer**, advanced or metastatic *RET*-mutant medullary, in patients ≥ 2 years of age who require systemic therapy as detected by an FDA-approved test.
- **Thyroid cancer**, advanced or metastatic *RET* gene fusion-positive, in patients ≥ 2 years of age who require systemic therapy and who are radioactive iodine-refractory (if radioactive iodine is appropriate), as detected by an FDA-approved test.

The indications of *RET* gene fusion solid tumors and *RET* mutant medullary thyroid cancers above were accelerated approvals based on overall response rate and duration of response. Continued approval of these indications may be contingent upon verification and description of clinical benefit in confirmatory trials.

Guidelines

Retevmo is addressed in the National Comprehensive Cancer Network (NCCN) compendium for a variety of solid tumors.² Retevmo is addressed in NCCN guidelines:

- **Histiocytic Neoplasms:** NCCN guidelines (version 1.2024 – March 15, 2024) recommend Retevmo as an agent that may be “useful in certain circumstances” as the first- or subsequent-line treatment for the following types of histiocytic neoplasm with *RET* fusion: Langerhans cell histiocytosis, Erdheim-Chester disease, and Rosai-Dorfman disease (category 2A).³
- **Non-Small Cell Lung Cancer:** NCCN guidelines (version 5.2024 – April 23, 2024) recommend Retevmo as a “preferred” option for first-line and subsequent treatment of patients with *RET* rearrangement-positive recurrent, advanced, or metastatic non-small cell lung cancer (category 2A).^{2,4}
- **Thyroid Carcinoma:** NCCN guidelines (version 2.2024 – March 12, 2024) recommend Retevmo and Gavreto® (pralsetinib capsules) as “preferred regimens” for the treatment of *RET* pathogenic variant recurrent or persistent locoregional or metastatic medullary carcinoma (category 1).⁵ Retevmo is also recommended for the treatment of locally recurrent, advanced, and/or metastatic *RET*-gene fusion positive thyroid carcinoma that is not amenable to radioactive iodine therapy as “useful in certain circumstances” (category 2A). Additionally NCCN recommends Retevmo for *RET*-fusion positive anaplastic thyroid carcinoma for locoregional disease and metastatic disease (category 2A).⁵

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Retevmo. All approvals are provided for the duration noted below.

06/05/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Retevmo is recommended in those who meet one of the following criteria:

FDA-Approved Indications

38. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has recurrent, advanced, or metastatic disease; AND
- C) The tumor is rearranged during transfection (*RET*) fusion-positive.

39. Thyroid Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 2 years of age; AND
- B) Patient has rearranged during transfection (*RET*) fusion-positive, *RET* mutation-positive disease, or *RET* pathogenic variant; AND
- C) Patient meets ONE of the following (i or ii):
 - i. Patient has anaplastic thyroid cancer; OR
 - ii. The disease requires treatment with systemic therapy and patient meets ONE of the following (a or b):
 - a) The patient has medullary thyroid cancer; OR
 - b) The disease is radioactive iodine-refractory.

40. Solid Tumors. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

Note: Examples of solid tumors include breast cancer, cervical cancer, cholangiocarcinoma, colorectal cancer, esophageal cancer, gastric cancer, ovarian cancer, pancreatic adenocarcinoma, salivary gland tumors, soft tissue sarcoma, small bowel adenocarcinoma, and unknown primary cancer.

- A) Patient is ≥ 2 years of age; AND
- B) Patient has recurrent, advanced, or metastatic disease; AND
- C) The tumor is rearranged during transfection (*RET*) fusion-positive.

Other Uses with Supportive Evidence

41. Histiocytic Neoplasm. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- G) Patient is ≥ 18 years of age; AND
- H) Patient meets ONE of the following (i, ii, or iii):
 - i. Patient has Langerhans cell histiocytosis; OR
 - ii. Patient has Erdheim-Chester disease; OR
 - iii. Patient has Rosai-Dorfman disease; AND
- I) Patient has a rearranged during transfection (*RET*) fusion.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Retevmo is not recommended in the following situations:

11. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Revuforj Prior Authorization Policy

- Revuforj™ (revumenib tablets – Syndax)

REVIEW DATE: 11/20/2024

OVERVIEW

Revuforj, a menin inhibitor, is indicated for the treatment of **relapsed or refractory acute leukemia with a lysine methyltransferase 2A (KMT2A) gene translocation** in adults and pediatric patients ≥ 1 year of age.¹

Disease Overview

Acute leukemia encompasses acute myeloid leukemia (AML), acute lymphoblastic leukemia (ALL), and mixed phenotype leukemia.^{2,3} *KMT2A* rearrangements occur in approximately 5% to 10% of patients with newly diagnosed AML, 10% of patients with ALL, and 8% of patients with mixed phenotypic acute leukemia.² Prognosis of acute leukemias with *KMT2A* rearrangements is poor; 5-year overall survival is $< 25\%$.³

Guidelines

Revuforj is addressed in National Comprehensive Cancer Network (NCCN) guidelines:⁴⁻⁶

- **ALL:** Guidelines (version 3.2024 – December 20, 2024) recommend Revuforj as an “Other Recommended Regimen” for patients with relapsed/refractory *KMT2A*-rearranged Philadelphia chromosome-negative ALL and for patients with relapsed/refractory *KMT2A*-rearranged T-cell ALL (both are category 2A recommendations).
- **Pediatric ALL:** Guidelines (version 2.2025 – December 16, 2024) recommend Revuforj as an “Other Recommended Regimen” for patients with relapsed/refractory *KMT2A*-rearranged BCR::ABL1-negative ALL and for patients with relapsed/refractory *KMT2A*-rearranged T-cell ALL (both are category 2A recommendations).
- **AML:** Guidelines (version 1.2025 – December 20, 2024) recommend Revuforj as a treatment option for patients (≥ 18 years of age) with relapsed/refractory *KMT2A*-rearranged AML (category 2A recommendation).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Revuforj. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Revuforj is recommended in those who meet the following criteria:

FDA-Approved Indication

85. Acute Leukemia. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 1 year of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. Patient has relapsed disease; OR
 - ii. Patient has refractory disease; AND
- C) The disease is positive for a lysine methyltransferase 2A (*KMT2A*) gene translocation.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Revuforj is not recommended in the following situations:

110. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Rezlidhia Prior Authorization Policy

- Rezlidhia™ (olutasidenib capsules – Rigel)

REVIEW DATE: 12/13/2023

OVERVIEW

Rezlidhia, an isocitrate dehydrogenase-1 (*IDH1*) inhibitor, is indicated for the treatment of relapsed or refractory **acute myeloid leukemia** with a susceptible *IDH1* mutation as detected by an FDA-approved test in adults.

Guidelines

The National Comprehensive Cancer Network (NCCN) acute myeloid leukemia guidelines (version 6.2023 – October 24, 2023) recommend Rezlidhia or Tibsovo® (ivosidenib tablets) for patients with relapsed or refractory AML with an *IDH1* mutation (both category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rezlidhia. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rezlidhia is recommended in those who meet the following criteria:

FDA-Approved Indication

108. Acute Myeloid Leukemia. Approve for 1 year if the patient meets the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has relapsed or refractory disease; AND
- C) Patient has isocitrate dehydrogenase-1 (*IDH1*) mutation positive disease as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rezlidhia is not recommended in the following situations:

111. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Rozlytrek Prior Authorization Policy

- Rozlytrek® (entrectinib capsules and oral pellets – Genentech)

REVIEW DATE: 10/16/2024

OVERVIEW

Rozlytrek, a kinase inhibitor, is indicated for the following uses:¹

- **Non-small cell lung cancer (NSCLC)**, with *ROS1*-positive metastatic disease, as detected by an FDA-approved test, in adults.
- **Solid tumors**, in adult and pediatric patients ≥ 1 month of age that:
 - Have a neurotrophic tyrosine receptor kinase (*NTRK*) gene fusion, as detected by an FDA-approved test without a known acquired resistance mutation; AND
 - Are metastatic or surgical resection of the tumor is likely to result in severe morbidity; AND
 - Have either progressed following treatment or there are no satisfactory alternative therapies.

Guidelines

Rozlytrek is addressed in guidelines by the National Comprehensive Cancer Network (NCCN):^{2,3}

- **NSCLC.** Guidelines (version 10.2024 – September 23, 2024) recommend Rozlytrek as a “Preferred” first-line treatment option for patients with *ROS1* rearrangement-positive NSCLC (category 2A).² Rozlytrek is also recommended as a preferred first-line treatment option for patients with *NTRK* gene fusion-positive NSCLC (category 2A).
- **Solid tumors.** The NCCN Drugs and Biologics Compendium notes the use of Rozlytrek for *NTRK* gene fusion-positive tumors associated with the following cancers: ampullary adenocarcinoma, breast cancer, central nervous system cancers (e.g., glioma, glioblastoma, brain metastases), cervical cancer, colon cancer, esophageal and esophagogastric junction cancers, gastric cancer, gastrointestinal stromal tumors, head and neck cancers (e.g., salivary gland tumors), hepatobiliary cancers, histiocytic neoplasms, melanoma (cutaneous), non-small cell lung cancer, ovarian cancer/fallopian tube cancer/primary peritoneal cancer, pancreatic cancer, rectal cancer, small bowel adenocarcinoma, soft tissue sarcomas, thyroid carcinoma, uterine neoplasms, and vulvar cancer.³ Rozlytrek is a category 2A recommendation for most of these cancers. Rozlytrek is recommended for use as a first-line and/or second-line treatment option for these cancers.
- **Pediatric Central Nervous System Cancers.** Guidelines (version 1.2024 – February 26, 2024) recommend Rozlytrek as adjuvant therapy and for recurrent or progressive disease (category 2A for both), for *TRK* fusion-positive pediatric diffuse high-grade gliomas.⁴

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rozlytrek. All approvals are provided for the duration noted below.

Automation: None.

10/16/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rozlytrek is recommended in those who meet one of the following criteria:

FDA-Approved Indications

2. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

Note: If the patient has non-small cell lung cancer with neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion, see **Solid Tumors** indication.

- A) Patient is ≥ 18 years of age; AND
- B) Patient has metastatic disease; AND
- C) Patient has *ROS1*-positive disease; AND
- D) The mutation was detected by an approved test.

3. **Solid Tumors.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):

Note: Examples of solid tumors include breast cancer, colorectal cancer, head/neck cancer, hepatocellular carcinoma, biliary cancer, histiocytic neoplasm, non-small cell lung cancer (*NTRK* gene fusion-positive), ovarian cancer, pancreatic cancer, salivary gland tumors, sarcoma, thyroid cancer, adult glioma.

- A) Patient is ≥ 1 month of age; AND
- B) The tumor is positive for neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion; AND
- C) Patient meets ONE of the following (i or ii):
 - i. The tumor is metastatic; OR
 - ii. Surgical resection of tumor will likely result in severe morbidity.

Other Uses with Supportive Evidence

4. **Pediatric Diffuse High-Grade Gliomas.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is < 18 years of age; AND
- B) The tumor is positive for neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion; AND
- C) Patient meets ONE of the following (i or ii):
 - i. The medication is used as adjuvant therapy; OR
 - ii. The medication is used for recurrent or progressive disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rozlytrek is not recommended in the following situations:

185. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Rubraca Prior Authorization Policy

- Rubraca® (rucaparib tablets – Clovis Oncology)

REVIEW DATE: 02/07/2024; selected revision 06/05/2024

OVERVIEW

Rubraca, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicated for the following uses:¹

- **Epithelial ovarian, fallopian tube, or primary peritoneal cancer, maintenance treatment** of deleterious *BRCA* mutation (germline and/or somatic)-associated recurrent disease in adults who are in a complete or partial response to platinum-based chemotherapy.
- **Prostate cancer**, metastatic castration-resistant (mCRPC), treatment of deleterious *BRCA* mutation (germline and/or somatic)-associated disease in adults who have been treated with androgen receptor-directed therapy and a taxane-based chemotherapy.

This indication is approved under accelerated approval based on objective response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

Guidelines

Rubraca is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Ovarian Cancer:** NCCN guidelines (version 2.2024 – May 13, 2024) recommend single-agent Rubraca as maintenance therapy if the patient has had a complete or partial response to primary treatment in the following situations: no bevacizumab was used during primary therapy (category 2A) or bevacizumab was used during primary therapy and the patient has a germline or somatic *BRCA* mutation (category 2A).² In patients with platinum-sensitive disease who have completed two or more lines of platinum-based therapy and are in a partial or complete response, bevacizumab can be continued as maintenance therapy or Rubraca can be considered as maintenance therapy if patient has a *BRCA* mutation and patient has not previously received a PARP inhibitor (category 1) or if disease has not progressed during prior PARP inhibitor therapy (category 2A).
- **Pancreatic Adenocarcinoma:** NCCN guidelines (version 1.2024 – December 13, 2023) recommend Rubraca as maintenance therapy for metastatic disease with germline or somatic *BRCA1/2* or *PALB2* mutations. This recommendation is for patients who have received prior platinum based therapy and did not have progression following their most recent platinum-based chemotherapy and it is listed as “Useful in Certain Circumstances” (category 2A).
- **Prostate Cancer:** NCCN guidelines (version 4.2023 – September 7, 2023) recommend Rubraca for *BRCA1* or *BRCA2* mutation (germline and/or somatic) for patients who have been treated with androgen receptor-directed therapy and a taxane-based chemotherapy in mCRPC (category 2A). It is listed under “Useful in Certain Circumstances” for patients who have received prior novel hormone therapy and no prior docetaxel and for patients who have received prior docetaxel and prior novel hormone therapy. The guidelines note that if the patient is not fit for chemotherapy, Rubraca can be considered even if taxane-based therapy has not been given.³
- **Uterine Neoplasms:** NCCN guidelines (version 1.2024 – September 20, 2023) state that Rubraca may be considered as a single-agent second-line therapy or subsequent therapy as “Useful in Certain Circumstances”, for *BRCA2*-altered uterine leiomyosarcoma (category 2A).^{4,5}

POLICY STATEMENT

02/07/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Prior Authorization is recommended for prescription benefit coverage of Rubraca. All approvals are provided for the duration note below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rubraca is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1. Ovarian, Fallopian Tube, or Primary Peritoneal Cancer –Maintenance Therapy.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient is in complete or partial response after a platinum-based chemotherapy regimen; AND
Note: Examples are carboplatin with gemcitabine, carboplatin with paclitaxel, cisplatin with gemcitabine.
 - C)** Patient meets one of the following (i or ii):
 - i.** Patient meets both of the following (a and b):
 - a)** Patient has recurrent disease; AND
 - b)** Patient has a *BRCA* mutation; OR
 - ii.** Patient is in complete or partial response to first-line primary treatment.
- 2. Prostate Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has metastatic castration resistant prostate cancer AND
 - C)** Patient has *BRCA* mutation-positive (germline and/or somatic) disease; AND
 - D)** Patient meets one of the following (i or ii):
 - i.** The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog; OR
Note: Examples are leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix subcutaneous injection), Orgovyx (relugolix tablets).
 - ii.** Patient has had a bilateral orchiectomy; AND
 - E)** Patient has been previously treated with at least one androgen receptor-directed therapy; AND
Note: Androgen receptor-directed therapy includes abiraterone, Xtandi (enzalutamide tablets), Nubeqa (darolutamide tablets), or Erleada (apalutamide tablets).
 - F)** Patient meets one of the following (i or ii):
 - i.** Patient has been previously treated with at least one taxane-based chemotherapy; OR
Note: Examples are docetaxel, cabazitaxel.
 - ii.** Patient is not a candidate or is intolerant to taxane-based chemotherapy, according to the prescriber.

Other Uses with Supportive Evidence:

- 3. Pancreatic Adenocarcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has a *BRCA* mutation or *PALB2* mutation; AND

02/07/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- C) Patient meets BOTH of the following (i and ii):
- i. Patient has tried platinum-based chemotherapy; AND
 - ii. Patient has not had disease progression following the most recent platinum-based chemotherapy.
4. **Uterine Leiomyosarcoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- D) Patient is ≥ 18 years of age; AND
 - E) Patient has *BRCA2*-altered disease; AND
 - F) Patient has tried one systemic regimen.
- Note: Examples of a systemic regimen include one or more of the following products: dacarbazine, docetaxel, doxorubicin, gemcitabine, ifosfamide, Yondelis (trabectedin intravenous infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rubraca is not recommended in the following situations:

- 186.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Rydapt Prior Authorization Policy

- Rydapt® (midostaurin capsules – Novartis)

REVIEW DATE: 03/06/2024

OVERVIEW

Rydapt, a tyrosine kinase inhibitor, is indicated in adults for the following uses:¹

- **Acute myeloid leukemia, newly diagnosed, that is FMS-like tyrosine kinase 3 (*FLT3*) mutation-positive** as detected by an FDA-approved test, in combination with standard cytarabine and daunorubicin induction and cytarabine consolidation. Limitations of use: Rydapt is not indicated as a single-agent induction therapy for treatment of patients with acute myeloid leukemia.
- **Aggressive systemic mastocytosis, systemic mastocytosis with associated hematological neoplasm, or mast cell leukemia.**

Guidelines

Rydapt is discussed in the National Comprehensive Cancer Network (NCCN) guidelines:²

- **Acute Myeloid Leukemia:** NCCN guidelines (version 1.2024 – February 28, 2024) recommend Rydapt + standard dose cytarabine and daunorubicin among the treatment options for induction (category 1) and re-induction, consolidation, and post-induction therapy and for relapsed/refractory disease for patients with *FLT3-ITD/TKD* mutation (category 2A).³ It was noted that while Rydapt was not FDA-approved for maintenance therapy, the pivotal trial was designed for consolidation and maintenance for a total of 12 months.
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusion:** NCCN guidelines (version 1.2024 – December 21, 2023) recommend Rydapt for patients with *FGFR1* or *FLT3* rearrangements in chronic phase or blast phase (category 2A).⁴ Rydapt is also recommended for treatment in combination with induction chemotherapy followed by allogeneic hematopoietic cell transplantation (if eligible) for lymphoid, myeloid or mixed lineage neoplasms with eosinophilia and *FGFR1* or *FLT3* rearrangements in blast phase (category 2A).
- **Systemic Mastocytosis:** NCCN guidelines (version 1.2024 – December 21, 2023) recommend Rydapt for the treatment of aggressive systemic mastocytosis, systemic mastocytosis with an associated hematologic neoplasm, and mast cell leukemia (all category 2A).⁵

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rydapt. All approvals are provided for the duration noted below.

Automation: None.

03/06/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rydapt is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 109. Acute Myeloid Leukemia.** Approve for 1 year if the patient meets the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has *FLT3* mutation-positive disease as detected by an approved test.
- 110. Aggressive Systemic Mastocytosis.** Approve for 1 year if the patient is ≥ 18 years of age.
- 111. Mast Cell Leukemia.** Approve for 1 year if the patient is ≥ 18 years of age.
- 112. Systemic Mastocytosis Associated with Acute Hematologic Neoplasm.** Approve for 1 year if the patient is ≥ 18 years of age.

Other Uses With Supportive Evidence

- 113. Myeloid or Lymphoid Neoplasms.** Approve for 1 year if the patient meets the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has eosinophilia; AND
 - C) Patient meets one of the following (i or ii):
 - i. Patient has an *FGFR1* rearrangement; OR
 - ii. Patient has an *FLT3* rearrangement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rydapt is not recommended in the following situations:

- 187.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Scemblix Prior Authorization Policy

- Scemblix® (asciminib tablets – Novartis)

REVIEW DATE: 05/01/2024; selected revision 11/13/2024 and 12/11/2024

OVERVIEW

Scemblix, a kinase inhibitor, is indicated for the following uses:¹

- **Chronic myeloid leukemia (CML)**, Philadelphia chromosome positive (Ph+), chronic phase, in newly diagnosed adults.
- **CML**, Ph+, chronic phase, in adults previously treated).
- **CML**, Ph+, chronic phase with the T315I mutation in adults.

The indication in newly diagnosed patients is approved under accelerated approval based on major molecular response rate. Continued approval for this indication may be contingent upon verification of clinical benefit in a confirmatory trial.

Guidelines

Scemblix is discussed in guidelines from National Comprehensive Cancer Network (NCCN):

- **CML:** NCCN guidelines (version 3.2025 – November 27, 2024) state that for patients with chronic phase CML with a low risk score, the recommended “Preferred” primary treatment includes a first-generation TKI (imatinib) [category 1], a second-generation TKI (Bosulif® [bosutinib tablets], Sprycel® [dasatinib tablets], or Tassigna® [nilotinib capsules] {all category 1}), an allosteric TKI (Scemblix [category 1]), or a clinical trial (category 2A).² For patients with chronic phase CML with an intermediate or high risk score, a second-generation TKI (Bosulif, Sprycel, or Tassigna [all category 1]) or an allosteric TKI (Scemblix [category 1]) is “Preferred”. A first-generation TKI (imatinib) is listed under “Other recommended regimen” (category 2A). Scemblix is recommended under “Useful in certain circumstances” (category 2A) along with imatinib (if second or third generation TKI is contraindicated) for advanced phase CML. Scemblix is a treatment option for chronic phase CML (Ph+ or BCR-ABL1 positive) in patients with the T315I mutation and/or previously treated chronic phase CML (category 2A). Scemblix is contraindicated for use in patients with the following mutations: A337T, P465S, M244V, and F359V/I/C.
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions:** NCCN guidelines (version 1.2024 – December 21, 2023) recommend Scemblix as “other recommended regimens” for *ALB1* rearrangements in chronic phase or blast phase (category 2A). It is also recommended as treatment in combination with acute lymphoblastic leukemia or acute myeloid leukemia-type induction chemotherapy followed by allogeneic hematopoietic stem cell transplantation (HSCT) [if eligible] for lymphoid, myeloid, or mixed lineage neoplasms with eosinophilia and *ABL1* rearrangement in blast phase (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Scemblix. All approvals are provided for the duration noted below.

Automation: None.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Scemblix is recommended in those who meet one of the following criteria:

FDA-Approved Indication

114. Chronic Myeloid Leukemia. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

D) Patient is ≥ 18 years of age; AND

E) Patient has Philadelphia chromosome-positive chronic myeloid leukemia; AND

F) Patient meets ONE of the following (i, ii, or iii):

iv. Patient has newly diagnosed disease; OR

v. The chronic myeloid leukemia is T315I-positive; OR

vi. Patient has tried at least one other tyrosine kinase inhibitor indicated for use in Philadelphia chromosome-positive chronic myeloid leukemia.

Note: Examples of tyrosine kinase inhibitors include imatinib tablets, Bosulif (bosutinib tablets and capsules), Iclusig (ponatinib tablets), Sprycel (dasatinib tablets), and Tasigna (nilotinib capsules).

Other Uses with Supportive Evidence

42. Myeloid/Lymphoid Neoplasms with Eosinophilia. Approve for 1 year if the patient meets BOTH of the following (A and B):

M) Patient is ≥ 18 years of age; AND

N) The tumor has an *ABL1* rearrangement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Scemblix is not recommended in the following situations:

112. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Sorafenib Prior Authorization Policy

- Nexavar® (sorafenib tablets – Bayer/Onyx, generic)

REVIEW DATE: 06/19/2024

OVERVIEW

Sorafenib, a kinase inhibitor, is indicated for the treatment of the following uses:¹

- **Differentiated thyroid carcinoma**, locally recurrent or metastatic, progressive disease that is refractory to radioactive iodine treatment.
- **Hepatocellular carcinoma** that is unresectable.
- **Renal cell carcinoma** that is advanced.

Guidelines

Sorafenib is discussed in the guidelines from the National Comprehensive Cancer Network (NCCN):²

- **Acute Myeloid Leukemia:** NCCN guidelines (version 3.2024 – May 17, 2024) recommend sorafenib + hypomethylating agents (azacitidine or decitabine) for *FLT3*-ITD positive disease for treatment induction or post-induction therapy for patients ≥ 60 years of age and for relapsed/refractory disease (category 2A).³ Single-agent sorafenib is recommended as maintenance therapy for patients who are post-allogeneic stem cell transplantation, in remission, and have a *FLT3*-ITD mutation (category 2A).
- **Bone Cancer:** NCCN guidelines (version 2.2024 – March 12, 2024) recommend sorafenib as a systemic therapy agent, “useful in certain circumstances”, for recurrent chordoma (category 2A).⁴ It also recommends sorafenib for osteosarcoma as a second-line therapy for relapsed/refractory or metastatic disease as a “preferred regimen” (category 2A) and as “other recommended regimens” in combination with everolimus (category 2B).
- **Gastrointestinal Stromal Tumor:** NCCN guidelines (version 1.2024 – March 8, 2024) recommend sorafenib (category 2A) as an additional option, “useful in certain circumstances”, after failure on approved therapies.⁵ The first-line preferred therapies are imatinib or Ayvakit™ (avapritinib tablets; for patients with *PDGFRA* exon 18 mutation, including the *PDGFRA* D842V mutation); second-line therapy is sunitinib or Sprycel® (dasatinib tablets) [for patients with *PDGFRA* exon 18 mutation that are insensitive to imatinib (including the *PDGFRA* D842V mutation); third-line therapy is Stivarga® (regorafenib tablets); fourth-line therapy is Qinlock® (ripretinib tablets).
- **Hepatocellular Carcinoma:** NCCN guidelines (version 1.2024 – April 9, 2024) recommend sorafenib as a first-line systemic therapy option as “other recommended regimens” for Child-Pugh Class A (category 1) or Child Pugh Class B7 (category 2A) and as a subsequent-line therapy if disease progression for Child Pugh Class A or B7 (category 2A) for unresectable, inoperable, or metastatic hepatocellular carcinoma.⁶ The guidelines note that there is limited safety data available for Child-Pugh Class B or C patients, and the dosing is uncertain; this drug should be used with extreme caution in patients with elevated bilirubin levels. The impact of sorafenib on patients potentially eligible for transplant is unknown.
- **Kidney Cancer:** NCCN guidelines (version 4.2024 – May 30, 2024) no longer recommend sorafenib as a treatment option for kidney cancer.⁷ Approval condition left in policy due to FDA approved indication.

06/19/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Gene Fusions:** NCCN guidelines (version 1.2024 – December 21, 2023) recommend sorafenib for myeloid/lymphoid neoplasms with *FLT3* rearrangements (category 2A).⁸
- **Ovarian Cancer Including Fallopian Tube Cancer and Primary Peritoneal Cancer:** NCCN guidelines (version 2.2024 – May 13, 2024) recommend sorafenib + topotecan (category 2A) as “Other Recommended Regimen” option as recurrence therapy for platinum-resistant disease.⁹
- **Soft Tissue Sarcoma:** NCCN guidelines (version 1.2024 – April 26, 2024) recommend sorafenib as single-agent therapy under “useful in certain circumstances” for angiosarcoma (category 2A); sorafenib as a “preferred” single-agent regimen for desmoid tumors (aggressive fibromatosis) (category 1) and for solitary fibrous tumor (category 2A).¹⁰
- **Thyroid Carcinoma:** NCCN guidelines (version 2.2024 – March 12, 2024) for differentiated thyroid carcinoma recommend sorafenib as “other recommended regimens” for progressive and/or symptomatic disease for locally recurrent, advanced, and/or metastatic disease not amenable to radioactive iodine therapy (category 1).¹¹ Sorafenib can be considered for treatment of progressive or symptomatic medullary thyroid disease if clinical trials or preferred systemic therapy options are not available or appropriate, or if there is progression on preferred systemic therapy options.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of sorafenib. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of sorafenib is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 115. Hepatocellular Cancer.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has unresectable or metastatic disease.
- 116. Renal Cell Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed or advanced disease; AND
 - C) Patient has clear cell histology AND
 - D) Patient has tried at least one systemic therapy.
- Note: Examples of systemic therapy include Inlyta (axitinib tablets), pazopanib, sunitinib, Cabometyx (cabozantinib tablets).
- 117. Thyroid Carcinoma, Differentiated.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has differentiated thyroid carcinoma; AND
- Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).

C) The disease is refractory to radioactive iodine therapy.

Other Uses with Supportive Evidence

118. Acute Myeloid Leukemia. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has *FLT3*-ITD mutation-positive disease as detected by an approved test; AND

C) Patient meets ONE of the following (i or ii):

i. This medication is used in combination with azacitidine or decitabine; OR

ii. Patient has had an allogeneic stem cell transplant and is in remission.

5. Bone Cancer. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i or ii):

i. Patient has recurrent chordoma; OR

ii. Patient meets BOTH of the following (a and b):

a) Patient has osteosarcoma; AND

b) Patient has tried one systemic chemotherapy regimen.

Note: Examples of a systemic chemotherapy regimen contain one of more of the following products: cisplatin, doxorubicin, methotrexate, or ifosfamide.

6. Gastrointestinal Stromal Tumor. Approve for 1 year if the patient meets BOTH of the following (A and B):

E) Patient is ≥ 18 years of age; AND

F) Patient has previously tried ALL of the following (i, ii, iii, and iv):

i. One of imatinib or Ayvakit (avapritinib tablets); AND

ii. One of sunitinib or Sprycel (dasatinib tablets); AND

iii. Stivarga (regorafenib tablets); AND

iv. Qinlock (ripretinib tablets).

7. Myeloid/Lymphoid Neoplasms with Eosinophilia. Approve for 1 year if the patient meets BOTH of the following (A and B):

O) Patient is ≥ 18 years of age; AND

P) The tumor has an *FLT3* rearrangement.

8. Ovarian, Fallopian Tube, Primary Peritoneal Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has platinum-resistant disease; AND

C) Sorafenib is used in combination with topotecan.

9. Soft Tissue Sarcoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has ONE of the following diagnoses (i, ii, or iii):

i. Angiosarcoma; OR

ii. Desmoid tumors (aggressive fibromatosis); OR

iii. Solitary Fibrous Tumor/Hemangiopericytoma.

10. Thyroid Carcinoma, Medullary. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has tried at least one systemic therapy.

Note: Examples of systemic therapy include: Caprelsa (vandetanib tablets), Cometriq (cabozantinib capsules), Retevmo (selpercatinib capsules), and Gavreto (pralsetinib capsules).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nexavar is not recommended in the following situations:

188. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Stivarga Prior Authorization Policy

- Stivarga® (regorafenib tablets – Bayer)

REVIEW DATE: 03/06/2024

OVERVIEW

Stivarga, a kinase inhibitor, is indicated for the following uses:¹

- **Colorectal cancer**, metastatic, in patients who have been previously treated with fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapy, an anti-vascular endothelial growth factor (VEGF) therapy, and, if RAS wild-type, an anti-epidermal growth factor receptor (EGFR) therapy.
- **Gastrointestinal stromal tumor**, locally advanced, unresectable, or metastatic in patients who have been previously treated with imatinib and sunitinib.
- **Hepatocellular carcinoma**, in patients who have been previously treated with sorafenib.

Guidelines

Stivarga is discussed in National Comprehensive Cancer Network (NCCN) guidelines:²

- **Bone Cancer:** NCCN guidelines (version 1.2024 – August 7, 2023) recommend Stivarga as a single agent “Preferred Regimen” for second-line therapy for relapsed/refractory or metastatic disease for patients with osteosarcoma (category 1).³ Stivarga is also recommended under “Other Recommended Regimens” for second-line treatment (relapsed/refractory or metastatic disease) of Ewing sarcoma (category 2A).
- **Central Nervous System Cancers:** NCCN guidelines (version 1.2023 – March 24, 2023) recommend Stivarga as a single agent “Preferred Regimen” for the treatment of recurrent or progressive glioblastoma (category 2A).⁴
- **Colon Cancer and Rectal Cancer:** NCCN guidelines (colon cancer [version 1.2024 – January 29, 2024] and rectal cancer [version 1.2024 – January 29, 2024]) recommend Stivarga as subsequent therapy as a single agent for advanced or metastatic disease not previously treated with Stivarga in patients who have progressed through all available regimens except Stivarga or Lonsurf® (trifluridine and tipiracil tablets) with or without bevacizumab.^{5,6} Stivarga may be given before or after Lonsurf. Appendiceal adenocarcinoma are treated similarly to colon cancer.
- **Gastrointestinal Stromal Tumors:** NCCN guidelines (version 1.2023 – March 13, 2023) recommend Stivarga as a “Preferred Regimen” in the third-line setting (category 1) for treatment of unresectable, progressive, or metastatic disease with after single-agent therapy with imatinib or sunitinib [both category 1].⁷ Ayvakit® (avapritinib tablets) is a “Preferred Regimen” in the first-line setting for GIST with *PDGFRA* exon 19 mutations that are insensitive to imatinib (including *PDGFRA* D842V). Stivarga in combination with everolimus tablets is recommended as “Useful in Certain Circumstances” for unresectable, recurrent, or metastatic disease after failure on approved therapies. Stivarga is also recommended as “Useful in Certain Circumstances” for unresectable, *succinate dehydrogenase*-deficient disease (category 2A).⁷
- **Hepatocellular Carcinoma:** NCCN guidelines (version 2.2023 – September 14, 2023) recommend Stivarga for subsequent treatment as a single agent for patients with hepatocellular carcinoma (adenocarcinoma) [Child-Pugh Class A only] and disease progression for the following uses (all are category 1): in patients who are not transplant candidates with unresectable disease; in patients who have liver-confined disease, inoperable by performance status or comorbidity or

03/06/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

with minimal or uncertain extrahepatic disease; or in patients who have extensive liver tumor burden or metastatic disease.⁸

- **Soft Tissue Sarcoma:** NCCN guidelines (version 3.2023 – December 12, 2023) recommend Stivarga as a single-agent subsequent therapy for patients with non-adipocytic sarcoma with advanced/metastatic disease, advanced/metastatic pleomorphic rhabdomyosarcoma, or angiosarcoma (all category 2A).⁹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Stivarga. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Stivarga is recommended in those who meet one of the following criteria:

FDA-Approved Indications

119. Colon, Rectal and Appendiceal Cancer. Approve for 1 year if the patient meets all of the following (A, B, C, D, E, and F):

II) Patient is ≥ 18 years of age; AND

JJ) Patient has advanced or metastatic disease; AND

KK) Patient has been previously treated with a fluoropyrimidine (e.g., capecitabine, 5-fluorouracil [5-FU]); AND

LL) Patient has been previously treated with oxaliplatin; AND

MM) Patient has been previously treated with irinotecan; AND

NN) Patient meets one of the following (i or ii):

i. Patient's tumor or metastases are wild-type *RAS* (*KRAS* wild-type and *NRAS* wild-type) and the patient meets one of the following (a or b):

Note: This includes tumors or metastases that are *KRAS* and *NRAS* mutation-negative.

a) The patient has tried Erbitux (cetuximab intravenous infusion) or Vectibix (panitumumab intravenous infusion); OR

b) The patient's tumor did not originate on the left side of the colon (from the splenic flexure to rectum); OR

ii. The patient's tumor has or metastases have a *RAS* mutation (either *KRAS* mutation or *NRAS* mutation).

2. Gastrointestinal Stromal Tumor. Approve for 1 year if the patient meets the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried both of the following (i and ii):

i. Imatinib or Ayvakit (avapritinib tablets); AND

ii. Sunitinib or Sprycel (dasatinib tablets).

3. Hepatocellular Carcinoma. Approve for 1 year if the patient meets the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has been previously treated with one systemic regimen.

Note: Examples of a systemic regimen include: Tecentriq (atezolizumab intravenous infusion), bevacizumab, sorafenib, Lenvima (lenvatinib capsules), Opdivo (nivolumab intravenous infusion), Imjudo (tremelimumab-actl intravenous infusion), Imfinzi (durvalumab intravenous infusion).

Other Uses with Supportive Evidence

4. **Glioblastoma.** Approve for 1 year if the patient meets the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has recurrent or progressive disease.
5. **Bone Cancer.** Approve for 1 year if the patient meets all of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed/refractory or metastatic disease; AND
 - C) Patient has tried one systemic chemotherapy regimen; AND
Note: Examples of a systemic chemotherapy regimen contain one of more of the following: cisplatin, doxorubicin, methotrexate, ifosfamide, cyclophosphamide, etoposide, topotecan, irinotecan, vincristine, temozolomide.
 - D) Patient meets ONE of the following (i or ii):
 - i. Patient has Ewing sarcoma; OR
 - ii. Patient has osteosarcoma.
6. **Soft Tissue Sarcoma.** Approve for 1 year if the patient meets the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced or metastatic disease; AND
 - C) Patient has one of the following (i, ii, or iii):
 - i. Non-adipocytic sarcoma; OR
 - ii. Pleomorphic rhabdomyosarcoma; OR
 - iii. Angiosarcoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Stivarga is not recommended in the following situations:

189. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Sunitinib Prior Authorization Policy

- Sutent® (sunitinib malate capsules – Pfizer; generic)

REVIEW DATE: 07/17/2024

OVERVIEW

Sunitinib, a kinase inhibitor, is indicated in adults for the following uses:¹

- **Gastrointestinal stromal tumor (GIST)**, after disease progression on or intolerance to imatinib mesylate tablets.
- **Pancreatic neuroendocrine tumors**, that is progressive and well-differentiated in patients with unresectable locally advanced or metastatic disease.
- **Renal cell carcinoma**, advanced, and for the adjuvant treatment of patients at high risk of recurrent renal cell carcinoma following nephrectomy.

Guidelines

Sunitinib is discussed in the guidelines from the National Comprehensive Cancer Network (NCCN):²⁻¹¹

- **Bone Cancer:** NCCN guidelines (version 2.2024 – March 12, 2024) recommend sunitinib as a systemic therapy agent for recurrent chordoma (category 2A).³
- **Central Nervous System Cancers:** NCCN guidelines (version 1.2024 – May 31, 2024) recommend sunitinib for meningioma for surgically inaccessible recurrent or progressive disease when radiation is not possible (category 2B).⁴
- **Gastrointestinal Stromal Tumor (GIST):** NCCN guidelines (version 1.2024 – March 8, 2024) recommend sunitinib as preferred second-line therapy for unresectable, progressive, or metastatic disease (category 1).⁵ The first-line therapies include imatinib or Ayvakit™ (avapritinib tablets; for GIST with *PDGFRA* exon 18 mutation that are insensitive to imatinib, including the *PDGFRA* D842V mutation).⁵ The guidelines also state in a footnote that for unresectable disease, sunitinib, Stivarga® (regorafenib tablets) and Votrient® (pazopanib tablets) are special considerations for succinate dehydrogenase (SDH)-deficient GIST (category 2A). Sunitinib is also recommended in combination with everolimus as “useful in certain circumstances” for unresectable, recurrent/progressive, or metastatic disease after progression on approved therapies (category 2A).
- **Kidney Cancer:** NCCN guidelines (version 1.2025 – July 1, 2024) recommend single-agent sunitinib as adjuvant treatment following nephrectomy for stage 3 disease with clear cell histology (category 3).⁶ NCCN guidelines also recommend single-agent sunitinib for relapse or stage IV disease as a first-line and subsequent therapy option for clear cell histology and as a “preferred” systemic therapy option for non-clear cell histology (all category 2A).⁶
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Fusion Genes:** NCCN guidelines (version 2.2024 – June 19, 2024) recommend sunitinib for myeloid/lymphoid neoplasms with *FLT3* rearrangements (category 2A).⁷
- **Neuroendocrine and Adrenal Tumors:** NCCN guidelines (version 1.2024 – June 20, 2024) recommend sunitinib as a “preferred” single-agent for the management of recurrent, locoregional advanced disease and/or distant metastatic disease (category 1 for progressive disease; category 2A for all others).⁸ NCCN guidelines also recommend sunitinib for treatment (pancreas only) of unresectable locally advanced/metastatic disease with favorable biology (e.g. relatively low Ki-67 [$<55\%$], positive SSR-based PET imaging) that has clinically significant tumor burden or evidence of progression (category 2A). Sunitinib is also recommended as a single agent for locally unresectable or distant metastatic pheochromocytoma and paraganglioma.⁸

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Soft Tissue Sarcoma:** NCCN guidelines (version 1.2024 – April 26, 2024) recommend sunitinib as a single agent therapy as “useful in certain circumstances” for angiosarcoma (category 2A).⁹ The guidelines also recommend sunitinib as a preferred single agent therapy for alveolar soft part sarcoma and for solitary fibrous tumor (both category 2A).⁹
- **Thymomas and Thymic Carcinomas:** NCCN guidelines (version 1.2024 – November 21, 2023) recommend single agent sunitinib as “Preferred” second-line systemic therapy for thymic carcinoma (category 2A).¹⁰
- **Thyroid Carcinoma:** NCCN guidelines (version 3.2024 – June 18, 2024) recommend sunitinib as one of the kinase inhibitors to be considered if clinical trials or other systemic therapies are not available or appropriate for the treatment of progressive and/or symptomatic iodine refractory thyroid cancer.¹¹ This recommendation is for follicular, oncocytic (formerly Hürthle cell carcinoma), and papillary cancer subtypes (all category 2A). Sunitinib can also be considered for treatment of progressive or symptomatic medullary thyroid disease if clinical trials or preferred systemic therapy options are not available or appropriate, or if there is disease progression on preferred systemic therapy options (category 2A).¹¹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of sunitinib. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sunitinib is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Gastrointestinal Stromal Tumor.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient has tried imatinib or Ayvakit (avapritinib tablets); OR
 - ii. Patient has succinate dehydrogenase (SDH)-deficient gastrointestinal stromal tumor.
120. **Neuroendocrine Tumors of the Pancreas.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - C) Patient is ≥ 18 years of age; AND
 - D) Patient has advanced or metastatic disease.
121. **Renal Cell Cancer.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed or advanced disease.

Other Uses with Supportive Evidence

4. **Bone Cancer.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has recurrent chordoma.
5. **Meningioma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has recurrent or progressive disease.
6. **Myeloid/Lymphoid Neoplasms.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - Q) Patient is ≥ 18 years of age; AND
 - R) Patient has eosinophilia; AND
 - S) The tumor has an *FLT3* rearrangement.
7. **Pheochromocytoma/Paraganglioma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has unresectable or metastatic disease.
8. **Soft Tissue Sarcoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has ONE of the following diagnosis (i, ii, or iii):
 - i. Alveolar soft part sarcoma; OR
 - ii. Angiosarcoma; OR
 - iii. Solitary fibrous tumor/Hemangiopericytoma.
9. **Thymic Carcinoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has tried at least one systemic chemotherapy regimen.
Note: Examples of a systemic chemotherapy regimen include one or more of the following products: carboplatin, paclitaxel, cisplatin, doxorubicin, cyclophosphamide, or etoposide.
10. **Thyroid Carcinoma, Differentiated.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has differentiated thyroid carcinoma; AND
Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).
 - C) Patient is refractory to radioactive iodine therapy.
11. **Thyroid Carcinoma, Medullary.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has tried at least one systemic therapy.
Note: Examples of systemic therapy include: Caprelsa (vandetanib tablets), Cometriq (cabozantinib capsules), Retevmo (selpercatinib capsules), and Gavreto (pralsetinib capsules).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of sunitinib is not recommended in the following situations:

- 190.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tabrecta Prior Authorization Policy

- Tabrecta® (capmatinib tablets – Novartis)

REVIEW DATE: 02/07/2024

OVERVIEW

Tabrecta, a kinase inhibitor, is indicated for the treatment of metastatic **non-small cell lung cancer (NSCLC)** in adults whose tumors have a mutation that leads to mesenchymal-epithelial transition (*MET*) exon 14 skipping as detected by an FDA-approved test.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 1.2024 – December 21, 2023) recommend Tabrecta (category 2A) as a “Preferred” first-line or subsequent line treatment option for patients with advanced or metastatic NSCLC who are positive for *MET* exon 14 skipping mutations or high-level *MET* amplification.²

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tabrecta. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tabrecta is recommended in those who meet the following criteria:

FDA-Approved Indication

43. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has advanced or metastatic disease; AND
- C) Patient meets one of the following (i or ii):
 - i. Patient has mesenchymal epithelial transition (*MET*) exon 14 skipping mutations as detected by an approved test; OR
 - ii. Patient has high-level *MET* amplification as detected by an approved test.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tafinlar Prior Authorization Policy

- Tafinlar® (dabrafenib capsules and tablets for oral suspension – Novartis)

REVIEW DATE: 04/24/2024

OVERVIEW

Tafinlar, a BRAF inhibitor, is indicated for the following uses:¹

- **Low-grade glioma**, in combination with Mekinist® (trametinib tablets and oral solution), for the treatment of pediatric patients ≥ 1 year of age with a BRAF V600E mutation who require systemic therapy.
- **Melanoma**, in the following situations:¹
 - As a single agent for unresectable or metastatic disease with *BRAF V600E* mutation as detected by an FDA-approved test.
 - In combination with Mekinist, for unresectable or metastatic disease with a *BRAF V600E* or *V600K* mutation, as detected by an FDA-approved test.
 - In combination with Mekinist, as adjuvant treatment of *BRAF V600E* or *V600K* mutation-positive disease as detected by an FDA-approved test, with involvement of the lymph node(s), following complete resection.
- **Non-small cell lung cancer**, in combination with Mekinist for disease that has the *BRAF V600E* mutation as detected by an FDA-approved test.
- **Solid tumors - unresectable or metastatic**, in combination with Mekinist, for *BRAF V600E* mutation-positive disease, as determined by an FDA-approved test, in patients ≥ 1 year of age who have no satisfactory alternative treatment options.
- **Thyroid cancer**, in combination with Mekinist, for locally advanced or metastatic anaplastic disease with *BRAF V600E* mutation and with no satisfactory locoregional treatment options.

Limitations of Use: Tafinlar is not indicated for treatment of patients with colorectal cancer because of the known intrinsic resistance to BRAF inhibition. Tafinlar is not indicated for treatment of patients with wild-type BRAF solid tumors.

Dosing: For the tablet dosage form, Tafinlar has dosing for patients who are adults and for patients who are between 6 and 17 years of age and weigh ≥ 26 kg. The oral solution dosage form also has weight-based dosing for patients ≥ 8 kg.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use in multiple cancers.

- **Central Nervous System Cancers:** Guidelines (version 1.2023 – March 24, 2023) recommend a BRAF/MEK inhibitor combination (i.e., Tafinlar/Mekinist or Zelboraf® [vemurafenib tablets]/Cotellic® [cobimetinib tablets]) for treatment of *BRAF V600E* activation mutations in adults in the following situations: adjuvant treatment of pilocytic astrocytoma, pleomorphic xanthoastrocytoma, or ganglioglioma; recurrent or progressive low-grade glioma, oligodendroglioma, or isocitrate dehydrogenase-2 (*IDH2*)-mutant astrocytoma; and recurrent glioblastoma. BRAF/MEK combination therapy is also recommended for melanoma with brain metastases.⁶ Guidelines for pediatric central nervous system (CNS) cancers (version 1.2024 – February 26, 2024) include targeted therapy with Tafinlar + Mekinist as adjuvant therapy or for recurrent or progressive disease, if the cancer has a *BRAF V600E* mutation.⁹

04/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Histiocytic Neoplasms:** Guidelines (version 1.2024 – March 15, 2024) recommend Zelboraf as “preferred” or Tafenlar as “other recommended regimen” for *BRAF V600E*-mutated Erdheim-Chester disease, and for multisystem, pulmonary, or CNS Langerhans cell histiocytosis.⁵
- **Melanoma, Cutaneous:** Guidelines (version 2.2024 – April 3, 2024) recommend BRAF/MEK inhibitor combinations among the “preferred” therapies for first-line and subsequent treatment of metastatic or unresectable melanoma with a *V600*-activating mutation.² While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor is an option. Tafenlar + Mekinist is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafenlar/Mekinist, other BRAF/MEK combinations can be considered.
- **Non-Small Cell Lung Cancer:** Guidelines (version 5.2024 – April 23, 2024) list Tafenlar + Mekinist among the first-line therapy and subsequent therapy options for tumors with a *BRAF* mutation.³ NCCN also notes that monotherapy with a BRAF inhibitor (Tafenlar or Zelboraf) is a treatment option when combination therapy is not tolerated.

The NCCN Compendium⁷ recommends use of Tafenlar, in combination with Mekinist, for the following *BRAF V600* positive tumors (all category 2A): High-grade gliomas, ampullary adenocarcinoma, neuroendocrine tumors, occult primary, pancreatic adenocarcinoma, salivary gland tumors, ovarian/fallopian tube/primary peritoneal cancer, hairy cell leukemia, esophageal and esophagogastric junction cancers, gastric cancer, biliary tract cancers, small bowel adenocarcinoma, gastrointestinal stromal tumors, brain metastases due to melanoma, and differentiated thyroid carcinoma.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tafenlar. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tafenlar is recommended in those who meet one of the following criteria:

FDA-Approved Indications

3. **Low Grade Glioma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 1 year of age; AND
 - B) Patient has *BRAF V600* mutation-positive disease; AND
 - C) The medication will be taken in combination with Mekinist (trametinib tablets or oral solution); AND
 - D) Patient requires systemic therapy.

4. **Melanoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
A) Patient has unresectable, advanced (including Stage III or Stage IV disease), or metastatic melanoma; AND
Note: This includes adjuvant treatment in patients with Stage III disease with no evidence of disease post-surgery.
B) Patient has *BRAF V600* mutation-positive disease.
5. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient has *BRAF V600* mutation-positive disease.
6. **Solid Tumors – Unresectable or Metastatic.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
Note: Examples of solid tumors are: biliary tract cancer, brain metastases due to melanoma, high-grade gliomas, ovarian/fallopian tube/primary peritoneal cancer, differentiated thyroid carcinoma, gastrointestinal stromal tumors, gastric cancer, esophageal and esophagogastric junction cancers, salivary gland tumors, occult primary, pancreatic adenocarcinoma, neuroendocrine tumors, and ampullary adenocarcinoma.
E) Patient is ≥ 1 year of age; AND
F) Patient has *BRAF V600* mutation-positive disease; AND
G) The medication will be taken in combination with Mekinist (trametinib tablets or oral solution); AND
H) According to the prescriber, the patient has no satisfactory alternative treatment options.
7. **Thyroid Carcinoma, Anaplastic.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
D) Patient has locally advanced or metastatic anaplastic disease; AND
E) Patient has *BRAF V600* mutation-positive disease; AND
F) The medication will be taken in combination with Mekinist (trametinib tablets or oral solution), unless intolerant.

Other Uses with Supportive Evidence

8. **Hairy Cell Leukemia.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
A) Patient has not been previously treated with a *BRAF* inhibitor therapy; AND
B) The medication will be used for relapsed/refractory disease; AND
C) The medication will be taken in combination with Mekinist (trametinib tablets and oral solution).
9. **Histiocytic Neoplasm.** Approve for 1 year if the patient meets BOTH of the following (A and B):
C) Patient meets one of the following (i or ii):
i. Patient has Langerhans cell histiocytosis AND one of the following (a, b, or c):
i. Multisystem disease; OR
ii. Pulmonary disease; OR
iii. Central nervous system lesions; OR
ii. Patient has Erdheim-Chester disease; AND
D) Patient has *BRAF V600*-mutation positive disease.

8. **Small Bowel Adenocarcinoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- B)** Patient meets BOTH of the following (i and ii):
- i. Patient has *BRAF V600E* mutation-positive advanced or metastatic disease; AND
 - ii. The medication will be taken in combination with Mekinist (trametinib tablets and oral solution); AND
- B)** Patient meets ONE of the following (i or ii):
- ii. Patient meets BOTH of the following (a and b):
 - c) The medication will be used as initial therapy; AND
 - d) Patient has received previous FOLFOX/CAPEOX therapy in the adjuvant setting within the past 12 months or has a contraindication; OR
 - ii. The medication will be used as second-line and subsequent therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tafenlar is not recommended in the following situations:

1. **Colon or Rectal Cancer.** Tafenlar is not indicated for treatment of patients with colorectal cancer because of known intrinsic resistance to BRAF inhibition.¹
2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tagrisso Prior Authorization Policy

- Tagrisso® (osimertinib tablets – AstraZeneca)

REVIEW DATE: 01/31/2024; selected revision 10/16/2024

OVERVIEW

Tagrisso, a tyrosine kinase inhibitor, is indicated for the following uses:¹

- **Non-Small Cell Lung Cancer (NSCLC) – Epidermal growth factor receptor (*EGFR*) Mutation-Positive:**
 - First-line treatment of **metastatic NSCLC** tumors that have *EGFR* exon 19 deletions or exon 21 L858R mutations, as detected by an FDA-approved test, in adults.
 - Tagrisso, **in combination with Alimta** (pemetrexed for intravenous use) **and platinum-based chemotherapy** is indicated for the first-line treatment of locally advanced or metastatic NSCLC that have *EGFR* exon 19 or exon 21 L858R mutations, as detected by an FDA-approved test, in adults.
- **NSCLC – *EGFR* T790M Mutation-Positive:** Treatment of metastatic *EGFR* T790M mutation-positive NSCLC, as detected by an FDA-approved test, in adults whose disease has progressed on or after *EGFR* tyrosine kinase inhibitor (TKI) therapy.
- **NSCLC – *EGFR* Mutation-Positive, Post Tumor Resection:** Adjuvant therapy after tumor resection in adults with NSCLC whose tumors have *EGFR* exon 19 deletions or exon 21 L858R mutations, as detected by an FDA-approved test.
- **NSCLC – *EGFR* Mutation-Positive, Unresectable (Stage III) Disease:** Treatment of locally advanced, unresectable (stage III) NSCLC in adults whose disease has not progressed during or following concurrent or sequential platinum-based chemoradiation therapy and whose tumors have *EGFR* exon 19 deletions or exon 21 L858R mutations, as detected by an FDA-approved test.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 10.2024 – September 23, 2024) recommend testing for *EGFR* mutations in patients with metastatic disease.² The most common *EGFR* mutations are exon 19 deletion and exon 21 (L858R) substitution mutations. Other less common mutations that are also responsive to *EGFR* tyrosine kinase inhibitors (TKIs) include L861Q, G719X, and S768I. NCCN recommends Tagrisso as the “Preferred” first-line treatment for patients with *EGFR* exon 19 deletion or exon 21 (L858R) substitution mutations. Tagrisso can also be used in combination with Alimta® (pemetrexed for injection) and either cisplatin or carboplatin in the first-line setting (category 1, “Other Recommended” regimens). Tagrisso is also a recommended “Preferred” first-line therapy (category 2A) for *EGFR* mutations L861Q, G719X, and S768I. Tagrisso is also recommended as subsequent treatment for all of these mutations. The panel recommends T790M (a secondary mutation in *EGFR*) testing in patients who progress on erlotinib tablets, Gilotrif® (afatinib tablets), Iressa® (gefitinib tablets), or Vizimpro® (dacomitinib tablets). If the patient has *EGFR* T790M-positive metastatic NSCLC, Tagrisso is recommended as subsequent therapy (category 1). If the disease is *EGFR* T790M-negative, the patient can be continued on the current TKI (i.e., erlotinib, Gilotrif, Iressa, or Vizimpro). Tagrisso is also recommended for use in patients with completely resected stage IB-IIIA *EGFR* (exon 19 deletion, L858R) NSCLC who received previous adjuvant chemotherapy or are ineligible to receive platinum-based chemotherapy. Tagrisso is recommended for stage IIIA unresectable disease (category 1) after definitive chemoradiation for *EGFR* exon 19 deletion or L858R mutation. A footnote also states that for patients who

have received sequential chemoradiation, Imfinzi (durvalumab intravenous infusion) can be considered, or if *EGFR* exon 19 deletion or L858R, Tagrisso is recommended.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tagrisso. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tagrisso is recommended in those who meet one of the following criteria:

FDA-Approved Indications

122. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets ALL of the following (A, B and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has advanced or metastatic disease; AND

C) Patient meets ONE of the following (i or ii):

i. Patient has epidermal growth factor receptor (*EGFR*) mutation-positive disease as detected by an approved test; OR

Note: Examples of *EGFR* mutation-positive non-small cell lung cancer include the following: exon 19 deletion, exon 21 (L858R) substitution mutations, L861Q, G719X, and S768I.

ii. Patient meets BOTH of the following (a and b):

a) Patient has epidermal growth factor receptor (*EGFR*) T790M mutation-positive disease as detected by an approved test; AND

b) Patient has progressed on treatment with at least one of the *EGFR* tyrosine kinase inhibitors.

Note: *EGFR* tyrosine kinase inhibitors are erlotinib, Iressa (gefitinib tablets), Vizimpro (dacomitinib tablets), Gilotrif (afatinib tablets).

2. Non-Small Cell Lung Cancer – Post Tumor Resection. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Patient has completely resected disease; AND

C) Patient has *EGFR* exon 19 deletion or exon 21 (L858R) substitution mutation as detected by an approved test; AND

D) Patient meets ONE of the following (i or ii):

i. Patient received previous adjuvant chemotherapy; OR

ii. Patient is ineligible to receive platinum-based chemotherapy.

3. Non-Small Cell Lung Cancer – Unresectable, Stage III. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Patient has locally advanced, unresectable (stage III) disease; AND

C) Patient has *EGFR* exon 19 deletions or exon 21 (L858R) substitution mutation as detected by an approved test; AND

- D)** Patient has not had disease progression during or following platinum-based chemoradiation therapy.

Note: Patient could have received concurrent or sequential chemoradiation therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tagrisso is not recommended in the following situations:

- 191.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Talzenna Prior Authorization Policy

- Talzenna® (talazoparib capsules and liquid-filled soft gelatin capsules – Pfizer)

REVIEW DATE: 12/13/2023; selected revision 05/15/2024

OVERVIEW

Talzenna, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicated for the following uses:¹

- **Breast cancer**, for the treatment of deleterious or suspected deleterious germline BReast CAncer susceptibility gene (BRCA)-mutated human epidermal growth factor receptor 2 (HER2)-negative locally-advanced or metastatic breast cancer in adults.
- **Prostate cancer**, for the treatment of homologous recombination repair (HRR) gene-mutated metastatic castration-resistant prostate cancer (mCRPC) in combination with Xtandi® (enzalutamide capsules or tablets) in adults.

GUIDELINES

Talzenna is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Breast Cancer:** NCCN guidelines (version 5.2023 – December 5, 2023) recommend Talzenna for patients with recurrent unresectable (local or regional) or Stage IV disease breast cancer with hormone receptor-positive, HER2-negative disease with visceral crisis or endocrine-refractory, germline *BRCA1/2* mutation as a “Preferred Regimen” (category 1).² Lynparza® (olaparib tablets) is another “Preferred Regimen” in this setting (category 1). There is a footnote which states PARP inhibitors can be considered for a later line for those with *BRCA1/2* mutation, however, available evidence suggests it is more effective if used earlier. Talzenna is also recommended as a single-agent for recurrent, unresectable, or stage IV HER2-positive disease with a *BRCA1/2* mutation (category 2A). The guidelines note that although Talzenna and Lynparza are FDA-approved for HER2-negative disease, the NCCN Panel supports use of these agents in any subtype associated with a germline *BRCA1/2* mutation. For triple negative breast cancer with germline *BRCA1/2* mutation, Talzenna and Lynparza are listed as a “Preferred Regimens” in the first-line setting for patients with programmed cell death ligand 1 combined positive score (PD-L1 CPS) < 10 (category 1), and also in the second-line setting (category 1).
- **Prostate Cancer:** NCCN guidelines (version 4.2023 – September 7, 2023) recommend Talzenna + Xtandi for HRR mutation (category 1) as “Useful in Certain Circumstances” in the first-line setting for mCRPC. For patients who have received prior novel hormone therapy and no prior docetaxel therapy, Talzenna + Xtandi is recommended for HRR mutation (category 2B) as “Useful in Certain Circumstances”. For patients who have received prior docetaxel therapy and no prior novel hormone therapy, Talzenna + Xtandi is recommended for HRR mutation (category 2A) as “Useful in Certain Circumstances”.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Talzenna. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Talzenna is recommended in those who meet one of the following criteria:

FDA-Approved Indication

2. **Breast Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has recurrent or metastatic breast cancer; AND
 - C) Patients has germline *BRCA* mutation-positive disease.
3. **Prostate Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
 - F) Patient is ≥ 18 years of age; AND
 - G) Patient has metastatic castration resistant prostate cancer; AND
 - H) Patient meets ONE of the following criteria (i or ii):
 - i. The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog;
OR
Note: Examples are leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), Orgovyx (relugolix tablets).
 - ii. Patient has had a bilateral orchiectomy; AND
 - I) Patient has homologous recombination repair (HRR) gene-mutated disease; AND
Note: HRR gene mutations include *ATM*, *ATR*, *BRCA1*, *BRCA2*, *CDK12*, *CHEK2*, *FANCA*, *MLH1*, *MRE11A*, *NBN*, *PALB2*, or *RAD51C*
 - J) The medication is used in combination with Xtandi (enzalutamide capsules and tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Talzenna is not recommended in the following situations:

192. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tazverik Prior Authorization Policy

- Tazverik® (tazemetostat tablets – Epizyme)

REVIEW DATE: 03/06/2024

OVERVIEW

Tazverik, an EZH2 inhibitor, is approved in the following conditions:¹

- **Epithelioid sarcoma**, metastatic or locally advanced disease not eligible for complete resection in patients ≥ 16 years of age.
- **Follicular lymphoma**, in the following situations:
 - Relapsed or refractory disease, positive for an EZH2 mutation as detected by an approved test and in adults who have received at least two prior systemic therapies.
 - Relapsed or refractory disease, with no satisfactory alternative treatment options in adults.

These indications are approved under accelerated approval based on overall response rate and duration of response. Continued approval may be contingent upon verification and description of clinical benefit in confirmatory trial(s).

Guidelines

Tazverik is addressed in the following guidelines from the National Comprehensive Cancer Network:

- **Epithelioid Sarcoma:** Guidelines for soft tissue sarcoma (version 3.2023 – December 12, 2023) recommend Tazverik as a “Preferred” therapy (category 2A) for treatment of metastatic or locally advanced epithelioid sarcoma not eligible for complete resection.² No other therapies are listed for this specific subtype of soft tissue sarcoma.
- **Follicular Lymphoma:** Guidelines for B-cell lymphomas (version 1.2024 – January 18, 2024) recommend Tazverik as a third-line and subsequent therapy (category 2A) for follicular lymphoma, under “Other Recommended Regimen”, irrespective of EZH2 mutation status.³ Tazverik is a “Preferred Regimen” in the second-line setting for a patient who is elderly or infirm (irrespective of EZH2 mutation status), and if none of the other therapies are expected to be tolerable in the opinion of the treating physician.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tazverik. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tazverik is recommended in those who meet one of the following criteria:

03/06/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indications

86. Epithelioid Sarcoma. Approve for 1 year if the patient meets the following (A, B, and C):

- A) Patient is ≥ 16 years of age; AND
- B) Patient has metastatic or locally advanced disease; AND
- C) Patient is not eligible for complete resection.

87. Follicular Lymphoma. Approve for 1 year if the patient meets the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has relapsed or refractory disease; AND
- C) Patient meets ONE of the following (i or ii):
 - i. Patient has tried at least two prior systemic therapies; OR
 - ii. According to the prescriber, there are no appropriate alternative therapies.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tazverik is not recommended in the following situations:

- 113.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Temozolomide Capsules Prior Authorization Policy

- Temodar® (temozolomide capsules – Merck, generic)

REVIEW DATE: 06/26/2024

OVERVIEW

Temozolomide, an alkylating agent, is indicated in adults for the following uses:¹

- **Anaplastic astrocytoma,**
 - Newly diagnosed as adjuvant treatment
 - Refractory
- **Glioblastoma,** newly diagnosed, concomitantly used with radiotherapy and then as maintenance therapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium recommends use of temozolomide for the indications listed in the FDA-Approved Indications and Other Uses with Supportive Evidence sections.²

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of temozolomide capsules. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of temozolomide capsules is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Anaplastic Astrocytoma.** Approve for 1 year.
2. **Glioblastoma Multiforme.** Approve for 1 year.
Note: This includes glioblastoma and grade IV astrocytoma.

Other Uses with Supportive Evidence

3. **Bone Cancer.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient has tried one chemotherapy regimen; AND
Note: Examples of a chemotherapy regimen include one or more of the following products: vincristine, doxorubicin, cyclophosphamide, ifosfamide, etoposide.
 - B) Patient has ONE of the following diagnosis (i or ii):
 - i. Ewing sarcoma; OR
 - ii. Mesenchymal chondrosarcoma.

06/26/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

4. **Brain Metastases from Solid Tumors.** Approve for 1 year.
5. **Ependymoma, Intracranial or Spinal.** Approve for 1 year.
6. **Glioma, Other Types.** Approve for 1 year.
Note: Examples of other types of gliomas include pediatric diffuse high-grade glioma, oligodendroglioma, low-grade glioma, circumscribed glioma; IDH-mutant astrocytoma. For anaplastic astrocytoma and glioblastoma multiforme, refer to the respective criteria under the FDA-approved indications.
7. **Gliosarcoma.** Approve for 1 year.
8. **Medulloblastoma.** Approve for 1 year if the patient has recurrent or progressive disease.
9. **Melanoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient has unresectable or metastatic melanoma; AND
 - B) Patient has tried one systemic regimen.
Note: Examples of a systemic regimen include one or more of the following medications: Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion), Yervoy (ipilimumab intravenous infusion), Tafinlar (dabrafenib capsule), Mekinist (trametinib tablet), Zelboraf (vemurafenib tablet), Cotellic (cobimetinib tablet), Braftovi (encorafenib capsule), Mektovi (binimetinib tablet).
10. **Mycosis Fungoides/Sézary Syndrome.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient has tried one prior therapy; AND
Note: Examples of a prior therapy include topical carmustine, topical corticosteroids, topical imiquimod, topical retinoids, Adcetris (brentuximab vedotin intravenous infusion), gemcitabine.
 - B) Patient has central nervous system (CNS) involvement.
11. **Neuroblastoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient has high risk disease; AND
 - B) Patient will be using this medication in combination with chemoimmunotherapy.
Note: Example of chemoimmunotherapy includes: irinotecan, Unituxin (dinutuximab intravenous infusion), and Leukine (sargramostim intravenous infusion).
12. **Neuroendocrine Tumors.** Approve for 1 year if the patient meets ONE of the following (A, B, C, D, E, or F):
 - A) Patient has carcinoid tumors or neuroendocrine tumor of gastrointestinal tract, lung or thymus; OR
 - B) Patient has islet cell tumors or pancreatic neuroendocrine tumors; OR
 - C) Patient has extrapulmonary poorly differentiated neuroendocrine carcinoma; OR
 - D) Patient has large or small cell carcinoma; OR
 - E) Patient has mixed neuroendocrine-non-neuroendocrine neoplasm; OR
 - F) Patient has well differentiated grade 3 neuroendocrine tumor.
13. **Pheochromocytoma or Paragangliomas.** Approve for 1 year in patients with unresectable or metastatic disease.
14. **Primary Central Nervous System Lymphoma.** Approve for 1 year.
15. **Small Cell Lung Cancer.** Approve for 1 year if the patient has tried one systemic regimen.

Note: Examples of systemic regimen include one or more of the following products: cisplatin, etoposide, carboplatin, Tecentriq (atezolizumab intravenous infusion), Imfinzi (durvalumab intravenous infusion), irinotecan.

16. Soft Tissue Sarcomas. Approve for 1 year if the patient has advanced or metastatic disease.

17. Uterine Sarcomas. Approve for 1 year if the patient has tried a chemotherapy regimen.

Note: Examples of a chemotherapy regimen include one or more of the following products: doxorubicin, docetaxel, epirubicin, gemcitabine, ifosfamine, dacarbazine, vinorelbine.

18. Uveal Melanoma. Approve for 1 year if the patient has unresectable or metastatic disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of temozolomide capsules is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tepmetko Prior Authorization Policy

- Tepmetko® (tepotinib tablets – EMD Serono)

REVIEW DATE: 02/07/2024

OVERVIEW

Tepmetko, a kinase inhibitor, is indicated for the treatment of metastatic **non-small cell lung cancer (NSCLC)** in adults harboring mesenchymal-epithelial transition (*MET*) exon 14 skipping alterations.¹ This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

Guidelines

The National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 1.2024 – December 21, 2023) recommend Tepmetko (category 2A) as a “Preferred” first-line or subsequent line treatment option for patients with advanced or metastatic NSCLC who are positive for *MET* exon 14 skipping mutations or high-level *MET* amplification.²

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tepmetko. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tepmetko is recommended in those who meet the following criteria:

FDA-Approved Indication

44. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has advanced or metastatic disease; AND
- C) Patient meets one of the following (i or ii):
 - i. Patient has mesenchymal epithelial transition (*MET*) exon 14 skipping mutations as detected by an approved test; OR
 - ii. Patient has high-level *MET* amplification as detected by an approved test.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Thalomid Prior Authorization Policy

- Thalomid® (thalidomide capsules – Celgene)

REVIEW DATE: 05/29/2024

OVERVIEW

Thalomid, an immunomodulatory agent, is indicated for the following uses:¹

- **Erythema nodosum leprosum (ENL)**, acute treatment of cutaneous manifestations in moderate to severe disease. Thalomid is not indicated as monotherapy for such ENL treatment in the presence of moderate to severe neuritis.
- **ENL**, maintenance therapy for prevention and suppression of the cutaneous manifestations of ENL recurrence.
- **Multiple myeloma**, newly diagnosed, in combination with dexamethasone.

Other Uses with Supportive Evidence

Discoid Lupus Erythematosus or Cutaneous Lupus Erythematosus

Thalomid has been used for discoid lupus erythematosus and cutaneous lupus erythematosus. Patients usually had refractory disease after trial of other therapies and good responses were achieved for many patients given Thalomid.²⁻¹² A retrospective medical review was done that involved 29 patients with refractory cutaneous manifestations of cutaneous lupus erythematosus who received Thalomid. Of the 23 patients who took Thalomid for 1 month, 74% of patients (n = 17/23) had complete resolution of the cutaneous manifestations and 13% of patients (n = 3/23) had a 75% or greater partial improvement.³ Another report involving patients with discoid lupus (n = 18), subacute cutaneous lupus (n = 6), and systemic lupus erythematosus with skin involvement (n = 24) who had been resistant to at least two other treatments found a response rate of 81% (n = 39/48) with use of Thalomid with 60% of patients (n = 29/48) achieving a complete cutaneous remission.⁴ Other therapies used for these conditions include antimalarial agents (e.g. hydroxychloroquine), corticosteroids (oral, topical, intralesional), methotrexate, azathioprine, cyclosporine, dapsone, mycophenolate mofetil, topical calcineurin inhibitors (e.g., Elidel® [pimecrolimus 1% cream], Protopic® [tacrolimus 0.03% and 0.1% ointment]), and Soriatane® (acitretin capsules).^{2,7,12}

Prurigo Nodularis

Thalomid has been studied in patients with prurigo nodularis, most of whom were refractory to other treatments or with adverse events from the other therapies.^{2,13-15} A retrospective review assessed the medical records of 42 patients with prurigo nodularis who were refractory to other therapy and who received Thalomid.¹³ Patients received Thalomid for an average of 105 weeks. Previous therapies tried included topical steroids, intralesional steroids, systemic steroids, topical tar, macrolides, cyclosporine, azathioprine, methotrexate, calcineurin inhibitors, antihistamines, dapsone, capsaicin, laser therapy, psoralen plus ultraviolet A therapy, ultraviolet B therapy, retinoids, hydroxyzine, and macrolides. With Thalomid, improvement was noted in approximately one-third of patients.

Aphthous Ulcers or Aphthous Stomatitis

Recurrent aphthous ulcers and recurrent aphthous stomatitis are associated with frequent and recurring symptoms that are painful and can lead to difficulty in speaking, eating, and swallowing.¹⁶⁻²⁷ Ulcers are larger and may persist for weeks to months. The conditions are noted in certain disease states such as in patients who are human immunodeficiency virus (HIV)-positive and Behcet's disease. In general, few adequately powered trials have assessed the efficacy of therapeutic agents for aphthous ulcers or aphthous

05/29/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

stomatitis. Although the data are older and limited, Thalomid has led to rapid resolution of symptoms in patients with recurrent aphthous ulcers or aphthous stomatitis.¹⁶⁻²⁷ A double-blind, randomized, placebo-controlled study assessed Thalomid as a therapy for oral aphthous ulcers in patients infected with HIV. In total, 55% of patients (n = 16/29) given Thalomid had complete healing of their aphthous ulcers after 4 weeks compared with only 7% of patients (n = 2/28) who received placebo. Patients given Thalomid had symptom improvements in regards to discomfort that occurred while eating.²¹ A retrospective cohort study involving patients with recurrent aphthous stomatitis found that Thalomid was rapidly effective as 85% of patients (n = 78/92) achieved a complete remission of the condition within 14 days.²⁵ Many other agents have been used for recurrent aphthous ulcers or stomatitis including topical or intralesional corticosteroids, systemic corticosteroids, topical anesthetics/analgesics (lidocaine 2% viscous solution, benzocaine lozenges), antimicrobial mouth washes (tetracycline, chlorhexidine), topical sucralfate, acyclovir, pentoxifylline, dapsone, colchicine, and azathioprine.¹⁶⁻²⁷ Due to toxicities, use of Thalomid is generally reserved for patients who have not obtained satisfactory results with other agents.^{26,27}

Guidelines

Thalomid is addressed in guidelines from National Comprehensive Cancer Network (NCCN):

- **Castleman's Disease:** NCCN guidelines (version 1.2024 – January 18, 2024) recommend use of Thalomid, with or without rituximab, for patients with Castleman's disease for those who have relapsed/refractory or progressive disease (category 2A).²⁸ Thalomid is cited as an “other recommended therapy” (when given with cyclophosphamide and prednisone) for patients with multi-centric Castleman's disease who are negative for HIV and human herpesvirus-8 (HHV-8) [category 2A].
- **Histiocytic Neoplasms:** NCCN guidelines (version 1.2024 – March 15, 2024) recommend Thalomid in a few clinical scenarios.²⁹ For Langerhans cell histiocytosis, Thalomid is recommended as first-line or as subsequent therapy for single system multifocal skin disease (including mucosa) and for relapsed/refractory disease (category 2A). Thalomid is also recommended as first-line or subsequent therapy for cutaneous skin disease associated with Rosai-Dorfman disease under “useful in certain circumstances”, irrespective of mutation (category 2A) [e.g., those with relapsed/refractory disease, symptomatic multifocal disease, symptomatic unresectable unifocal disease].
- **Kaposi Sarcoma:** NCCN guidelines (version 1.2024 – November 7, 2023) recommended Thalomid as an agent “useful under certain circumstances” for subsequent systemic therapy options for relapsed/refractory therapy (category 2A) [for patients with corticosteroid-refractory immune reconstitution inflammatory syndrome].³⁰ This includes use when given alone (in patients without HIV) or with antiretroviral therapy for patients with HIV. First-line systemic therapy options include liposomal doxorubicin (preferred), and paclitaxel. Other subsequent systemic therapy options for relapsed/refractory therapy are also cited (e.g., Pomalyst® [pomalidomide capsules] {preferred}, lenalidomide, imatinib).
- **Multiple Myeloma:** NCCN guidelines (version 4.2024 – April 26, 2024) recommend use of Thalomid in various scenarios (category 2A).³¹ It is considered “useful in certain circumstances” among patients with previously treated multiple myeloma, as well as for primary therapy for transplant candidates. Thalomid is always recommended to be used with at least two other therapies to comprise the regimen.
- **Myelofibrosis:** NCCN has guidelines regarding myeloproliferative neoplasms (version 1.2024 – December 21, 2023) that discuss myelofibrosis.³² Thalomid is recommended in the management of anemia associated with myelofibrosis “useful in certain circumstances”, with or without prednisone, for a variety of clinical scenarios (category 2A) including patients with erythropoietin levels ≥ 500 mU/mL and with erythropoietin levels < 500 mU/mL and no response or loss of response to erythropoietin stimulating agents.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Thalomid. All approvals are provided for the duration noted below.

Automation: None.

Recommended Authorization Criteria

Coverage of Thalomid is recommended in those who meet one of the following criteria:

FDA-Approved Indications

2. **Erythema Nodosum Leprosum.** Approve for 1 year.
3. **Multiple Myeloma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Thalomid is being taken in combination with at least two other medications.

Note: Examples of medications include bortezomib, dexamethasone, cisplatin, doxorubicin, cyclophosphamide, etoposide, and Kyprolis (carfilzomib intravenous infusion).

Other Uses with Supportive Evidence

3. **Castleman's Disease.** Approve for 1 year if the patient meets ONE of the following (A or B):
 - A) Patient has relapsed/refractory or progressive disease; OR
 - B) Patient meets BOTH of the following (i and ii):
 - i. Patient has multi-centric Castleman's disease; AND
 - ii. Patient is negative for the human immunodeficiency virus and human herpesvirus-8.
4. **Discoid Lupus Erythematosus or Cutaneous Lupus Erythematosus.** Approve for 1 year if the patient has tried at least two other medications.

Note: Examples of medications include corticosteroids (oral, topical, intralesional), antimalarial agents (e.g., hydroxychloroquine), topical calcineurin inhibitors (e.g., Protopic [tacrolimus ointment], Elidel [pimecrolimus cream]), azathioprine, cyclosporine, mycophenolate mofetil, methotrexate, dapsone, and Soriatane (acitretin capsules).
5. **Histiocytic Neoplasms:** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient has Langerhans cell histiocytosis with single-system multifocal skin disease; OR
 - ii. Patient has Rosai-Dorfman cutaneous disease.

6. **Kaposi Sarcoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient has tried at least one medication; AND
Note: Examples include liposomal doxorubicin, paclitaxel, Pomalyst (pomalidomide capsules), lenalidomide, and imatinib.
 - B) Patient has relapsed or refractory disease.
7. **Myelofibrosis.** Approve for 1 year if the patient meets ONE of the following (A or B):
- B) Patient meets ALL of the following (i, ii, and iii):
 - i. Patient is ≥ 18 years of age; AND
 - ii. According to the prescriber the patient has anemia; AND
 - iii. Patient has serum erythropoietin levels ≥ 500 mU/mL; OR
 - C) Patient meets ALL of the following (i, ii, iii, and iv):
 - i. Patient is ≥ 18 years of age; AND
 - ii. According to the prescriber the patient has anemia; AND
 - iii. Patient has serum erythropoietin levels < 500 mU/mL; AND
 - iv. Patient has experienced no response or loss of response to an erythropoiesis-stimulating agent.
8. **Prurigo Nodularis.** Approve for 1 year if the patient has tried at least two other medications.
Note: Examples of medications include topical steroids, intralesional steroids, systemic steroids, topical tar, cyclosporine, macrolides, azathioprine, methotrexate, topical calcineurin inhibitors (Elidel [pimecrolimus cream], Protopic [tacrolimus ointment]), retinoids, antihistamines, hydroxyzine, dapsone, capsaicin, psoralen plus ultraviolet A therapy, and ultraviolet B therapy.
9. **Recurrent Aphthous Ulcers or Aphthous Stomatitis.** Approve for 1 year if the patient has tried at least two other medications.
Note: Examples of medications include topical or intralesional corticosteroids, systemic corticosteroids, topical anesthetics/analgesics (e.g., lidocaine 2% viscous solution, benzocaine lozenges), antimicrobial mouthwashes (e.g., tetracycline, chlorhexidine), topical sucralfate, acyclovir, pentoxifylline, dapsone, colchicine, and azathioprine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Thalomid is not recommend in the following situations:

193. **Cancer Cachexia.** Several small studies are available that have investigated Thalomid in the management of cancer cachexia related to various cancers.³³⁻³⁷ A single center double-blind, controlled trial randomized patients with pancreatic cancer who had lost at least 10% of their body weight to receive Thalomid or placebo for 24 weeks (n = 50).³⁴ Of the 33 patients evaluable at 4 weeks, patients given Thalomid had gained an average of 0.37 kg compared with a loss of 2.21 kg in the patients given placebo.³⁴ A published review of data regarding use of Thalomid for the management of cancer cachexia concluded that there is inadequate evidence to recommend Thalomid in clinical practice.³⁷
194. **Crohn's Disease.** Several publications report use of Thalomid in patients with Crohn's disease.³⁸⁻⁵⁴ Thalomid was used as an adjunctive therapy, or in those refractory to other therapy, and usually involved children. The data were not of high quality and primarily consisted of open-label designs or retrospective reviews, without a placebo control, and involved very few patients.³⁸⁻⁵⁴ Guidelines from the American College of Gastroenterology (2018) for the management of Crohn's disease in adults do not mention Thalomid as a therapeutic alternative.⁴⁹ Also, guidelines from the American Gastroenterological Association (2021) do not mention Thalomid in the guidelines for the medical management of moderate to severe luminal and perianal fistulizing Crohn's Disease.⁵⁵ Although some improvements were noted

in published data with Thalomid, more definite data from randomized, controlled trials are required before this is a recommended therapy.⁴⁹ Consensus guidelines of the European Crohn's and Colitis Organization and the European society of Pediatric Gastroenterology, Hepatology and Nutrition (2014) state that even though some data are available that suggest efficacy of Thalomid in refractory pediatric Crohn's disease, there are insufficient data to recommend Thalomid therapy at this juncture.⁵⁴ Many other therapies are available for the management of Crohn's disease.

195. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tibsovo Prior Authorization Policy

- Tibsovo® (ivosidenib tablets –Servier/Les)

REVIEW DATE: 03/06/2024

OVERVIEW

Tibsovo, an isocitrate dehydrogenase-1 (IDH1) inhibitor, is indicated for the treatment of cancers with a susceptible *IDH1* mutation as detected by an FDA-approved test:¹

- **Acute myeloid leukemia, newly diagnosed disease, in combination with azacitidine or as monotherapy**, in patients who are ≥ 75 years of age or who have comorbidities that preclude use of intensive induction chemotherapy.
- **Acute myeloid leukemia, relapsed or refractory disease**, in adults.
- **Cholangiocarcinoma, locally advanced or metastatic**, in adults who have been previously treated.
- **Myelodysplastic syndrome, relapsed or refractory disease**, in adults.

Guidelines

Tibsovo is discussed in the National Comprehensive Cancer Network (NCCN) guidelines:²

- **Acute Myeloid Leukemia:** NCCN guidelines (version 1.2024 – February 28, 2024) recommend Tibsovo as a single-agent (category 2A) as “Other Recommended Regimen” or in combination with azacitidine (category 1) as “Preferred” therapy for treatment induction for patients with an *IDH1* mutation who are not candidates for intensive induction therapy; and it is also used for follow-up after induction therapy, and consolidation therapy for patients with an *IDH1* mutation. Tibsovo is also recommended for relapsed or refractory disease with *IDH1* mutation (category 2A).³
- **Bone Cancer:** NCCN guidelines (version 1.2024 – August 7, 2023) recommend Tibsovo for conventional (grades 1 to 3) and dedifferentiated chondrosarcoma in patients with susceptible *IDH1* mutations as “Useful in Certain Circumstances” (category 2A).⁵
- **Central Nervous System Cancers:** NCCN guidelines (version 1.2023 – March 24, 2023) recommend Tibsovo for recurrent or progressive *IDH-1* mutant oligodendroglioma World Health Organization (WHO) grade 2 as “Other Recommend Regimens” and WHO grade 3 as “Useful in Certain Circumstances” (both category 2A) and *IDH-1* mutant astrocytoma WHO grade 2 as “Other Recommended Regimens” (category 2A) and WHO grade 3 or 4 as “Useful in Certain Circumstances” (category 2B).⁶
- **Cholangiocarcinoma:** NCCN guidelines for biliary tract cancer (version 3.2023 – November 8, 2023) cite Tibsovo as “Useful in Certain Circumstances” for patients with cholangiocarcinoma with *IDH1* mutations as subsequent-line therapy if there is disease progression (category 1).⁴
- **Myelodysplastic Syndromes:** NCCN guidelines (version 1.2024 – February 12, 2024) recommend Tibsovo for patients with myelodysplastic syndrome with *IDH 1* o mutation when patients has not experienced a response to other therapies.⁷

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tibsovo. All approvals are provided for the duration noted below.

Automation: None.

03/06/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tibsovo is recommended in those who meet one of the following criteria:

FDA-Approved Indications

123. Acute Myeloid Leukemia. Approve for 1 year if the patient meets the following (A and B):

- D)** Patient is ≥ 18 years of age; AND
- E)** Patient has isocitrate dehydrogenase-1 (*IDH1*) mutation-positive disease as detected by an approved test.

124. Cholangiocarcinoma. Approve for 1 year if the patient meets the following (A, B and C):

- A)** Patient is ≥ 18 years of age; AND
- B)** Patient has isocitrate dehydrogenase-1 (*IDH1*) mutation-positive disease; AND
- C)** Patient has been previously treated with at least one chemotherapy regimen.
Note: Examples are gemcitabine + cisplatin; Imfinzi (durvalumab intravenous infusion) + gemcitabine + cisplatin, 5-fluorouracil + oxaliplatin or cisplatin; capecitabine + oxaliplatin or cisplatin; gemcitabine + Abraxane (paclitaxel protein-bound particles intravenous infusion) or capecitabine or oxaliplatin; and FOLFOX (5-fluorouracil, leucovorin, and oxaliplatin).

125. Myelodysplastic Syndrome. Approve for 1 year if the patient meets the following (A, B, and C):

- A)** Patient is ≥ 18 years of age; AND
- B)** Patient has isocitrate dehydrogenase-1 (*IDH1*) mutation-positive disease; AND
- C)** Patient has relapsed or refractory disease.

Other Uses with Supportive Evidence

126. Bone Cancer. Approve for 1 year if the patient meets the following (A and B):

- A)** Patient has chondrosarcoma; AND
- B)** Patient has isocitrate dehydrogenase-1 (*IDH1*) mutation-positive disease.

127. Central Nervous System Cancer. Approve for 1 year if the patient meets the following (A, B and C):

- A)** Patient is ≥ 18 years of age; AND
- B)** Patient has recurrent or progressive disease; AND
- C)** Patient has meets one of the following (i or ii):
 - i.** Patient has World Health Organization (WHO) grade 2 or 3 oligodendroglioma; OR
 - ii.** Patient has WHO grade 2 astrocytoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tibsovo is not recommended in the following situations:

196. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Truqap Prior Authorization Policy

- Truqap™ (capivasertib tablets – AstraZeneca)

REVIEW DATE: 07/10/2024

OVERVIEW

Truqap, a kinase inhibitor, is indicated in combination with fulvestrant for the treatment of hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative, locally advanced or metastatic breast cancer with one or more phosphatidylinositol 3-kinase (*PIK3CA*)/ serine/threonine protein kinase 1 (*AKT1*)/ phosphatase and tensin homolog (*PTEN*)-alterations as detected by an FDA-approved test following progression on at least one endocrine-based regimen in the metastatic setting or recurrence on or within 12 months of completing adjuvant therapy in adults.¹

Guidelines

National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 4.2024 – July 3, 2024) state that for patients with HR+/HER2-negative tumors with *PIK3CA* or *AKT1* activating mutations or *PTEN* alterations, Truqap + fulvestrant is a “Preferred Regimen” for second or subsequent-line therapy in selected patients (category 1).² This would include adults with *PIK3CA*/*AKT1* activating mutations or *PTEN* alterations after disease progression or recurrence after one or more prior lines of endocrine therapy, including one line containing a cyclin-dependent kinase (CDK) 4/6 inhibitor. In this setting, for patients with *PIK3CA*-mutated tumors, Piqray® (alpelisib tablets) + fulvestrant is recommended (category 1). In the first-line setting for all patients, aromatase inhibitor or fulvestrant is recommended in combination with a CDK4/6 inhibitor (category 1 or category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Truqap. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Truqap is recommended in those who meet the following criteria:

FDA-Approved Indication

88. Breast Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):

OO) Patient is ≥ 18 years of age; AND

PP) Patient has locally advanced or metastatic disease; AND

QQ) Patient has hormone receptor-positive (HR+) disease; AND

RR) Patient has human epidermal growth factor receptor 2 (*HER2*)-negative disease; AND

SS) Patient has at least one phosphatidylinositol 3-kinase (*PIK3CA*), serine/threonine protein kinase (*AKT1*), or phosphatase and tensin homolog (*PTEN*)-alteration; AND

TT) Patient meets ONE of the following (i or ii):

i. Patient meets BOTH of the following (a and b):

07/10/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- a) Patient has had progression with at least one endocrine-based regimen in the metastatic setting; AND
Note: Examples of endocrine-based therapy include anastrozole, exemestane, and letrozole.
 - b) Patient has had progression with at least one cyclin-dependent kinase (CDK) 4/6 inhibitor in the metastatic setting; OR
Note: Examples of CDK4/6 inhibitor include: Ibrance (palbociclib tablets or capsules), Verzenio (abemaciclib tablets), Kisqali (ribociclib tablets), Kisqali Femara Co-Pack (ribociclib and letrozole tablets).
- ii. Patient has recurrence on or within 12 months of completing adjuvant endocrine therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Truqap is not recommended in the following situations:

- 114.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Truseltiq Prior Authorization Policy

- Truseltiq™ (infigratinib capsules – QED Therapeutics)

REVIEW DATE: 06/12/2024

OVERVIEW

Truseltiq, a kinase inhibitor, is indicated for the treatment of previously treated, unresectable locally advanced or metastatic **cholangiocarcinoma** with a fibroblast growth factor 2 (FGFR2) fusion or other rearrangement as detected by an FDA-approved test in adults.¹

This indication was approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

In October 2022, Helsinn, the manufacturer, announced the discontinuation of distribution of Truseltiq on March 31, 2023.³ Helsinn stated that this was not for safety reason and they recommend that no new patients be started on Truseltiq.

Guidelines

The National Comprehensive Cancer Network Biliary Tract Cancers (version 2.2024 – April 19, 2024) clinical practice guidelines no longer recommend Truseltiq for the subsequent treatment of unresectable or metastatic cholangiocarcinoma with FGFR2 fusions or rearrangements, as a single agent for progression on or after systemic treatment.²

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Truseltiq. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Truseltiq is recommended in those who meet the following criteria:

FDA-Approved Indication

89. Cholangiocarcinoma. Approve for 1 year if the patient meets the following (A, B, C, D, and E):

- A) Patient is currently receiving Truseltiq; AND
- B) Patient is ≥ 18 years of age; AND
- C) Patient has unresectable locally advanced or metastatic disease; AND
- D) Patient has fibroblast growth factor receptor 2 (FGFR2) fusion or other rearrangement, as detected by an approved test; AND
- E) Truseltiq is used as subsequent therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

06/12/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Coverage of Truseltiq is not recommended in the following situations:

- 115.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tukysa Prior Authorization Policy

- Tukysa® (tucatinib tablets –Seagan)

REVIEW DATE: 05/15/2024

OVERVIEW

Tukysa, a kinase inhibitor, is indicated for the following uses in adults:¹

- **Breast cancer**, in combination with trastuzumab and capecitabine, for the treatment of advanced unresectable or metastatic human epidermal growth factor receptor 2 (HER2)-positive disease, including patients with brain metastases, who have received one or more prior anti-HER2-based regimens in the metastatic setting.
- **Colorectal cancer**, in combination with trastuzumab, for the treatment of RAS wild-type HER2-positive unresectable or metastatic disease that has progressed following treatment with fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapy.

This indication is approved under accelerated approval based on tumor response rate and durability of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

Guidelines

Tukysa is discussed in the guidelines from the National Comprehensive Cancer Network (NCCN):

- **Biliary Tract Cancers:** NCCN guidelines (version 2.2024 – April 19, 2024) recommend Tukysa + trastuzumab as “useful in certain circumstances” as subsequent line therapy for unresectable and metastatic disease if there is disease progression.²
- **Breast Cancer:** NCCN guidelines (version 2.2024 – March 11, 2024) recommend Tukysa + trastuzumab + capecitabine in the third-line and beyond setting as a “preferred” regimen (category 1) for the treatment of recurrent unresectable (local or regional) or Stage IV HER2-positive disease in patients with both systemic and central nervous system (CNS) progression.³ There is a footnote that states it may be given in the second-line setting. Perjeta® (pertuzumab intravenous infusion) + trastuzumab + docetaxel (category 1) and Perjeta + trastuzumab + paclitaxel (category 2A) are “preferred” first-line regimens. Enhertu® (fam-trastuzumab deruxtecan-nxki intravenous infusion) [category 1] is a “preferred” second-line agent.
- **Colon Cancer and Rectal Cancer:** NCCN colon cancer guidelines (version 2.2023 – April 25, 2023) and NCCN rectal cancer guidelines (version 2.2024 – April 30, 2024) recommend Tukysa in combination with trastuzumab as a primary or subsequent treatment option for advanced or metastatic HER2-amplified, RAS and BRAF wild type disease (category 2A) in a variety of different clinical scenarios.^{4,5}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tukysa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

05/15/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Coverage of Tukysa is recommended in those who meet one of the following criteria:

FDA-Approved Indications

45. Breast Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has recurrent or metastatic breast cancer; AND
- C) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- D) Patient has received at least one prior anti-HER2-based regimen in the metastatic setting; AND
Note: Examples of anti-HER2-based regimens include Perjeta (pertuzumab intravenous infusion) + trastuzumab + docetaxel, Perjeta + trastuzumab + paclitaxel; Kadcyla (ado-trastuzumab emtansine intravenous infusion), capecitabine + trastuzumab or lapatinib tablets, trastuzumab + lapatinib tablets, Enhertu (fam-trastuzumab deruxtecan-nxki intravenous infusion), trastuzumab + docetaxel or vinorelbine, Nerlynx (neratinib tablets) + capecitabine, and Margenza (margetuximab-cmkb intravenous infusion) + chemotherapy (capecitabine, Halaven [eribulin intravenous infusion], gemcitabine, or vinorelbine).
- E) The medication is used in combination with trastuzumab and capecitabine.

46. Colon or Rectal Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has unresectable or metastatic disease; AND
- C) Patient has human epidermal growth factor receptor 2 (HER2)-amplified disease; AND
- D) Patient's tumor or metastases are wild-type RAS (KRAS wild-type and NRAS wild-type); AND
- E) The medication is used in combination with trastuzumab.

Other Uses With Supportive Evidence

3. Biliary Tract Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has unresectable or metastatic disease; AND
- C) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- D) Patient has tried at least one systemic regimen; AND
Note: Examples of a systemic regimen include one or more of the following medications: Imfinzi (durvalumab intravenous infusion), gemcitabine, cisplatin, Keytruda (pembrolizumab intravenous infusion), capecitabine, oxaliplatin, albumin-bound paclitaxel.
- E) The medication is used in combination with trastuzumab.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tukysa is not recommended in the following situations:

14. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Turalio Prior Authorization Policy

- Turalio® (pexidartinib capsules – Daiichi Sankyo)

REVIEW DATE: 06/19/2024

OVERVIEW

Turalio, a kinase inhibitor, is indicated for the treatment of **symptomatic tenosynovial giant cell tumor** associated with severe morbidity or functional limitations and not amenable to improvement with surgery in adults.¹

Guidelines

Turalio is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Histiocytic Neoplasms:** NCCN guidelines (version 1.2024 – March 15, 2024) recommend Turalio as first-line or subsequent therapy for colony stimulating factor 1 receptor *CSF1R* mutation target as “Useful in Certain Circumstances,” for Langerhans cell histiocytosis, Erdheim-Chester disease, and Rosai-Dorfman disease in various settings (category 2A).²⁻³
- **Soft Tissue Sarcoma:** NCCN guidelines (version 1.2024 – April 26, 2024), indicate that Turalio is the “preferred” single-agent therapy for the treatment of pigmented villonodular synovitis/tenosynovial giant cell tumor (category 1).³⁻⁴

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Turalio. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Turalio is recommended in those who meet one of the following criteria:

FDA-Approved Indication

- 1) **Tenosynovial Giant Cell Tumor (Pigmented Villonodular Synovitis).** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) According to the prescriber, the tumor is not amenable to improvement with surgery.

Other Uses with Supportive Evidence

- 2) **Histiocytic Neoplasms.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has a colony stimulating factor 1 receptor (*CSF1R*) mutation; AND
 - C) Patient has ONE of the following (i, ii, or iii):

06/19/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- i. Langerhans cell histiocytosis; OR
- ii. Erdheim-Chester disease; OR
- iii. Rosai-Dorfman disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Turalio is not recommended in the following situations:

- 197.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – CAR-T) – Abecma Prior Authorization Policy

- Abecma® (idecabtagene vicleucel intravenous infusion – Bristol-Myers Squibb and bluebird bio)

REVIEW DATE: 03/27/2024; selected revision 05/29/2024

OVERVIEW

Abecma, a B-cell maturation antigen (BCMA)-directed genetically modified autologous T-cell immunotherapy, is indicated for the treatment of relapsed or refractory **multiple myeloma** in adults after two or more prior lines of therapy, including an immunomodulatory agent, a proteasome inhibitor, and an anti-CD38 monoclonal antibody.¹ Abecma is a chimeric antigen receptor T-cell (CAR-T) therapy.

Abecma is supplied in one or more frozen infusion bags contain a suspension of genetically modified autologous chimeric antigen receptor (CAR)-positive T-cells in 5% dimethyl sulfoxide.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) clinical practice guidelines for multiple myeloma (version 4.2024 – April 26, 2024) recommend Abecma as a “Preferred Regimen” for the treatment of previously treated multiple myeloma after two prior treatment regimens (category 1) and after at least four prior treatment regimens (category 2A).^{2,3} Patients should receive a proteasome inhibitor, an immunomodulatory agent, and an anti-CD38 monoclonal antibody before receiving Abecma.

Safety

Abecma has a Boxed Warning for cytokine release syndrome, neurologic toxicity, hemophagocytic lymphohistiocytosis/macrophage activation syndrome, prolonged cytopenias, and T-cell malignancies.¹ Abecma is only available through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called Abecma REMS.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Abecma. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Abecma as well as the monitoring required for adverse events and long-term efficacy, approval requires Abecma to be prescribed by or in consultation with a physician who specializes in the condition being treated. The approval duration is 6 months to allow for an adequate time frame to prepare and administer 1 dose of therapy.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Abecma is recommended in those who meet the following criteria:

03/27/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indication

1. **Multiple Myeloma.** Approve a single dose if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has received two or more lines of systemic therapy, including one from each of the following (i, ii, and iii):
 - i. Patient has received an immunomodulatory agent; AND
Note: Immunomodulatory agents include Thalomid (thalidomide capsules), lenalidomide capsules, Pomalyst (pomalidomide capsules).
 - ii. Patient has received a proteasome inhibitor; AND
Note: Proteasome inhibitors include bortezomib injection, Kyprolis (carfilzomib intravenous infusion), Ninlaro (ixazomib capsules).
 - iii. Patient has received an anti-CD38 monoclonal antibody; AND
Note: Anti-CD38 monoclonal antibodies include Darzalex (daratumumab intravenous infusion), Darzalex Faspro (daratumumab and hyaluronidase-fihj subcutaneous injection), Sarclisa (isatuximab-irfc intravenous infusion).
 - C) Patient has received or plans to receive lymphodepleting chemotherapy prior to infusion of Abecma; AND
 - D) Patient has not been previously treated with chimeric antigen receptor T-cell (CAR-T) therapy; AND
Note: Examples of CAR-T therapy includes Abecma, Carvykti (ciltacabtagene autoleucel intravenous infusion), Breyanzi (lisocabtagene maraleucel intravenous infusion), Kymriah (tisagenlecleucel intravenous infusion), Tecartus (brexucabtagene intravenous infusion), and Yescarta (axicabtagene intravenous infusion).
 - E) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Abecma is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – CAR-T) – Aucatzyl Prior Authorization Policy

- Aucatzyl® (obecabtagene autoleucel intravenous infusion – Autolus)

REVIEW DATE: 11/20/2024

OVERVIEW

Aucatzyl, a CD19-directed genetically modified autologous T cell immunotherapy, is indicated for the treatment of relapsed or refractory **B-cell precursor acute lymphoblastic leukemia** in adults.¹

Guidelines

The National Comprehensive Cancer Network ALL (version 3.2024 – December 20, 2024) guidelines recommend Aucatzyl for the treatment of relapsed or refractory Philadelphia chromosome negative B-cell ALL as a “Preferred Regimen” (category 2A) and Philadelphia chromosome positive B-cell ALL following treatment with a tyrosine kinase inhibitor as an “Other Recommended Regimen” (category 2A).^{2,3}

Safety

Aucatzyl has a Boxed Warning concerning cytokine release syndrome, neurologic toxicity including immune effector cell-associated neurotoxicity syndrome, and secondary hematological malignancies.¹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Aucatzyl. Because of the specialized skills required for evaluation and diagnosis of patients treated with Aucatzyl as well as the monitoring required for adverse events and long-term efficacy, approval requires Aucatzyl to be prescribed by or in consultation with a physician who specializes in the condition being treated. The Approval duration is 6 months to allow for an adequate time frame to prepare and administer 1 dose of therapy.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Aucatzyl is recommended in those who meet the following criteria:

FDA-Approved Indications

- 2. Acute Lymphoblastic Leukemia.** Approve a single dose if the patient meets ALL of the following (A, B, C, D, E, and F):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has B-cell precursor disease; AND
 - C) Patient has relapsed or refractory disease; AND
 - D) Patient received or plans to receive lymphodepleting chemotherapy prior to infusion of Aucatzyl; AND
 - E) Patient has not been previously treated with CAR-T therapy; AND

Note: Examples of CAR-T therapy include Aucatzyl, Tecartus (brexucabtagene autoleucel intravenous infusion), Breyanzi (lisocabtagene maraleucel intravenous infusion), Kymriah

11/20/2024

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – CAR-T) – Breyanzi Prior Authorization Policy

- Breyanzi® (lisocabtagene maraleucel intravenous infusion – Juno Therapeutics)

REVIEW DATE: 11/13/2024

OVERVIEW

Breyanzi, a CD19-directed genetically modified autologous T-cell immunotherapy, is indicated for the treatment of:¹

- **Large B-cell lymphoma (LBCL)** including diffuse large B-cell lymphoma (DLBCL) not otherwise specified (including DLBCL arising from indolent lymphoma), high-grade B-cell lymphoma, primary mediastinal large B-cell lymphoma, and follicular lymphoma grade 3B, in adults who have:¹
 - Refractory disease to first-line chemoimmunotherapy or relapse within 12 months of first-line chemoimmunotherapy.
 - Refractory disease to first-line chemoimmunotherapy or relapse after first-line chemoimmunotherapy and are not eligible for hematopoietic stem cell transplantation due to age or comorbidities.
 - Relapsed or refractory disease after ≥ 2 lines of systemic therapy.

Limitations of use: Breyanzi is not indicated for the treatment of patients with primary central nervous system lymphoma.

- Relapsed or refractory **chronic lymphocytic leukemia (CLL)** or **small lymphocytic lymphoma (SLL)** in adults who have received at least two prior lines of therapy including a Bruton tyrosine kinase (BTK) inhibitor and a B-cell lymphoma 2 (BCL-2) inhibitor.
- Relapsed or refractory **follicular lymphoma** in adults who have received two or more prior lines of systemic therapy.
- Relapsed or refractory **mantle cell lymphoma** in adults who have received at least two prior lines of systemic therapy, including a BTK inhibitor.

Guidelines

The National Comprehensive Cancer Network (NCCN) clinical practice guidelines address Breyanzi:

- **B-Cell Lymphomas** (version 3.2024 – August 26, 2024) guidelines recommend Breyanzi for the treatment of a variety of lymphomas.^{2,3} Breyanzi can be used as second-line and subsequent therapy for relapsed or refractory DLBCL, high-grade B-cell lymphoma, mantle cell lymphoma, human immunodeficiency virus (HIV)-related B-cell lymphoma, and post-transplant lymphoproliferative disorders. Breyanzi can also be used as third-line and subsequent therapy for classic follicular lymphoma and transformed indolent lymphoma to DLBCL.
- **Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma** (version 1.2025 – October 1, 2024) guidelines recommend Breyanzi for relapsed or refractory CLL/SLL in patients who have been treated with a BTK inhibitor and Venclexta® (venetoclax tablets) based regimens with or without del(17p)/T53 mutation (category 2A).^{3,5} Breyanzi is also recommended for the treatment of histologic transformation to DLBCL in patients with del(17p)/TP53 mutation or who are chemotherapy refractory or unable to receive chemoimmunotherapy.
- **Pediatric Aggressive Mature B-Cell Lymphomas** (version 2.2024 – September 3, 2024) guidelines recommend Breyanzi for consolidation/additional therapy if the patient has achieved a partial response after treatment for relapsed/refractory primary mediastinal large B-cell lymphoma.^{3,4} NCCN states this recommendation is based on extrapolation of results from clinical

11/13/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

trials in adults with relapsed/refractory DLBCL including primary mediastinal large B-cell lymphoma.

Safety

Breyanzi has a Boxed Warning regarding cytokine release syndrome (CRS), neurologic toxicities, and T-cell malignancies.¹ Breyanzi is only available through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called the Breyanzi REMS.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Breyanzi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Breyanzi as well as the monitoring required for adverse events and long-term efficacy, approval requires Breyanzi to be prescribed by or in consultation with a physician who specializes in the condition being treated. The approval duration is 6 months to allow for an adequate time frame to prepare and administer 1 dose of therapy.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Breyanzi is recommended in those who meet the following criteria:

FDA-Approved Indications

3. **B-Cell Lymphoma.** Approve a single dose if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient meets BOTH of the following (a and b):
 - a) Patient has ONE of the following diagnoses [(1), (2), (3), (4), (5), (6), (7), (8), (9), or (10)]:
 - (1) Large B-cell lymphoma; OR
 - (2) Diffuse large B-cell lymphoma; OR
 - (3) High-grade B-cell lymphoma; OR
 - (4) Primary mediastinal large B-cell lymphoma; OR
 - (5) Follicular lymphoma, Grade 3B; OR
 - (6) Human immunodeficiency virus (HIV)-related diffuse large B-cell lymphoma; OR
 - (7) Human herpesvirus-8 (HHV8)-positive diffuse large B-cell lymphoma; OR
 - (8) Primary effusion lymphoma; OR
 - (9) Post-transplant lymphoproliferative disorders; OR
 - (10) Mantle cell lymphoma; AND
 - b) Patient has received at least one line of systemic therapy; OR
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient has ONE of the following diagnoses [(1) or (2)]:
 - (1) Transformed indolent lymphoma to diffuse large B-cell lymphoma; OR
 - (2) Classic follicular lymphoma; AND
 - b) Patient has received at least two lines of systemic therapy; AND
 - C) Patient has received or plans to receive lymphodepleting chemotherapy prior to infusion of Breyanzi; AND
 - D) Patient has not been previously treated with CAR-T therapy; AND

Note: Examples of CAR-T therapy includes Breyanzi, Kymriah (tisagenlecleucel intravenous infusion), Tecartus (brexucabtagene intravenous infusion), and Yescarta (axicabtagene intravenous infusion).

E) The medication is prescribed by or in consultation with an oncologist.

4. Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma. Approve a single dose if the patient meets ALL of the following (A, B, C, D, and E):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i or ii):

i. Patient meets BOTH of the following (a and b):

a) Patient has received a Bruton tyrosine kinase inhibitor; AND

Note: Examples of Bruton tyrosine kinase inhibitors include Imbruvica (ibrutinib capsules and tablets), Calquence (acalabrutinib capsules and tablets), and Brukinsa (zanubrutinib capsule).

b) Patient has received Venclexta (venetoclax tablets); OR

ii. Patient meets BOTH of the following (a and b):

a) Patient has histologic transformation to diffuse large B-cell lymphoma; AND

b) Patient meets ONE of the following [(1), (2), or (3)]:

(1) Patient has del(17p)/TP53 mutation positive disease; OR

(2) Patient is chemotherapy refractory; OR

(3) Patient is unable to receive chemoimmunotherapy; AND

Note: Examples of chemoimmunotherapy include dose-adjusted EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin, rituximab) and RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone).

C) Patient has received or plans to receive lymphodepleting chemotherapy prior to infusion of Breyanzi; AND

D) Patient has not been previously treated with CAR-T therapy; AND

Note: Examples of CAR-T therapy includes Breyanzi, Kymriah (tisagenlecleucel intravenous infusion), Tecartus (brexucabtagene intravenous infusion), and Yescarta (axicabtagene intravenous infusion).

E) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Breyanzi is not recommended in the following situations:

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – CAR-T) – Carvykti Prior Authorization Policy

- Carvykti® (ciltacabtagene autoleucel intravenous infusion – Janssen Biotech)

REVIEW DATE: 03/20/2024; selected revision 05/29/2024

OVERVIEW

Carvykti, a B-cell maturation antigen (BCMA)-directed genetically modified autologous T-cell immunotherapy, is indicated for the treatment of relapsed or refractory **multiple myeloma** in adults after at least one prior line of therapy, including a proteasome inhibitor and an immunomodulatory agent, and are refractory to lenalidomide.¹

Carvykti is supplied in one infusion bag containing a frozen suspension of genetically modified autologous T-cells in 5% dimethyl sulfoxide.¹ The bag is stored in the vapor phase of liquid nitrogen (-184°F).

Guidelines

The National Comprehensive Cancer Network clinical practice guidelines for multiple myeloma (version 4.2024 – April 26, 2024) recommend Carvykti as a “Preferred Regimen” for the treatment of multiple myeloma in patients who have received at least one prior therapy including a proteasome inhibitor and an immunomodulatory agent, and are refractory to lenalidomide.^{2,3} Carvykti is also recommended as a “Preferred Regimen” for the treatment of multiple myeloma in patients who have received four or more previous therapies including a proteasome inhibitor, an immunomodulatory agent, and an anti-CD38 monoclonal antibody before receiving Carvykti.

Safety

Carvykti has a Boxed Warning for cytokine release syndrome, immune effector cell-associated neurotoxicity syndrome, parkinsonism and Guillain-Barre syndrome, hemophagocytic lymphohistiocytosis/macrophage activation syndrome, prolonged and/or recurrent cytopenias, and secondary hematological malignancies.¹ Carvykti is only available through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called the Carvykti REMS.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Carvykti. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Carvykti as well as the monitoring required for adverse events and long-term efficacy, approval requires Carvykti to be prescribed by or in consultation with a physician who specializes in the condition being treated. The approval duration is 6 months to allow for an adequate time frame to prepare and administer 1 dose of therapy.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Carvykti is recommended in those who meet the following criteria:

FDA-Approved Indication

03/20/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

5. **Multiple Myeloma.** Approve a single dose if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient has received four or more lines of systemic therapy, including one from each of the following (a, b, and c):
 - a) Immunomodulatory agent; AND
Note: Immunomodulatory agents include Thalomid (thalidomide capsules), lenalidomide capsules, and Pomalyst (pomalidomide capsules).
 - b) Proteasome inhibitor; AND
Note: Proteasome inhibitors include bortezomib injection, Kyprolis (carfilzomib intravenous infusion), and Ninlaro (ixazomib capsules).
 - c) Anti-CD38 monoclonal antibody; OR
Note: Anti-CD38 monoclonal antibodies include Darzalex (daratumumab intravenous infusion), Darzalex Faspro (daratumumab and hyaluronidase-fihj subcutaneous injection), and Sarclisa (isatuximab-irfc intravenous infusion).
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient has received one or more lines of systemic therapy, including one therapy from BOTH of the following [(1) and (2)]:
 - (1) Immunomodulatory agent; AND
Note: Immunomodulatory agents include Thalomid (thalidomide capsules), lenalidomide capsules, and Pomalyst (pomalidomide capsules).
 - (2) Proteasome inhibitor; AND
Note: Proteasome inhibitors include bortezomib injection, Kyprolis (carfilzomib intravenous infusion), and Ninlaro (ixazomib capsules).
 - b) Patient is refractory to lenalidomide; AND
 - C) Patient has received or plans to receive lymphodepleting chemotherapy prior to infusion of Carvykti; AND
 - D) Patient has not been previously treated with chimeric antigen receptor (CAR-T) therapy; AND
Note: Examples of CAR-T therapy includes Carvykti, Abecma (idecabtagene vicleucel intravenous infusion), Breyanzi (lisocabtagene maraleucel intravenous infusion), Kymriah (tisagenlecleucel intravenous infusion), Tecartus (brexucabtagene intravenous infusion), and Yescarta (axicabtagene intravenous infusion).
 - E) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Carvykti is not recommended in the following situations:

- 4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – CAR-T) – Kymriah Prior Authorization Policy

- Kymriah® (tisagenlecleucel intravenous infusion – Novartis Oncology)

REVIEW DATE: 03/27/2024

OVERVIEW

Kymriah, a CD19-directed genetically modified autologous T cell immunotherapy, is indicated for the following uses:¹

- **B-cell precursor acute lymphoblastic leukemia (ALL)**, in patients ≤ 25 years of age with disease that is refractory or in second or later relapse.
- **Follicular lymphoma**, in patients ≥ 18 years of age with relapsed or refractory disease after two or more lines of systemic therapy. This indication is approved under accelerated approval based on response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trial(s).
- **Large B-cell lymphoma**, in patients ≥ 18 years of age with relapsed or refractory disease after two or more lines of systemic therapy including diffuse large B-cell lymphoma (DLBCL) not otherwise specified, high-grade B-cell lymphoma, and DLBCL arising from follicular lymphoma.

Limitation of Use: Kymriah is not indicated for treatment of patients with primary central nervous system lymphoma.

Kymriah, a chimeric antigen receptor T-cell (CAR-T) therapy, is supplied as a frozen suspension of genetically modified autologous T cells in infusion bag(s) labeled for the specific recipient.¹ Kymriah is shipped directly to the cell laboratory associated with the infusion center in a liquid nitrogen Dewar. The product and patient-specific labels are found inside the Dewar. Store the infusion bag in the vapor phase of liquid nitrogen (less than or equal to minus 120°C) in a temperature-monitored system. Kymriah should be thawed prior to infusion.

Guidelines

Kymriah is discussed in guidelines from The National Comprehensive Cancer Network (NCCN).

- **ALL, adult:** The NCCN guidelines (version 4.2023 – February 5, 2024) address Kymriah.^{2,3} In Philadelphia chromosome-positive B-cell ALL, Kymriah is cited as a treatment option for patients < 26 years of age and with refractory disease or $\geq$ two relapses and failure of two tyrosine kinase inhibitors (TKIs) [category 2A]. For Philadelphia chromosome-negative B-cell ALL, Kymriah is listed as a therapy option for patients < 26 years of age and with refractory disease or $\geq$ two relapses (category 2A).
- **ALL, pediatric:** The NCCN guidelines (version 4.2024 – February 7, 2024) recommend Kymriah for the treatment of patients with refractory or $\geq$ two relapses, TKI intolerant or refractory disease, or relapse post-hematopoietic stem cell transplantation (category 2A).^{3,5} Kymriah is also recommended for patients who are minimal residual disease positive after consolidation therapy, and in Philadelphia chromosome-positive disease with less than complete response (category 2B).
- **B-cell lymphoma:** The NCCN guidelines (version 1.2024 – January 18, 2024) recommend Kymriah for the treatment of the following relapsed or refractory disease after at least two course of systemic therapy: DLBCL, DLBCL following transformation from indolent lymphoma, follicular lymphoma, high-grade B-cell lymphoma, human immunodeficiency virus (HIV)-related B-cell lymphoma, human herpes virus 8 (HHV8)-positive DLBCL, primary effusion lymphoma, and post-transplant lymphoproliferative disorders (category 2A).^{3,4}

03/27/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Safety

Kymriah has a Boxed Warning regarding cytokine release syndrome and neurological toxicities.¹ Due to these risks, Kymriah is only available through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called the Kymriah REMS.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Kymriah. All approvals for therapy are provided for the approval duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kymriah as well as the monitoring required for adverse events and long-term efficacy, approval requires Kymriah to be prescribed by or in consultation with a physician who specializes in the condition being treated. The approval duration is 6 months to allow for an adequate time frame to prepare and administer 1 dose of therapy.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kymriah is recommended in those who meet one of the following criteria:

FDA-Approved Indications

6. **Acute Lymphoblastic Leukemia, B-Cell Precursor.** Approve a single dose if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is < 26 years of age; AND
 - B) Patient meets ONE of the following (i, ii, or iii):
 - i. Patient has disease that is refractory, or in second or later relapse; OR
 - ii. Patient is minimal residual disease positive after consolidation therapy; OR
 - iii. Patient is Philadelphia chromosome-positive and has experienced ONE of the following (a, b, or c):
 - a) Less than complete response; OR
 - b) Tyrosine kinase inhibitor intolerant or refractory disease; OR

Note: Examples of tyrosine kinase inhibitors include Sprycel (dasatinib tablets), imatinib tablets, Iclusig (ponatinib tablets), Tasigna (nilotinib capsules), and Bosulif (bosutinib tablets).
 - c) Relapse post-hematopoietic stem cell transplantation; AND
 - C) Patient received or plans to receive lymphodepleting chemotherapy prior to Kymriah infusion; AND
 - D) Patient has not been previously treated with chimeric antigen receptor T-cell (CAR-T) therapy; AND

Note: Examples of CAR-T therapy includes Kymriah, Brexanzi (lisocabtagene maraleucel intravenous infusion), Tecartus (brexucabtagene autoleucel intravenous infusion), Yescarta (axicabtagene ciloleucel intravenous infusion), Abecma (idecabtagene vicleucel intravenous infusion) and Carvykti (ciltacabtagene autoleucel intravenous infusion).

 - E) Kymriah is prescribed by or in consultation with an oncologist.
2. **B-Cell Lymphoma.** Approve a single dose if the patient meets ALL of the following (A, B, C, D, E, and F):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has ONE of the following diagnoses (i, ii, iii, iv, v, vi, vii, viii, or ix):

03/27/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- i. Large B-cell lymphoma; OR
 - ii. Diffuse large B-cell lymphoma; OR
 - iii. Diffuse large B-cell lymphoma arising from indolent lymphoma; OR
 - iv. Follicular lymphoma; OR
 - v. High-grade B-cell lymphoma; OR
 - vi. Human immunodeficiency virus (HIV)-related B-cell lymphoma; OR
 - vii. Human Herpes Virus 8-positive diffuse large B-cell lymphoma; OR
 - viii. Primary effusion lymphoma; OR
 - ix. Post-transplant lymphoproliferative disorders, B-cell type; AND
- C) Kymriah is being used for disease that is relapsed or refractory after two or more lines of systemic therapy; AND
- D) Patient meets ONE of the following (i or ii):
- i. Patient received or plans to receive lymphodepleting chemotherapy prior to Kymriah infusion; OR
 - ii. Patient's white blood cell count is less than or equal to $1 \times 10^9/L$ within 1 week prior to Kymriah infusion; AND
- E) Patient has not been previously treated with chimeric antigen receptor T-cell (CAR-T) therapy; AND
- Note: Examples of CAR-T therapy includes Kymriah, Brexanzi (lisocabtagene maraleucel intravenous infusion), Tecartus (brexucabtagene autoleucel intravenous infusion), Yescarta (axicabtagene ciloleucel intravenous infusion), Abecma (idecabtagene vicleucel intravenous infusion), and Carvykti (ciltacabtagene autoleucel intravenous infusion).
- F) Kymriah is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kymriah is not recommended in the following situations:

- 5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – CAR-T) – Tecartus Prior Authorization Policy

- Tecartus® (brexucabtagene autoleucel intravenous infusion – Kite Pharma)

REVIEW DATE: 08/21/2024

OVERVIEW

Tecartus, a CD19-directed genetically modified autologous T cell immunotherapy, is indicated for the treatment of adults with relapsed or refractory:¹

- **B-cell precursor acute lymphoblastic leukemia.**
- **Mantle cell lymphoma.**

Tecartus is supplied in infusion bag(s) containing frozen suspension of genetically modified autologous T cells in human serum albumin.¹ Each bag is supplied in a metal cassette stored in the vapor phase of liquid nitrogen. Store Tecartus frozen in the vapor phase of liquid nitrogen and thaw prior to administration.

Guidelines

Tecartus is addressed in National Comprehensive Cancer Network guidelines:

- **Acute lymphoblastic leukemia:** Guidelines (version 2.2024 – July 19, 2024) recommend Tecartus for the treatment of relapsed or refractory B-cell precursor acute lymphoblastic leukemia.^{3,4}
- **B-cell lymphomas:** Guidelines (version 2.2024 – April 30, 2024) recommend Tecartus for the second-line and subsequent treatment of relapsed or refractory mantle cell lymphoma, following treatment with Bruton tyrosine kinase inhibitor therapy.^{2,3}

Safety

Tecartus has a Boxed Warning regarding cytokine release syndrome, neurological toxicities, and T-cell malignancies.¹ Due to these risks, Tecartus is only available through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called the Tecartus REMS.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tecartus. All approvals for therapy are provided for the approval duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tecartus as well as the monitoring required for adverse events and long-term efficacy, approval requires Tecartus to be prescribed by or in consultation with a physician who specializes in the condition being treated. The approval duration is 6 months to allow for an adequate time frame to prepare and administer 1 dose of therapy.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tecartus is recommended in those who meet one of the following criteria:

FDA-Approved Indications

08/21/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

7. **Acute Lymphoblastic Leukemia.** Approve a single dose if the patient meets ALL of the following (A, B, C, D, E, and F):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has B-cell precursor disease; AND
 - C) Patient has relapsed or refractory disease; AND
 - D) Patient received or plans to receive lymphodepleting chemotherapy prior to Tecartus infusion; AND
 - E) Patient has not been previously treated with CAR-T therapy; AND
- Note: Examples of CAR-T therapy include Tecartus, Breyanzi (lisocabtagene maraleucel intravenous infusion), Kymriah (tisagenlecleucel intravenous infusion), Yescarta (axicabtagene intravenous infusion) and Abecma (idecabtagene vicleucel intravenous infusion).
- F) Tecartus is prescribed by or in consultation with an oncologist.
8. **Mantle Cell Lymphoma.** Approve a single dose if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed or refractory disease; AND
 - C) Patient received or plans to receive lymphodepleting chemotherapy prior to Tecartus infusion; AND
 - D) Patient has not been previously treated with CAR-T therapy; AND
- Note: Examples of CAR-T therapy include Tecartus, Breyanzi (lisocabtagene maraleucel intravenous infusion), Kymriah (tisagenlecleucel intravenous infusion), Yescarta (axicabtagene intravenous infusion) and Abecma (idecabtagene vicleucel intravenous infusion).
- E) Tecartus is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tecartus is not recommended in the following situations:

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – CAR-T) – Yescarta Prior Authorization Policy

- Yescarta® (axicabtagene ciloleucel intravenous infusion – Kite Pharma)

REVIEW DATE: 03/27/2024

OVERVIEW

Yescarta, a CD19-directed genetically modified autologous T cell immunotherapy, is indicated for the treatment of adults with:¹

- **Follicular lymphoma** that has relapsed or is refractory after two or more lines of systemic therapy. This indication was approved under accelerated approval based on response rate. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trial(s).
 - **Large B-cell lymphoma** in the following situations:
 - Disease that is refractory to first-line chemoimmunotherapy or relapses within 12 months of first-line chemoimmunotherapy.
 - Relapsed or refractory disease after two or more lines of systemic therapy, including diffuse B-cell lymphoma (DLBCL) not otherwise specified, primarily mediastinal large B-cell lymphoma, high-grade B-cell lymphoma, and DLBCL arising from follicular lymphoma.
- Limitation of Use: Yescarta is not indicated for the treatment of patients with primary central nervous system lymphoma.

Yescarta, a chimeric antigen receptor T-cell (CAR-T) therapy, is supplied as an infusion bag containing approximately 68 mL of frozen suspension of genetically modified autologous T cells.¹ Yescarta is stored in the vapor phase of liquid nitrogen (less than or equal to minus 150°C) and supplied in a liquid nitrogen dry shipper.

Guidelines

The National Comprehensive Cancer Network (NCCN) has addressed Yescarta in the following guidelines:

- **B-cell lymphoma:** Guidelines (version 1.2024 – January 18, 2024) recommend Yescarta for the treatment of a variety of B-cell lymphomas in patients with relapsed or refractory disease and after at least two chemotherapy regimens.^{2,3} Recommended indications include follicular lymphoma grade 1 or 2, extranodal marginal zone lymphoma of the stomach, extranodal marginal zone lymphoma of nongastric sites (noncutaneous), nodal marginal zone lymphoma, splenic marginal zone lymphoma, DLBCL, DLBCL which transformed from indolent lymphoma, high-grade B-cell lymphoma, human immunodeficiency virus (HIV)-related B-cell lymphoma, primary effusion lymphoma, human herpes virus 8 (HHV8)-positive DLBCL, and post-transplant lymphoproliferative disorders (category 2A). In addition, Yescarta is recommended for DLBCL, high-grade B-cell lymphoma, HIV-related B-cell lymphoma, primary effusion lymphoma, HHV8-positive DLBCL, and post-transplant lymphoproliferative disorders as additional therapy for relapsed or refractory disease > 12 months after completion of first-line therapy and partial response following second-line therapy (category 2A) and for patients with primary refractory or relapsed disease < 12 months after first-line therapy (category 1 for DLBCL, category 2A for all others).
- **Pediatric aggressive mature B-cell lymphoma:** Guidelines (version 1.2023 – April 4, 2023) recommend Yescarta for relapsed or refractory primary mediastinal large B-cell lymphoma after at least two chemoimmunotherapy regimens, as consolidation/additional therapy if partial response following therapy for refractory or relapsed disease (category 2A).^{3,4}

03/27/2024

Safety

Yescarta has a Boxed Warning regarding cytokine release syndrome and neurological toxicities. Due to these risks, Yescarta is only available through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called Yescarta REMS.¹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Yescarta. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Yescarta as well as the monitoring required for adverse events and long-term efficacy, approval requires Yescarta to be prescribed by or in consultation with a physician who specializes in the condition being treated. The approval duration is 6 months to allow for an adequate time frame to prepare and administer 1 dose of therapy.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Yescarta is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **B-Cell Lymphoma.** Approve a single dose if the patient meets ALL of the following (A, B, C, D, and E):
 - C) Patient is ≥ 18 years of age; AND
 - D) Patient meets ONE of the following (i or ii):
 - a) Patient meets BOTH of the following (a and b):
 1. Patient has ONE of the following diagnoses [(1), (2), (3), (4), (5), or (6)]:
 - (1) Follicular lymphoma; OR
 - (2) Extranodal marginal zone lymphoma of the stomach; OR
 - (3) Extranodal marginal zone lymphoma of nongastric sites (noncutaneous); OR
 - (4) Nodal marginal zone lymphoma; OR
 - (5) Splenic marginal zone lymphoma; OR
 - (6) Diffuse large B-cell lymphoma arising from indolent lymphoma; AND
 - b) Yescarta is used for disease that is relapsed or refractory after two or more lines of systemic therapy; OR
 - Note: Examples of systemic therapy include CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) + Gazyva (obinutuzumab intravenous infusion) or rituximab products, CVP (cyclophosphamide, vincristine, prednisone) + rituximab products, lenalidimide + rituximab products.
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient has ONE of the following diagnoses [(1), (2), (3), (4), (5), (6), (7), or (8)]:
 - (1) Human immunodeficiency virus (HIV)-related B-cell lymphoma; OR
 - (2) Human herpes virus 8-positive diffuse large B-cell lymphoma; OR
 - (3) Primary effusion lymphoma; OR
 - (4) Post-transplant lymphoproliferative disorders; OR
 - (5) Diffuse large B-cell lymphoma; OR
 - (6) Primary mediastinal large B-cell lymphoma; OR

03/27/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

(7) High-grade B-cell lymphoma; OR

(8) Large B-cell lymphoma; AND

b) Yescarta is used in ONE of the following situations [(1), (2), (3), or (4)]:

a. Disease that is relapsed or refractory after two or more lines of systemic therapy; OR

Note: Examples of systemic therapy include RCHOP (rituximab product, cyclophosphamide, doxorubicin, vincristine, prednisone), dose-adjusted EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin) + rituximab product, DHA (dexamethasone, cytarabine) + platinum (carboplatin, cisplatin, or oxaliplatin) ± rituximab product.

b. Primary refractory disease; OR

c. Relapsed disease < 12 months after completion of first-line therapy; OR

Note: Examples of first-line therapy include RCHOP (rituximab product, cyclophosphamide, doxorubicin, vincristine, prednisone), dose-adjusted EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin) + rituximab product, RCDOP (rituximab product, cyclophosphamide, liposomal doxorubicin, vincristine, prednisone).

d. Disease relapse > 12 months after first-line therapy and partial response to second-line therapy; AND

Note: Examples of systemic therapy include RCHOP (rituximab product, cyclophosphamide, doxorubicin, vincristine, prednisone), dose-adjusted EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin) + rituximab product, RCDOP (rituximab product, cyclophosphamide, liposomal doxorubicin, vincristine, prednisone).

E) Patient received or plans to receive lymphodepleting chemotherapy prior to Yescarta infusion; AND

F) Patient has not been previously treated with chimeric antigen receptor T-cell (CAR-T) therapy; AND

Note: Examples of CAR-T therapy includes Yescarta, Breyanzi (lisocabtagene maraleucel intravenous infusion), Kymriah (tisagenlecleucel intravenous infusion), Tecartus (brexucabtagene autoleucel intravenous infusion) Abecma (idecabtagene vicleucel intravenous infusion) and Carvykti (ciltacabtagene autoleucel intravenous infusion).

G) Yescarta is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Yescarta is not recommended in the following situations:

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – Programmed Death Receptor-1) – Jemperli Prior Authorization Policy

- Jemperli™ (dostarlimab intravenous infusion – GlaxoSmithKline)

REVIEW DATE: 05/08/2024

OVERVIEW

Jemperli, a programmed death receptor-1 blocking antibody, is indicated for the treatment of adults with recurrent or advanced:¹

- **Endometrial cancer** that is mismatch repair deficient (dMMR) as determined by an FDA-approved test, that has progressed on or following prior treatment with a platinum-containing regimen in any setting and are not candidates for curative surgery or radiation, as a single agent.
- **Endometrial cancer** in combination with carboplatin and paclitaxel, followed by Jemperli as a single agent.
- **Solid tumors**, that is dMMR as determined by an FDA-approved test, that have progressed on or following prior treatment and who have no satisfactory alternative treatment options.

Guidelines

Jemperli is addressed in the National Comprehensive Cancer Network guidelines:*

- **Ampullary Adenocarcinoma:** Guidelines (version 1.2024 – December 13, 2023) recommend Jemperli as subsequent therapy for MSI-H/dMMR tumors in patients whose cancer has progressed on or following prior treatment and who have no satisfactory alternative treatment options.^{2,8}
- **Biliary Tract Cancer:** Guidelines (version 2.2024 – April 19, 2024) recommend Jemperli for the subsequent treatment of MSI-H/dMMR gallbladder cancer, intrahepatic cholangiocarcinoma, and extrahepatic cholangiocarcinoma in patients whose cancer has progressed on or following prior treatment and who have no satisfactory alternative treatment options (category 2B).^{2,14}
- **Breast Cancer:** Guidelines (version 2.2024 – March 11, 2024) recommend Jemperli as subsequent therapy for MSI-H/dMMR tumors in patients whose cancer has progressed on or following prior treatment and who have no satisfactory alternative treatment options.^{2,7}
- **Colon Cancer:** Guidelines (version 2.2024 – April 30, 2024) recommend Jemperli as neoadjuvant therapy for MSI-H/dMMR or DNA polymerase epsilon/delta (POLE/POLD1) colon cancer, and primary or subsequent therapy for MSI-H/dMMR or POLE/POLD1 colon cancer or appendiceal adenocarcinoma.^{2,11}
- **Esophageal and Esophagogastric Junction Cancers:** Guidelines (version 3.2024 – April 26, 2024) recommend Jemperli as subsequent therapy for MSI-H/dMMR tumors in patients whose cancer has progressed on or following prior treatment and who have no satisfactory alternative treatment options.^{2,6}
- **Gastric Cancer:** Guidelines (version 1.2024 – March 7, 2024) recommend Jemperli as subsequent therapy for MSI-H/dMMR tumors in patients whose cancer has progressed on or following prior treatment and who have no satisfactory alternative treatment options.^{2,5}
- **Hepatocellular Carcinoma:** Guidelines (version 1.2024 – April 9, 2024) recommend Jemperli for the subsequent treatment of MSI-H/dMMR hepatocellular carcinoma in patients whose cancer has progressed on or following prior treatment and who have no satisfactory alternative treatment options (category 2B).^{2,10}

05/08/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Occult Primary:** Guidelines (version 2.2024 – April 29, 2024) recommend Jemperli as a single agent for dMMR/MSI-H tumors in symptomatic patients with performance status of 1 or 2, or asymptomatic patients with performance status of 0, in a variety of solid tumors.^{3,4}
- **Ovarian Cancer:** Guidelines (version 1.2024 – January 17, 2024) recommend Jemperli as subsequent therapy for MSI-H/dMMR epithelial ovarian cancer/fallopian tube cancer/primary peritoneal cancer, carcinosarcoma, clear cell or mucinous carcinoma of the ovary, grade 1 endometrioid carcinoma, and low grade serous carcinoma in patients with recurrent or advanced tumors.^{2,9}
- **Pancreatic Adenocarcinoma:** Guidelines (version 2.2024 – April 30, 2024) recommend Jemperli for dMMR/MSI-H tumors as subsequent treatment of recurrent, locally advanced, or metastatic disease.^{2,15}
- **Rectal Cancer:** Guidelines (version 2.2024 – April 30, 2024) recommend Jemperli as neoadjuvant, primary, or subsequent therapy for MSI-H/dMMR or POLE/POLD1 disease.^{2,12}
- **Small Bowel Adenocarcinoma:** Guidelines (version 3.2024 – April 30, 2024) recommend Jemperli as initial therapy for MSI-H/dMMR or POLE/POLD1 disease in patients who received oxaliplatin in the adjuvant setting or have a contraindication to oxaliplatin.^{2,13} Jemperli is recommended for the subsequent treatment of MSI-H/dMMR or POLE/POLD1 disease in patients with no prior adjuvant oxaliplatin use or a contraindication to oxaliplatin.
- **Uterine Neoplasms:** Guidelines (version 2.2024 – March 6, 2024) recommend Jemperli for primary or adjuvant treatment, and for first- and second-line treatment of advanced, recurrent, or metastatic endometrial carcinoma.^{2,3}

*All are category 2A recommendations unless otherwise noted.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Jemperli. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Jemperli as well as the monitoring required for adverse events and long-term efficacy, approval requires Jemperli to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Jemperli is recommended in those who meet one of the following criteria:

FDA-Approved Indications

9. Endometrial Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has recurrent, advanced, or metastatic disease; AND
- C) The medication is prescribed by or in consultation with an oncologist.

10. Mismatch Repair Deficient (dMMR) or Microsatellite Instability-High (MSI-H) Solid Tumors.

Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

Note: Examples of solid tumors include ampullary adenocarcinoma, biliary tract cancer, breast cancer, esophageal and esophagogastric junction cancer, gastric cancer, hepatocellular cancer, and ovarian cancer.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- A) Patient is ≥ 18 years of age; AND
- B) Patient has progressed on or after prior treatment; AND
- C) According to the prescriber, the patient does not have any satisfactory alternative treatment options; AND
- D) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

11. Colon, Rectal, or Appendiceal Cancer. Approve for the duration noted if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. Patient has mismatch repair deficient (dMMR) or microsatellite instability-high (MSI-H) disease; OR
 - ii. Patient has DNA polymerase epsilon/delta (POLE/POLD1) mutation; AND
- C) Patient has advanced or metastatic disease; AND
- D) Patient meets ONE of the following (i or ii):
 - i. Approve for 6 months total if medication used for neoadjuvant therapy; OR
 - ii. Approve for 1 year if medication is used for primary or subsequent therapy; AND
- E) Medication is prescribed by or in consultation with an oncologist.

12. Small Bowel Adenocarcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. Patient has mismatch repair deficient (dMMR) or microsatellite instability-high (MSI-H) disease; OR
 - ii. Patient has DNA polymerase epsilon/delta (POLE/POLD1) mutation; AND
- C) Patient has advanced or metastatic disease; AND
- D) Patient meets ONE of the following (i or ii):
 - i. Patient meets BOTH of the following (a and b):
 - a) Jemperli will be used as initial therapy; AND
 - b) Patient meets ONE of the following [(1) or (2)]:
 - (1) Patient has received adjuvant oxaliplatin; OR
 - (2) Patient has a contraindication to oxaliplatin; OR
 - ii. Patient meets ALL of the following (a, b, and c):
 - a) Jemperli is used as subsequent therapy; AND
 - b) Patient has NOT received oxaliplatin in the adjuvant setting; AND
 - c) Patient does NOT have contraindications to oxaliplatin; AND
- E) The medication is prescribed by or consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Jemperli is not recommended in the following situations:

- 8. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – Programmed Death Receptor-1) – Keytruda Prior Authorization Policy

- Keytruda® (pembrolizumab intravenous infusion – Merck)

REVIEW DATE: 05/01/2024

OVERVIEW

Keytruda, a human programmed death receptor-1 (PD-1) blocking antibody, is indicated for the treatment of the following indications:¹

- **Biliary tract cancer**, in combination with gemcitabine and cisplatin for the treatment of locally advanced unresectable or metastatic disease.
- **Breast cancer, triple-negative**, in the following situations:
 - In combination with chemotherapy for the treatment of locally recurrent unresectable or metastatic disease in patients whose tumors express programmed death-ligand 1 (PD-L1) [combined positive score {CPS} ≥ 10] as determined by an FDA-approved test.
 - For the treatment of high-risk, early-stage disease in combination with chemotherapy as neoadjuvant treatment, and then continued as a single agent as adjuvant treatment after surgery.
- **Cervical cancer**, in the following situations:
 - In combination with chemotherapy, with or without bevacizumab, for persistent, recurrent, or metastatic disease in patients whose tumor expresses PD-L1 (CPS ≥ 1) as determined by an FDA-approved test.
 - As a single agent, for treatment of recurrent or metastatic disease with disease progression on or after chemotherapy in patients whose tumors express PD-L1 (CPS ≥ 1) as determined by an FDA-approved test.
 - In combination with chemoradiotherapy for FIGO 2014 Stage III-IVA disease.
- **Classical Hodgkin lymphoma**, in the following situations:
 - For treatment of relapsed or refractory disease in adults.
 - For the treatment of refractory disease, or disease that has relapsed after two or more prior lines of therapy in pediatric patients.
- **Cutaneous squamous cell carcinoma**, for treatment of patients with recurrent, metastatic disease or locally advanced disease that is not curable by surgery or radiation.
- **Endometrial cancer**, in the following situations:
 - In combination with Lenvima® (lenvatinib capsules), for the treatment of advanced disease that is mismatch repair proficient (pMMR) as determined by an FDA-approved test or not microsatellite instability high (MSI-H), in patients, who have disease progression following prior systemic therapy and are not candidates for curative surgery or radiation.
 - As a single agent, for the treatment of advanced disease that is MSI-H or mismatch repair deficient (dMMR) as determined by an FDA-approved test, in patients who have disease progression following prior systemic therapy in any setting and are not candidates for curative surgery or radiation.
- **Esophageal cancer**, treatment of locally advanced or metastatic esophageal or gastroesophageal junction (GEJ) carcinoma (tumors with epicenter 1 to 5 centimeters above the GEJ) that is not amenable to surgical resection or definitive chemoradiation in the following situations:
 - In combination with platinum- and fluoropyrimidine-based chemotherapy.
 - As a single agent after one or more prior lines of systemic therapy for tumors of squamous cell histology that express PD-L1 (CPS ≥ 10) as determined by an FDA-approved test.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Gastric cancer**, in the following situations:
 - For the first-line treatment of locally advanced unresectable or metastatic human epidermal growth factor receptor 2 (HER2)-positive gastric or GEJ adenocarcinoma, in combination with trastuzumab, fluoropyrimidine- and platinum-containing chemotherapy.*
 - In combination with fluoropyrimidine- and platinum-containing chemotherapy for the first-line treatment of adults with locally advanced unresectable or metastatic HER2-negative gastric or GEJ adenocarcinoma.
- **Head and neck squamous cell carcinoma**, in the following situations:
 - As a single agent for the treatment of recurrent or metastatic disease with disease progression on or after platinum-containing chemotherapy.
 - In combination with platinum and fluorouracil for the first-line treatment of metastatic or with unresectable, recurrent disease.
 - As a single agent, for the first line treatment of metastatic or unresectable, recurrent disease in patients whose tumors express PD-L1 (CPS ≥ 1) as determined by an FDA-approved test.
- **Hepatocellular carcinoma**, for treatment of hepatocellular carcinoma secondary to hepatitis B who have received prior systemic therapy other than a PD-1/PD-L1 containing regimen.
- **Melanoma**, in the following situations:
 - For the treatment of unresectable or metastatic disease.
 - As adjuvant treatment of Stage IIB, IIC, or III melanoma following complete resection in patients ≥ 12 years of age.
- **Merkel cell carcinoma**, for treatment of recurrent, locally advanced, or metastatic disease in adults and pediatric patients.
- **Microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) cancer**, for treatment of unresectable or metastatic MSI-H or dMMR solid tumors, as determined by an FDA-approved test, in adult and pediatric patients that have progressed following prior treatment and who have no satisfactory alternative treatment options.
- **Microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) colorectal cancer**, for the treatment of unresectable or metastatic disease, as determined by an FDA-approved test.
- **Non-small cell lung cancer (NSCLC)**, in the following situations:
 - As a single agent for the first-line treatment of tumors that express PD-L1 (tumor proportion score [TPS] $\geq 1\%$) as determined by an FDA-approved test, with no epidermal growth factor receptor (*EGFR*) or anaplastic lymphoma kinase (*ALK*) genomic tumor aberrations, and is stage III where patients are not candidates for surgical resection or definitive chemoradiation or for metastatic disease.
 - As a single agent for the treatment of metastatic disease in patients whose tumors express PD-L1 (TPS $\geq 1\%$) as determined by an FDA-approved test and with disease progression on or after platinum-containing chemotherapy. Patients with *EGFR* or *ALK* genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving Keytruda.
 - In combination with pemetrexed and platinum-based chemotherapy, for the first-line treatment of metastatic nonsquamous NSCLC in patients with no *EGFR* or *ALK* genomic tumor aberrations.
 - In combination with carboplatin and either paclitaxel or paclitaxel protein-bound, for first-line treatment in metastatic squamous NSCLC.
 - In combination with platinum-containing chemotherapy, for the neoadjuvant treatment of resectable (tumors ≥ 4 cm or node positive) NSCLC and then continued as a single agent as adjuvant treatment after surgery.
 - As a single agent, as adjuvant treatment following resection and platinum-based chemotherapy for stage IB, II, or IIIA NSCLC in adults.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Primary mediastinal large B-cell lymphoma (PMBCL)**, for treatment of refractory disease, or relapsed disease after two or more prior lines of therapy, in adults and pediatric patients.
Limitation of Use: Keytruda is not recommended for treatment of patients with PMBCL who require urgent cytoreductive therapy.
- **Renal cell carcinoma**, in the following situations:
 - In combination with Inlyta® (axitinib tablets) or Lenvima, for the first-line treatment of advanced disease in adults.
 - For adjuvant treatment of disease that is intermediate-high or high risk of recurrence following nephrectomy, or following nephrectomy and resection of metastatic lesions.
- **Tumor mutational burden-high (TMB-H) cancer**, for treatment of unresectable or metastatic TMB-H (≥ 10 mutations/megabase) disease, as determined by an FDA-approved test, in adults and pediatric patients that have progressed following prior treatment and who have no satisfactory alternative treatment options.*
Limitation of Use: The safety and effectiveness of Keytruda in pediatric patients with TMB-H central nervous system cancers have not been established.
- **Urothelial carcinoma**, in the following situations:
 - Treatment of locally advanced or metastatic disease in patients who are not eligible for platinum-containing chemotherapy as a single agent.
 - Treatment of locally advanced or metastatic urothelial carcinoma in patients who have disease progression during or following platinum-containing chemotherapy or within 12 months of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy as a single agent.
 - Treatment of Bacillus Calmette-Guerin (BCG)-unresponsive, high-risk, non-muscle invasive bladder cancer with carcinoma in situ with or without papillary tumors in patients who are ineligible for or have elected not to undergo cystectomy as a single agent.
 - In combination with Padcev® (enfortumab intravenous infusion), for the treatment of locally advanced or metastatic urothelial carcinoma in adults.

* This indication is approved under accelerated approval based on tumor response rate and durability of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in the confirmatory trials.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Keytruda. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Keytruda as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Keytruda is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Biliary Tract Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):

Note: Biliary tract cancer includes gallbladder cancer, intrahepatic cholangiocarcinoma, and extrahepatic cholangiocarcinoma.

05/01/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- A) Patient is ≥ 18 years of age; AND
 - B) Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
Note: If the tumor is MSI-H or dMMR, see Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors criteria.
 - C) Disease is not tumor mutational burden-high (≥ 10 mutations/megabase); AND
Note: If the tumor is mutational burden-high, see Tumor Mutational Burden-High (TMB-H) Cancer criteria.
 - D) Patient has unresectable, resected gross residual, or metastatic disease; AND
 - E) Patient meets ONE of the following (i or ii):
 - i. Medication is used in combination with cisplatin and gemcitabine; OR
 - ii. If the medication is used in combination with Lenvima (lenvatinib capsules), it is used for subsequent treatment; AND
 - F) The medication is prescribed by or in consultation with an oncologist.
2. **Breast Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):
- A) Patient is ≥ 18 years of age; AND
 - B) Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
Note: If the tumor is MSI-H or dMMR, see Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors criteria.
 - C) Disease is not tumor mutational burden-high (≥ 10 mutations/megabase); AND
Note: If the tumor is mutational burden-high, see Tumor Mutational Burden-High (TMB-H) Cancer criteria.
 - D) Patient has triple-negative breast cancer; AND
Note: Triple negative breast cancer is estrogen receptor-negative, progesterone receptor-negative, human epidermal growth factor receptor 2 (HER2)-negative.
 - E) Patient meets ONE of the following (i or ii):
 - i. Patient meets ALL of the following (a, b, and c):
 - a) Patient has recurrent unresectable (local or regional) or metastatic disease; AND
 - b) The medication is used in combination with chemotherapy; AND
 - c) Patient's tumor expression for programmed death-ligand 1 (PD-L1) as determined by an approved test has a combined positive score (CPS) ≥ 10 ; OR
 - ii. Patient has high-risk, early-stage disease; AND
 - F) The medication is prescribed by or in consultation with an oncologist.
3. **Cervical Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
Note: If the tumor is MSI-H or dMMR, see Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors criteria.
 - C) Disease is not tumor mutational burden-high (≥ 10 mutations/megabase); AND
Note: If the tumor is mutational burden-high, see Tumor Mutational Burden-High (TMB-H) Cancer criteria.
 - D) Patient meets ONE of the following (i or ii):
 - i. Patient meets BOTH of the following (a and b):
 - a) Patient has persistent, recurrent, or metastatic disease; AND
 - b) Patient's tumor expression for programmed death-ligand 1 (PD-L1), as determined by an approved test, has a combined positive score (CPS) ≥ 1 ; OR
 - ii. Patient has FIGO 2014 stage III to IVA disease; AND
 - E) The medication is prescribed by or in consultation with an oncologist.

4. **Classic Hodgkin Lymphoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient meets ONE of the following (i or ii):
 - i. Patient meets BOTH of the following (a and b):
 - a) Patient is ≥ 18 years of age; AND
 - b) Patient has tried at least one systemic regimen; OR

Note: Examples of systemic regimens are ABVD (doxorubicin, bleomycin, vinblastine, dacarbazine) + rituximab, CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) + rituximab, CVbP (cyclophosphamide, vinblastine, prednisolone) + rituximab, Adcetris (brentuximab vedotin intravenous infusion) + AVD (doxorubicin, vinblastine, dacarbazine).
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient is < 18 years of age; AND
 - b) Patient has relapsed or refractory disease; AND
 - B) The medication is prescribed by or in consultation with an oncologist.
5. **Colon, Rectal, or Appendiceal Cancer.** Approve for duration noted if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
 - Note: If the tumor is MSI-H or dMMR, see Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors criteria.
 - C) Patient is DNA polymerase epsilon/delta (POLE/POLD1) mutation positive; AND
 - D) Patient meets ONE of the following (i or ii):
 - i. Approve for 1 year if the patient meets ONE of the following (a or b):
 - a) Patient has locally unresectable or medically inoperable disease; OR
 - b) Patient has metastatic disease; OR
 - ii. Approve for 6 months if the medication is used for neoadjuvant therapy; AND
 - E) The medication is prescribed by or in consultation with an oncologist.
6. **Cutaneous Squamous Cell Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has locally advanced, recurrent, or metastatic disease; AND
 - C) The disease is not curable by surgery or radiation; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
7. **Endometrial Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
 - Note: If the tumor is MSI-H or dMMR, see Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors criteria.
 - C) Disease is not tumor mutational burden-high (≥ 10 mutations/megabase); AND
 - Note: If the tumor is mutational burden-high, see Tumor Mutational Burden-High (TMB-H) Cancer criteria.
 - D) Patient meets ONE of the following (i or ii):
 - i. Patient meets BOTH of the following (a and b):
 - a) Medication is used for primary or adjuvant therapy; AND
 - b) Patient meets ONE of the following [(1) or (2)]:

- (1) Medication is used in combination with carboplatin and paclitaxel; OR
 - (2) Medication is used as a single agent for maintenance therapy; OR
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient has recurrent disease; AND
 - b) Patient meets ONE of the following [(1), (2), or (3)]:
 - (1) Medication is used in combination with Lenvima (lenvatinib capsules); OR
 - (2) Medication is used in combination with carboplatin and paclitaxel; OR
 - (3) Medication is used as a single agent for maintenance therapy; AND
 - E) The medication is prescribed by or in consultation with an oncologist.
- 8. **Esophageal and Esophagogastric Junction Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
Note: If the tumor is MSI-H or dMMR, see Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors criteria.
 - C) Disease is not tumor mutational burden-high (≥ 10 mutations/megabase); AND
Note: If the tumor is mutational burden-high, see Tumor Mutational Burden-High (TMB-H) Cancer criteria.
 - D) Patient meets ONE of the following (i, ii, or iii):
 - i. Patient meets BOTH of the following (a and b):
 - a) Patient's tumor expression for programmed death-ligand 1 (PD-L1) as determined by an approved test has a combined positive score (CPS) ≥ 1 ; AND
 - b) The medication is used in combination with chemotherapy; OR
Note: Examples of chemotherapy include cisplatin plus fluorouracil or capecitabine; and oxaliplatin plus fluorouracil or capecitabine.
 - ii. Patient meets ALL of the following (a, b, and c):
 - a) Patient has squamous cell carcinoma; AND
 - b) Patient's tumor expression for programmed death-ligand 1 (PD-L1) as determined by an approved test has a combined positive score (CPS) ≥ 10 ; AND
 - c) Patient meets ONE of the following [(1) or (2)]:
 - (1) The medication is used as monotherapy; OR
 - (2) The medication is used in combination with chemotherapy; OR
Note: Examples of chemotherapy include cisplatin plus fluorouracil or capecitabine; and oxaliplatin plus fluorouracil or capecitabine.
 - iii. Patient meets ALL of the following (a, b, c, and d):
 - a) Patient has adenocarcinoma; AND
 - b) Patient's tumor expression for PD-L1 as determined by an approved test has a CPS ≥ 1 ; AND
 - c) Tumor is human epidermal growth factor receptor 2 (HER2) or HER2/neu positive; AND
 - d) Medication is used in combination with trastuzumab, cisplatin or oxaliplatin, and fluorouracil or capecitabine; AND
 - E) The medication is prescribed by or in consultation with an oncologist.
- 9. **Gastric Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
Note: If the tumor is MSI-H or dMMR, see Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors criteria.
 - C) Disease is not tumor mutational burden-high (≥ 10 mutations/megabase); AND

Note: If the tumor is mutational burden-high, see Tumor Mutational Burden-High (TMB-H) Cancer criteria.

- D)** Patient meets ONE of the following (i or ii):
- i.** Patient meets ALL of the following (a, b, and c):
 - a)** Tumor is human epidermal growth factor receptor 2 (HER2) or HER2/neu positive; AND
 - b)** Patient's tumor expression for programmed death-ligand 1 (PD-L1) as determined by an approved test has a combined positive score (CPS) ≥ 1 ; AND
 - c)** Medication is used in combination with trastuzumab, cisplatin or oxaliplatin, and fluorouracil or capecitabine; OR
 - ii.** Patient meets BOTH of the following (a and b):
 - a)** Patient's tumor expression for PD-L1 as determined by an approved test has a CPS ≥ 1 ; AND
 - b)** Medication is used in combination with cisplatin or oxaliplatin, and fluorouracil or capecitabine; AND
- E)** The medication is prescribed by or in consultation with an oncologist.

10. Head and Neck Squamous Cell Carcinoma. Approve for 1 year if the patients meets ALL of the following (A, B, C, D, E, and F):

- A)** Patient is ≥ 18 years of age; AND
- B)** Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
Note: If the tumor is MSI-H or dMMR, see Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors criteria.
- C)** Disease is not tumor mutational burden-high (≥ 10 mutations/megabase); AND
Note: If the tumor is mutational burden-high, see Tumor Mutational Burden-High (TMB-H) Cancer criteria.
- D)** Patient has recurrent, unresectable, or metastatic disease; AND
- E)** Patient meets ONE of the following (i or ii):
 - i.** If the medication is used for first-line treatment, patient must meet ONE of the following (a or b):
 - a)** Keytruda is used in combination with chemotherapy; OR
Note: Examples of chemotherapy are cisplatin, carboplatin, fluorouracil, gemcitabine.
 - b)** Keytruda is used as a single agent if the tumors are PD-L1-positive (combined positive score ≥ 1), as determined by an approved test.
 - ii.** For subsequent therapy, patient has tried at least one platinum-containing chemotherapy regimen; AND
Note: Examples of platinum-contain chemotherapy regimens are: cisplatin or carboplatin with Erbitux (cetuximab intravenous infusion), gemcitabine, or 5-fluorouracil (5-FU).
- F)** The medication is prescribed by or in consultation with an oncologist.

11. Hepatocellular Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):

- A)** Patient is ≥ 18 years of age; AND
- B)** Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
Note: If the tumor is MSI-H or dMMR, see Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors criteria.
- C)** Disease is not tumor mutational burden-high (≥ 10 mutations/megabase); AND
Note: If the tumor is mutational burden-high, see Tumor Mutational Burden-High (TMB-H) Cancer criteria.
- D)** Patient meets ONE of the following (i, ii, or iii):
 - i.** Patient has unresectable disease and is not a transplant candidate; OR

- ii. Patient has liver-confined disease, inoperable by performance status, comorbidity, or with minimal or uncertain extrahepatic disease; OR
- iii. Patient has metastatic disease or extensive liver tumor burden; AND
- E) If medication is used as subsequent therapy, the patient has Child-Pugh Class A disease only; AND
- F) The medication is prescribed by or in consultation with an oncologist.

12. Melanoma. Approve for the duration noted below if the patient meets ALL of the following (A and B):

Note: This includes cutaneous melanoma, brain metastases due to melanoma, and uveal melanoma.

A) Patient meets ONE of the following (i, ii, or iii):

- i. Approve for 1 year if the patient meets BOTH of the following (a and b):
 - a) Patient is ≥ 18 years of age; AND
 - b) Patient has unresectable, advanced, or metastatic melanoma; OR
- ii. Approve for up to 1 year (total) if patient meets BOTH of the following (a and b):
 - a) Patient is ≥ 12 years of age; AND
 - b) Keytruda will be used as adjuvant treatment; OR
- iii. Approve for 4 months if the patient meets BOTH of the following (a and b):
 - a) Patient is ≥ 18 years of age; AND
 - b) Keytruda will be used as neoadjuvant treatment; AND

B) The medication is prescribed by or in consultation with an oncologist.

13. Merkel Cell Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient meets ONE of the following (i, ii, or iii):

- i. Patient has locally advanced disease, if according to the prescriber curative surgery and curative radiation therapy are not feasible; OR
- ii. Patient has recurrent regional disease, if according to the prescriber curative surgery and curative radiation therapy are not feasible; OR
- iii. Patient has metastatic disease; AND

B) The medication is prescribed by or in consultation with an oncologist.

14. Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors.

Approve for 1 year if the patient meets BOTH of the following (A and B):

Note: Examples of solid tumors with MSI-H or dMMR are adrenal gland, biliary tract cancers, breast cancer, cervical cancer, chondrosarcoma, colon or rectal cancer, endometrial carcinoma, esophageal or esophagogastric cancers, Ewing sarcoma, gallbladder carcinoma, gastric cancer, head and neck squamous cell carcinoma, hepatocellular carcinoma, occult primary (cancer of unknown primary), osteosarcoma, ovarian/fallopian tube/primary peritoneal, pancreatic adenocarcinoma, penile cancer, neuroendocrine tumor, prostate cancer, small bowel adenocarcinoma, testicular cancer, vulvar cancer.

A) One of the following conditions applies (i, ii, iii, iv, v, vi, vii, or viii):

- i. Patient has advanced or metastatic ampullary cancer; OR
- ii. Patient has unresectable or metastatic colon or rectal cancer; OR
- iii. Patient has unresectable or metastatic gallbladder cancer (including intra- and extra-hepatic cholangiocarcinoma); OR
- iv. Patient has unresectable or metastatic head and neck squamous cell carcinoma; OR
- v. Patient has persistent or recurrent ovarian/fallopian tube/primary peritoneal carcinoma; OR
- vi. Patient has locally advanced or metastatic pancreatic adenocarcinoma; OR
- vii. Patient has advanced or metastatic small bowel carcinoma; OR
- viii. Patient meets BOTH of the following (a and b):

- a) Patient has tried at least one prior systemic therapy for an MSI-H or dMMR solid tumor; AND

- b) Patient has unresectable or metastatic disease; AND
- B) The medication is prescribed by or in consultation with an oncologist.

15. Non-Small Cell Lung Cancer. Approve for the duration noted if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i, ii, iii, iv, v, vi, or vii):
 - i. Approve for 1 year if the patient meets ALL of the following (a, b, and c):
 - a) Patient has recurrent, advanced, or metastatic disease; AND
 - b) Keytruda is used as first-line or continuation maintenance therapy; AND
Note: This is regardless of programmed death-ligand 1 (PD-L1) status.
 - c) The tumor is negative for actionable mutations; OR
Note: Examples of actionable mutations include sensitizing epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *NTRK* gene fusion-positive, *ROS1*, *BRAF V600E*, *MET 14* skipping mutation, *RET* rearrangement. *KRAS G12C* is not considered an actionable mutation (the tumor may be *KRAS G12C* mutation positive).
 - ii. Approve for 1 year if the patient meets ALL of the following (a, b, and c):
 - a) Patient has advanced or metastatic disease; AND
 - b) Keytruda is used as first-line therapy; AND
Note: This is regardless of the PD-L1 status.
 - c) The tumor is positive for one of the following mutations [(1) or (2)]:
 - (1) *EGFR* exon 20 mutation; OR
 - (2) *ERBB2* (*HER2*) mutation; OR
 - iii. Approve for 1 year if the patient meets ALL of the following (a, b, and c):
 - a) Patient has recurrent, advanced, or metastatic disease; AND
 - b) Keytruda is used as first-line or subsequent therapy; AND
Note: This is regardless of the PD-L1 status.
 - c) The tumor is positive for one of the following mutations [(1), (2), (3), or (4)]:
 - (1) *BRAF V600E* mutation; OR
 - (2) *NTRK1/2/3* gene fusion; OR
 - (3) *MET* exon 14 skipping mutation; OR
 - (4) *RET* rearrangement; OR
 - iv. Approve for 1 year if the patient meets ALL of the following (a, b, c, and d):
 - a) Patient has recurrent, advanced, or metastatic disease; AND
 - b) Keytruda is used as subsequent therapy; AND
 - c) The tumor is positive for ONE of the following mutations [(1), (2), (3), or (4)]:
 - (1) *EGFR S768I*, *L861Q*, and/or *G719X* mutation; OR
 - (2) *EGFR* exon 19 deletion or exon 21 *L858R*; OR
 - (3) *ALK* rearrangement; OR
 - (4) *ROS1* rearrangement; AND
 - d) The patient has received targeted drug therapy for the specific mutation; OR
Note: Examples of targeted drug therapy include Gilotrif (afatinib tablets), Tagrisso (osimertinib tablets), erlotinib, Iressa (gefitinib tablets), or Vizimpro (dacomitinib tablets), Xalkori (crizotinib capsules), Rozlytrek (entrectinib capsules), or Zykadia (ceritinib tablets).
 - v. Approve for 1 year if the patient meets ALL of the following (a, b, c, d, and e):
 - a) Patient has advanced, recurrent, or metastatic disease; AND
 - b) Patient has tried systemic therapy; AND

Note: Examples of systemic chemotherapy include cisplatin, carboplatin, pemetrexed, paclitaxel albumin-bound, gemcitabine, paclitaxel.

- c) The tumor is PD-L1 positive, with tumor proportion score (TPS) $\geq 1\%$, as determined by an approved test; AND
- d) Patient has not progressed on prior therapy with a programmed death receptor-1 (PD-1)/PD-L1 inhibitor; AND
Note: This includes previous therapy with either one of Keytruda, Opdivo (nivolumab intravenous infusion), or Tecentriq (atezolizumab intravenous infusion).
- e) If tumor is positive for an actionable mutation, the patient has received targeted drug therapy for the specific mutation; AND
Note: Examples of actionable mutations include sensitizing epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *NTRK* gene fusion positive, *ROS1*, *BRAF V600E*, *MET* exon 14 skipping mutation, *RET* rearrangement.
- vi. Approve for 1 year (total) if the patient meets ONE of the following (a or b):
 - a) Patient meets ALL of the following [(1), (2), and (3)]:
 - (1) Patient has completely resected stage II or III disease; AND
 - (2) Tumor is negative for *EGFR* exon 19 deletion, exon 21 *L858R* mutation, and *ALK* rearrangements; AND
 - (3) Patient has received adjuvant chemotherapy; OR
 - b) Patient has received neoadjuvant treatment with Keytruda; AND
- iv. Approve for 4 months if the patient meets ALL of the following (a, b, and c):
 - a) Patient has resectable disease; AND
Note: Resectable disease is defined as tumors ≥ 4 cm or node positive.
 - b) Keytruda is used as neoadjuvant therapy; AND
 - c) Keytruda is used in combination with platinum-doublet chemotherapy; AND
Note: Examples of platinum-doublet chemotherapy include cisplatin plus pemetrexed and cisplatin plus gemcitabine.
- C) The medication is prescribed by or in consultation with an oncologist.

16. Primary Mediastinal Large B-Cell Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient has relapsed after, or is refractory to, at least two previous regimens; AND
Note: Examples of previous regimens include autologous hematopoietic stem cell transplant (auto-HSCT), EPOCH-R (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin, rituximab), RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone), RCEPP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone).
- B) The medication is prescribed by or in consultation with an oncologist.

17. Renal Cell Carcinoma. Approve for the duration noted below if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i, ii, or iii):
 - i. Approve for 1 year if the patient meets ALL of the following (a, b, and c):
 - a) The tumor has clear cell histology; AND
 - b) Patient has relapsed or metastatic disease; AND
 - c) The medication is used in combination with Inlyta (axitinib tablets) or Lenvima (lenvatinib capsules); OR
 - ii. Approve for 1 year if the patient meets ALL of the following (a, b, and c):
 - a) The tumor has non-clear cell histology; AND
 - b) Patient has relapsed or metastatic disease; AND

- c) The medication is used as single-agent therapy; OR
- iii. Approve for up to 1 year (total) if patient meets ALL of the following (a, b, c, and d):
 - a) Keytruda is used as adjuvant therapy; AND
 - b) The tumor has clear cell histology; AND
 - c) Patient has advanced disease; AND
 - d) The medication is used as single-agent therapy; AND
- C) The medication is prescribed by or in consultation with an oncologist.

18. Tumor Mutational Burden-High (TMB-H) Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient has unresectable or metastatic tumor mutational burden-high (≥ 10 mutations/megabase) solid tumor; AND
Note: Examples of solid tumors are adrenal cancer, ampullary adenocarcinoma, breast cancer, cervical cancer, cholangiocarcinoma (intrahepatic and extrahepatic), chondrosarcoma, chordoma, endometrial carcinoma, esophageal carcinoma, esophagogastric junction carcinoma, Ewing sarcoma, gallbladder cancer, gastric cancer, head and neck cancer, neuroendocrine cancer, osteosarcoma, ovarian/fallopian tube/primary peritoneal carcinoma, pancreatic adenocarcinoma, penile cancer, primary occult, prostate cancer, salivary gland tumors, testicular cancer, thyroid cancer, uterine sarcoma, vulvar cancer.
- B) Patient has progressed on prior therapy; AND
- C) Patient has no satisfactory alternative treatment options; AND
- D) The medication is prescribed by or in consultation with an oncologist.

19. Urothelial Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following conditions (i, ii, iii, or iv):
 - i. Patient has locally advanced or metastatic disease; OR
 - ii. Patient has tried at least one platinum-based chemotherapy; OR
Note: Cisplatin and carboplatin are platinum-based chemotherapies.
 - iii. According to the prescriber, patient is not eligible for platinum-based chemotherapy; OR
Note: This is regardless of PD-L1 status. Cisplatin and carboplatin are platinum-based chemotherapies.
 - iv. Patient meets both of the following (a and b):
 - a) Patient has non-muscle invasive bladder cancer; AND
 - b) Patient has tried Bacillus Calmette-Guerin (BCG) or intravesical chemotherapy; AND
Note: Examples of agents used as intravesical chemotherapy include mitomycin and gemcitabine.
- C) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

20. Adrenal Gland Tumor. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has unresectable or metastatic adrenocortical carcinoma; AND
- C) The medication is prescribed by or in consultation with an oncologist.

21. Anal Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. Patient has locally recurrent, persistent disease; OR

- ii. Patient has metastatic disease; AND
 - C) Medication is used for subsequent therapy; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
- 22. Extranodal NK/T-Cell Lymphoma, Nasal Type.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has received an asparaginase-based chemotherapy regimen; AND
Note: Examples of asparaginase-based chemotherapy are dexamethasone, ifosfamide, pegaspargase, etoposide; and gemcitabine, pegaspargase, oxaliplatin.
 - C) The medication is prescribed by or in consultation with an oncologist.
- 23. Gestational Trophoblastic Neoplasia.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient has tried at least one previous chemotherapy regimen for recurrent or progressive disease; OR
Note: Examples of chemotherapy regimens contain etoposide, cisplatin/carboplatin, paclitaxel, bleomycin, ifosfamide, methotrexate.
 - ii. Patient has high-risk disease; AND
 - C) The medication is prescribed by or in consultation with an oncologist.
- 24. Glioma.** Approve for duration noted if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is < 18 years of age; AND
 - B) Patient has diffuse high-grade disease; AND
 - C) Tumor is hypermutant; AND
 - D) Patient meets ONE of the following (i or ii):
 - i. Approve for 1 year (total) if the patient meets BOTH of the following (a and b):
 - a) Medication is used for adjuvant treatment; AND
 - b) Patient does NOT have diffuse midline glioma, H3 K27-altered, or pontine location; OR
 - ii. Approve for 1 year if the patient has meets BOTH of the following (a and b):
 - a) Patient has recurrent or progressive; AND
 - b) Patient does NOT have either of the following [(1) or (2)]:
 - (1) Oligodendroglioma isocitrate dehydrogenase (IDH)-mutant and 1p/19q co-deleted; OR
 - (2) Astrocytoma, IDH-mutant; AND
 - E) The medication is prescribed by or in consultation with an oncologist.
- 25. Kaposi Sarcoma.** Approve for 6 months if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has endemic or classic Kaposi sarcoma; AND
 - C) Patient has relapsed or refractory advanced cutaneous, oral, visceral, or nodal disease; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
- 26. Mycosis Fungoides/Sezary Syndrome.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) The medication is prescribed by or in consultation with an oncologist.

- 27. Ovarian/Fallopian Tube/Peritoneal Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, F, and G):
- A) Patient is ≥ 18 years of age; AND
 - B) Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
Note: If the tumor is MSI-H or dMMR, see Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors criteria.
 - C) Disease is not tumor mutational burden-high (≥ 10 mutations/megabase); AND
Note: If the tumor is mutational burden-high, see Tumor Mutational Burden-High (TMB-H) Cancer criteria.
 - D) Patient has platinum-resistant disease; AND
 - E) Medication is used for the treatment of recurrence; AND
 - F) Medication is used in combination with cyclophosphamide and bevacizumab; AND
 - G) The medication is prescribed by or in consultation with an oncologist.
- 28. Primary Cutaneous Anaplastic Large Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed or refractory disease; AND
 - C) Patient meets ONE of the following (i or ii):
 - ii. Patient has disease with multifocal lesions; OR
 - iii. Patient has disease with regional node; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
- 29. Small Bowel Adenocarcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):
- A) Patient is ≥ 18 years of age; AND
 - B) Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
Note: If the tumor is MSI-H or dMMR, see Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors criteria.
 - C) Disease is not tumor mutational burden-high (≥ 10 mutations/megabase); AND
Note: If the tumor is mutational burden-high, see Tumor Mutational Burden-High (TMB-H) Cancer criteria.
 - D) Disease is DNA polymerase epsilon/delta 1 (POLE/POLD1) mutation positive; AND
 - E) Patient has advanced or metastatic disease; AND
 - F) The medication is prescribed by or in consultation with an oncologist.
- 30. Small Cell Lung Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Keytruda is used as subsequent therapy; AND
 - C) The medication is prescribed by or in consultation with an oncologist.
- 31. Soft Tissue Sarcoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
Note: If the tumor is MSI-H or dMMR, see Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors criteria.
 - C) Disease is not tumor mutational burden-high (≥ 10 mutations/megabase); AND
Note: If the tumor is mutational burden-high, see Tumor Mutational Burden-High (TMB-H) Cancer criteria.

- D) Patient has ONE of the following (i, ii, iii, iv, or v):
 - i. Alveolar soft part sarcoma; OR
 - ii. Cutaneous angiosarcoma; OR
 - iii. Extremity, body wall, or head and neck sarcoma; OR
 - iv. Retroperitoneal or intra-abdominal sarcoma;
 - v. Rhabdomyosarcoma; AND
 - E) The medication is prescribed by or in consultation with an oncologist.
- 32. Squamous Cell Skin Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has locally advanced, recurrent, or metastatic disease; AND
 - C) According to the prescriber, curative surgery and curative radiation therapy are not feasible; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
- 33. Thymic Carcinoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) The medication is prescribed by or in consultation with an oncologist.
- 34. Thyroid Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has metastatic anaplastic carcinoma; AND
 - C) The medication is used in combination with Lenvima (lenvatinib capsules); AND
 - D) The medication is prescribed by or in consultation with an oncologist.
- 35. Vaginal Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):
- A) Patient is ≥ 18 years of age; AND
 - B) Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
Note: If the tumor is MSI-H or dMMR, see Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors criteria.
 - C) Disease is not tumor mutational burden-high (≥ 10 mutations/megabase); AND
Note: If the tumor is mutational burden-high, see Tumor Mutational Burden-High (TMB-H) Cancer criteria.
 - D) Patient has recurrent or metastatic disease; AND
 - E) Patient's tumor expression for programmed death-ligand 1 (PD-L1), as determined by an approved test, has a combined positive score (CPS) ≥ 1 ; AND
 - F) The medication is prescribed by or in consultation with an oncologist.
- 36. Vulvar Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):
- A) Patient is ≥ 18 years of age; AND
 - B) Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
Note: If the tumor is MSI-H or dMMR, see Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors criteria.
 - C) Disease is not tumor mutational burden-high (≥ 10 mutations/megabase); AND
Note: If the tumor is mutational burden-high, see Tumor Mutational Burden-High (TMB-H) Cancer criteria.
 - D) The tumor is PD-L1-positive (combined positive score ≥ 1), as determined by an approved test; AND
 - E) Patient has tried at least one other chemotherapy regimen; AND
Note: Examples of chemotherapy regimen are cisplatin, carboplatin, fluorouracil, paclitaxel.

- F) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Keytruda is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – Programmed Death Receptor-1) – Libtayo Prior Authorization Policy

- Libtayo® (cemiplimab-rwlc intravenous infusion – Regeneron/Sanofi Genzyme)

REVIEW DATE: 12/11/2024

OVERVIEW

Libtayo, a programmed death receptor-1 (PD-1) blocking antibody, is indicated for the treatment of the following conditions:¹

- **Basal Cell Carcinoma**, for treatment of locally advanced or metastatic disease in patients previously treated with a hedgehog pathway inhibitor or for whom a hedgehog pathway inhibitor is not appropriate.
- **Cutaneous Squamous Cell Carcinoma**, for metastatic or locally advanced disease in patients who are not candidates for curative surgery or curative radiation.
- **Non-Small Cell Lung Cancer (NSCLC)**, for first-line treatment, as a single agent, in adults with tumors that have high programmed death-ligand 1 (PD-L1) expression (tumor proportion score [TPS] $\geq 50\%$), as determined by an FDA-approved test, with no epidermal growth factor receptor (EGFR), anaplastic lymphoma kinase (ALK), or ROS1 aberrations. The disease can be locally advanced where patients are not candidates for surgical resection or definitive chemoradiation or for metastatic disease.
- **NSCLC**, for first-line treatment, in combination with platinum-based chemotherapy, for adults with NSCLC without EGFR, ALK, or ROS1 aberrations and with disease that is locally advanced where patients are not candidates for surgical resection or definitive chemoradiation, or for metastatic disease.

Guidelines

Libtayo is addressed in National Comprehensive Cancer Network guidelines:

- **Basal Cell Carcinoma:** Guidelines (version 3.2024 – March 1, 2024) recommend Libtayo for locally advanced disease where surgery and/or radiation therapy may not result in a cure or would possibly produce a significant functional limitation, for nodal disease if surgery is not feasible, or metastatic disease (category 2A).^{2,5}
- **Cervical Cancer:** Guidelines (version 4.2024 – September 24, 2024) recommend Libtayo for the subsequent treatment of local or regional recurrence, or stage IVB or recurrence with distant metastases, as a single agent (category 2A).^{5,6}
- **Cutaneous Squamous Cell Carcinoma:** Guidelines (version 1.2024 – November 9, 2023) recommend Libtayo as a preferred therapy (category 2A) for locally advanced, recurrent, or metastatic disease in which curative surgery or curative radiotherapy is not feasible.^{3,5} Libtayo is also recommended for the adjuvant treatment of very-high risk, locally advanced, unresectable, or regional disease.
- **Non-Small Cell Lung Cancer:** Guidelines (version 11.2024 – October 15, 2024) recommend Libtayo as a single agent for the first-line and continuation maintenance therapy of advanced, recurrent, or metastatic disease with PD-L1 $\geq 50\%$ and negative for actionable molecular markers.^{4,5} Libtayo is also recommended as a single agent or in combination with chemotherapy, as first-line, continuation maintenance, and subsequent therapy in a variety of clinical situations.

12/11/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Vaginal Cancer:** Guidelines (version 2.2025 – August 8, 2024) recommend Libtayo for the subsequent treatment of local or regional recurrence, or stage IVB or recurrence with distant metastases, as a single agent (category 2A).^{5,8}
- **Vulvar Cancer:** Guidelines (version 4.2024 – May 1, 2024) recommend single agent Libtayo for the subsequent treatment of advanced, recurrent, or metastatic disease.^{5,7}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Libtayo. Because of the specialized skills required for evaluation and diagnosis of patients treated with Libtayo as well as the monitoring required for adverse events and long-term efficacy, approval requires Libtayo to be prescribed by, or in consultation with, a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Libtayo is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Basal Cell Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has locally advanced, nodal, or metastatic disease; AND
 - C) The medication is prescribed by or in consultation with an oncologist.
2. **Cutaneous Squamous Cell Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient meets BOTH of the following (a and b):
 - a) Patient has locally advanced, recurrent, or metastatic disease; AND
 - b) Patient is not a candidate for curative surgery or curative radiation; OR
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient has very-high risk, locally advanced, unresectable, or regional disease; AND
 - b) Medication will be used as neoadjuvant therapy; AND
 - C) The medication is prescribed by or in consultation with an oncologist.
3. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has recurrent, advanced, or metastatic disease; AND
 - C) Patient meets ONE of the following (i, ii, iii, or iv):
 - i. Patient meets BOTH of the following (a and b):
 - a) Medication is used for first-line or continuation maintenance therapy; AND
Note: This is regardless of programmed death-ligand 1 (PD-L1) status.
 - b) The tumor is negative for actionable mutations; OR

Note: Examples include sensitizing epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *RET* rearrangement, *MET* exon 14 skipping, *NTRK* gene fusion positive, *BRAF V600E* mutation-positive, and *ROS1* rearrangement positive. Tumor may be *KRAS G12C* mutation positive.

- ii. Patient meets BOTH of the following (a and b):
 - a) Medication will be used first-line; AND
 - b) The tumor is positive for ONE of the following mutations [(1) or (2)]:
 - (3) *EGFR* exon 20 mutation; OR
 - (4) *ERBB2* (*HER2*) mutation; OR
 - iii. Patient meets BOTH of the following (a and b):
 - a) Medication will be used as first-line or subsequent therapy; AND
Note: This is regardless of the PD-L1 status.
 - b) The tumor is positive for ONE of the following mutations [(1), (2), (3), or (4)]:
 - (1) *BRAF V600E* mutation; OR
 - (2) *NTRK1/2/3* gene fusion; OR
 - (3) *MET* exon 14 skipping mutation; OR
 - (4) *RET* rearrangement; OR
 - iv. Patient meets ALL of the following (a, b, and c):
 - a) Medication will be used as subsequent therapy; AND
 - b) The tumor is positive for ONE of the following mutations [(1), (2), (3), or (4)]:
 - (1) *EGFR S768I*, *L861Q*, and/or *G719X* mutation; OR
 - (2) *EGFR* exon 19 deletion or exon 21 *L858R*; OR
 - (3) *ALK* rearrangement; OR
 - (4) *ROS1* rearrangement; AND
 - c) The patient has received targeted drug therapy for the specific mutation; OR
Note: Examples of targeted drug therapy include Gilotrif (afatinib tablet), Tagrisso (osimertinib tablet), erlotinib, Iressa (gefitinib tablet), Vizimpro (dacomitinib tablet) Xalkori (crizotinib capsule), Rozlytrek (entrectinib capsule), Alecensa (alectinib capsule), or Zykadia (ceritinib tablet).
- D) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

- 4. **Cervical Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient has local or regional recurrence; OR
 - ii. Patient has distant metastatic disease; AND
 - C) Medication is used as subsequent therapy; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
- 5. **Vaginal Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient has local or regional recurrence; OR
 - ii. Patient has distant metastatic disease; AND
 - C) Medication is used as subsequent therapy; AND
 - D) The medication is prescribed by or in consultation with an oncologist.

6. **Vulvar Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced, recurrent, or metastatic disease; AND
 - C) Medication is used as subsequent therapy; AND
 - D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Libtayo is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – Programmed Death Receptor-1) - Loqtorzi Prior Authorization Policy

- Loqtorzi™ (toripalimab intravenous infusion – Coherus BioSciences)

REVIEW DATE: 12/20/2023

OVERVIEW

Loqtorzi, a programmed death receptor-1 blocking antibody, is indicated for the following uses:¹

- **Nasopharyngeal carcinoma**, in adults for the first-line treatment of metastatic or recurrent, locally advanced disease in combination with cisplatin and gemcitabine.
- **Nasopharyngeal carcinoma**, in adults as a single agent for the treatment of previously treated unresectable or metastatic disease.

Guidelines

The National Comprehensive Cancer Network (NCCN) head and neck cancers (version 2.2024 – December 8, 2023) clinical practice guidelines recommend Loqtorzi in combination with cisplatin and gemcitabine as a “Preferred Regimen” for the first-line treatment of recurrent, unresectable, oligometastatic, or metastatic nasopharyngeal carcinoma without any surgical or radiation therapy options (category 1).^{2,3} Loqtorzi is recommended as a single agent, as a “Preferred Regimen” for the subsequent treatment of nasopharyngeal carcinoma if disease progression on or after platinum-containing therapy (category 2A). It is also an “Other Recommended Regimen” for the subsequent treatment of nasopharyngeal carcinoma, in combination with cisplatin and gemcitabine if not previously used (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Loqtorzi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Loqtorzi as well as the monitoring required for adverse events and long-term efficacy, approval requires Loqtorzi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Loqtorzi is recommended in those who meet the following criteria:

FDA-Approved Indication

13. Nasopharyngeal Carcinoma. Approve for 1 year if the patient meets the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has recurrent, unresectable, oligometastatic, or metastatic disease; AND
- C) Patient meets ONE of the following (i or ii):
 - i. Patient meets BOTH of the following (a and b):
 - a) Loqtorzi is used for first-line treatment; AND
 - b) Loqtorzi is used in combination with cisplatin and gemcitabine; OR

12/20/2023

© 2023. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- ii. Patient meets both of the following (a and b):
 - a) Loqtorzi is used for subsequent treatment; AND
 - b) Loqtorzi is used as a single agent; AND
- D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Loqtorzi is not recommended in the following situations:

- 9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – Programmed Death Receptor-1) – Opdivo Prior Authorization Policy

- Opdivo® (nivolumab intravenous infusion – Bristol-Myers Squibb)

REVIEW DATE: 01/31/2024; selected revision 03/20/2024

OVERVIEW

Opdivo, a human programmed death receptor-1 (PD-1) blocking antibody, is indicated for the following uses:¹

- **Classical Hodgkin lymphoma**, for adults who have relapsed or progressed after autologous hematopoietic stem cell transplantation (auto-HSCT) and Adcetris® (brentuximab vedotin intravenous infusion) OR after three or more lines of systemic therapy that includes auto-HSCT.*
- **Colorectal cancer**, with or without Yervoy® (ipilimumab intravenous infusion) for patients ≥ 12 years of age with microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) metastatic disease that has progressed following treatment with a fluoropyrimidine, oxaliplatin, and irinotecan.*
- **Esophageal carcinoma**, in the following situations:
 - For adults with unresectable advanced, recurrent, or metastatic squamous cell disease after prior fluoropyrimidine- and platinum-based chemotherapy.
 - Adjuvant treatment of completely resected esophageal or gastroesophageal junction cancer with residual pathologic disease in adults who have received neoadjuvant chemoradiotherapy.
 - First-line treatment of adults with unresectable advanced or metastatic esophageal squamous cell carcinoma in combination with fluoropyrimidine- and platinum-containing chemotherapy.
 - First-line treatment of adults with unresectable advanced or metastatic esophageal squamous cell carcinoma in combination with Yervoy.
- **Gastric cancer, esophagogastric junction cancer, and esophageal adenocarcinoma**, for adults with advanced or metastatic disease, in combination with fluoropyrimidine- and platinum-containing chemotherapy.
- **Head and neck squamous cell carcinoma**, in adults with recurrent or metastatic disease with disease progression on or after platinum-based therapy.
- **Hepatocellular carcinoma**, in adults who have been previously treated with Nexavar® (sorafenib tablets), in combination with Yervoy.*
- **Malignant pleural mesothelioma**, for first-line treatment, in combination with Yervoy in adults with unresectable disease.
- **Melanoma**, in patients ≥ 12 years of age with:
 - Unresectable or metastatic disease as a single agent.
 - Unresectable or metastatic disease in combination with Yervoy.
 - Adjuvant treatment for Stage IIB to Stage IV disease in patients who have undergone complete resection.
- **Non-small cell lung cancer:**
 - As first-line treatment in combination with Yervoy, in adults with metastatic disease expressing programmed death-ligand 1 (≥ 1%) as determined by an FDA-approved test, without epidermal growth factor receptor (EGFR) or anaplastic lymphoma kinase (ALK) genomic tumor aberrations.

01/31/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- As first-line treatment in combination with Yervoy and two cycles of platinum-doublet chemotherapy, in adults with recurrent or metastatic disease without *EGFR* or *ALK* genomic tumor aberrations.
- In adults with metastatic disease and progression on or after platinum-based chemotherapy. Patients with *EGFR* or *ALK* genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving Opdivo.
- In combination with platinum-doublet chemotherapy, as neoadjuvant treatment of adults with resectable (tumors ≥ 4 cm or node positive) disease.
- **Renal cell carcinoma:**
 - In adults with advanced disease who have received prior anti-angiogenic therapy.
 - In combination with Yervoy, for adults with intermediate or poor risk advanced disease, as first-line therapy.
 - In combination with Cabometyx® (cabozantinib tablets), for the first-line treatment of adults with advanced disease.
- **Urothelial carcinoma**, in the following situations:
 - In adults with unresectable or metastatic disease, as first-line treatment in combination with cisplatin and gemcitabine.
 - In adults with advanced or metastatic disease who have disease progression during or following platinum-containing chemotherapy.
 - In adults with advanced or metastatic disease who have disease progression within 12 months of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy.
 - Adjuvant treatment of adults at high risk of recurrence after undergoing radical resection of urothelial carcinoma.

* This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in the confirmatory trials.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Opdivo. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Opdivo as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Opdivo is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Classic Hodgkin Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):

Note: For pediatric patients, see Pediatric Hodgkin Lymphoma criteria.

- A) Patient is ≥ 18 years of age; AND

01/31/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- B) Patient meets ONE of the following conditions (i, ii, or iii):**
- ii.** Patient has had a hematopoietic stem cell transplantation (HSCT); OR
 - iii.** Patient has tried three or more systemic regimens AND this includes an auto-HSCT as one line of therapy; OR
- Note: Examples of systemic regimens are ABVD (doxorubicin, bleomycin, vinblastine, and dacarbazine), Sanford V (doxorubicin, vinblastine, mechlorethamine, etoposide, vincristine, bleomycin, and prednisone), escalated BEACOPP (bleomycin, etoposide, doxorubicin, cyclophosphamide, vincristine, procarbazine, and prednisone).
- iv.** Patient has relapsed or refractory disease and the medication is used in combination with Adcetris (brentuximab intravenous infusion) or ICE (ifosfamide, carboplatin, and etoposide); AND
- C) The medication is prescribed by or in consultation with an oncologist.**

2. Colon, Rectal, or Appendiceal Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 12 years of age; AND**
- B) Patient meets ONE of the following (i or ii):**
 - i.** The tumor is microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); OR
 - ii.** The tumor is polymerase epsilon/delta (POLE/POLD1) mutation positive; AND
- C) Patient meets ONE of the following (i, ii, or iii):**
 - i.** Patient has tried chemotherapy; OR

Note: Examples of chemotherapy are fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine, oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).

 - ii.** Patient has unresectable, advanced, or metastatic disease; OR
 - iii.** The medication is used for neoadjuvant therapy; AND
- D) The medication is prescribed by or in consultation with an oncologist.**

3. Esophageal and Esophagogastric Junction Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND**
- B) Patient meets ONE of the following (i, ii, iii, iv, or v):**
 - i.** Patient meets BOTH of the following (a and b):
 - a)** Patient has received preoperative chemotherapy; AND

Note: Examples of chemotherapy include 5-fluorouracil plus either cisplatin or oxaliplatin; and paclitaxel plus carboplatin.

 - b)** According to the prescriber, the patient has residual disease; OR
 - ii.** Patient meets BOTH of the following (a and b):
 - a)** Patient has squamous cell carcinoma; AND
 - b)** Patient meets ONE of the following [(1) or (2)]:
 - (1)** According to the prescriber, the patient is not a surgical candidate; OR
 - (2)** Patient has unresectable locally advanced, recurrent, or metastatic disease; OR
 - iii.** Patient meets ALL of the following (a, b, c, d, and e):
 - a)** Patient has adenocarcinoma; AND
 - b)** Patient meets ONE of the following [(1) or (2)]:
 - (1)** According to the prescriber, the patient is not a surgical candidate; OR
 - (2)** Patient has unresectable locally advanced, recurrent, or metastatic disease; AND
 - c)** The disease is negative for human epidermal growth factor receptor 2 (HER2) overexpression; AND

- d) The tumor expression for programmed death ligand-1 (PD-L1) has a combined positive score (CPS) ≥ 5 ; AND
- e) The medication is used in combination with fluoropyrimidine (fluorouracil or capecitabine) and oxaliplatin; OR
Note: Examples of fluoropyrimidines include 5-fluorouracil and capecitabine.
- iv. Patient meets ALL of the following (a, b, and c):
 - a) Patient meets ONE of the following [(1) or (2)]:
 - (1) According to the prescriber, the patient is not a surgical candidate; OR
 - (2) Patient has unresectable locally advanced, recurrent, or metastatic disease; AND
 - b) Tumor is microsatellite instability-high (MSI-H) or deficient mismatch repair (dMMR); AND
 - c) The medication will be used in combination with ONE of the following [(1) or (2)]:
 - (1) Fluoropyrimidine and oxaliplatin containing chemotherapy; OR
 - (2) Yervoy (ipilimumab intravenous infusion); OR
- v. Patient meets ALL of the following (a, b, and c):
 - a) Patient has adenocarcinoma; AND
 - b) Tumor is MSI-H or dMMR; AND
 - c) The medication is used as neoadjuvant or perioperative immunotherapy; AND
- C) The medication is prescribed by or in consultation with an oncologist.

4. Gastric Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i, ii or iii):
- i. Patient meets ALL of the following (a, b, and c):
 - a) Patient has locoregional disease; AND
 - b) Tumor is microsatellite instability-high (MSI-H) or deficient mismatch repair (dMMR); AND
 - c) The medication is used as neoadjuvant or perioperative immunotherapy; OR
- ii. Patient meets ALL of the following (a, b, and c):
 - a) Patient meets ONE of the following [(1) or (2)]:
 - (1) Patient has unresectable locally advanced, recurrent, or metastatic disease; OR
 - (2) According to the prescriber, the patient is not a surgical candidate; AND
 - b) The disease is negative for human epidermal growth factor receptor 2 (HER2) overexpression; AND
 - c) The medication is used in combination with fluoropyrimidine and oxaliplatin; OR
- Note: Examples of fluoropyrimidines include fluorouracil and capecitabine.
- iii. Patient meets ALL of the following (a, b, and c):
 - a) Patient meets ONE of the following [(1) or (2)]:
 - (1) Patient has unresectable locally advanced, recurrent, or metastatic disease; OR
 - (2) According to the prescriber, the patient is not a surgical candidate; AND
 - b) Tumor is MSI-H or dMMR; AND
 - c) Patient meets ONE of the following [(1) or (2)]:

- (1) The medication is used in combination with Yervoy (ipilimumab intravenous infusion); OR
- (2) The medication is used in combination with fluoropyrimidine and oxaliplatin; AND

Note: Examples of fluoropyrimidines include fluorouracil and capecitabine.

- C) The medication is prescribed by or in consultation with an oncologist.

5. Head and Neck Squamous Cell Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. Patient has non-nasopharyngeal disease; OR
 - ii. Patient meets ALL of the following conditions (a, b, and c):
 - a) Patient has nasopharyngeal disease; AND
 - b) Patient has recurrent, unresectable, oligometastatic, or metastatic disease; AND
 - c) Opdivo is used in combination with cisplatin and gemcitabine; AND
- C) The medication is prescribed by or in consultation with an oncologist.

6. Hepatocellular Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- F) Patient is ≥ 18 years of age; AND
- G) Patient has ONE of the following (i, ii, or iii):
 - i. Unresectable disease and is not a transplant candidate; OR
 - ii. Liver-confined disease, inoperable by performance status, comorbidity, or with minimal or uncertain extrahepatic disease; OR
 - iii. Metastatic disease or extensive liver tumor burden; AND
- H) If the medication is used first-line, patient meets BOTH of the following (i and ii):
 - i. Patient has Child-Pugh Class B liver disease; AND
 - ii. The medication is used as a single agent; AND
- I) The medication is prescribed by or in consultation with an oncologist.

7. Melanoma. Approve for the duration noted if the patient meets ALL of the following (A, B, and C):

Note: This includes cutaneous melanoma, brain metastases due to melanoma, and uveal melanoma.

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. Approve for 1 year if the patient has unresectable, advanced, or metastatic melanoma; OR
 - ii. Approve for up to 1 year of treatment (total) if Opdivo will be used as adjuvant treatment; AND
- C) The medication is prescribed by or in consultation with an oncologist.

8. Mesothelioma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has ONE of the following (i, ii, iii, or iv):
 - i. Malignant pleural mesothelioma; OR
 - ii. Malignant peritoneal mesothelioma; OR
 - iii. Pericardial mesothelioma; OR
 - iv. Tunica vaginalis testis mesothelioma; AND
- C) If used as first-line therapy, the medication is used in combination with Yervoy (ipilimumab intravenous infusion); AND
- D) The medication is prescribed by or in consultation with an oncologist.

9. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i, ii, iii, iv, v, or vi):

- i. Opdivo is used as first-line or continuation maintenance therapy and the patient meets ALL of the following (a, b, and c):

Note: This is regardless of programmed death-ligand-1 (PD-L1) status.

 - a) Patient has recurrent, advanced, or metastatic disease; AND
 - b) Opdivo will be used in combination with Yervoy (ipilimumab intravenous infusion); AND
 - c) The tumor is negative for actionable mutations; OR

Note: Examples of actionable mutations include sensitizing epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *NTRK* gene fusion-positive, *ROS1*, *BRAF V600E*, *MET 14* skipping mutation, *RET* rearrangement. *KRAS G12C* is not considered an actionable mutation (the tumor may be *KRAS G12C* mutation positive).
- ii. Opdivo is used as first-line or subsequent therapy and the patient meets ALL of the following (a, b, and c):

Note: This is regardless of PD-L1 status.

 - a) Patient has recurrent, advanced, or metastatic disease; AND
 - b) The tumor is positive for ONE of the following mutations [(1), (2), (3), or (4)]:
 - (1) *BRAF V600E* mutation; OR
 - (2) *NTRK1/2/3* gene fusion; OR
 - (3) *MET* exon 14 skipping mutation; OR
 - (4) *RET* rearrangement; AND
 - c) The medication will be used in combination with Yervoy; OR
- iii. Opdivo is used as first-line therapy and the patient meets ALL of the following (a, b, and c):

Note: This is regardless of PD-L1 status.

 - a) Patient has recurrent, advanced, or metastatic disease; AND
 - b) The tumor is positive for ONE of the following mutations [(1) or (2)]:
 - (1) Epidermal growth factor receptor (*EGFR*) exon 20 mutation; OR
 - (2) *ERBB2 (HER2)*; AND
 - c) The medication will be used in combination with Yervoy; OR
- iv. Opdivo is used as subsequent therapy and the patient meets ALL of the following (a, b, c, and d):
 - a) Patient has recurrent, advanced, or metastatic disease; AND
 - b) The tumor is positive for ONE of the following mutations [(1), (2), (3), or (4)]:
 - (1) Epidermal growth factor receptor (*EGFR*) *S768I*, *L861Q*, and/or *G719X* mutation positive; OR
 - (2) *EGFR* exon 19 deletion or exon 21 L858R; OR
 - (3) Anaplastic lymphoma kinase (*ALK*) rearrangement positive; OR
 - (4) *ROS1* rearrangement positive; AND
 - c) The patient has received targeted drug therapy for the specific mutation; AND

Note: Examples of targeted drug therapy include Gilotrif (afatinib tablets), Tagrisso (osimertinib tablets), erlotinib, Iressa (gefitinib tablets), Vizimpro (dacomitinib tablets), Xalkori (crizotinib capsules), Rozlytrek (entrectinib capsules), or Zykadia (ceritinib tablets).
 - d) Opdivo is used in combination with Yervoy; OR
- v. Patient meets ALL of the following (a, b, c, and d):
 - a) Patient has recurrent, advanced, or metastatic disease; AND
 - b) Patient has tried systemic chemotherapy; AND

Note: Examples of systemic chemotherapy include cisplatin, carboplatin, Alimta (pemetrexed injection), Abraxane (paclitaxel albumin-bound injection), gemcitabine, paclitaxel.

- c) Patient has not progressed on prior therapy with a programmed death-1 (PD-1)/PD-L1 inhibitor; AND
Note: This includes previous therapy with either one of Opdivo, Keytruda (pembrolizumab intravenous infusion), or Tecentriq (atezolizumab intravenous infusion).
- d) If the tumor is positive for an actionable mutation, the patient has received targeted drug therapy for the specific mutation; AND
Note: Examples of actionable mutations include sensitizing epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *NTRK* gene fusion-positive, *ROS1*, *BRAF V600E*, *MET 14* skipping mutation, *RET* rearrangement; OR
- vi. Patient meets ALL of the following (a, b, and c):
 - a) Patient has resectable disease; AND
Note: Resectable disease is defined as tumors ≥ 4 cm or node positive.
 - b) Opdivo is used as neoadjuvant therapy; AND
 - c) Opdivo is used in combination with platinum-doublet chemotherapy; AND
Note: Examples of platinum-doublet chemotherapy include carboplatin plus paclitaxel, cisplatin plus pemetrexed, and cisplatin plus gemcitabine.
- C) The medication is prescribed by or in consultation with an oncologist.

10. Renal Cell Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has advanced, relapsed, or metastatic disease; AND
- C) The medication is prescribed by or in consultation with an oncologist.

11. Urothelial Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

12. Ampullary Adenocarcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

- E) Patient is ≥ 18 years of age; AND
- F) Patient has microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) disease; AND
- G) Patient meets ONE of the following (i or ii):
 - i. The medication is used first-line and the patient has ONE of the following (a, b, or c):
 - a) Unresectable localized disease; OR
 - b) Stage IV resected disease; OR
 - c) Metastatic disease at initial presentation; OR
 - ii. The medication is used for subsequent therapy; AND
- H) The medication is used in combination with Yervoy (ipilimumab intravenous infusion); AND
- I) The medication is prescribed by or in consultation with an oncologist.

13. Anal Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has tried at least one chemotherapy regimen; AND

Note: Examples of chemotherapy are 5-fluorouracil (5-FU), cisplatin, carboplatin plus paclitaxel, FOLFOX (oxaliplatin, leucovorin, and 5-FU).

C) The medication is prescribed by or in consultation with an oncologist.

14. Biliary Tract Cancers. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):

A) Patient is ≥ 18 years of age; AND

B) Patient has ONE of the following (i, ii, or iii):

i. Unresectable disease; OR

ii. Resected gross residual disease; OR

iii. Metastatic disease; AND

C) Tumor is tumor mutational burden-high (TMB-H); AND

D) The medication is used as subsequent therapy; AND

E) The medication is used in combination with Yervoy (ipilimumab intravenous infusion); AND

F) The medication is prescribed by or in consultation with an oncologist.

15. Bone Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, F, G, and H):

A) Patient is ≥ 18 years of age; AND

B) Patient has ONE of the following conditions (i, ii, iii, iv, or v):

i. Chondrosarcoma; OR

ii. Chordoma; OR

iii. Ewing sarcoma; OR

iv. Osteosarcoma; OR

v. High-grade undifferentiated pleomorphic sarcoma; AND

C) Patient has unresectable or metastatic disease; AND

D) Patient has tumor mutational burden-high (TMB-H) disease; AND

E) Patient has progressed following prior treatment; AND

F) Patient has no satisfactory alternative treatment options; AND

G) The medication is used in combination with Yervoy (ipilimumab intravenous infusion); AND

H) The medication is prescribed by or in consultation with an oncologist.

16. Cervical Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

A) Patient is ≥ 18 years of age; AND

B) Patient has recurrent or metastatic disease; AND

C) Patient has programmed death ligand-1 (PD-L1) positive disease (combined positive score [CPS] ≥ 1); AND

D) The medication is used as second-line or subsequent therapy; AND

E) The medication is prescribed by or in consultation with an oncologist.

17. Diffuse High-Grade Gliomas. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

A) Patient is < 18 years of age; AND

B) Patient has hypermutant tumor diffuse high-grade glioma; AND

C) Patient meets ONE of the following (i or ii):

i. The medication is used for adjuvant treatment; OR

ii. The medication is used for recurrent or progressive disease; AND

D) The medication is prescribed by or in consultation with an oncologist.

18. Endometrial Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one prior systemic therapy; AND

Note: Examples of systemic therapy are carboplatin, paclitaxel, docetaxel, cisplatin, doxorubicin, topotecan, ifosfamide, everolimus/letrozole.

C) Patient has mismatch repair deficient/microsatellite instability-high (dMMR/MSI-H) disease; AND

D) The medication is prescribed by or in consultation with an oncologist.

19. Extranodal NK/T-Cell Lymphomas. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has received an asparaginase-based chemotherapy regimen; AND

Note: Examples of asparaginase-based chemotherapy are dexamethasone, ifosfamide, pegaspargase, etoposide; and gemcitabine, pegaspargase, oxaliplatin.

C) The medication is prescribed by or in consultation with an oncologist.

20. Gestational Trophoblastic Neoplasia. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient has multiagent chemotherapy-resistant disease; AND

Note: Examples of chemotherapy regimens contain etoposide, cisplatin/carboplatin, paclitaxel, bleomycin, ifosfamide, methotrexate.

B) The medication is prescribed by or in consultation with an oncologist.

21. Kaposi Sarcoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

A) Patient has classic disease; AND

B) Patient has relapsed or refractory disease; AND

C) The medication is used in combination with Yervoy (ipilimumab intravenous infusion); AND

D) The medication is prescribed by or in consultation with an oncologist.

22. Merkel Cell Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i or ii):

i. Patient has disseminated Merkel cell carcinoma; OR

ii. The medication is used as neoadjuvant therapy; AND

C) The medication is prescribed by or in consultation with an oncologist.

23. Neuroendocrine Tumors. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

A) Patient is ≥ 18 years of age; AND

B) Patient has advanced or metastatic disease; AND

C) Patient meets ONE of the following (i or ii):

i. Patient has well differentiated, Grade 3 disease; OR

ii. Patient has poorly differentiated, large or small cell disease (other than lung); AND

D) The medication is used in combination with Yervoy (ipilimumab intravenous infusion); AND

E) The medication is prescribed by or in consultation with an oncologist.

24. Pediatric Hodgkin Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is < 18 years of age; AND
- B) Patient has tried at least one prior systemic chemotherapy; AND
Note: Examples of chemotherapy are AVPC (doxorubicin, vincristine, prednisone, cyclophosphamide), ABVE-PC (doxorubicin, bleomycin, vincristine, etoposide, prednisone, cyclophosphamide), OEPA (vincristine, etoposide, prednisone, doxorubicin).
- C) If used for re-induction therapy, the medication is used in combination with Adcetris (brentuximab intravenous infusion); AND
- D) The medication is prescribed by or in consultation with an oncologist.

24. Primary Mediastinal Large B-Cell Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient has relapsed or refractory disease; AND
- B) Patient meets ONE of the following (i or ii):
 - i. The medication is used as a single agent; OR
 - ii. The medication is used in combination with Adcetris (brentuximab intravenous infusion) after a partial response to therapy for relapsed or refractory disease; AND
- C) The medication is prescribed by or in consultation with an oncologist.

25. Small Bowel Adenocarcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is $\geq$ 18 years of age; AND
- B) Patient has advanced or metastatic disease; AND
- C) The tumor is microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
- D) The medication is prescribed by or in consultation with an oncologist.

26. Small Cell Lung Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is $\geq$ 18 years of age; AND
- B) The medication is used as second-line or subsequent therapy; AND
- C) The medication is prescribed by or in consultation with an oncologist.

28. Soft Tissue Sarcoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is $\geq$ 18 years of age; AND
- B) Patient has ONE of the following (i or ii):
 - i. Patient has advanced or metastatic disease and has ONE of the following (a, b, c, d, e, or f):
 - a) Myxofibrosarcoma; OR
 - b) Undifferentiated pleomorphic sarcoma; OR
 - c) Dedifferentiated liposarcoma; OR
 - d) Cutaneous angiosarcoma; OR
 - e) Undifferentiated sarcoma; OR
 - f) Tumor mutation burden-high (TMB-H); OR
 - ii. Angiosarcoma; AND
- C) The medication is prescribed by or in consultation with an oncologist.

29. Vulvar Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is $\geq$ 18 years of age; AND
- B) Patient has human papilloma virus (HPV)-related disease; AND
- C) Patient has tried at least one prior systemic therapy; AND
Note: Examples of systemic therapy are cisplatin, carboplatin, fluorouracil, paclitaxel, bevacizumab.
- D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Opdivo is not recommended in the following situations:

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – (Injectable – Programmed Death Receptor-1) – Opdivo Qvantig Prior Authorization Policy

- Opdivo Qvantig™ (nivolumab and hyaluronidase-nvhy subcutaneous injection – Bristol-Myers Squibb and Halozyme)

REVIEW DATE: 01/08/2025

OVERVIEW

Opdivo Qvantig, a programmed death receptor-1 (PD-1) blocking antibody and hyaluronidase-nvhy, is indicated for the following uses:¹

- **Colorectal cancer**, in adults with microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) metastatic disease that has progressed following treatment with a fluoropyrimidine, oxaliplatin, and irinotecan, as monotherapy or following treatment with Opdivo (nivolumab intravenous infusion) and Yervoy (ipilimumab intravenous infusion) combination therapy.

Limitation of use: Opdivo Qvantig is not indicated in combination with Yervoy for the treatment of MSI-H or dMMR metastatic colorectal cancer.

This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

- **Esophageal cancer:**
 - In adults for adjuvant therapy for completely resected esophageal or gastroesophageal junction cancer with residual pathologic disease in patients who have received neoadjuvant chemotherapy, as monotherapy.
 - In adults for the first-line treatment of unresectable advanced or metastatic esophageal squamous cell carcinoma in combination with fluoropyrimidine- and platinum-containing chemotherapy.

Limitation of use: Opdivo Qvantig is not indicated in combination with Yervoy for the treatment of unresectable advanced or metastatic esophageal squamous cell carcinoma.

- In adults with unresectable advanced, recurrent, or metastatic esophageal squamous cell carcinoma after prior fluoropyrimidine- and platinum-based chemotherapy, as monotherapy.
- **Gastric cancer, gastroesophageal junction cancer, and esophageal adenocarcinoma**, in adults with advanced or metastatic disease in combination with fluoropyrimidine- and platinum-containing chemotherapy.
- **Head and neck squamous cell carcinoma**, in adults with recurrent or metastatic disease with progression on or after platinum-based therapy, as monotherapy.
- **Hepatocellular carcinoma**, in adults who have been previously treated with sorafenib and following treatment with Opdivo and Yervoy, as monotherapy.

Limitation of use: Opdivo Qvantig is not indicated in combination with Yervoy for the treatment of hepatocellular carcinoma.

This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

- **Melanoma:**
 - In adults with unresectable or metastatic disease, as monotherapy.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- In adults with unresectable or metastatic melanoma following treatment with Opdivo and Yervoy combination therapy, as monotherapy.
Limitation of use: Opdivo Qvantig is not indicated in combination with Yervoy for the treatment of unresectable or metastatic melanoma.
- For the adjuvant treatment of adults with completely resected Stage IIB, Stage IIC, Stage III, or Stage IV melanoma, as monotherapy.
- **Non-small cell lung cancer:**
 - In adults for the neoadjuvant treatment of resectable (tumors ≥ 4 cm or node positive) disease in combination with platinum-doublet chemotherapy.
 - In adults for the neoadjuvant treatment of resectable (tumors ≥ 4 cm or node positive) disease with no known epidermal growth factor receptor (*EGFR*) mutations or anaplastic lymphoma kinase (*ALK*) rearrangements in combination with platinum-doublet chemotherapy, followed by Opdivo Qvantig monotherapy in the adjuvant setting after surgical resection.
 - In adults with metastatic disease with disease progression on or after platinum-based chemotherapy as monotherapy. Patients with *EGFR* or *ALK* tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving Opdivo Qvantig.
Limitation of use: Opdivo Qvantig is not indicated in combination with Yervoy for the treatment of metastatic non-small cell lung cancer.
- **Renal cell carcinoma:**
 - In adults for the first-line treatment of intermediate or poor risk advanced disease following treatment with Opdivo and Yervoy combination therapy.
Limitation of use: Opdivo Qvantig is not indicated in combination with Yervoy for the treatment of renal cell carcinoma.
 - In combination with Cabometyx[®] (cabozantinib tablets), for the first-line treatment of adults with advanced disease.
 - In adults with advanced disease who have received prior anti-angiogenic therapy, as monotherapy.
- **Urothelial carcinoma:**
 - In adults for the adjuvant treatment of adult patients with urothelial carcinoma who are at high risk of recurrence after undergoing radical resection, as monotherapy.
 - In adults for the first-line treatment of unresectable or metastatic disease in combination with cisplatin and gemcitabine.
 - In adults with locally advanced or metastatic disease who have disease progression during or following platinum-containing chemotherapy, as monotherapy.
 - In adults with locally advanced or metastatic disease who have disease progression within 12 months of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy, as monotherapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) has not addressed Opdivo Qvantig.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Opdivo Qvantig. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Opdivo Qvantig as well as the monitoring required for adverse events and long-term efficacy, approval requires Opdivo Qvantig to be prescribed by or in consultation with a physician who specializes in the condition being treated.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Opdivo Qvantig is recommended in those who meet one of the following criteria:

FDA-Approved Indications

14. Colon and Rectal Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has metastatic disease; AND
- C) Patient has microsatellite instability-high or mismatch repair deficient disease; AND
- D) Patient has disease progression following treatment with a fluoropyrimidine, oxaliplatin, and irinotecan; AND

Note: Examples of a fluoropyrimidine included fluorouracil and capecitabine.

- E) Medication will be used as monotherapy; AND
- F) Medication is prescribed by or in consultation with an oncologist.

15. Esophageal and Esophagogastric Junction Cancer. Approve for the duration noted if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Approve for up to 1 year if the patient meets ONE of the following (i, ii, or iii):
 - i. Patient meets ALL of the following (a, b, and c):
 - a) Patient has completely resected esophageal or esophagogastric junction cancer with residual pathologic disease; AND
 - b) Patient received neoadjuvant chemotherapy; AND
 - c) Medication is used as monotherapy for adjuvant treatment; OR
 - ii. Approve for 1 year if the patient meets BOTH of the following (a and b):
 - a) Patient has unresectable advanced or metastatic esophageal squamous cell carcinoma; AND
 - b) Patient meets ONE of the following [(1) or (2)]:
 - (1) Medication is used first-line in combination with fluoropyrimidine- and platinum-containing chemotherapy; OR
 - Note: Examples of a fluoropyrimidine included fluorouracil and capecitabine. Examples of platinum agents include cisplatin and oxaliplatin.
 - (2) Medication is used as monotherapy following prior fluoropyrimidine- and platinum-containing chemotherapy; OR
 - Note: Examples of a fluoropyrimidine included fluorouracil and capecitabine. Examples of platinum agents include cisplatin and oxaliplatin.
 - iii. Approve for 1 year if the patient meets ALL of the following (a, b, and c):
 - a) Patient has ONE of the following [(1) or (2)]:
 - (1) Esophagogastric junction cancer; OR
 - (2) Esophageal adenocarcinoma; AND
 - b) Patient has advanced or metastatic disease; AND
 - c) Medication is used in combination with fluoropyrimidine- and platinum-containing chemotherapy; AND
 - Note: Examples of a fluoropyrimidine included fluorouracil and capecitabine. Examples of platinum agents include cisplatin and oxaliplatin.

C) Medication is prescribed by or in consultation with an oncologist.

16. Gastric Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Patient has advanced or metastatic disease; AND

C) Medication will be used in combination with fluoropyrimidine- and platinum-containing chemotherapy; AND

Note: Examples of a fluoropyrimidine included fluorouracil and capecitabine. Examples of platinum agents include cisplatin and oxaliplatin.

D) Medication is prescribed by or in consultation with an oncologist.

17. Head and Neck Squamous Cell Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Patient has recurrent or metastatic disease; AND

C) Patient has progressed on or after platinum-containing chemotherapy; AND

Note: Examples of platinum agents include cisplatin and oxaliplatin.

D) Medication is prescribed by or in consultation with an oncologist.

18. Hepatocellular Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Patient has been previously treated with sorafenib; AND

C) Medication will be administered as monotherapy following treatment with Opdivo (nivolumab intravenous infusion) and Yervoy (ipilimumab intravenous infusion); AND

D) Medication is prescribed by or in consultation with an oncologist.

19. Melanoma. Approve for duration noted if the patient meets ALL of the following (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Medication is used as monotherapy; AND

C) Patient meets ONE of the following (i or ii):

i. Approve for 1 year if the patient has unresectable or metastatic disease; OR

ii. Approve for up to 1 year if the patient meets BOTH of the following (a and b):

a) Patient has Stage IIB, IIC, III, or IV disease; AND

b) Medication is used for adjuvant therapy; AND

D) Medication is prescribed by or in consultation with an oncologist.

20. Non-Small Cell Lung Cancer. Approve for the duration noted if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i, ii, or iii):

i. Approve for up to 4 months if the patient meets ALL of the following (a, b, and c):

a) Patient has resectable (tumors ≥ 4 cm or node positive) disease; AND

b) Medication is used for neoadjuvant therapy; AND

c) Medication is used in combination with platinum-doublet chemotherapy; OR

Note: Examples of platinum agents include cisplatin and oxaliplatin.

ii. Approve for up to 1 year if the patient meets ALL of the following (a, b, and c):

a) Medication is used as monotherapy for adjuvant treatment; AND

b) Patient received Opdivo Qvantig in the neoadjuvant setting; AND

- c) Patient is negative for epidermal growth factor receptor (EGFR) mutations and anaplastic lymphoma kinase (ALK) rearrangements; OR
- iii. Approve for 1 year if the patient meets ALL of the following (a, b, c, and d):
 - a) Patient has metastatic disease; AND
 - b) Patient has progressed on or after platinum-based chemotherapy; AND
 - c) Medication will be used as monotherapy; AND
 - d) If the patient has EGFR mutations or ALK rearrangements, the patient has progressed on FDA-approved therapy for these aberrations; AND

Note: Examples of FDA-approved therapies include Gilotrif (afatinib tablets), erlotinib, Vizimpro (dacomitinib tablets), gefitinib, Alecensa (alectinib capsules), Alunbrig (brigatinib tablets), and Xalkori (crizotinib capsules and pellets).
- C) Medication is prescribed by or in consultation with an oncologist.

21. Renal Cell Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i, ii, or iii):
 - i. Patient meets ALL of the following (a, b, and c):
 - a) Patient has intermediate or poor risk advanced disease; AND
 - b) Medication is used as monotherapy for first-line treatment; AND
 - c) Medication is administered following treatment with Opdivo (nivolumab intravenous infusion) and Yervoy (ipilimumab intravenous infusion); OR
 - ii. Patient meets ALL of the following (a, b, and c):
 - a) Patient has advanced disease; AND
 - b) Medication is used for first-line treatment; AND
 - c) Medication is used in combination with Cabometyx (cabozantinib tablets); OR
 - iii. Patient meets ALL of the following (a, b, and c):
 - a) Patient has advanced disease; AND
 - b) Patient has received prior anti-angiogenic therapy; AND

Note: Examples of anti-angiogenic therapy include bevacizumab, Inlyta (axitinib tablets), and pazopanib.
 - c) Medication is used as monotherapy; AND
- C) Medication is prescribed by or in consultation with an oncologist.

22. Urothelial Carcinoma. Approve for the duration noted if the patient meets the ONE of the following (A or B):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i, ii, or iii):
 - i. Approve for up to 1 year if the patient meets BOTH of the following (a and b):
 - a) Patient is at high risk of recurrence after radical resection of urothelial carcinoma; AND
 - b) Medication is used as monotherapy for adjuvant therapy; OR
 - ii. Approve for 1 year if the patient meets ALL of the following (a, b, and c):
 - a) Patient has unresectable or metastatic disease; AND
 - b) Medication will be used for first-line treatment; AND
 - c) Medication will be used in combination with cisplatin and gemcitabine; OR
 - iii. Approve for 1 year if the patient meets ALL of the following (a, b, and c):
 - a) Patient has locally advanced or metastatic disease; AND
 - b) Medication is used as monotherapy; AND
 - c) Patient meets ONE of the following [(1) or (2)]:
 - (1) Patient has disease progression on or after platinum-containing chemotherapy; OR

Note: Examples of platinum agents include cisplatin and oxaliplatin.

- (2) Patient has disease progression within 12 months of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy; AND

Note: Examples of platinum agents include cisplatin and oxaliplatin.

- C) Medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Odivo Qvantig is not recommended in the following situations:

- 10.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – Programmed Death Receptor-1) – Opdualag Prior Authorization Policy

- Opdualag™ (nivolumab and relatlimab-rmbw intravenous infusion – Bristol-Myers Squibb)

REVIEW DATE: 03/27/2024

OVERVIEW

Opdualag, a combination of a programmed death receptor-1 (PD-1) blocking antibody and a lymphocyte activation gene-3 (LAG-3) blocking antibody, is indicated for the treatment of unresectable or metastatic **melanoma** in patients ≥ 12 years of age.¹

Guidelines

The National Comprehensive Cancer Network clinical practice guidelines for **cutaneous melanoma** (version 1.2024 – February 12, 2024) recommend Opdualag as a preferred first-line treatment option for patients with metastatic or unresectable disease (category 1).^{2,3} Opdualag is also recommended for second-line or subsequent treatment, and for re-induction therapy in patients with disease control with previous anti-PD-1/LAG-3 therapy and disease progression or relapse occurring > 3 months after treatment discontinuation (category 2A). In addition, Opdualag is recommended as primary treatment for neoadjuvant therapy for stage III clinically positive, resectable nodal disease; initial and/or subsequent treatment for limited resectable stage III disease with clinical satellite/in-transit metastases and limited resectable local satellite/in-transit recurrence; and treatment for resectable disease limited to nodal recurrence (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Opdualag. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Opdualag as well as the monitoring required for adverse events and long-term efficacy, approval requires Opdualag to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Opdualag is recommended in those who meet the following criteria:

FDA-Approved Indication

23. Melanoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 12 years of age; AND
- B) Patient is ≥ 40 kg; AND
- C) Patient meets ONE of the following (i or ii):
 - i. Patient has unresectable or metastatic disease; OR
 - ii. Medication is used for neoadjuvant therapy; AND

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – Programmed Death Receptor-1) – Tevimbra Prior Authorization Policy

- Tevimbra® (tislelizumab-jsgr intravenous infusion – BeiGene)

REVIEW DATE: 06/12/2024

OVERVIEW

Tevimbra, a programmed death receptor-1 (PD-1) blocking antibody, is indicated for the treatment of unresectable or metastatic esophageal squamous cell carcinoma in adults after prior systemic chemotherapy that did not include a PD-1 or programmed death-ligand 1 (PD-L1) inhibitor.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) **esophageal and esophagogastric junction cancers** (version 3.2024 – April 26, 2024) clinical practice guidelines recommend Tevimbra as a “Preferred Regimen” for the treatment of unresectable locally advanced, recurrent, or metastatic esophageal squamous cell carcinoma as a single agent, if checkpoint inhibitors were not previously used and local therapy is not indicated (category 1).^{2,3}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tevimbra. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tevimbra as well as the monitoring required for adverse events and long-term efficacy, approval requires Tevimbra to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tevimbra is recommended in those who meet the following criteria:

FDA-Approved Indication

24. Esophageal Squamous Cell Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):

A) Patient is ≥ 18 years of age:

B) Patient meets ONE of the following (i or ii):

i. Patient has unresectable locally advanced, recurrent, or metastatic disease; OR

ii. Patient is not a surgical candidate; AND

C) Medication is used as a single agent; AND

D) Medication is used for subsequent therapy; AND

E) Patient has NOT previously received a checkpoint inhibitor; AND

Note: Examples of checkpoint inhibitors include Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion).

F) Medication is prescribed by or in consultation with an oncologist.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – Programmed Death Receptor-1) – Zynyz Prior Authorization Policy

- Zynyz™ (retifanlimab-dlwr intravenous infusion – Incyte)

REVIEW DATE: 03/27/2024

OVERVIEW

Zynyz, a programmed death receptor-1 blocking antibody, is indicated for the treatment of metastatic or recurrent locally advanced **Merkel cell carcinoma** in adults.¹

Guidelines

Zynyz is addressed in the National Comprehensive Cancer Network (NCCN) clinical practice guidelines:

- The **Merkel Cell Carcinoma** (version 1.2024 – November 22, 2023) treatment guidelines recommend Zynyz as a “Preferred Regimen” for recurrent locally advanced and recurrent regional disease if curative surgery and radiation therapy are not feasible, and for disseminated disease. In addition, Zynyz is recommended as an “Other Recommended Regimen” for primary locally advanced disease if curative surgery and radiation therapy are not feasible (all category 2A).^{2,3}
- The **Anal Carcinoma** (version 1.2024 – December 20, 2023) treatment guidelines recommend Zynyz as a “Preferred Regimen” for the second-line and subsequent treatment of metastatic disease if no prior immunotherapy received (category 2A).^{2,4} In addition, NCCN states that Zynyz should be considered prior to abdominoperineal resection for locally recurrent, progressive disease (category 2B).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zynyz. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zynyz as well as the monitoring required for adverse events and long-term efficacy, approval requires Zynyz to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zynyz is recommended in those who meet the following criteria:

FDA-Approved Indication

- 25. Merkel Cell Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient meets ONE of the following (i, ii, or iii):
 - i.** Patient has metastatic disease; OR
 - ii.** Patient has locally advanced disease; OR
 - iii.** Patient has recurrent regional disease; AND

03/27/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- C) Patient has not received prior systemic therapy for Merkel cell carcinoma; AND
- D) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

- 26. Anal Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient has locally recurrent, persistent disease; OR
 - ii. Patient has metastatic disease; AND
 - C) Medication is used for subsequent treatment; AND
 - D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zynyz is not recommended in the following situations:

- 13.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – Programmed Death-Ligand 1) – Bavencio Prior Authorization Policy

- Bavencio® (avelumab intravenous infusion – EMD Serono)

REVIEW DATE: 07/24/2024

OVERVIEW

Bavencio, a programmed cell death ligand-1 (PD-L1) blocking antibody, is indicated for the treatment of the following uses:¹

- **Merkel cell carcinoma**, in patients ≥ 12 years of age with metastatic disease.
- **Renal cell carcinoma**, in combination with Inlyta® (axitinib tablets), for the first-line treatment of patients with advanced disease.
- **Urothelial carcinoma**, in patients with locally advanced or metastatic disease who have:
 - Disease progression during or following platinum-containing chemotherapy.
 - Disease progression within 12 months of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy.
 - Maintenance treatment of locally advanced or metastatic disease that has not progressed with first-line platinum-containing chemotherapy.

Guidelines

Bavencio is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **Bladder Cancer:** Guidelines (version 4.2024 – May 9, 2024) recommend Bavencio as an alternative preferred regimen for second-line therapy (category 2A) for locally advanced or metastatic disease (Stage IV).^{2,3} Guidelines also recommend Bavencio as maintenance therapy following platinum-based chemotherapy (category 1). The NCCN Compendium recommends Bavencio, as a single agent, for urothelial carcinoma of the bladder; for upper genitourinary tract tumors (metastatic disease); urothelial carcinoma of the prostate (metastatic disease); and for primary carcinoma of the urethra (recurrent or metastatic disease) as second-line or maintenance therapy.³
- **Gestational Trophoblastic Neoplasm:** Guidelines (version 1.2024 – October 27, 2023) recommend Bavencio as a single agent for multidrug resistant high-risk disease, or recurrent or progressive intermediate trophoblastic tumor.^{3,6}
- **Kidney Cancer:** Guidelines (version 1.2025 – July 1, 2024) recommend Bavencio in combination with Inlyta for first-line treatment for relapsed or Stage IV clear cell disease (category 2A).^{3,5} For subsequent therapy, Bavencio + Inlyta is a category 3 recommendation.
- **Merkel Cell Carcinoma:** Guidelines (version 1.2024 – November 22, 2023) recommend Bavencio as a “Preferred Regimen” for the treatment of primary locally advanced disease (if curative surgery and curative radiation therapy are not feasible) and for disseminated disease (both category 2A).^{3,4} Bavencio is also recommended as “Other Recommended Regimen” for the treatment of recurrent locally advanced or recurrent regional disease if curative surgery or curative radiation therapy are not feasible (both category 2A).
- **Uterine Neoplasms:** Guidelines (version 2.2024 – March 6, 2024) recommend Bavencio, as a single agent, for the second-line and subsequent treatment of recurrent or metastatic microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) tumors.^{3,7}

POLICY STATEMENT

07/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Prior Authorization is recommended for prescription benefit coverage of Bavencio. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Bavencio, as well as the monitoring required for adverse events and long-term efficacy, approval requires Bavencio to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Bavencio is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1. Merkel Cell Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A)** Patient is ≥ 12 years of age; AND
 - B)** Patient meets ONE of the following (i, ii, or iii):
 - i.** Patient has locally advanced disease; OR
 - ii.** Patient has recurrent regional disease; OR
 - iii.** Patient has metastatic (disseminated) Merkel cell carcinoma; AND
 - C)** The medication is prescribed by or in consultation with an oncologist.
- 2. Renal Cell Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has relapsed or Stage IV clear cell disease; AND
 - C)** The medication will be used in combination with Inlyta (axitinib tablets); AND
 - D)** The medication is prescribed by or in consultation with an oncologist.
- 3. Urothelial Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has locally advanced or metastatic urothelial carcinoma; AND
 - C)** Patient has tried platinum-containing chemotherapy (cisplatin or carboplatin); AND
 - D)** The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

- 4. Endometrial Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has recurrent or metastatic disease; AND
 - C)** Patient has microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) tumors; AND
 - D)** The medication will be used as a single agent; AND
 - E)** The medication is prescribed by or in consultation with an oncologist.
- 5. Gestational Trophoblastic Neoplasia.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

07/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- A) Patient is ≥ 18 years of age; AND
- B) Patient has multi-agent chemotherapy resistant disease; AND
- C) The medication will be used as a single agent; AND
- D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Bavencio is not recommended in the following situations:

- 3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – Programmed Death-Ligand 1) – Imfinzi Prior Authorization Policy

- Imfinzi® (durvalumab intravenous infusion – AstraZeneca)

REVIEW DATE: 07/24/2024

OVERVIEW

Imfinzi, a programmed cell death ligand 1 (PD-L1) blocking antibody, is indicated for the following uses:¹

- **Biliary tract cancers**, in combination with gemcitabine and cisplatin for the treatment locally advanced or metastatic disease in adults.
- **Endometrial cancer**, in combination with carboplatin and paclitaxel, followed by single-agent Imfinzi for the treatment of adults with mismatch repair deficient (dMMR), primary advanced or recurrent disease.
- **Hepatocellular carcinoma**, in combination with Imjudo® (tremelimumab-actl intravenous infusion) for the treatment of unresectable disease in adults.
- **Non-small cell lung cancer (NSCLC)**, in adults with unresectable Stage III disease that has not progressed following concurrent platinum-based chemotherapy and radiation therapy.
- **NSCLC**, in adults with metastatic disease with no sensitizing epidermal growth factor receptor (*EGFR*) mutations or anaplastic lymphoma kinase (*ALK*) genomic tumor aberrations, in combination with Imjudo and platinum-based chemotherapy.
- **Small cell lung cancer**, in combination with etoposide and either carboplatin or cisplatin for the first-line treatment of extensive-stage disease in adults.

Guidelines

Imfinzi is addressed in National Comprehensive Cancer Network guidelines:

- **Ampullary Adenocarcinoma:** Guidelines (version 1.2024 – December 13, 2023) recommend Imfinzi for the first-line treatment of pancreatobiliary/mixed type disease in patients with unresectable localized disease or metastatic disease.^{2,8}
- **Biliary Tract Cancers:** Guidelines (version 3.2024 – July 2, 2024) recommend Imfinzi for the primary and subsequent treatment of unresectable, resected gross residual, or metastatic biliary tract cancers; for recurrent disease > 6 months after surgery with curative intent and > 6 months after completion of adjuvant therapy; and for the neoadjuvant treatment of resectable locoregionally advanced gallbladder disease, in combination with cisplatin and gemcitabine.^{2,7}
- **Cervical Cancer:** Guidelines (version 2.2024 – February 23, 2024) recommend Imfinzi, in combination with etoposide and either cisplatin or carboplatin for the treatment of persistent, recurrent, or metastatic small cell neuroendocrine carcinoma of the cervix.^{2,5}
- **Esophageal and Esophagogastric Junction Cancers:** The guidelines (version 3.2024 – April 26, 2024) recommend Imfinzi in combination with Imjudo for the neoadjuvant treatment of microsatellite instability-high (MSI-H) or deficient mismatch repair (dMMR) adenocarcinoma in patients who are medically fit for surgery.^{2,9}
- **Gastric Cancer:** The guidelines (version 2.2024 – May 29, 2024) recommend Imfinzi in combination with Imjudo for the neoadjuvant treatment of microsatellite instability-high (MSI-H) or deficient mismatch repair (dMMR) locoregional disease in patients who are medically fit for surgery.^{2,10}
- **Hepatocellular Carcinoma:** Guidelines (version 2.2024 – July 2, 2024) recommend Imfinzi, as monotherapy or in combination with Imjudo, as first-line treatment of hepatocellular carcinoma in patients with liver-confined, unresectable disease who are not transplant candidates; and in patients

07/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

with extrahepatic or metastatic disease who are deemed ineligible for resection, transplant, or locoregional therapy.^{2,5}

- **Non-Small Cell Lung Cancer:** Guidelines (version 7.2024 – June 26, 2024) recommend Imfinzi as consolidation therapy for patients with unresectable stage II (category 2A) or stage III (category 1) disease with a performance status of 0 or 1 and no disease progression following definitive chemoradiation.^{2,3} The guidelines recommend Imfinzi for the first-line treatment of recurrent, advanced, or metastatic disease with PD-L1 expression $\geq 1\%$ and negative for actionable molecular markers. The guidelines also recommend Imfinzi for disease with PD-L1 expression $< 1\%$, and for disease that is positive for a variety of molecular markers.
- **Small Cell Lung Cancer:** Guidelines (version 3.2024 – June 11, 2024) recommend Imfinzi in combination with etoposide and carboplatin/cisplatin as a “Preferred” primary treatment, followed by Imfinzi as single-agent maintenance therapy (category 1) for patients with extensive stage disease.^{2,4}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Imfinzi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Imfinzi, as well as the monitoring required for adverse events and long-term efficacy, approval requires Imfinzi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Imfinzi is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Biliary Tract Cancer.** Approve for the duration noted if the patient meets ONE of the following (A or B):
 - A) Patient has resectable locoregionally advanced disease: Approve for 6 months (total) if the patient meets ALL of the following (i, ii, iii, iv, and v):
 - i. Patient is ≥ 18 years of age; AND
 - ii. Patient has gallbladder cancer; AND
 - iii. The medication is used as neoadjuvant therapy; AND
 - iv. The medication is used in combination with cisplatin and gemcitabine; AND
 - v. The medication is prescribed by or in consultation with an oncologist; OR
 - B) Patient has unresectable, resected gross residual, or metastatic disease: Approve for 1 year if the patient meets ALL of the following (i, ii, iii, iv, and v):
 - i. Patient is ≥ 18 years of age; AND
 - ii. If the patient has recurrent disease, recurrence occurred at least 6 months after surgery and at least 6 months after adjuvant therapy; AND
 - iii. Patient has ONE of the following (a, b, or c):
 - a) Gallbladder cancer; OR
 - b) Intrahepatic cholangiocarcinoma; OR
 - c) Extrahepatic cholangiocarcinoma; AND
 - iv. The medication will be used in combination with cisplatin and gemcitabine; AND
 - v. The medication is prescribed by or in consultation with an oncologist.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

2. **Endometrial Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has primary advanced or recurrent disease; AND
 - C) Disease is mismatch repair deficient (dMMR); AND
 - D) Patient meets ONE of the following (i or ii):
 - i. The medication is used in combination with carboplatin and paclitaxel; OR
 - ii. The medication is used as a single agent; AND
 - E) The medication is prescribed by or in consultation with an oncologist.
3. **Hepatocellular Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient meets BOTH of the following (a and b):
 - a) Patient has liver-confined, unresectable disease; AND
 - b) According to the prescriber, the patient is not eligible for transplant; OR
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient has metastatic disease; AND
 - b) According to the prescriber, the patient is not eligible for resection, transplant, or locoregional therapy; AND
 - C) The medication will be used first-line; AND
 - D) Patient meets ONE of the following (i or ii):
 - i. The medication is used as monotherapy; OR
 - ii. The medication is used in combination with Imjudo (tremelimumab-actl intravenous infusion); AND
 - E) The medication is prescribed by or in consultation with an oncologist.
4. **Non-Small Cell Lung Cancer.** Approve for the duration noted if the patient meets ONE of the following (A or B):
- A) Patient has unresectable Stage II or III disease: Approve for 1 year (total) of therapy if the patient meets ALL of the following (i, ii, and iii):
 - i. Patient is ≥ 18 years of age; AND
 - ii. Patient has not had disease progression following treatment with concurrent platinum-based chemotherapy and radiation therapy; AND
 - iii. The medication is prescribed by or in consultation with an oncologist; OR
 - B) Patient has recurrent, advanced, or metastatic disease: Approve for 1 year if the patient meets ONE of the following (i, ii, iii, or iv):
 - i. Patient meets ALL of the following (a, b, c, and d):
 - a) Patient is ≥ 18 years of age; AND
 - b) The tumor is negative for actionable molecular markers; AND
Note: Examples of actionable molecular markers include epidermal growth factor receptor (*EGFR*) mutations, anaplastic lymphoma kinase (*ALK*) genomic tumor aberrations, *KRAS*, *ROS1*, *BRAF*, *NTRK1/2/3*, *MET*, *RET*, and *ERBB2* (*HER2*). *KRAS G12C* is not considered an actionable mutation (the tumor may be *KRAS G12C* mutation positive).
 - c) Patient meets ONE of the following [(1) or (2)]:
 - (1) Imfinzi is used as first-line therapy; OR
 - (2) Imfinzi is used as continuation maintenance therapy; AND
 - d) The medication is prescribed by or in consultation with an oncologist; OR

07/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- ii. Patient meets ALL of the following (a, b, c, and d):
 - a) Patient is ≥ 18 years of age; AND
 - b) The tumor is positive for ONE of the following [(1) or (2)]:
 - (1) Epidermal growth factor receptor (*EGFR*) exon 20 mutation positive; OR
 - (2) *ERBB2* (*HER2*) mutation positive; AND
 - c) Imfinzi is used as first-line therapy; AND
 - d) The medication is prescribed by or in consultation with an oncologist; OR
 - iii. Patient meets ALL of the following (a, b, c, and d):
 - a) Patient is ≥ 18 years of age; AND
 - b) The tumor is positive for ONE of the following [(1), (2), (3), or (4)]:
 - (1) *BRAF V600E* mutation positive; OR
 - (2) *NTRK1/2/3* gene fusion positive; OR
 - (3) *MET* exon 14 skipping mutation positive; OR
 - (4) *RET* rearrangement positive; AND
 - c) Imfinzi is used as first-line or subsequent therapy; AND
 - d) The medication is prescribed by or in consultation with an oncologist; OR
 - iv. Patient meets ALL of the following (a, b, c, d, and e):
 - a) Patient is ≥ 18 years of age; AND
 - b) The tumor is positive for ONE of the following [(1), (2), (3), or (4)]:
 - (1) *EGFR* exon 19 deletion or exon 21 *L858R* mutation positive; OR
 - (2) *EGFR S768I*, *L861Q*, and/or *G719X* mutation positive; OR
 - (3) *ALK* rearrangement positive; OR
 - (4) *ROS1* rearrangement; AND
 - c) The patient has received targeted drug therapy for the specific mutation; AND
Note: Examples of targeted drug therapy include Gilotrif (afatinib tablets), Tagrisso (osimertinib tablets), erlotinib, Iressa (gefitinib tablets), Xalkori (crizotinib capsules), Zykadia (ceritinib capsules), Alecensa (alectinib capsules), Alunbrig (brigatinib tablets), Lorbrena (lorlatinib tablets), Rozlytrek (entrectinib capsules), or Vizimpro (dacomitinib tablets).
 - d) Imfinzi is used as subsequent therapy; AND
 - e) Imfinzi is prescribed by or in consultation with an oncologist.
5. **Small Cell Lung Cancer.** Approve for 1 year if the patient meets ALL of the following criteria (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has extensive stage disease; AND
 - C) Patient meets ONE of the following (i or ii):
 - i. The medication is used in combination with etoposide and platinum chemotherapy; OR
Note: Examples of platinum chemotherapy agents include cisplatin and carboplatin.
 - ii. The medication is used as a single-agent for maintenance after chemotherapy; AND
 - D) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

6. **Ampullary Adenocarcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has pancreatobiliary/mixed type disease; AND
 - C) Patient has unresectable localized disease or metastatic disease; AND
 - D) The medication is used as first-line therapy; AND

- E) The medication is used in combination with gemcitabine and cisplatin; AND
 - F) The medication is prescribed by or in consultation with an oncologist.
7. **Cervical Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has small cell neuroendocrine carcinoma of the cervix; AND
 - C) Patient has persistent, recurrent, or metastatic disease; AND
 - D) Patient meets ONE of the following (i or ii):
 - i. The medication is used in combination with etoposide and platinum chemotherapy; OR
Note: Examples of platinum chemotherapy agents include cisplatin and carboplatin
 - ii. The medication is used as a single agent for maintenance therapy; AND
 - E) The medication is prescribed by or in consultation with an oncologist.
8. **Esophageal and Esophagogastric Junction Cancers.** Approve for 3 months if the patient meets ALL of the following (A, B, C, D, E, F, and G):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has adenocarcinoma tumor; AND
 - C) Patient has microsatellite instability-high (MSI-H) or deficient mismatch repair (dMMR) disease; AND
 - D) Imfinzi is as neoadjuvant therapy; AND
 - E) Imfinzi is used in combination with Imjudo (tremelimumab intravenous infusion); AND
 - F) According to the physician, the patient is medically fit for surgery; AND
 - G) The medication is prescribed by or in consultation with an oncologist.
9. **Gastric Cancer.** Approve for 3 months if the patient meets ALL of the following (A, B, C, D, E, F, and G):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has locoregional disease; AND
 - C) Patient has microsatellite instability-high (MSI-H) or deficient mismatch repair (dMMR) disease; AND
 - D) Imfinzi is as neoadjuvant therapy; AND
 - E) Imfinzi is used in combination with Imjudo (tremelimumab intravenous infusion); AND
 - F) According to the physician, the patient is medically fit for surgery; AND
 - G) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Imfinzi is not recommended in the following situations:

- 4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – Programmed Death-Ligand 1) – Tecentriq Hybreza Prior Authorization Policy

- Tecentriq Hybreza™ (atezolizumab and hyaluronidase-tqjs subcutaneous injection – Genentech)

REVIEW DATE: 09/25/2024

OVERVIEW

Tecentriq Hybreza, a programmed death-ligand 1 (PD-L1) blocking antibody and hyaluronidase, is indicated for the treatment of the following:¹

- **Alveolar Soft Part Sarcoma**, in adults with unresectable or metastatic disease.
- **Hepatocellular carcinoma**, in combination with bevacizumab, for the treatment of unresectable or metastatic hepatocellular carcinoma in adults who have not received prior systemic therapy.
- **Melanoma**, in combination with Cotellic® (cobimetinib tablets) and Zelboraf® (vemurafenib tablets), for the treatment of *BRAF V600* mutation-positive unresectable or metastatic disease as determined by an FDA-approved test in adults.
- **Non-small cell lung cancer (NSCLC), metastatic** disease in adults:
 - As a single agent, as adjuvant treatment following resection and platinum-based chemotherapy for adults with Stage II to IIIA disease whose tumors express PD-L1 on $\geq 1\%$ of tumor cells.
 - As a single-agent, for the first-line treatment of tumors with high PD-L1 expression (PD-L1 staining $\geq 50\%$ of tumor cells or PD-L1 staining of tumor infiltrating immune cells covering $\geq 10\%$ of the tumor area), with no anaplastic lymphoma kinase (*ALK*) or epidermal growth factor receptor (*EGFR*) genomic tumor aberrations.
 - In combination with bevacizumab, paclitaxel, and carboplatin, for the first-line treatment of metastatic non-squamous NSCLC with no *ALK* or *EGFR* genomic tumor aberrations.
 - In combination with paclitaxel protein-bound and carboplatin, for the first-line treatment of non-squamous metastatic NSCLC with no *ALK* or *EGFR* genomic tumor aberrations.
 - As a single-agent, for disease progression during or following platinum-containing chemotherapy. Patients with *EGFR* or *ALK* genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving Tecentriq Hybreza.
- **Small cell lung cancer** in combination with carboplatin and etoposide, for the first-line treatment of adults with extensive-stage disease.

Guidelines

The National Comprehensive Cancer Network has addressed Tecentriq Hybreza.

- **Cervical cancer:** Guidelines (version 4.2024 – September 24, 2024) state that Tecentriq Hybreza can be substituted for Tecentriq.^{2,3}
- **Hepatocellular carcinoma:** Guidelines (version 3.2024 – September 24, 2024) state that Tecentriq Hybreza can be substituted for Tecentriq.^{2,4}
- **Melanoma, cutaneous:** Guidelines (version 3.2024 – September 23, 2024) state that Tecentriq Hybreza can be substituted for Tecentriq.^{2,5}
- **Mesothelioma, peritoneal:** Guidelines (version 2.2024 – September 23, 2024) state that Tecentriq Hybreza can be substituted for Tecentriq.^{2,6}

09/25/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Non-small cell lung cancer:** Guidelines (version 10.2024 – September 23, 2024) state that Tecentriq Hybreza can be substituted for Tecentriq.^{2,7}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tecentriq Hybreza. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tecentriq Hybreza as well as the monitoring required for adverse events and long-term efficacy, approval requires Tecentriq Hybreza to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tecentriq Hybreza is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Alveolar Soft Part Sarcoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has unresectable or metastatic disease; AND
 - C) The medication is used as a single agent; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
2. **Hepatocellular Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, F, and G):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient has unresectable or metastatic hepatocellular carcinoma; OR
 - ii. According to the prescriber, the patient is not a surgical candidate; AND
 - C) Patient has Child-Pugh Class A or B liver function; AND
 - D) According to the prescriber, the patient has ONE of the following (i, ii, or iii):
 - i. Unresectable disease and is not a transplant candidate; OR
 - ii. Liver-confined disease, inoperable by performance status, comorbidity, or with minimal or uncertain extrahepatic disease; OR
 - iii. Metastatic disease or extensive liver tumor burden; AND
 - E) Patient has not received prior systemic therapy; AND
 - F) The medication will be used in combination with bevacizumab; AND
 - G) The medication is prescribed by or in consultation with an oncologist.
3. **Melanoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has unresectable or metastatic melanoma; AND
 - C) Patient has *BRAF V600* mutation-positive disease; AND
 - D) The medication will be used as subsequent therapy; AND
 - E) The medication will be used in combination with Cotellic (cobimetinib tablets) and Zelboraf (vemurafenib tablets); AND
 - F) The medication is prescribed by or in consultation with an oncologist.

09/25/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- 4. Non-Small Cell Lung Cancer.** Approve for the duration noted if the patient meets ALL of the following (A, B, and C):
- A)** Patient is ≥ 18 years of age; AND
- B)** Patient meets ONE of the following (i, ii, iii, iv, or v):
- i.** Approve for 1 year if the patient has non-squamous non-small cell lung cancer (NSCLC) and the patient meets ALL of the following (a, b, and c):
- Note: Non-squamous NSCLC includes adenocarcinoma, large cell, or NSCLC not otherwise specified.
- a)** Patient has recurrent, advanced or metastatic disease; AND
- b)** The tumor is negative for actionable mutations; AND
- Note: Examples of actionable mutations include epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *ROS1*, *KRAS*, *BRAF V600E*, *NTRK1/2/3*, *MET* exon 14 skipping mutation, *RET* rearrangement.
- c)** Patient meets ONE of the following [(1), (2), or (3)]:
- (1)** Patient's tumor expresses programmed death-ligand 1 (PD-L1) $\geq 1\%$ as determined by an approved test; OR
- Note: In this setting, Tecentriq can be used either as a single agent or in combination with other agents.
- (2)** The medication will be used in combination with chemotherapy; OR
- Note: Examples of chemotherapy regimens may include bevacizumab, paclitaxel and carboplatin; carboplatin and paclitaxel albumin-bound intravenous infusion.
- (3)** The medication is used as continuation maintenance therapy; OR
- Note: Tecentriq can be used in combination with bevacizumab or as single agent in this setting.
- ii.** Approve for 1 year if the patient has squamous cell NSCLC and meets ALL of the following (a, b, and c):
- a)** Patient has recurrent, advanced, or metastatic disease; AND
- b)** The tumor is negative for actionable mutations; AND
- Note: Examples of actionable mutations include epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *ROS1*, *KRAS*, *BRAF V600E*, *NTRK1/2/3*, *MET* exon 14 skipping mutation, *RET* rearrangement.
- c)** Patient's tumor expresses programmed death-ligand 1 (PD-L1) $\geq 50\%$ as determined by an approved test; OR
- iii.** Approve for 1 year if the patient has recurrent, advanced, or metastatic non-squamous cell NSCLC and meets ONE of the following (a, b, or c):
- Note: Non-squamous NSCLC includes adenocarcinoma, large cell, or NSCLC not otherwise specified.
- a)** Patient meets ALL of the following [(1), (2), and (3)]:
- (1)** The tumor is epidermal growth factor receptor (*EGFR*) exon 20 mutation positive, *KRAS G12C* mutation positive, or *ERBB2 (HER2)* mutation positive; AND
- (2)** The medication is used first-line; AND
- (3)** The medication is used in combination with chemotherapy; OR
- Note: Examples of chemotherapy include carboplatin, paclitaxel, and bevacizumab; and carboplatin plus paclitaxel albumin-bound.
- b)** Patient meets ALL of the following [(1), (2), and (3)]:
- (1)** The tumor is *BRAF V600E* mutation positive, *NTRK1/2/3* gene fusion positive, *MET* exon 14 skipping mutation positive, or *RET* rearrangement positive; AND
- (2)** The medication is used for first-line or subsequent treatment; AND
- (3)** The medication is used in combination with chemotherapy; OR

Note: Examples of chemotherapy include carboplatin, paclitaxel, and bevacizumab; and carboplatin plus paclitaxel albumin-bound.

- c) Patient meets ALL of the following [(1), (2), and (3)]:
 - (1) The tumor is epidermal growth factor receptor (*EGFR*) exon 19 deletion or exon 21 *L858R* positive, *EGFR S768I*, *L861Q*, and/or *G719X* mutation positive, *ALK* rearrangement positive, or *ROS1* rearrangement positive; AND
 - (2) Patient has received targeted drug therapy for the specific mutation; AND
Note: Examples of targeted drug therapy include Gilotrif (afatinib tablets), Tagrisso (osimertinib tablets), erlotinib, Iressa (gefitinib tablets), Xalkori (crizotinib capsules), Zykadia (ceritinib capsules), Alecensa (alectinib capsules), Alunbrig (brigatinib tablets), Lorbrena (lorlatinib tablets), Rozlytrek (entrectinib capsules), or Vizimpro (dacomitinib tablets).
 - (3) The medication is used in combination with chemotherapy; OR
Note: Examples of chemotherapy include carboplatin, paclitaxel, and bevacizumab; and carboplatin plus paclitaxel albumin-bound.
 - iv. Approve for 1 year if the patient meets ALL of the following (a, b, c, and d):
 - a) Patient has recurrent, advanced, or metastatic disease; AND
 - b) The medication is used as subsequent therapy; AND
 - c) The medication is used as a single agent; AND
 - d) The patient has not progressed on a programmed death receptor-1 (PD-1) or programmed death-ligand 1 inhibitor (PD-L1); OR
Note: Examples of PD-1 or PD-L1 inhibitors include Tecentriq, Keytruda (pembrolizumab intravenous infusion), and Opdivo (nivolumab intravenous infusion).
 - v. Approve for up to 1 year (total) if the patient meets BOTH of the following (a and b):
 - a) Patient's tumor expresses programmed death-ligand 1 (PD-L1) $\geq 1\%$ as determined by an approved test; AND
 - b) Patient has received previous adjuvant chemotherapy; AND
 - C) The medication is prescribed by or in consultation with an oncologist.
5. **Small Cell Lung Cancer.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

6. **Cervical Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has small cell neuroendocrine carcinoma of the cervix; AND
 - C) Patient has persistent, recurrent, or metastatic disease; AND
 - D) The medication is used in combination with chemotherapy; AND
Note: Examples of chemotherapy include cisplatin or carboplatin, with etoposide.
 - E) The medication is prescribed by or in consultation with an oncologist.
7. **Mesothelioma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- J) Patient is ≥ 18 years of age; AND
 - K) The medication is used as subsequent therapy; AND
 - L) The medication is used in combination with bevacizumab; AND
 - M) Patient has ONE of the following (i, ii, or iii):
 - i. Malignant peritoneal mesothelioma; OR
 - ii. Pericardial mesothelioma; OR

- iii. Tunica vaginalis testis mesothelioma; AND
N) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tecentriq Hybreza is not recommended in the following situations:

14. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – Programmed Death-Ligand 1) – Tecentriq Prior Authorization Policy

- Tecentriq® (atezolizumab intravenous infusion – Genentech/Roche)

REVIEW DATE: 12/20/2023

OVERVIEW

Tecentriq, a programmed death-ligand 1 (PD-L1) blocking antibody, is indicated for the treatment of the following:¹

- **Alveolar Soft Part Sarcoma**, in patients ≥ 2 years of age with unresectable or metastatic disease.
- **Hepatocellular carcinoma**, in combination with bevacizumab, for the treatment of unresectable or metastatic hepatocellular carcinoma in adults who have not received prior systemic therapy.
- **Melanoma**, in combination with Cotellic® (cobimetinib tablets) and Zelboraf® (vemurafenib tablets), for the treatment of *BRAF V600* mutation-positive unresectable or metastatic disease in adults.
- **Non-small cell lung cancer (NSCLC), metastatic** disease in adults:
 - As a single agent, as adjuvant treatment following resection and platinum-based chemotherapy for adults with Stage II to IIIA disease whose tumors express PD-L1 on $\geq 1\%$ of tumor cells.
 - As a single agent, for the first-line treatment of tumors with high PD-L1 expression (PD-L1 staining $\geq 50\%$ of tumor cells or PD-L1 staining of tumor infiltrating immune cells covering $\geq 10\%$ of the tumor area), for adults with no anaplastic lymphoma kinase (*ALK*) or epidermal growth factor receptor (*EGFR*) genomic tumor aberrations.
 - In combination with bevacizumab, paclitaxel, and carboplatin, in adults for the first-line treatment of metastatic non-squamous NSCLC with no *ALK* or *EGFR* genomic tumor aberrations.
 - In combination with paclitaxel protein-bound and carboplatin, in adults for the first-line treatment of non-squamous metastatic NSCLC with no *ALK* or *EGFR* genomic tumor aberrations.
 - As a single-agent, in adults who have disease progression during or following platinum-containing chemotherapy. Patients with *EGFR* or *ALK* genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving Tecentriq.
- **Small cell lung cancer** in adults, in combination with carboplatin and etoposide, for the first-line treatment of adults with extensive-stage disease.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tecentriq. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tecentriq as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

12/20/2023

© 2023. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Coverage of Tecentriq is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 4. Alveolar Soft Part Sarcoma.** Approve for 1 year if the patient meets the following (A, B, C, and D):
 - E)** Patient is ≥ 2 years of age; AND
 - F)** Patient has unresectable or metastatic disease; AND
 - G)** The medication is used as a single agent; AND
 - H)** The medication is prescribed by or in consultation with an oncologist.
- 5. Hepatocellular Carcinoma.** Approve for 1 year if the patient meets the following (A, B, C, D, E, F, and G):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient meets ONE of the following (i or ii):
 - i.** Patient has unresectable or metastatic hepatocellular carcinoma; OR
 - ii.** According to the prescriber, the patient is not a surgical candidate; AND
 - C)** Patient has Child-Pugh Class A or B liver function; AND
 - D)** According to the prescriber, the patient has ONE of the following (i, ii, or iii):
 - iv.** Unresectable disease and is not a transplant candidate; OR
 - v.** Liver-confined disease, inoperable by performance status, comorbidity, or with minimal or uncertain extrahepatic disease; OR
 - vi.** Metastatic disease or extensive liver tumor burden; AND
 - E)** Patient has not received prior systemic therapy; AND
 - F)** The medication will be used in combination with bevacizumab; AND
 - G)** The medication is prescribed by or in consultation with an oncologist.
- 3. Melanoma.** Approve for 1 year if the patient meets the following (A, B, C, D, E, and F):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has unresectable or metastatic melanoma; AND
 - C)** Patient has *BRAF V600* mutation-positive disease; AND
 - D)** The medication will be used as subsequent therapy; AND
 - E)** The medication will be used in combination with Cotellic (cobimetinib tablets) and Zelboraf (vemurafenib tablets); AND
 - F)** The medication is prescribed by or in consultation with an oncologist.
- 4. Non-Small Cell Lung Cancer.** Approve for the duration noted if the patient meets the following (A, B, and C):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient meets one of the following (i, ii, iii, iv, or v):
 - i.** Approve for 1 year if the patient has non-squamous non-small cell lung cancer (NSCLC) and the patient meets all of the following (a, b, and c):

Note: Non-squamous NSCLC includes adenocarcinoma, large cell, or NSCLC not otherwise specified.

 - a)** Patient has recurrent, advanced, or metastatic disease; AND
 - b)** The tumor is negative for actionable mutations; AND

Note: Examples of actionable mutations include epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *ROS1*, *KRAS*, *BRAF V600E*, *NTRK1/2/3*, *MET* exon 14 skipping mutation, *RET* rearrangement.
 - c)** Patient meets one of the following [(1), (2), or (3)]:

- (1) Patient's tumor expresses programmed death-ligand 1 (PD-L1) $\geq 1\%$ as determined by an approved test; OR
Note: In this setting Tecentriq can be used either as a single agent or in combination with other agents.
 - (2) The medication will be used in combination with chemotherapy; OR
Note: Examples of chemotherapy regimens may include bevacizumab, paclitaxel, and carboplatin; carboplatin and paclitaxel albumin-bound intravenous infusion.
 - (3) The medication is used as continuation maintenance therapy; OR
Note: Tecentriq can be used in combination with bevacizumab or as single agent in this setting.
- ii. Approve for 1 year if the patient has squamous cell NSCLC and meets all of the following (a, b, and c):
- a) Patient has recurrent, advanced, or metastatic disease; AND
 - b) The tumor is negative for actionable mutations; AND
Note: Examples of actionable mutations include epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *ROS1*, *KRAS*, *BRAF V600E*, *NTRK1/2/3*, *MET* exon 14 skipping mutation, *RET* rearrangement.
 - c) Patient's tumor expresses programmed death-ligand 1 (PD-L1) $\geq 50\%$ as determined by an approved test; OR
- iii. Approve for 1 year if the patient has recurrent, advanced, or metastatic non-squamous cell NSCLC and meets one of the following (a, b, or c):
- a) Patient meets all of the following [(1), (2), and (3)]:
 - (1) The tumor is epidermal growth factor receptor (*EGFR*) exon 20 mutation positive, *KRAS G12C* mutation positive, or *ERBB2 (HER2)* mutation positive; AND
 - (2) The medication is used first-line; AND
 - (3) The medication is used in combination with chemotherapy; OR
Note: Examples of chemotherapy include carboplatin, paclitaxel, and bevacizumab; and carboplatin plus paclitaxel albumin-bound.
 - b) Patient meets all of the following [(1), (2), and (3)]:
 - (1) The tumor is *BRAF V600E* mutation positive, *NTRK1/2/3* gene fusion positive, *MET* exon 14 skipping mutation positive, or *RET* rearrangement positive; AND
 - (2) The medication is used for first-line or subsequent treatment; AND
 - (3) The medication is used in combination with chemotherapy; OR
Note: Examples of chemotherapy include carboplatin, paclitaxel, and bevacizumab; and carboplatin plus paclitaxel albumin-bound.
 - c) Patient meets all of the following [(1), (2), and (3)]:
 - (1) The tumor is epidermal growth factor receptor (*EGFR*) exon 19 deletion or exon 21 *L858R* positive, *EGFR S768I*, *L861Q*, and/or *G719X* mutation positive, *ALK* rearrangement positive, or *ROS1* rearrangement positive; AND
 - (2) Patient has received targeted drug therapy for the specific mutation; AND
 - (3) The medication is used in combination with chemotherapy; OR
Note: Examples of chemotherapy include carboplatin, paclitaxel, and bevacizumab; and carboplatin plus paclitaxel albumin-bound.
- iv. Approve for 1 year if the patient meets all of the following (a, b, c, and d):
- a) Patient has recurrent, advanced, or metastatic disease; AND
 - b) The medication is used as subsequent therapy; AND
 - c) The medication is used as a single agent; AND
 - d) The patient has not progressed on a programmed death receptor-1 (PD-1) or programmed death-ligand 1 inhibitor (PD-L1); OR

Note: Examples of PD-1 or PD-L1 inhibitors include Tecentriq, Keytruda (pembrolizumab intravenous infusion), and Opdivo (nivolumab intravenous infusion).

v. Approve for up to 1 year (total) if the patient meets both of the following (a and b):

- a) Patient's tumor expresses programmed death-ligand 1 (PD-L1) $\geq 1\%$ as determined by an approved test; AND
 - b) Patient has received previous adjuvant chemotherapy; AND
- C) The medication is prescribed by or in consultation with an oncologist.

5. **Small Cell Lung Cancer.** Approve for 1 year if the patient meets both of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

7. **Cervical Cancer.** Approve for 1 year if the patient meets the following (A, B, C, D, and E):

- F) Patient is ≥ 18 years of age; AND
 - G) Patient has small cell neuroendocrine carcinoma of the cervix; AND
 - H) Patient has persistent, recurrent, or metastatic disease; AND
 - I) The medication is used in combination with chemotherapy; AND
- Note: Examples of chemotherapy include cisplatin or carboplatin, with etoposide.
- J) The medication is prescribed by or in consultation with an oncologist.

7. **Mesothelioma.** Approve for 1 year if the patient meets the following (A, B, C, D, and E):

- O) Patient is ≥ 18 years of age; AND
- P) The medication is used as subsequent therapy; AND
- Q) The medication is used in combination with bevacizumab; AND
- R) Patient has ONE of the following (i, ii, or iii):
 - i. Malignant peritoneal mesothelioma; OR
 - ii. Pericardial mesothelioma; OR
 - iii. Tunica vaginalis testis mesothelioma; AND
- S) The medication is prescribed by or in consultation with an oncologist.

8. **Urothelial Carcinoma.** Approve for 1 year if the patient meets the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient is currently receiving Tecentriq for the treatment of urothelial carcinoma; AND
- C) According to the prescriber, the patient is deriving benefit from Tecentriq; AND
- D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tecentriq is not recommended in the following situations:

- 5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable – Programmed Death Ligand-1) – Unloxcyt Prior Authorization Policy

- Unloxcyt™ (cosibelimab-ipdl intravenous infusion – Checkpoint Therapeutics)

REVIEW DATE: 01/08/2025

OVERVIEW

Unloxcyt, a programmed death ligand-1 blocking antibody, is indicated for the treatment of metastatic cutaneous squamous cell carcinoma or locally advanced cutaneous squamous cell carcinoma in adults who are not candidates for curative surgery or curative radiation.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) has not addressed Unloxcyt.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Unloxcyt. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Unloxcyt as well as the monitoring required for adverse events and long-term efficacy, approval requires Unloxcyt to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Unloxcyt is recommended in those who meet the following criteria:

FDA-Approved Indication

- 6. Cutaneous Squamous Cell Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has locally advanced or metastatic disease; AND
 - C)** According to the prescriber, the patient is not a candidate for curative surgery or curative radiation therapy; AND
 - D)** Medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Unloxcyt is not recommended in the following situations:

- 15.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Adcetris Prior Authorization Policy

- Adcetris® (brentuximab intravenous infusion – Seattle Genetics)

REVIEW DATE: 10/02/2024

OVERVIEW

Adcetris, a CD30 directed antibody conjugate, is indicated for the following uses:¹

- **Classical Hodgkin lymphoma:**
 - In adults with previously untreated Stage III or IV disease, in combination with doxorubicin, vinblastine, and dacarbazine.
 - In adults at high risk of relapse or progression as post-autologous hematopoietic stem cell transplantation consolidation.
 - After failure of autologous hematopoietic stem cell transplantation or after failure of at least two prior multi-agent chemotherapy regimens in adults who are not autologous hematopoietic stem cell transplantation candidates.
 - In patients ≥ 2 years of age with previously untreated, high risk disease in combination with doxorubicin, vincristine, etoposide, prednisone, and cyclophosphamide.
- **Primary cutaneous anaplastic large cell lymphoma** or **CD30-expressing mycosis fungoides**, in adults who have received prior systemic therapy.
- **Systemic anaplastic large cell lymphoma** or other **CD30-expressing peripheral T-cell lymphomas**, including angioimmunoblastic T-cell lymphoma and peripheral T-cell lymphomas not otherwise specified, in previously untreated adults in combination with cyclophosphamide, doxorubicin, and prednisone.
- **Systemic anaplastic large cell lymphoma**, in adults who have failed at least one prior multi-agent chemotherapy regimen.

Guidelines

Adcetris is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **B-Cell Lymphomas:** Guidelines for adults (version 3.2024 – August 26, 2024) recommend Adcetris for second-line or subsequent treatment of CD30+ diffuse large B-cell lymphoma (DLBCL), CD30+ high-grade B-cell lymphoma, CD30+ human immunodeficiency virus (HIV)-related B-cell lymphoma, and CD30+ post-transplant lymphoproliferative disorders.^{2,6} Pediatric guidelines (version 2.2024 – September 3, 2024) recommend Adcetris for consolidation/additional therapy if partial response is achieved after therapy for relapsed or refractory disease.^{2,8} While these guidelines recommend Adcetris for the treatment of primary mediastinal B-cell lymphoma, the study cited by NCCN to support this indication only included patients > 18 years of age.⁹ The median age in this study was 35.5 years (range: 19 to 83 years).
- **Hodgkin Lymphoma:** Guidelines for adults (version 3.2024 – March 18, 2024) recommend Adcetris for the treatment of classical Hodgkin Lymphoma in combination with chemotherapy, as primary treatment, second-line or subsequent therapy for relapsed or refractory disease, as maintenance therapy following high-dose therapy and autologous stem cell rescue for relapsed or refractory disease, or as palliative therapy.^{2,3} Pediatric guidelines (version 1.2024 – May 14, 2024) recommend Adcetris for primary and additional treatment of high risk disease; re-induction or subsequent therapy for relapsed or refractory disease in heavily pretreated patients or patients with reduced cardiac function in combination with bendamustine, Opdivo® (nivolumab intravenous

10/02/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

infusion), and gemcitabine; and as maintenance therapy following high-dose therapy and autologous stem cell rescue.^{2,7}

- **T-Cell Lymphomas:** Guidelines (version 4.2024 – May 28, 2024) recommend Adcetris as a first-line or subsequent treatment option for a variety of CD30+ T-cell lymphomas, either as a single agent or in combination with cyclophosphamide, doxorubicin, and prednisone.^{2,4} Primary cutaneous lymphomas guidelines (version 3.2024 – August 22, 2024) recommend Adcetris for the systemic therapy of CD30+: mycosis fungoides/Sezary syndrome, primary cutaneous anaplastic large cell lymphoma, and lymphomatoid papulosis.^{2,5}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Adcetris. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Adcetris as well as the monitoring required for adverse events and long-term efficacy, approval requires Adcetris to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Adcetris is recommended in those who meet one of the following criteria:

FDA-Approved Indications

7. **Hodgkin Lymphoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient has classical Hodgkin lymphoma; AND
 - B) The medication is prescribed by or in consultation with an oncologist.
8. **T-Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Adcetris is used for CD30+ T-cell lymphoma; AND
Note: Examples include CD30+ systemic anaplastic large cell lymphoma, CD30+ angioimmunoblastic T-cell lymphoma, CD30+ peripheral T-cell lymphoma not otherwise specified, CD30+ mycosis fungoides/Sezary syndrome, CD30+ primary cutaneous anaplastic large cell lymphoma, CD30+ lymphomatoid papulosis, CD30+ breast implant-associated anaplastic large cell lymphoma, CD30+ adult T-cell leukemia/lymphoma, CD30+ hepatosplenic T-cell lymphoma, CD30+ extranodal NK/T-cell lymphoma.
 - C) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

9. **B-Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Adcetris is used as second-line or subsequent therapy for CD30+ B-cell lymphoma; AND
Note: Examples include CD30+ diffuse large B-cell lymphoma, CD30+ post-transplant lymphoproliferative disorders, CD30+ HIV-related B-cell lymphoma, CD30+ high-grade B-cell lymphoma, CD30+ primary mediastinal large B-cell lymphoma.
 - C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Aliqopa Prior Authorization Policy

- Aliqopa® (copanlisib intravenous infusion – Bayer)

REVIEW DATE: 09/04/2024

OVERVIEW

Aliqopa, a kinase inhibitor, is indicated for the treatment of relapsed **follicular lymphoma** in adults who have received at least two prior systemic therapies.¹

On November 13, 2023, Bayer announced that Aliqopa would be voluntarily withdrawn from the United States market after it failed to confirm the clinical benefit of Aliqopa in a confirmatory clinical trial.² Bayer recommended that no new patients be started on Aliqopa and patients currently receiving Aliqopa should consult their healthcare provider. Bayer is exploring options for patients deriving benefits from Aliqopa and for patients who have no other treatment options. The New Drug Application for Aliqopa was withdrawn by the FDA on March 18, 2024.³

Guidelines

The National Comprehensive Cancer Network guidelines on **B-Cell Lymphomas** (version 2.2024 – April 30, 2024) no longer recommend Aliqopa for the treatment of relapsed/refractory follicular lymphoma (grade 1 or 2), extranodal marginal zone lymphoma of the stomach, extranodal marginal zone lymphoma of nongastric sites, splenic marginal zone lymphoma, and nodal marginal zone lymphoma.⁴

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Aliqopa. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Aliqopa as well as the monitoring required for adverse events and long-term efficacy, approval requires Aliqopa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Aliqopa is recommended in those who meet one of the following criteria:

FDA-Approved Indication

10. Follicular Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient is currently receiving Aliqopa; AND
- C) Patient has received ≥ 2 prior systemic therapies; AND

Note: Examples of systemic therapies include bendamustine, cyclophosphamide, doxorubicin, vincristine, rituximab product (e.g., Rituxan, biosimilars), Gazyva (obinutuzumab intravenous infusion).

09/04/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

D) Aliqopa is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

11. Marginal Zone Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

Note: This includes extranodal marginal zone lymphoma of the stomach, extranodal marginal zone lymphoma of nongastric sites, nodal marginal zone lymphoma, and splenic marginal zone lymphoma.

A) Patient is ≥ 18 years of age; AND

B) Patient is currently receiving Aliqopa; AND

C) Patient has received ≥ 2 prior systemic therapies; AND

Note: Examples of systemic therapies include bendamustine, cyclophosphamide, doxorubicin, vincristine, rituximab product (e.g., Rituxan, biosimilars), Gazyva (obinutuzumab intravenous infusion).

D) Aliqopa is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Aliqopa is not recommended in the following situations:

17. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Amtagvi Prior Authorization Policy

- Amtagvi™ (lifileucel intravenous infusion – Iovance Biotherapeutics)

REVIEW DATE: 02/21/2024

OVERVIEW

Amtagvi, a tumor-derived autologous T cell immunotherapy, is indicated for the treatment of unresectable or metastatic melanoma in adults who have been previously treated with a programmed death receptor-1 (PD-1) blocking antibody, and if *BRAF V600* mutation positive, a BRAF inhibitor with or without a MEK inhibitor.¹

Dosing Information

Amtagvi is provided as a single dose for intravenous infusion containing a suspension of tumor-derived T cells in 5% dimethyl sulfoxide.¹ The dose contains between 7.5×10^9 to 72×10^9 viable cells and is supplied in one or more frozen infusion bags. The bags are stored in the vapor phase of liquid nitrogen (less than or equal to minus 150°C). Amtagvi is for autologous use only.

Prior to receiving Amtagvi, patients are pretreated with lymphodepleting chemotherapy consisting of cyclophosphamide 60 mg/kg intravenously with mesna for 2 days followed by fludarabine 25 mg/m² intravenously daily for 5 days. Amtagvi is administered as soon as possible, 24 hours after the last dose of fludarabine but no later than 4 days after the last dose of fludarabine.

Guidelines

The National Comprehensive Cancer Network (NCCN) melanoma: cutaneous treatment guidelines recommend Amtagvi as a “Preferred” high-dose therapy as second-line or subsequent treatment for metastatic or unresectable disease following progression on anti-PD-1 therapy and BRAF/MEK inhibitor therapy if *BRAF V600* mutation positive.^{2,3}

Safety

Amtagvi has a Boxed Warning for treatment-related mortality, prolonged severe cytopenia, severe infection, and cardiopulmonary and renal impairment.¹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Amtagvi. Because of the specialized skills required for evaluation and diagnosis of patients treated with Amtagvi as well as the monitoring required for adverse events and long-term efficacy, approval requires Amtagvi to be prescribed by or in consultation with a physician who specializes in the condition being treated. The approval duration is 6 months to allow an adequate time frame to prepare and administer 1 dose of therapy.

Automation: None.

02/21/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Amtagvi is recommended in those who meet the following criteria:

FDA-Approved Indication

- 12. Melanoma.** Approve a single dose if the patient meets ALL of the following (A, B, C, D, E, F, and G):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has unresectable or metastatic disease; AND
 - C)** Patient has been treated with a programmed death receptor-1 (PD-1) blocking antibody or a programmed death-ligand 1 (PD-L1) blocking antibody; AND
Note: Examples of PD-1/PD-L1 blocking antibodies includes Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion), and Tecentriq (atezolizumab intravenous infusion).
 - D)** If the patient is BRAF V600 mutation positive, the patient has been treated with a BRAF inhibitor with or without a MEK inhibitor; AND
Note: Examples of BRAF inhibitors includes Braftovi (encorafenib capsules), Zelboraf (vemurafenib tablets), and Tafinlar (dabrafenib capsules).
 - E)** Patient has received or is planning to receive lymphodepleting chemotherapy prior to infusion of Amtagvi; AND
 - F)** Patient has NOT been previously treated with Amtagvi; AND
 - G)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Amtagvi is not recommended in the following situations:

- 18.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Arsenic Trioxide Prior Authorization Policy

- Trisenox® (arsenic trioxide intravenous infusion – Teva, generic)

REVIEW DATE: 10/16/2024

OVERVIEW

Arsenic trioxide is indicated for **acute promyelocytic leukemia (APL)**:¹

- In combination with tretinoin for the treatment of adults with newly diagnosed low-risk disease whose APL is characterized by the presence of the t(15;17) translocation or PML/RAR-alpha gene expression.
- For induction of remission and consolidation in patients with APL who are refractory to, or have relapsed from, retinoid and anthracycline chemotherapy, and whose APL is characterized by the presence of the t(15;17) translocation or PML/RAR-alpha gene expression.

Guidelines

Arsenic trioxide is addressed in National Comprehensive Cancer Network (NCCN) Guidelines.

- **Acute Myeloid Leukemia:** Guidelines (version 3.2024 – May 17, 2024) recommend arsenic trioxide for induction and consolidation therapy in low-risk (white blood cell [WBC] count < 10,000/ μ L) and in high-risk (WBC > 10,000/ μ L) APL with or without cardiac issues.^{2,3} NCCN also recommends arsenic trioxide for the first relapse (either morphologic or molecular) and as single-agent consolidation therapy in patients who are not transplant candidates and are polymerase chain reaction negative following second remission (morphologic).
- **T-Cell Lymphoma:** Guidelines (version 4.2024 – May 28, 2024) recommend arsenic trioxide as a single agent for the second-line or subsequent treatment of non-responders to first-line therapy for adult T-cell leukemia/lymphoma, acute or lymphoma subtypes.^{2,4}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of arsenic trioxide. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with arsenic trioxide as well as the monitoring required for adverse events and long-term efficacy, approval requires arsenic trioxide to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of arsenic trioxide is recommended in those who meet one of the following criteria:

FDA-Approved Indication

13. Acute Promyelocytic Leukemia. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

10/16/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

14. Adult T-Cell Leukemia/Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

A) Patient is $\geq$ 18 years of age; AND

B) Patient has acute or lymphoma subtype; AND

C) Patient has tried chemotherapy; AND

Note: Examples include CHOP (cyclophosphamide, doxorubicin, vincristine, and prednisone), CHOEP (cyclophosphamide, doxorubicin, vincristine, etoposide, and prednisone).

D) Arsenic trioxide will be used as a single agent; AND

E) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of arsenic trioxide is not recommended in the following situations:

19. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Asparlas Prior Authorization Policy

- Asparlas® (calaspargase pegol-mknl intravenous infusion – Servier)

REVIEW DATE: 01/10/2024

OVERVIEW

Asparlas is indicated as a component of a multi-agent chemotherapy regimen for the treatment of **acute lymphoblastic leukemia (ALL)** in pediatric and young adults, age 1 month to 21 years.¹

Asparlas is a conjugate of L-asparaginase, produced by *E. coli*, and monomethoxypolyethylene glycol (mPEG) with a succinimidyl carbonate linker.¹ The succinimidyl carbonate linker forms a stable chemical bond between mPEG and L-asparaginase. Asparlas catalyzes the conversion of L-asparagine into aspartic acid and ammonia. Leukemia cells with low expression of asparagine synthetase cannot make L-asparagine and require exogenous sources for survival. Asparlas kills leukemia cells by depleting the plasma of exogenous L-asparagine.

Guidelines

The National Comprehensive Cancer Network clinical practice guidelines for ALL (version 3.2023 – October 9, 2023) state that Asparlas can be substituted for pegaspargase in patients ≤ 21 years of age.^{2,3} The Pediatric ALL (version 3.2024 – October 31, 2023) guidelines state that Asparlas can be used for induction and consolidation therapy, and for the treatment of relapsed or refractory B-cell and T-cell ALL.^{2,4}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Asparlas. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Asparlas as well as the monitoring required for adverse events and long-term efficacy, approval requires Asparlas to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Asparlas is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Acute Lymphoblastic Leukemia.** Approve for 1 year if the patient meets the following (A and B):
 - A) Patient is 1 month to 21 years of age; AND
 - B) Asparlas is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Asparlas is not recommended in the following situations:

01/10/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

20. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Azedra Prior Authorization Policy

- Azedra® (iobenguane I 131 intravenous infusion – Progenics)

REVIEW DATE: 06/26/2024

OVERVIEW

Azedra, a radioactive therapeutic agent, is indicated for the treatment of **iobenguane scan positive, unresectable, locally advanced or metastatic pheochromocytoma or paraganglioma** in patients ≥ 12 years of age who require systemic anticancer therapy.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for Neuroendocrine and Adrenal Tumors (version 1.2023 – August 2, 2023) note surgical resection as the mainstay of treatment for benign and malignant pheochromocytomas and paragangliomas.² For locally unresectable tumors, observation is recommended if the patient is asymptomatic or has slow-growing, low-volume disease. For patients with locally unresectable or distant metastatic pheochromocytoma or paraganglioma, primary treatment for secreting tumors that are positive on metaiodobenzylguanidine (MIBG) scan include Azedra or other I-131 MIBG therapy (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Azedra. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Azedra as well as the monitoring required for adverse events and long-term efficacy, approval requires Azedra to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Azedra is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1. Pheochromocytoma.** Approve for 6 months if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 12 years of age; AND
 - B) Patient has iobenguane scan positive pheochromocytoma; AND
 - C) The tumor is unresectable; AND
 - D) The tumor is locally advanced or metastatic; AND
 - E) The medication is prescribed by or in consultation with an oncologist or radiologist.
- 2. Paraganglioma.** Approve for 6 months if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 12 years of age; AND
 - B) Patient has iobenguane scan positive paraganglioma; AND

06/26/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- C) The tumor is unresectable; AND
- D) The tumor is locally advanced or metastatic; AND
- E) The medication is prescribed by or in consultation with an oncologist or radiologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Azedra is not recommended in the following situations:

- 6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Beleodaq Prior Authorization Policy

- Beleodaq® (belinostat intravenous infusion – Spectrum)

REVIEW DATE: 09/04/2024

OVERVIEW

Beleodaq, a histone deacetylase inhibitor, is indicated for the treatment of relapsed or refractory **peripheral T-cell lymphoma** in adults.¹

Guidelines

Beleodaq is addressed in the National Comprehensive Cancer Network (NCCN) **T-Cell Lymphomas** guidelines (version 4.2024 – May 28, 2024). NCCN recommends Beleodaq as a single-agent for second-line and subsequent therapy of peripheral T-cell lymphoma, breast implant-associated anaplastic large cell lymphoma, adult T-cell leukemia/lymphoma, extranodal NK/T-cell lymphoma, and hepatosplenic T-cell lymphoma.^{2,3} NCCN also recommends Beleodaq for the initial palliative treatment of peripheral T-cell lymphoma.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Beleodaq. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Beleodaq as well as the monitoring required for adverse events and long-term efficacy, approval requires Beleodaq to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Beleodaq is recommended in those who meet the following criteria:

FDA-Approved Indication

2. **T-Cell Lymphoma.** Approve for 1 year if Beleodaq is prescribed by or in consultation with an oncologist or a dermatologist.

Note: Examples include peripheral T-cell lymphoma, breast implant-associated anaplastic large cell lymphoma, adult T-cell leukemia/lymphoma, hepatosplenic T-cell lymphoma, extranodal NK/T-cell lymphoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Beleodaq is not recommended in the following situations:

21. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Bendamustine Products Prior Authorization Policy

- Belrapzo® (bendamustine intravenous infusion – Eagle)
- Bendeka® (bendamustine intravenous infusion – Teva)
- Treanda® (bendamustine intravenous infusion – Cephalon)
- Vivimusta® (bendamustine intravenous infusion – Slayback, Latina)
- Bendamustine intravenous infusion – various manufacturers

REVIEW DATE: 07/17/2024

OVERVIEW

Bendamustine, an alkylating agent, is indicated for the following uses:^{1-3,14}

- **B-cell non-Hodgkin lymphoma, indolent**, that has progressed during or within 6 months of treatment with rituximab or a rituximab containing regimen.
- **Chronic lymphocytic leukemia**. Efficacy compared to first-line agents other than chlorambucil has not been established.

Guidelines

Bendamustine is addressed in National Comprehensive Cancer Network guidelines:

- **B-Cell Lymphomas:** Guidelines (version 2.2024 – April 30, 2024) recommend bendamustine for the treatment of a variety B-cell lymphomas, including follicular lymphoma (grade 1 and 2), gastric extranodal marginal zone lymphoma of the stomach, extranodal marginal zone lymphoma of nongastric sites, nodal marginal zone lymphoma, splenic marginal zone lymphoma, histologic transformation of indolent lymphomas to diffuse large B-cell lymphoma (DLBCL), mantle cell lymphoma, DLBCL, high-grade B-cell lymphoma, human immunodeficiency virus (HIV)-related B-cell lymphoma, and post-transplant lymphoproliferative disorders.^{4,6} Bendamustine is recommended as monotherapy, or in combination with rituximab (e.g., Rituxan, biosimilars), Polivy™ (polatuzumab vedotin-piiq intravenous [IV] infusion), or Gazyva® (obinutuzumab IV infusion) depending on the lymphoma type and previous treatment .
- **Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma:** Guidelines (version 3.2024 – March 26, 2024) recommend bendamustine, in combination with rituximab or Gazyva, for the first-line treatment of patients without del(17p)/TP53 mutation, who have indications for treatment (not recommended for frail patients).^{4,5} Bendamustine in combination with rituximab is recommended for the treatment of relapsed or refractory disease without del(17p)/TP53 mutation in patients with indications for treatment (not recommended for frail patients).
- **Hematopoietic Cell Transplantation:** Guidelines (version 1.2024 – April 26, 2024) recommend bendamustine in combination with etoposide, cytarabine, and melphalan as a conditioning regimen for autologous transplantation for patients with non-Hodgkin lymphoma without central nervous system disease, or Hodgkin lymphoma.^{4,13}
- **Hodgkin Lymphoma and Pediatric Hodgkin Lymphoma:** Guidelines for Hodgkin lymphoma (version 3.2024 – March 18, 2024) and pediatric Hodgkin lymphoma (version 1.2024 – May 14, 2024) recommend bendamustine for the treatment of recurrent or refractory Hodgkin lymphoma.^{4,7,11} In patients ≥ 18 years of age with classic Hodgkin lymphoma, bendamustine in combination with gemcitabine and vinorelbine, or in combination with Adcetris® (brentuximab IV infusion) is recommended for second-line or subsequent therapy (if not previously used), or in combination with carboplatin and etoposide for third-line or subsequent therapy, or as a single agent for subsequent therapy. In patients ≥ 18 years of age with nodular lymphocyte-predominant

07/17/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Hodgkin lymphoma, bendamustine in combination with rituximab is recommended for the subsequent treatment of progressive, relapsed, or refractory disease. In patients > 60 years of age, bendamustine is recommended as a single agent for palliative therapy of relapsed or refractory disease. For heavily pretreated pediatric patients with Hodgkin lymphoma, bendamustine in combination with Adcetris is recommended for re-induction or subsequent treatment of relapsed or refractory disease.

- **Multiple Myeloma:** Guidelines (version 4.2024 – April 26, 2024) recommend bendamustine as a treatment option for late relapsed or progressive multiple myeloma (patient has received > 3 prior therapies).^{4,8} Bendamustine is recommended as a single agent, or in combination with dexamethasone and lenalidomide, with dexamethasone and bortezomib, or with dexamethasone and Kyprolis® (carfilzomib intravenous infusion).
- **Primary Cutaneous Lymphomas:** Guidelines (version 2.2024 – May 6, 2024) recommend bendamustine in combination with Adcetris for the primary treatment of CD30+ mycosis fungoides stage IVA2 and mycosis fungoides/Sezary syndrome stage IVB visceral disease, or generalized cutaneous or extracutaneous lesions with large cell transformation.^{4,15} Bendamustine in combination with Adcetris is also recommended for the subsequent treatment of stage IIB to Stage IV mycosis fungoides.
- **Systemic Light Chain Amyloidosis:** Guidelines (version 2.2024 – December 12, 2023) recommend bendamustine in combination with dexamethasone for relapsed/refractory disease.^{4,12}
- **T-Cell Lymphomas:** Guidelines (version 4.2024 – May 28, 2024) recommend bendamustine as a single agent for the treatment of relapsed or refractory peripheral T-cell lymphomas, breast implant-associated anaplastic large cell lymphoma, adult T-cell leukemia/lymphoma, and refractory hepatosplenic T-cell lymphoma as subsequent therapy.^{4,9}
- **Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma:** Guidelines (version 2.2024 – December 5, 2023) recommend bendamustine as a single agent or in combination with rituximab for primary treatment, for the treatment of previously treated disease that did not respond, or for progressive or relapsed disease, or symptomatic Bing-Neel syndrome.^{4,10}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of bendamustine. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with bendamustine as well as the monitoring required for adverse events and long-term efficacy, approval requires bendamustine to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of bendamustine is recommended in those who meet one of the following criteria:

FDA-Approved Indications

2. **B-Cell Non-Hodgkin Lymphoma.** Approve for 6 months if the patient meets BOTH of the following (A and B):

Note: Examples include follicular lymphoma, extranodal marginal zone lymphoma of the stomach, extranodal marginal zone lymphoma of nongastric sites, nodal marginal zone lymphoma, splenic

marginal zone lymphoma, histologic transformation of indolent lymphomas to diffuse large B-cell lymphoma (DLBCL), DLBCL, and high-grade B-cell lymphoma.

A) Patient is ≥ 18 years of age; AND

B) Bendamustine is prescribed by or in consultation with an oncologist.

3. **Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma.** Approve for 6 months if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Bendamustine is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

4. **Hematopoietic Cell Transplantation.** Approve for 1 month if the patient meets ALL of the following (A, B, and C):

A) Bendamustine is used as conditioning prior to autologous hematopoietic cell transplantation; AND

B) Patient has ONE of the following conditions (i or ii):

i. Non-Hodgkin lymphoma without central nervous system disease; OR

ii. Hodgkin lymphoma; AND

C) Bendamustine is prescribed by or in consultation with an oncologist or a physician who specializes in hematopoietic cell transplantation.

5. **Hodgkin Lymphoma.** Approve for 6 months if the patient meets BOTH of the following (A and B):

A) Bendamustine is used as second-line or subsequent therapy; AND

B) Bendamustine is prescribed by or in consultation with an oncologist.

6. **Multiple Myeloma.** Approve for 6 months if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has been treated with more than 3 prior regimens; AND

C) Bendamustine is prescribed by or in consultation with an oncologist.

7. **Mycosis Fungoides/Sezary Syndrome.** Approve for 6 months if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Bendamustine is used in combination with Adcetris (brentuximab intravenous infusion); AND

C) Bendamustine is prescribed by or in consultation with an oncologist.

8. **Systemic Light Chain Amyloidosis.** Approve for 6 months if the patient meets ALL of the following (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Patient has relapsed or refractory disease; AND

C) Bendamustine is used in combination with dexamethasone; AND

D) Bendamustine is prescribed by or in consultation with an oncologist.

9. **T-Cell Lymphoma.** Approve for 6 months if the patient meets ALL of the following (A, B, and C):

Note: Examples include peripheral T-cell lymphoma, breast implant-associated anaplastic large cell lymphoma, adult T-cell leukemia/lymphoma, hepatosplenic T-cell lymphoma.

A) Patient is ≥ 18 years of age; AND

B) Bendamustine is used as a single agent; AND

C) Bendamustine is prescribed by or in consultation with an oncologist.

10. Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 6 months if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Bendamustine is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of bendamustine is not recommended in the following situations:

22. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Besponsa Prior Authorization Policy

- Besponsa® (inotuzumab ozogamicin intravenous infusion – Pfizer)

REVIEW DATE: 07/17/2024

OVERVIEW

Besponsa, an antibody-drug conjugate directed against human CD22, is indicated for the treatment of relapsed or refractory CD-22-positive B-cell precursor **acute lymphoblastic leukemia** (ALL) in patients ≥ 1 year of age.¹

Guidelines

Besponsa is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **ALL:** Guidelines (version 1.2024 – June 14, 2024) recommend Besponsa for the frontline treatment of relapsed/refractory Philadelphia chromosome negative (Ph-) B-cell ALL, or relapsed/refractory Ph- B-cell ALL or Philadelphia chromosome positive (Ph+) B-cell ALL if refractory to tyrosine kinase inhibitors (TKI), as a single agent or in combination with mini-hyper CVD (cyclophosphamide, dexamethasone, vincristine, methotrexate, cytarabine).^{2,3} For Ph+ B-cell ALL only, guidelines recommend Besponsa in combination with a TKI. Besponsa is also recommended for induction therapy for Ph- B-cell ALL, or for relapsed or refractory disease in patients ≥ 65 years of age or in patients with substantial comorbidities.
- **Pediatric ALL:** Guidelines (version 5.2024 – April 3, 2024) for pediatric patients recommend Besponsa as a single-agent or in combination with mini-hyper-CVD for the treatment of relapsed/refractory Ph- B-cell ALL, or as a single-agent for relapsed/refractory Ph+ B-cell ALL with tyrosine kinase inhibitor intolerant or refractory disease.^{3,4}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Besponsa. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Besponsa as well as the monitoring required for adverse events and long-term efficacy, approval requires Besponsa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Besponsa is recommended in those who meet the following criteria:

FDA-Approved Indication

3. **Acute Lymphoblastic Leukemia.** Approve for 6 months if the patient meets ALL of the following (A, B, and C):

Note: This applies to Philadelphia chromosome positive and negative acute lymphoblastic leukemia.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Besremi Prior Authorization Policy

- Besremi® (ropeginterferon alfa-2b-njft subcutaneous injection – PharmaEssentia)

REVIEW DATE: 07/10/2024

OVERVIEW

Besremi, an interferon alfa-2b, is indicated for treatment of **polycythemia vera** in adults.¹

Guidelines

The National Comprehensive Cancer Network guidelines for myeloproliferative neoplasms (version 1.2024 – December 21, 2023) discuss therapies for polycythemia vera.² In low-risk patients, management of cardiovascular risk factors, low-dose aspirin (81 to 100 mg/day), and phlebotomy to maintain hematocrit < 45% are recommended (category 2A for all). Besremi or participation in a clinical trial are listed as “preferred” regimens for symptomatic low-risk polycythemia vera (category 2A). In high-risk patients, “preferred” regimens for cytoreductive therapy include hydroxyurea or Besremi (category 2A for both). Besremi is listed as “other recommended regimen” if the patient has an inadequate response or loss of response to first-line therapy, if not previously used.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Besremi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Besremi as well as the monitoring required for adverse events and long-term efficacy, approval requires Besremi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Besremi is recommended in those who meet the following criteria:

FDA-Approved Indication

15. Polycythemia Vera. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Besremi is not recommended in the following situations:

24. Concomitant Use with Other Interferon Products. Besremi was not studied in combination with other interferon products; concomitant use would be expected to result in increased toxicity.

Note: An example of an interferon product is Pegasys® (peginterferon alfa-2a subcutaneous injection).

07/10/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- 25. Hepatitis B Virus.** Besremi is not indicated for hepatitis B.¹ Pegylated interferons are recommended in American Association for the Study of Liver Diseases (AASLD) guidelines for chronic hepatitis B (updated 2018).³ Phase I/II data suggest similar efficacy between Besremi and Pegasys for chronic hepatitis B; however, further data are needed.⁴
- 26. Hepatitis C Virus.** Besremi is not indicated for hepatitis C.¹ Pegasys, another pegylated interferon, is indicated for the treatment of chronic hepatitis C. However, peginterferons are no longer addressed by the AASLD recommendations for testing, managing, and treating HCV (updated October 24, 2022).⁵
- 27.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Oncology (Injectable) – Bevacizumab Products Prior Authorization Policy
- Avastin® (bevacizumab intravenous infusion – Genentech)
 - Alymsys® (bevacizumab-maly intravenous infusion – Amneal)
 - Mvasi™ (bevacizumab-awwb intravenous infusion – Amgen)
 - Vegzelma™ (bevacizumab-adcd intravenous infusion – Celltrion)
 - Zirabev™ (bevacizumab-bvzr intravenous infusion – Pfizer)

REVIEW DATE: 03/20/2024

OVERVIEW

Bevacizumab is a recombinant humanized monoclonal antibody that binds to and inhibits the biologic activity of human vascular endothelial growth factor (VEGF), a key mediator of angiogenesis.¹ Bevacizumab is indicated for the following uses:

- **Cervical cancer**, in combination with paclitaxel and cisplatin OR paclitaxel and topotecan for persistent, recurrent, or metastatic disease.
- **Colorectal cancer**, metastatic:
 - In combination with intravenous fluorouracil-based chemotherapy for first- or second-line treatment.
 - In combination with fluoropyrimidine-irinotecan-based or fluoropyrimidine-oxaliplatin-based chemotherapy for second-line treatment in patients who have progressed on a first-line bevacizumab-containing regimen.

Limitation of use: Bevacizumab is not indicated for adjuvant treatment of colon cancer.

- **Glioblastoma**, for treatment of recurrent disease in adults.
- **Hepatocellular carcinoma**, in combination with Tecentriq® (atezolizumab intravenous infusion) for the treatment of unresectable or metastatic disease in patients who have not received prior systemic therapy.
- **Non-small cell lung cancer (NSCLC)**, for non-squamous disease, in combination with carboplatin and paclitaxel for first-line treatment of unresectable, locally advanced, recurrent, or metastatic disease.
- **Ovarian (epithelial), fallopian tube, or primary peritoneal cancer:**
 - Recurrent disease that is platinum-resistant in combination with paclitaxel, Doxil® (doxorubicin liposome intravenous infusion), or topotecan, in patients who received no more than two prior chemotherapy regimens.
 - Recurrent disease that is platinum-sensitive in combination with carboplatin and paclitaxel or in combination with carboplatin and gemcitabine, followed by bevacizumab as a single agent.
 - In combination with carboplatin and paclitaxel, followed by bevacizumab as a single agent, for stage III or IV disease in patients following initial surgical resection.
- **Renal cell carcinoma**, metastatic, in combination with interferon alfa.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of bevacizumab for uses other than ophthalmic conditions. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with bevacizumab as well as the monitoring required for adverse events and long-term efficacy, approval requires bevacizumab to be prescribed by or in consultation with a physician who specializes in the condition being treated.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of bevacizumab products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Central Nervous System Tumors.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

Note: For pediatric patients see Pediatric Central Nervous System Tumors.

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one previous therapy; AND

Note: Examples are temozolomide capsules or injection, etoposide, carmustine, radiotherapy.

C) Patient has ONE of the following (i, ii, iii, iv, v, vi, or vii):

i. Anaplastic gliomas; OR

ii. Astrocytoma; OR

iii. Glioblastoma; OR

iv. Intracranial and spinal ependymoma (excluding subependymoma); OR

v. Meningiomas; OR

vi. Oligodendroglioma; OR

vii. Symptoms due to ONE of the following (a, b, or c):

a) Radiation necrosis; OR

b) Poorly controlled vasogenic edema; OR

c) Mass effect; AND

D) The medication is prescribed by or in consultation with an oncologist.

2. **Cervical Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):

T) Patient is ≥ 18 years of age; AND

U) Patient meets ONE of the following (i or ii):

i. Patient has recurrent or metastatic cervical cancer; OR

ii. Patient has persistent, recurrent, or metastatic small cell neuroendocrine carcinoma of the cervix; AND

V) The medication is prescribed by or in consultation with an oncologist.

3. **Colon, Rectal, or Appendiceal Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Patient has recurrent, advanced, or metastatic colon, rectal, or appendiceal cancer; AND

C) The medication is used in combination with a chemotherapy regimen; AND

Note: Examples of chemotherapy are 5-fluorouracil with leucovorin, and may include one or both of oxaliplatin, irinotecan; capecitabine with or without oxaliplatin; irinotecan with or without oxaliplatin.

D) The medication is prescribed by or in consultation with an oncologist.

4. **Hepatocellular Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):

A) Patient is ≥ 18 years of age; AND

B) Patient has Child-Pugh Class A or B disease; AND

03/20/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- C) According to the prescriber, the patient has ONE of the following (i, ii, or iii):
 - i. Unresectable disease and is not a transplant candidate; OR
 - ii. Liver-confined disease, inoperable by performance status, comorbidity, or with minimal or uncertain extrahepatic disease; OR
 - iii. Metastatic disease or extensive liver tumor burden; AND
 - D) The medication is used in combination with Tecentriq (atezolizumab intravenous infusion); AND
 - E) Patient has not received prior systemic therapy; AND
 - F) The medication is prescribed by or in consultation with an oncologist.
5. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient does not have a of recent hemoptysis; AND
 - C) Patient has recurrent, advanced, or metastatic non-squamous non-small cell lung cancer (NSCLC) and meets ONE of the following (i, ii, iii, iv, or v):

Note: Non-squamous NSCLC includes adenocarcinoma, large cell, or NSCLC not otherwise specified.

 - i. The NSCLC tumor is negative or unknown for actionable mutations and the patient meets ONE of the following (a, b, or c):

Note: Examples of actionable mutations include sensitizing epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *RET* rearrangement positive, *MET* exon 14 skipping, *NTRK* gene fusion positive, *BRAF V600E* mutation positive, and ROS proto-oncogene 1 (*ROS1*) rearrangement positive. *KRAS G12C* is not considered an actionable mutation (the tumor may be *KRAS G12C* mutation positive).

 - a) The medication is used as initial therapy in combination with other systemic therapies; OR

Note: Examples of systemic therapies are cisplatin, carboplatin, Tecentriq (atezolizumab intravenous infusion), pemetrexed, paclitaxel.
 - b) The medication is used as continuation maintenance therapy and meets ONE of the following [(1), (2), or (3)]:
 - (1) The medication is used as a single agent; OR
 - (2) The medication is used in combination with Tecentriq, if Tecentriq was used in combination with bevacizumab for first-line therapy; OR
 - (3) The medication is used in combination with pemetrexed, if pemetrexed was used in combination with bevacizumab for first-line therapy; OR
 - c) The medication is used as subsequent therapy in combination with other systemic therapies; OR

Note: Examples of systemic therapies are cisplatin, carboplatin, pemetrexed, paclitaxel.
 - ii. The tumor is positive for *EGFR* exon 19 deletion or exon 21 *L858R* mutations and the patient meets ONE of the following (a or b):
 - a) The medication is used as first-line or continuation maintenance therapy in combination with erlotinib; OR
 - b) The medication is used as subsequent therapy following prior targeted therapy; OR

Note: Examples of targeted therapy include Gilotrif (afatinib tablet), Tagrisso (osimertinib tablet), erlotinib, Iressa (gefitinib tablet), Vizimpro (dacomitinib tablet).
 - iii. Patient meets ALL of the following (a, b, and c):
 - a) The medication is used first-line; AND
 - b) The medication is used in combination with other systemic therapies; AND

Note: Examples of systemic therapies include carboplatin plus paclitaxel or pemetrexed, cisplatin plus pemetrexed, and Tecentriq plus carboplatin and paclitaxel.

- c) The tumor is positive for ONE of the following mutations [(1) or (2)]:
 - (1) *EGFR* exon 20 mutation; OR
 - (2) *ERBB2* (HER2) mutation; OR
 - iv. Patient meets ALL of the following (a, b, and c):
 - a) The medication is used as first-line or subsequent therapy; AND
 - b) The medication is used in combination with other systemic therapies; AND
Note: Examples of systemic therapies include carboplatin plus paclitaxel or pemetrexed, cisplatin plus pemetrexed, and Tecentriq plus carboplatin and paclitaxel.
 - c) The tumor is positive for ONE of the following mutations [(1), (2), (3), or (4)]:
 - (1) *BRAF V600E* mutation; OR
 - (2) *NTRK1/2/3* gene fusion positive; OR
 - (3) *MET* exon 14 skipping mutation; OR
 - (4) *RET* rearrangement positive; OR
 - v. Patient meets ALL of the following (a, b, c, and d):
 - a) The medication is used as subsequent therapy; AND
 - b) The medication is used in combination with other systemic therapies; AND
Note: Examples of systemic therapies include carboplatin plus paclitaxel or pemetrexed, cisplatin plus pemetrexed, and Tecentriq plus carboplatin and paclitaxel.
 - c) The tumor is positive for ONE of the following mutations [(1), (2), or (3)]
 - (1) *EGFR S768I, L861Q, and/or G719X* mutation; OR
 - (2) *ALK* rearrangement positive; OR
 - (3) *ROS1* rearrangement positive; AND
 - d) Patient has previously received targeted drug therapy for the specific mutation; AND
Note: Examples of targeted drug therapy include Gilotrif (afatinib tablet), Tagrisso (osimertinib tablet), erlotinib, Iressa (gefitinib tablet), Vizimpro (dacomitinib tablet), Xalkori (crizotinib capsule), Rozlytrek (entrectinib capsule), or Zykadia (ceritinib tablet).
 - D) The medication is prescribed by or in consultation with an oncologist.
6. **Ovarian, Fallopian Tube, or Primary Peritoneal Cancer.** Approve for 1 year if the patient meets BOTH of the following criteria (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) The medication is prescribed by or in consultation with an oncologist.
7. **Renal Cell Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed, metastatic, or stage IV renal cell cancer; AND
 - C) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

8. **Ampullary Adenocarcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has intestinal type disease; AND
 - C) The medication is used in combination with chemotherapy; AND
Note: Examples of chemotherapy include FOLFOX (leucovorin, fluorouracil, oxaliplatin), FOLFIRI (leucovorin, fluorouracil, irinotecan), FOLFIRINOX (leucovorin, fluorouracil, oxaliplatin, irinotecan), and CapeOX (capecitabine, oxaliplatin).
 - D) The medication is prescribed by or in consultation with an oncologist.

9. **Endometrial Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has recurrent, advanced, or metastatic disease; AND
 - C) The medication is prescribed by or in consultation with an oncologist.
10. **Mesothelioma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has ONE of the following (i, ii, iii, or iv):
 - i. Pleural mesothelioma; OR
 - ii. Peritoneal mesothelioma; OR
 - iii. Pericardial mesothelioma; OR
 - iv. Tunica vaginalis testis mesothelioma; AND
 - C) Patient meets ONE of the following (i or ii):
 - i. Bevacizumab will be used in combination with a chemotherapy regimen; OR
Note: Examples of chemotherapy are pemetrexed, cisplatin, carboplatin.
 - ii. Bevacizumab will be used in combination with Tecentriq (atezolizumab intravenous infusion); AND
 - D) The medication is prescribed by or in consultation with an oncologist.
11. **Neovascular or Vascular Ophthalmic Conditions.** Approve for 3 years.
Note: Examples of neovascular or vascular ophthalmic conditions include diabetic macular edema (includes patients with diabetic retinopathy and diabetic macular edema), macular edema following retinal vein occlusion, myopic choroidal neovascularization, neovascular (wet) age-related macular degeneration, other neovascular diseases of the eye (e.g., neovascular glaucoma, retinopathy of prematurity, sickle cell neovascularization, choroidal neovascular conditions).
12. **Pediatric Central Nervous System Tumors.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is < 18 years of age; AND
 - B) Patient has ONE of the following (i or ii):
 - i. Pediatric-type diffuse high-grade glioma; OR
Note: Examples include diffuse hemispheric glioma, diffuse pediatric-type high-grade glioma, infant-type hemispheric glioma, and diffuse midline glioma.
 - ii. Pediatric medulloblastoma; AND
 - C) Patient has recurrent or progressive disease; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
13. **Small Bowel Adenocarcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced or metastatic disease; AND
 - C) The medication is used in combination with chemotherapy; AND
Note: Examples of chemotherapy are fluorouracil, leucovorin, and oxaliplatin (FOLFOX), capecitabine and oxaliplatin (CapeOX), fluorouracil, leucovorin, oxaliplatin, and irinotecan (FOLFIRINOX).
 - D) The medication is prescribed by or in consultation with an oncologist.
14. **Soft Tissue Sarcoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND

- B) Patient has angiosarcoma or solitary fibrous tumor; AND
- C) The medication is prescribed by or in consultation with an oncologist.

15. **Vulvar Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has advanced, recurrent, or metastatic disease; AND
- C) Bevacizumab is used in combination with a chemotherapy regimen; AND
- Note: Examples of chemotherapy regimens are cisplatin and paclitaxel, carboplatin and paclitaxel.
- D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of bevacizumab products is not recommended in the following situations:

- 2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Bizengri Prior Authorization Policy

- Bizengri® (zenocutuzumab-zbco intravenous infusion –Merus/Partner)

REVIEW DATE: 12/18/2024

OVERVIEW

Bizengri, a bispecific human epidermal growth factor receptor 2 and 3 (HER2)- and (HER3)-directed antibody, is indicated for the treatment of:¹

- Non-small cell lung cancer (NSCLC), advanced, unresectable or metastatic, harboring a neuregulin 1 (*NRG1*) gene fusion with disease progression on or after prior systemic therapy in adults.
- Pancreatic adenocarcinoma, advanced, unresectable or metastatic, harboring a *NRG1* gene fusion with disease progression on or after prior systemic therapy in adults.

Guidelines

Bizengri is not discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **NSCLC:** NCCN guidelines (version 1.2025 – December 20, 2024) recommend molecular testing for patients with advanced or metastatic disease.² Recommendations are given based on the type of mutation or gene fusion. Generally, platinum based therapy such as carboplatin and cisplatin are used and programmed cell death protein 1 (PD)-1 or PD-ligand 1 (PD-L1) blockers are used as systemic therapy. Bizengri is recommended as a subsequent therapy for patients with the *NRG1* gene fusion for patients with recurrent, advanced, or metastatic disease (category 2A).
- **Pancreatic Adenocarcinoma:** NCCN guidelines (version 1.2025 – December 20, 2024) recommend tumor/somatic molecular profiling for patients with locally advanced/metastatic disease who are candidates for anti-cancer therapy to identify uncommon mutations, such as *NRG1* fusions.³ Bizengri is not included in these guidelines. For patient with advanced or metastatic disease, clinical trial is preferred. For patients with metastatic or advanced disease, some of the “Preferred” regimens include FOLFIRINOX (fluorouracil + leucovorin + irinotecan + oxaliplatin) or a modified FOLFIRINOX with or without subsequent chemoradiation; and gemcitabine + albumin-bound paclitaxel with or without subsequent chemoradiation. There are other recommendations based on performance status and mutation type. There are no recommendations for patients with *NRG1* fusions.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Bizengri. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Bizengri, as well as the monitoring required for adverse events and long-term efficacy, approval requires Bizengri to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Bizengri is recommended in those who meet one of the following criteria:

12/18/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indications

1. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D and E):
 11. Patient is ≥ 18 years of age; AND
 12. Patient has advanced, unresectable, or metastatic disease; AND
 13. The disease is neuregulin 1 (*NRG1*) gene fusion positive; AND
 14. Patient has tried at least one systemic regimen; AND
Note: Examples of a systemic regimen include one or more of the following drugs: carboplatin, cisplatin, or programmed cell death protein 1 (PD)-1 or PD-ligand 1 (PD-L1) blockers.
 15. The medication will be prescribed by or in consultation with an oncologist.
2. **Pancreatic Adenocarcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced, unresectable, or metastatic disease; AND
 - C) The disease is neuregulin 1 (*NRG1*) gene fusion positive; AND
 - D) Patient has tried at least one systemic regimen; AND
Note: Examples of systemic regimen include one or more of the following drugs: fluorouracil, leucovorin, irinotecan, oxaliplatin, gemcitabine, paclitaxel, capecitabine
 - E) The medication will be prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Bizengri is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Blenrep Prior Authorization Policy

- Blenrep™ (belantamab mafodotin-blmf intravenous infusion – GlaxoSmithKline)

REVIEW DATE: 10/16/2024

OVERVIEW

Blenrep, a B-cell maturation antigen-directed antibody and microtubule inhibitor conjugate, is indicated for treatment of relapsed or refractory **multiple myeloma**, in adults who have received at least four prior therapies, including an anti-CD38 monoclonal antibody, a proteasome inhibitor, and an immunomodulatory drug. The FDA granted accelerated approval to Blenrep in August 2020, based on overall response rate from an open-label, Phase II study. Because the primary endpoint (progression-free survival) was not met in the confirmatory Phase III study, the manufacturer has initiated the process of removing Blenrep from the market. In November 2022, the manufacturer announced that no new patients would be allowed enrollment in the Blenrep REMS program.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for multiple myeloma (version 1.2025 – September 17, 2024) recommend various regimens as primary therapy (transplant eligible and non-transplant candidates), maintenance therapy, and previously treated multiple myeloma.² The choice of regimen takes into account patient factors as well as response and tolerability to previous regimens. Triplet regimens (e.g., with a proteasome inhibitor, immunomodulatory drug, and corticosteroid) are standard therapy for multiple myeloma. Blenrep is listed as useful in certain circumstances if available through the compassionate use program, and after at least four prior therapies (including an anti-CD38 monoclonal antibody, proteasome inhibitor, and an immunomodulatory drug).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Blenrep. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Blenrep as well as the monitoring required for adverse events and long-term efficacy, approval requires Blenrep to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Blenrep is recommended in those who meet the following criteria:

10/16/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indication

- 4. Multiple Myeloma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- 16.** Patient is currently receiving Blenrep; AND
- 17.** Patient is ≥ 18 years of age; AND
- 18.** Patient has tried at least four systemic regimens; AND
- 19.** Among the previous regimens tried, the patient has received at least one drug from each of the following classes (i, ii, and iii):
- i.** Proteasome inhibitor; AND
Note: Examples include Velcade (bortezomib injection), Kyprolis (carfilzomib infusion), Ninlaro (ixazomib capsules).
 - ii.** Immunomodulatory drug; AND
Note: Examples include Revlimid (lenalidomide capsules), Pomalyst (pomalidomide capsules), Thalomid (thalidomide capsules).
 - iii.** Anti-CD38 monoclonal antibody; AND
Note: Examples include Darzalex (daratumumab intravenous infusion), Darzalex Faspro (daratumumab and hyaluronidase-fihj subcutaneous injection), or Sarclisa (isatuximab-irfc intravenous infusion).
- 20.** The medication will be prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Blenrep is not recommended in the following situations:

- 28.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Blincyto Prior Authorization Policy

- Blincyto® (blinatumomab intravenous infusion – Amgen)

REVIEW DATE: 09/04/2024

OVERVIEW

Blincyto, a bispecific CD19-directed CD3 T-cell engager, is indicated for the following uses:¹

- **Minimal residual disease (MRD)-positive, CD19-positive B-cell precursor acute lymphoblastic leukemia (ALL)** in first or second complete remission with MRD $\geq 0.1\%$ in patients ≥ 1 month of age.
- **Relapsed or refractory CD19-positive B-cell ALL** in patients ≥ 1 month of age.
- **B-cell precursor, CD-19-positive Philadelphia chromosome-negative ALL** in the consolidation phase of multiphase chemotherapy in patients ≥ 1 month of age.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on **Acute Lymphoblastic Leukemia** (version 2.2024 – July 19, 2024) and **Pediatric Acute Lymphoblastic Leukemia** (version 1.2025 – August 28, 2024) recommend Blincyto for relapsed/refractory B-cell ALL, induction therapy, consolidation therapy, and maintenance therapy.²⁻⁴

Safety

Blincyto contains a boxed warning for cytokine release syndrome which may be life-threatening or fatal and neurologic toxicities which may be severe, life-threatening, or fatal.¹ Stop or discontinue Blincyto as recommended for either toxicity.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Blincyto. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Blincyto, as well as the monitoring required for adverse events and long-term efficacy, approval requires Blincyto to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Blincyto is recommended in those who meet the following criteria:

FDA-Approved Indication

16. Acute Lymphoblastic Leukemia. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

H) Patient has B-cell precursor disease; **AND**

I) Patient meets ONE of the following (i, ii, or iii):

a. Patient is Philadelphia chromosome negative and meets ONE of the following (a, b, c, or d):

09/04/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- a) Patient has relapsed or refractory disease; OR
 - b) The medication is used for induction therapy; OR
 - c) The medication is used for consolidation therapy; OR
 - d) The medication is used for maintenance therapy; OR
- b. Patient is Philadelphia chromosome-like and the medication is used for consolidation therapy; OR
- c. Patient is Philadelphia chromosome positive and meets ONE of the following (a, b, c, or d):
 - a) Patient has relapsed or refractory disease; OR
 - b) The medication is used for induction therapy; OR
 - c) The medication is used for consolidation therapy; OR
 - d) The medication is used for maintenance therapy; AND
- J) Blincyto is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Blincyto is not recommended in the following situations:

- 29. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Oncology (Injectable) – Bortezomib Products Prior Authorization Policy
- Boruzu® (bortezomib intravenous or subcutaneous injection – Amneal Pharmaceuticals)
 - Velcade® (bortezomib intravenous or subcutaneous injection – Takeda, generic)

REVIEW DATE: 11/20/2024; selected revision 12/11/2024

OVERVIEW

Bortezomib, a proteasome inhibitor, is indicated in adults with the following conditions:¹

- **Mantle cell lymphoma.**
- **Multiple myeloma.**

Guidelines

Bortezomib is mentioned in several guidelines published by the National Comprehensive Cancer Network (NCCN).²⁻¹¹

- **Acute lymphoblastic leukemia:** Guidelines for adults (version 2.2024 – July 19, 2024) and for pediatric patients (version 1.2025 – August 28, 2024) include bortezomib + chemotherapy among the other recommended regimens for relapsed or refractory disease.^{3,4}
- **B-cell lymphomas:** Guidelines (version 3.2024 – August 26, 2024) recommend bortezomib as a component of VR-CAP (bortezomib/rituximab/cyclophosphamide/doxorubicin/prednisone) as a preferred less aggressive therapy option for the initial treatment of patients (induction therapy) with newly diagnosed mantle cell lymphoma.⁵ Bortezomib ± rituximab is also listed as second-line and subsequent therapy for relapsed or refractory mantle cell lymphoma. For patients with relapsed or refractory multicentric Castleman's disease, bortezomib ± rituximab is listed among the treatment options.
- **Classic Hodgkin lymphoma:** Guidelines for pediatric disease (version 1.2024 – May 14, 2024) include bortezomib/ifosfamide/vinorelbine among the subsequent therapy options for relapsed or refractory disease.⁷
- **Kaposi sarcoma:** Guidelines (version 1.2025 – November 1, 2024) include bortezomib among the subsequent systemic therapy options for patients who have relapsed or refractory disease.⁶
- **Multiple myeloma:** Bortezomib features prominently in the NCCN Multiple Myeloma clinical practice guidelines (version 1.2025 – September 17, 2024).⁸ Bortezomib-containing regimens are listed as preferred for primary therapy (transplant and nontransplant candidates) and previously treated disease. Bortezomib is also a component of multiple other regimens across the spectrum of disease. For maintenance therapy, bortezomib ± lenalidomide capsules (and ± dexamethasone for transplant candidates) are also listed as treatment options.
- **Systemic light chain amyloidosis:** Guidelines (version 1.2025 – September 13, 2024) list bortezomib alone or in combination with other agents for primary therapy (transplant and non-transplant candidates) and previously treated disease.⁹ NCCN notes that bortezomib was well tolerated at doses up to 1.6 mg/m² on a once-weekly schedule and 1.3 mg/m² on a twice-weekly schedule. The once-weekly regimen was associated with lower neurotoxicity.
- **T-cell lymphomas:** Guidelines (version 1.2025 – November 11, 2024) recommend bortezomib (category 2A) as an alternative regimen for second-line or subsequent therapy.¹¹
- **Waldenstrom's macroglobulinemia/lymphoplasmacytic lymphoma:** Guidelines (version 1.2025 – September 13, 2024) recommend bortezomib/dexamethasone/rituximab as one of the

"Other Recommended Regimens" (category 2A) for primary therapy and for previously treated disease.¹⁰

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of bortezomib. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with bortezomib, as well as the monitoring required for adverse events and long-term efficacy, approval requires bortezomib to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of bortezomib is recommended in those who meet one of the following criteria:

FDA-Approved Indications

5. **Mantle Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - a. Patient is ≥ 18 years of age; AND
 - b. Patient meets ONE of the following (i or ii):
 - i. Patient has previously tried at least one other therapy for mantle cell lymphoma; OR
Note: Examples of other therapies for mantle cell lymphoma include regimens containing a rituximab product, cytarabine, cisplatin, cyclophosphamide, doxorubicin, vincristine, or bendamustine.
 - ii. The medication is used in combination with at least one other agent; AND
Note: Examples of other agents used in combination with bortezomib for mantle cell lymphoma include a rituximab product, bendamustine, cyclophosphamide, and doxorubicin.
 - c. The medication is prescribed by or in consultation with an oncologist or a hematologist.
-
6. **Multiple Myeloma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 21. Patient is ≥ 18 years of age; AND
 22. Patient meets ONE of the following (i or ii):
- i. The medication will be used in combination with at least one other agent; OR
Note: Examples of other agents that may be used in combination with bortezomib include dexamethasone, cyclophosphamide, doxorubicin, Doxil (doxorubicin liposomal intravenous infusion), Revlimid (lenalidomide capsules), Thalomid (thalidomide capsules), cisplatin, etoposide, Darzalex (daratumumab intravenous infusion), Pomalyst (pomalidomide capsules), bendamustine, Empliciti (elotuzumab intravenous infusion), Farydak (panobinostat capsules).
- ii. The medication is being used for maintenance therapy; AND
23. The medication is prescribed by or in consultation with an oncologist or a hematologist.

Other Uses with Supportive Evidence

7. **Acute Lymphoblastic Leukemia.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - a. Patient has relapsed or refractory disease; AND
 - b. The medication is prescribed by or in consultation with an oncologist.
8. **Castleman's Disease.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - a. Patient is ≥ 18 years of age; AND
 - b. Patient has multicentric Castleman's disease; AND
 - c. Patient has relapsed, refractory, or progressive disease; AND
 - d. The medication is prescribed by or in consultation with an oncologist.
9. **Classic Hodgkin Lymphoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - a. Patient has tried at least one systemic chemotherapy regimen; AND

Note: Examples of systemic chemotherapies used in regimens for Hodgkin lymphoma include doxorubicin, bleomycin, vincristine, etoposide, and dacarbazine.

 - b. The medication is prescribed by or in consultation with an oncologist.
10. **Kaposi Sarcoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - a. Patient is ≥ 18 years of age; AND
 - b. Patient has tried at least one systemic chemotherapy; AND

Note: Examples of systemic chemotherapies include doxorubicin and paclitaxel.

 - c. The medication is prescribed by or in consultation with an oncologist.
11. **Systemic Light Chain Amyloidosis.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) The medication is prescribed by or in consultation with an oncologist or a hematologist.
12. **T-Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has tried at least one systemic therapy; AND

Note: Examples of systemic therapies include EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, and doxorubicin), Adcetris (brentuximab vedotin intravenous infusion) + CHP (cyclophosphamide, doxorubicin, and prednisone), zidovudine + interferon, CHOEP (cyclophosphamide, doxorubicin, vincristine, etoposide, and prednisone), HyperCVAD (cyclophosphamide, vincristine, doxorubicin, and dexamethasone) alternating with high-dose methotrexate and cytarabine.

 - C) The medication is prescribed by or in consultation with an oncologist.
13. **Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - a. Patient is ≥ 18 years of age; AND
 - b. The medication will be used in combination with rituximab and dexamethasone; AND
 - c. The medication is prescribed by or in consultation with an oncologist or a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of bortezomib is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Carmustine Products Prior Authorization Policy

- Carmustine intravenous infusion (BICNU® – Avet, generics)

REVIEW DATE: 01/10/2024

OVERVIEW

Carmustine intravenous infusion, a nitrosourea, is approved as palliative therapy as a single agent or in established combination therapy in the following conditions:¹

- **Brain tumors**, including glioblastoma, brainstem glioma, medulloblastoma, astrocytoma, ependymoma, and metastatic brain tumors.
- **Hodgkin lymphoma**, in relapsed or refractory disease in combination with other approved drugs.
- **Multiple myeloma**, in combination with prednisone.
- **Non-Hodgkin lymphoma**, in relapsed or refractory disease in combination with other approved drugs.

Guidelines

Carmustine is addressed in the following National Comprehensive Cancer Network (NCCN) guidelines:

- **Central nervous system (CNS) cancers** (version 1.2023 – March 24, 2023) clinical practice guidelines support the use of carmustine injection for certain adults with recurrent or progressive low-grade glioma/pilocytic and infiltrative supratentorial astrocytoma/oligodendroglioma, and recurrent anaplastic glioma, glioblastoma, adult intracranial and spinal ependymoma (excluding subependymoma).^{2,3} Carmustine injection is also part of a Preferred regimen (in combination with thiotepe) as consolidation therapy with stem cell rescue in patients with primary CNS lymphoma. The **Pediatric CNS** (version 2.2023 – October 31, 2022) recommend carmustine for the palliative treatment of patients with diffuse high-grade gliomas.^{3,8}
- **Hematopoietic Cell Transplantation** (version 3.2023 – October 9, 2023) clinical practice guidelines recommend carmustine as part of a conditioning regimen prior to autologous hematopoietic cell transplantation (category 2A) in patients with non-Hodgkin lymphoma, Hodgkin lymphoma, or primary CNS lymphoma.^{3,7}

The NCCN clinical practice guidelines on **Hodgkin Lymphoma** (version 1.2024 – October 12, 2023), **Multiple Myeloma** (version 2.2024 – November 1, 2023) and **B-Cell Lymphomas** (version 6.2023 – October 10, 2023) do not provide recommendations on the use of carmustine for the treatment of these respective indications.⁴⁻⁶

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of carmustine products. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with carmustine products as well as the monitoring required for adverse events and long-term efficacy, approval requires carmustine products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of carmustine intravenous infusion (BICNU, generics) is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Central Nervous System Tumor.** Approve for 1 year if the patient meets ONE of the following (A or B):

Note: Includes adult low-grade infiltrative supratentorial astrocytoma/oligodendroglioma, anaplastic gliomas, glioblastoma, adult intracranial and spinal ependymoma, primary central nervous system lymphoma, pediatric diffuse high-grade gliomas.

- A) Patient is ≥ 18 years of age: Approve if the patient meets BOTH of the following (i and ii):

- i. Patient meets ONE of the following (a, b, or c):

- a) Patient has recurrent or progressive disease; OR

- b) The medication is being used in a regimen with stem cell rescue; OR

Note: For example, as consolidation therapy in combination with thiotepa with stem cell rescue.

- c) The medication is used in place of lomustine in any PCV (procarbazine, lomustine, and vincristine) regimen; AND

- ii. The medication is prescribed by or in consultation with an oncologist.

- B) Patient is < 18 years of age: Approve if the patient meets ALL of the following (i, ii, and iii):

- i. Patient has diffuse high-grade glioma; AND

- ii. The medication is used for palliative treatment; AND

- iii. The medication is prescribed by or in consultation with an oncologist.

2. **Hodgkin Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Patient has relapsed or refractory disease; AND

C) The medication is being used as part of a chemotherapy regimen; AND

Note: For example, as a component of MiniBEAM (carmustine/cytarabine/etoposide/melphalan).

D) The medication is prescribed by or in consultation with an oncologist.

3. **Multiple Myeloma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) The medication is being used with prednisone; AND

C) The medication is prescribed by or in consultation with an oncologist.

4. **Non-Hodgkin Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Patient has relapsed or refractory disease; AND

C) The medication is being used as part of a chemotherapy regimen; AND

D) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

5. **Hematopoietic Cell Transplantation.** Approve for 1 month if the patient meets ALL of the following (A, B, and C):

- A) Patient is undergoing an autologous transplant; AND
- B) The medication is being used as part of a conditioning regimen, given prior to transplantation; AND
- C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of carmustine intravenous infusion is not recommended in the following situations:

- 30. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Columvi Prior Authorization Policy

- Columvi™ (glofitamab-gxbm intravenous infusion – Genentech)

REVIEW DATE: 06/26/2024

OVERVIEW

Columvi, a bispecific anti-CD20-directed CD3 T-cell engager, is indicated for the treatment of **relapsed or refractory diffuse large B-cell lymphoma** (DLBCL) not otherwise specified or **large B-cell lymphoma** (LBCL) arising from follicular lymphoma, in adults after two or more lines of systemic therapy.¹

Guidelines

The National Comprehensive Cancer Network **B-cell lymphoma** clinical practice guidelines (version 2.2024 – April 30, 2024) recommend Columvi for the third-line and subsequent treatment of DLBCL, high-grade B-cell lymphoma, histologic transformation of indolent lymphoma to DLBCL, human immunodeficiency virus (HIV)-related B-cell lymphoma, and post-transplant lymphoproliferative disorders.^{2,3}

Safety

Columvi has a Boxed Warning for cytokine release syndrome.¹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Columvi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Columvi as well as the monitoring required for adverse events and long-term efficacy, approval requires Columvi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Columvi is recommended in those who meet the following criteria:

FDA-Approved Indication

17. Diffuse Large B-Cell Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

Note: Examples of diffuse large B-cell lymphoma (DLBCL) include DLBCL not otherwise specified, high-grade B-cell lymphoma, and DLBCL arising from indolent lymphoma.

A) Patient is ≥ 18 years of age; AND

B) Patient has received two or more lines of systemic therapy; AND

Note: Examples of systemic therapy include RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone) and DHA (dexamethasone, cytarabine) + platinum (carboplatin, cisplatin, or oxaliplatin) $\pm$ rituximab.

C) Medication is given as a single agent; AND

06/26/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- D) Patient has or will receive pretreatment with Gazyva (obinutuzumab intravenous infusion) before the first dose of Columvi; AND
- E) Medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

18. Human Immunodeficiency Virus (HIV)-Related B-Cell Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

Note: HIV-related B-cell lymphomas includes HIV-related diffuse large B-cell lymphoma (DLBCL), primary effusion lymphoma, and human herpes virus-8 (HHV8) positive DLBCL

- A) Patient is ≥ 18 years of age; AND
- B) Patient has received two or more lines of systemic therapy; AND
Note: Examples of systemic therapy include RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone) and R-EPOCH (rituximab, etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin).
- C) Medication is given as a single agent; AND
- D) Patient has or will receive pretreatment with Gazyva (obinutuzumab intravenous infusion) before the first dose of Columvi; AND
- E) Medication is prescribed by or in consultation with an oncologist.

19. Post-Transplant Lymphoproliferative Disorders. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has received two or more lines of systemic therapy; AND
Note: Examples of systemic therapy include RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone) and RCEPP (rituximab, cyclophosphamide, etoposide, prednisone, procarbazine).
- C) Medication is given as a single agent; AND
- D) Patient has or will receive pretreatment with Gazyva (obinutuzumab intravenous infusion) before the first dose of Columvi; AND
- E) Medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Columvi is not recommended in the following situations:

- 31. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Cosela Prior Authorization Policy

- Cosela™ (trilaciclib intravenous infusion – G1 Therapeutics)

REVIEW DATE: 03/20/2024; selected revision 10/23/2024

OVERVIEW

Cosela, a cyclin dependent kinase (CDK) 4/6 kinase inhibitor, is indicated to **decrease the incidence of chemotherapy-induced myelosuppression** in adults when administered prior to a platinum/etoposide-containing regimen or topotecan-containing regimen for extensive-stage small cell lung cancer (SCLC).¹

The recommended dose of Cosela is 240 mg/m² per dose.¹ Cosela is administered prior to the start of chemotherapy on each day chemotherapy is given.¹ During Cycle 1 of the three Cosela pivotal studies, primary prophylactic granulocyte-colony stimulating factor (G-CSF) and erythropoiesis-stimulating agent (ESA) use was prohibited. Both ESAs and prophylactic G-CSF were allowed from Cycle 2, if clinically indicated. Therapeutic G-CSF, red blood cell, and platelet transfusions were allowed at any time during the studies as clinically indicated.

Guidelines

Cosela is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):^{2,3}

- **Hematopoietic Growth Factors:** NCCN guidelines (version 3.2024 – January 30, 2024) recommend Cosela as a prophylactic option to decrease the incidence of chemotherapy-induced myelosuppression when administered before (prophylactic granulocyte colony stimulating factor [G-CSF] may be administered after cycle 1) platinum/etoposide ± immune checkpoint inhibitor-containing regimens or a topotecan-containing regimen for extensive-stage SCLC (category 2A). It is also recommended as a prophylactic option to decrease the incidence of anemia and red blood cell transfusions when administered before platinum/etoposide ± immune checkpoint inhibitor-containing regimens or a topotecan-containing regimen for extensive-stage SCLC (category 2B).²
- **Small Cell Lung Cancer:** Under supportive care, the NCCN guidelines (version 2.2024 – November 21, 2023) note that Cosela or G-CSF may be used as prophylactic options to decrease the incidence of chemotherapy-induced myelosuppression when administering platinum/etoposide ± immune checkpoint inhibitor-containing regimens or a topotecan-containing regimen for extensive-stage SCLC (category 2A).³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cosela. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Cosela as well as the monitoring required for adverse events and long-term efficacy, approval requires Cosela to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

03/20/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cosela is recommended in those who meet the following criteria:

FDA-Approved Indication

- 3. Small Cell Lung Cancer.** Approve for 6 months if the patient meets ALL of the following (A, B, C, D, E, and F):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has extensive-stage disease; AND
 - C)** The medication is used to decrease the incidence of chemotherapy-induced myelosuppression; AND
 - D)** Patient meets ONE of the following (i or ii):
 - i.** Patient will be receiving a platinum (carboplatin or cisplatin) and etoposide-containing chemotherapy regimen; OR
 - ii.** Patient will be receiving a topotecan-containing regimen; AND
 - E** According to the prescriber, during the first cycle of chemotherapy, Cosela will not be co-administered with a granulocyte-colony stimulating factor (G-CSF) or an erythropoiesis-stimulating agent (ESA); AND
 - F)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cosela is not recommended in the following situations:

- 1.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Cyramza Prior Authorization Policy

- Cyramza® (ramucirumab intravenous infusion – Eli Lilly)

REVIEW DATE: 06/12/2024

OVERVIEW

Cyramza, a human vascular endothelial growth factor receptor 2 (VEGFR2) antagonist, is indicated for the following:¹

- **Colorectal cancer**, metastatic, in combination with FOLFIRI (irinotecan, leucovorin, and 5-fluorouracil [5-FU]) for patients with disease progression on or after prior therapy with bevacizumab, oxaliplatin, and a fluoropyrimidine.
- **Gastric or gastroesophageal junction adenocarcinoma**, as a single agent or in combination with paclitaxel for patients with advanced or metastatic disease with disease progression on or after prior fluoropyrimidine- or platinum-containing chemotherapy.
- **Hepatocellular carcinoma**, as a single agent in patients who have an alpha fetoprotein of ≥ 400 ng/mL and have been treated with Nexavar® (sorafenib tablets).
- **Non-small cell lung cancer (NSCLC)**, metastatic, in combination with docetaxel for patients with disease progression on or after platinum-based chemotherapy. Patients with epidermal growth factor receptor (*EGFR*) or anaplastic lymphoma kinase (*ALK*) genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving Cyramza.
- **NSCLC**, metastatic, in combination with erlotinib for the first-line treatment of NSCLC with *EGFR* exon 19 deletions or exon 21 (L858R) mutations.

Guidelines

Cyramza is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **Colon Cancer** (version 3.2024 – May 24, 2024) and **rectal cancer** (version 2.2024 – April 30, 2024): Guidelines recommend Cyramza as primary therapy and subsequent therapy for patients with unresectable advanced or metastatic disease, and as adjuvant treatment for unresectable metachronous metastases that converted to resectable disease after primary treatment, in combination with either irinotecan or FOLFIRI.²⁻⁴
- **Gastric Cancer** (version 2.2024 – May 29, 2024) and **Esophageal and Esophagogastric Junction Cancers** (version 3.2024 – April 26, 2024): Guidelines recommend Cyramza as palliative treatment for patients who are not surgical candidates or have unresectable locally advanced, recurrent, or metastatic disease.⁴⁻⁶
- **Hepatocellular Carcinoma**: Guidelines (version 1.2024 – April 9, 2024) recommend Cyramza as a single agent for the treatment of progressive disease with an alpha fetoprotein ≥ 400 ng/mL.^{4,8}
- **NSCLC**: Guidelines (version 5.2024 – April 23, 2024) recommend Cyramza as subsequent therapy in combination with docetaxel for recurrent, advanced, or metastatic disease for patients who have not previously received docetaxel either following progression on initial cytotoxic therapy or for further progression on a systemic immune checkpoint inhibitor or other systemic therapy.^{4,7} Cyramza is also recommended in combination with erlotinib for patients with *EGFR* exon 19 deletion or exon 21 L858R mutation positive, recurrent, advanced, or metastatic disease as first-line therapy or as continuation therapy following disease progression on Cyramza and erlotinib.

06/12/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Mesothelioma – Pleural:** Guidelines (version 1.2024 – November 21, 2023) recommend Cyramza as subsequent therapy in combination with gemcitabine for pleural mesothelioma, pericardial mesothelioma, and tunica vaginalis testis mesothelioma.^{4,9}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cyramza. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Cyramza as well as the monitoring required for adverse events and long-term efficacy, approval requires Cyramza to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cyramza is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 14. Colon, Rectal, or Appendiceal Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced or metastatic disease; AND
 - C) Patient has received BOTH of the following (i and ii):
 - i. Oxaliplatin; AND
 - ii. Fluoropyrimidine (e.g., 5-fluorouracil [5-FU], capecitabine); AND
 - D) Cyramza will be used in combination with ONE of the following (i or ii):
 - i. Irinotecan; OR
 - ii. FOLFIRI (irinotecan, folinic acid [leucovorin], and 5-fluorouracil [5-FU]); AND
 - E) Cyramza is prescribed by or in consultation with an oncologist.
- 15. Gastric, Esophagogastric Junction, or Esophageal Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following criteria (i, ii, or iii):
 - i. Cyramza will be used alone; OR
 - ii. Cyramza will be used in combination with paclitaxel; OR
 - iii. Cyramza will be used in combination with irinotecan; AND
 - C) Patient has received chemotherapy with at least ONE of the following (i or ii):
 - i. 5-Fluorouracil (5-FU) or capecitabine; OR
 - ii. Cisplatin, carboplatin, or oxaliplatin; AND
 - D) Cyramza is prescribed by or in consultation with an oncologist.
- 16. Hepatocellular Carcinoma.** Approve for 1 year if the patient meets ALL of the following criteria (A, B, C, D and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Cyramza will be used as subsequent therapy; AND
 - C) Cyramza will be used as a single agent; AND
 - D) Patient has an alpha fetoprotein of ≥ 400 ng/mL; AND

06/12/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

E) Cytarabine is prescribed by or in consultation with an oncologist.

17. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following criteria (i or ii):

i. Cytarabine will be used as first-line or continuation therapy and the patient meets BOTH of the following (a and b):

a) Patient has epidermal growth factor receptor (EGFR) exon 19 deletion or exon 21 L858R mutation positive disease; AND

b) Cytarabine will be used in combination with erlotinib; OR

ii. Cytarabine will be used as subsequent therapy and the patient meets BOTH of the following (a and b):

a) Cytarabine will be used in combination with docetaxel intravenous infusion; AND

b) Patient has received targeted drug therapy if the patient's tumor is positive for a targetable mutation; AND

Note: Examples of targetable mutations include sensitizing epidermal growth factor receptor mutation, anaplastic lymphoma kinase fusions.

C) Cytarabine is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

5. Mesothelioma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

A) Patient is ≥ 18 years of age; AND

B) Patient has ONE of the following (i, ii, or iii):

i. Pleural mesothelioma; OR

ii. Pericardial mesothelioma; OR

iii. Tunica vaginalis testis mesothelioma; AND

C) Medication is used as subsequent therapy; AND

D) Medication is used in combination with gemcitabine; AND

E) Medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cytarabine is not recommended in the following situations:

32. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Danyelza Prior Authorization Policy

- Danyelza® (naxitamab-ggqk intravenous infusion – Y-mAbs Therapeutics)

REVIEW DATE: 01/10/2024

OVERVIEW

Danyelza, a glycolipid disialoganglioside (GD2)-binding monoclonal antibody, is indicated in combination with granulocyte-macrophage colony-stimulating factor (GM-CSF), for the treatment of relapsed or refractory high-risk **neuroblastoma** in the bone or bone marrow in patients ≥ 1 year of age who have demonstrated a partial response, minor response, or stable disease to prior therapy.¹ This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

Disease Overview

Neuroblastoma is a rare cancer; however, it is the most common extracranial solid tumor of childhood.² Neuroblastoma originates from primordial neural crest cells³ that develop into sympathetic neural ganglia and adrenal medulla.² There are approximately 700 cases diagnosed each year in the US,⁴ and around 90% of cases are diagnosed in patients < 5 years of age.⁵ Patients most commonly present with an abdominal mass,^{4,5} most often arising from the adrenal gland.² The mass may be asymptomatic or associated with abdominal pain, hypertension, distension, and constipation. Other tumors may also initiate in the neck, chest, and pelvis.⁴ In 10% to 15% of patients, the tumor extends to the epidural or intradural space and may result in spinal cord compression and paraplegia.² Patients may also present with proptosis and periorbital ecchymosis, bone pain, pancytopenia, watery diarrhea, presence of Horner syndrome, and subcutaneous skin nodules.⁵

Guidelines

The National Comprehensive Cancer Network has not addressed Danyelza.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Danyelza. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Danyelza as well as the monitoring required for adverse events and long-term efficacy, approval requires Danyelza to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Danyelza is recommended in those who meet the following criteria:

FDA-Approved Indication

01/10/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

6. **Neuroblastoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 1 year of age; AND
 - B) Danyelza is used as subsequent therapy; AND
 - C) Danyelza is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Danyelza is not recommended in the following situations:

33. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Darzalex Faspro Prior Authorization Policy

- Darzalex Faspro® (daratumumab and hyaluronidase-fihj subcutaneous injection – Janssen)

REVIEW DATE: 06/26/2024

OVERVIEW

Darzalex Faspro, a CD38-directed antibody, is approved for use in adults in the following situations:¹

- **Light chain amyloidosis**, in newly diagnosed patients, in combination with bortezomib, cyclophosphamide, and dexamethasone. It is a limitation of use that Darzalex Faspro is not indicated and is not recommended in patients with New York Heart Association Class IIIB or Class IV cardiac disease or Mayo Stage IIIB outside of clinical trials.
- **Multiple myeloma:**
 - in newly diagnosed patients, in combination with lenalidomide and dexamethasone, for the treatment of patients who are ineligible for autologous stem cell transplant and in relapsed/refractory disease, in combination with lenalidomide and dexamethasone in patients who have received at least one prior therapy.
 - in newly diagnosed patients, in combination with bortezomib, melphalan, and prednisone in those ineligible for autologous stem cell transplant.
 - in newly diagnosed patients, in combination with bortezomib, Thalomid (thalidomide capsules), and dexamethasone, for treatment of patients who are eligible for autologous stem cell transplant.
 - in patients who have received at least one prior therapy, in combination with bortezomib and dexamethasone.
 - in patients who have received at least one prior therapy (including lenalidomide and a proteasome inhibitor), in combination with Pomalyst (pomalidomide capsules) and dexamethasone.
 - in patients who have received at least three prior lines of therapy (including a proteasome inhibitor and an immunomodulatory agent or who are double-refractory to a proteasome inhibitor and an immunomodulatory agent), as monotherapy.
 - in relapsed/refractory disease, in combination with Kyprolis (carfilzomib intravenous infusion) and dexamethasone in patients who have received one to three prior lines of therapy.

Darzalex Faspro is a fixed combination of daratumumab and hyaluronidase (recombinant human). It contains the identical molecular antibody of daratumumab available in Darzalex intravenous, but hyaluronidase has been added to facilitate systemic delivery. Darzalex Faspro should be administered under the care of a healthcare provider as a 3 to 5 minute subcutaneous injection. The dose of Darzalex Faspro is fixed regardless of the patient's body surface area; dose reductions are not recommended. Safety and efficacy is not established in patients < 18 years of age.

Guidelines

Darzalex Faspro is addressed in guidelines from the National Comprehensive Cancer Network (NCCN).

- **Systemic Light Chain Amyloidosis:** The NCCN guidelines (version 2.2024 – December 12, 2023) specifically recommended Darzalex Faspro/bortezomib/cyclophosphamide/dexamethasone as a first-line preferred therapy (category 1) for systemic light chain amyloidosis. Dose-modified Darzalex Faspro in combination with other agents and single-agent daratumumab (either Faspro or

06/26/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

intravenous) are also “Preferred Regimens” (category 2A) for primary therapy. Darzalex Faspro or Darzalex intravenous as monotherapy are among the alternatives for previously treated disease (category 2A).⁴

- **Multiple Myeloma:** The NCCN guidelines (version 4.2024 – April 26, 2024) include Darzalex Faspro in the recommendations for all of the daratumumab-containing regimens.³ NCCN does recommend Darzalex intravenous or Faspro in multiple regimens both as primary treatment and in previously treated disease. Darzalex/bortezomib/dexamethasone in combination with lenalidomide, Thalomid, or cyclophosphamide and Darzalex/Kyprolis/lenalidomide/dexamethasone are among the regimens recommended as primary therapy for transplant candidates. Darzalex intravenous or Faspro as monotherapy is recommended (category 2A) under “other recommended regimens” as maintenance therapy for transplant candidates. For patients who are non-transplant candidates, Darzalex/lenalidomide/prednisone is a preferred regimen, and Darzalex/bortezomib/melphalan/prednisone and Darzalex/cyclophosphamide/bortezomib/dexamethasone are other recommended regimens for primary treatment. For previously treated multiple myeloma, there are multiple Darzalex-containing regimens in the guidelines, including Darzalex/dexamethasone plus bortezomib, Kyprolis, or lenalidomide (preferred regimens). Darzalex/Pomalyst/dexamethasone is a preferred regimen after two prior therapies, including lenalidomide and a proteasome inhibitor. Darzalex/cyclophosphamide/bortezomib/dexamethasone is an “other recommended regimen”, and Darzalex monotherapy (in patients who have received at least three prior therapies) and Xpovio[®] (selinexor tablets)/Darzalex/dexamethasone are listed as useful in certain circumstances.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Darzalex Faspro. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Darzalex Faspro as well as the monitoring required for adverse events and long-term efficacy, approval requires Darzalex Faspro to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Darzalex Faspro is recommended in those who meet the following criteria:

FDA-Approved Indications

- 18. Systemic Light Chain Amyloidosis.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - a. Patient is ≥ 18 years of age; AND
 - b. Patient does NOT have severe heart failure, according to the prescriber; AND

Note: Severe heart failure is defined as New York Heart Association Class IIIB or IV cardiac disease or Mayo Stage IIIB.

 - c. The medication is prescribed by or in consultation with an oncologist or a hematologist.

- 19. Multiple Myeloma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 24. Patient is ≥ 18 years of age; AND

06/26/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

25. Patient meets ONE of the following (i or ii):
- A) The medication is used in combination with at least two other therapies; OR
- Note: Examples of medications that may be used in combination with Darzalex Faspro include dexamethasone or prednisone, lenalidomide capsules, Pomalyst (pomalidomide capsules), Thalomid (thalidomide capsules), melphalen, bortezomib, or Kyprolis (carfilzomib intravenous infusion).
- B) Patient meets ONE of the following (a or b):
- a) Patient has tried at least three different regimens for multiple myeloma; OR
- Note: Examples of agents used in other regimens include bortezomib injection, Kyprolis (carfilzomib injection), lenalidomide capsules, cyclophosphamide, Ninlaro (ixazomib capsules).
- b) The medication is used as maintenance therapy in transplant candidates; AND
26. The medication is prescribed by or in consultation with an oncologist or a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Darzalex Faspro is not recommended in the following situations:

34. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Darzalex Intravenous Prior Authorization Policy

- Darzalex™ (daratumumab intravenous infusion – Janssen Biotech)

REVIEW DATE: 04/24/2024

OVERVIEW

Darzalex, a CD38-directed cytolytic antibody, is indicated for treatment of **multiple myeloma** in the following situations:¹

- in newly diagnosed patients, in combination with lenalidomide and dexamethasone, for the treatment of patients who are ineligible for autologous stem cell transplant and in relapsed/refractory disease, in combination with lenalidomide and dexamethasone in patients who have received at least one prior therapy.
- in newly diagnosed patients, in combination with bortezomib, melphalan, and prednisone in those ineligible for autologous stem cell transplant.
- in newly diagnosed patients, in combination with bortezomib, Thalomid® (thalidomide capsules), and dexamethasone, for treatment of patients who are eligible for autologous stem cell transplant.
- in patients who have received at least one prior therapy, in combination with bortezomib and dexamethasone.
- in patients who have received at least two prior therapies (including lenalidomide and a proteasome inhibitor), in combination with Pomalyst® (pomalidomide capsules) and dexamethasone.
- in patients who have received at least three prior lines of therapy (including a proteasome inhibitor and an immunomodulatory agent or who are double-refractory to a proteasome inhibitor and an immunomodulatory agent), as monotherapy.
- in relapsed/refractory disease, in combination with Kyprolis® (carfilzomib intravenous infusion) and dexamethasone in patients who have received one to three prior lines of therapy.

Guidelines

Darzalex Intravenous is discussed in guidelines from the National Comprehensive Cancer Network (NCCN).

- **Multiple Myeloma:** NCCN guidelines (version 3.2024 – March 8, 2024) recommend Darzalex in treatment regimens for primary therapy.²⁻³ Darzalex/lenalidomide/bortezomib/dexamethasone, Darzalex/bortezomib/Thalomid/dexamethasone, Darzalex/Kyprolis/lenalidomide/dexamethasone, and Darzalex/cyclophosphamide/bortezomib/dexamethasone are among the recommended regimens for primary therapy for transplant candidates. For patients who are non-transplant candidates, Darzalex with: lenalidomide/dexamethasone (preferred; category 1), and bortezomib/melphalan/prednisone, (category 1) and cyclophosphamide/bortezomib/dexamethasone are among the regimens for primary treatment. All other recommendations are category 2A. For previously treated multiple myeloma (one to three prior therapies), Darzalex/dexamethasone plus bortezomib (category 1), lenalidomide (category 1), Pomalyst, or Kyprolis (category 1) are among the Preferred regimens, whereas other Darzalex-containing regimens are listed as other or useful in certain circumstances. Darzalex ± lenalidomide has been added under “Useful in Certain Circumstances” for maintenance therapy in transplant candidates.
- **Pediatric Acute Lymphoblastic Leukemia:** NCCN guidelines (version 5.2024 – April 3, 2024) recommend Darzalex-containing regimen as one of the “Other Recommended Regimens” for relapsed/refractory disease (category 2A).⁶

04/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Systemic Light Chain Amyloidosis:** The NCCN guidelines (version 2.2024 – December 12, 2023) list Darzalex Intravenous as a therapy for previously treated disease, or for newly diagnosed disease (both category 2A).⁴ In both settings Darzalex is recommended as a single agent. Of note, Darzalex Faspro is indicated and is specifically recommended as a preferred first-line therapy for systemic light chain amyloidosis, given in combination with cyclophosphamide and dexamethasone.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Darzalex. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Darzalex as well as the monitoring required for adverse events and long-term efficacy, approval requires Darzalex to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Darzalex Intravenous is recommended in those who meet one of the following criteria:

FDA-Approved Indication

20. **Multiple Myeloma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 27. Patient is ≥ 18 years of age; AND
 28. Patient meets ONE of the following (i or ii):
 - A) Darzalex is used in combination with at least two other therapies; OR

Note: Examples of therapies that may be used in combination with Darzalex include dexamethasone or prednisone, lenalidomide, Pomalyst (pomalidomide capsules), Thalomid (thalidomide capsules), melphalan, bortezomib, or Kyprolis (carfilzomib intravenous infusion).
 - B) Patient meets ONE of the following (a or b):
 - a) Patient has tried at least three different regimens for multiple myeloma; OR

Note: Examples of agents used in other regimens include bortezomib, Kyprolis, lenalidomide, cyclophosphamide, Ninlaro (ixazomib capsules).
 - b) Darzalex is used as maintenance therapy in a transplant candidate; AND
 29. The medication is prescribed by or in consultation with an oncologist or a hematologist.

Other Uses with Supportive Evidence

21. **Pediatric Acute Lymphoblastic Leukemia.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) Patient is ≤ 18 years of age; AND
 - B) Patient has relapsed or refractory disease; AND
 - C) The medication is prescribed by or in consultation with an oncologist.

- 22. Systemic Light Chain Amyloidosis.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient meets ONE of the following (i or ii):
- A)** The medication will be used as a single agent for newly diagnosed disease; OR
 - B)** The medication will be used as a single agent for relapsed/refractory disease; AND
 - C)** The medication is prescribed by or in consultation with an oncologist or a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Darzalex Intravenous is not recommended in the following situations:

- 35.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Decitabine Products Prior Authorization Policy

- Dacogen® (decitabine intravenous infusion – Otsuka, generic)

REVIEW DATE: 12/11/2024

OVERVIEW

Decitabine (Dacogen), a hypomethylating agent, is indicated for the treatment of **myelodysplastic syndromes** (MDS) in adults including previously treated and untreated, *de novo* and secondary MDS of all French-American-British subtypes (refractory anemia, refractory anemia with ringed sideroblasts, refractory anemia with excess blasts, refractory anemia with excess blasts in transformation, and chronic myelomonocytic leukemia) and intermediate-1, intermediate-2, and high-risk International Prognostic Scoring System groups.¹

Guidelines

Decitabine is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **Acute Myeloid Leukemia:** Guidelines (version 3.2024 – May 17, 2024) recommend decitabine as a single agent, or in combination with Nexavar® (sorafenib tablet) or Venclexta® (venetoclax tablet) for lower intensity therapy, consolidation therapy, and for the treatment of relapsed/refractory disease.^{2,4} Decitabine in combination with Venclexta is also recommended for intensive induction therapy. In addition, decitabine is recommended in combination with Venclexta for relapsed/refractory blastic plasmacytoid dendritic cell neoplasm or as palliative treatment.
- **Myelodysplastic Syndromes:** Guidelines (version 1.2025 – November 15, 2024) recommend decitabine for the treatment of lower risk and higher risk MDS, and for the treatment of myelodysplastic/myeloproliferative neoplasms.^{2,3}
- **Myeloproliferative Neoplasms:** Guidelines (version 2.2024 – August 8, 2024) recommend decitabine for the treatment of myeloproliferative neoplasms (MPN)-accelerated phase or MPN-blast/acute myeloid leukemia phase.^{2,5}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of decitabine. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with decitabine as well as the monitoring required for adverse events and long-term efficacy, approval requires decitabine to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of decitabine is recommended in those who meet one of the following criteria:

FDA-Approved Indication

12/11/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

7. **Myelodysplastic Syndromes.** Approve for 1 year if the patient meets BOTH of the following (A and B):

Note: Examples include refractory anemia, refractory anemia with ringed sideroblasts, refractory anemia with excess blasts, refractory anemia with excess blasts in transformation, and chronic myelomonocytic leukemia.

- A) Patient is ≥ 18 years of age; AND
B) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

8. **Acute Myeloid Leukemia.** Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
B) The medication is prescribed by or in consultation with an oncologist.

9. **Blastic Plasmacytoid Dendritic Cell Neoplasm.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
B) Patient meets ONE of the following (i or ii):
i. Patient has relapsed or refractory disease; OR
ii. Decitabine is used for palliative treatment; AND
C) Decitabine is used in combination with Venclexta (venetoclax tablets); AND
D) The medication is prescribed by or in consultation with an oncologist.

10. **Myeloproliferative Neoplasms.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
B) Patient meets ONE of the following (i or ii):
i. Patient has accelerated phase; OR
ii. Patient has blast/acute myeloid leukemia phase; AND
C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of decitabine is not recommended in the following situations:

36. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Elahere Prior Authorization Policy

- Elahere® (mirvetuximab soravtansine-gynx intravenous infusion – ImmunoGen)

REVIEW DATE: 06/05/2024

OVERVIEW

Elahere, a folate receptor alpha (FR α)-directed antibody and microtubule inhibitor conjugate, is indicated for the treatment of FR α positive, platinum-resistant epithelial ovarian, fallopian tube, or primary peritoneal cancer, in adults who have received one to three prior systemic treatment regimens.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) ovarian cancer (including fallopian tube cancer and primary peritoneal cancer) clinical practice guidelines (version 2.2024 – May 13, 2024) recommend a variety of treatment options as recurrence therapy for platinum-resistant disease.² Single-agent Elahere is listed as a “preferred” targeted therapy for FR α -expressing tumors ($\geq 75\%$ positive tumor cells) (category 1) for platinum-resistant disease. Other preferred agents include cytotoxic chemotherapy (e.g., oral cyclophosphamide + bevacizumab, docetaxel, etoposide, gemcitabine, or liposomal doxorubicin) [category 2A] and targeted therapy with single-agent bevacizumab (category 2A). Elahere + bevacizumab is listed under “useful in certain circumstances” for FR α -expressing tumors (category 2A for platinum-resistant disease and category 2B for platinum-sensitive disease).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Elahere. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Elahere as well as the monitoring required for adverse events and long-term efficacy, approval requires Elahere to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Elahere is recommended in those who meet the following criteria:

FDA-Approved Indication

- 1. Ovarian, Fallopian Tube, or Primary Peritoneal Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A)** Patient is ≥ 18 years of age; **AND**
 - B)** Patient has folate receptor alpha positive disease and meets ONE of the following (i or ii):
 - i.** Patient has $\geq 75\%$ folate receptor alpha positive tumor cells; **OR**
 - ii.** Patient is using this medication in combination with bevacizumab; **AND**
 - C)** Patient has platinum-resistant disease; **AND**
 - D)** The medication will be prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Elrexio Prior Authorization Policy

- Elrexio™ (elranatamab-bcmm subcutaneous injection – Pfizer)

REVIEW DATE: 09/11/2024

OVERVIEW

Elrexio, a bispecific B-cell maturation antigen (BCMA)-directed CD3 T-cell engager, is indicated for the treatment of relapsed or refractory **multiple myeloma** in adults who have received at least four prior lines of therapy including a proteasome inhibitor, an immunomodulatory agent, and an anti-CD38 monoclonal antibody.¹

Guidelines

The National Comprehensive Cancer Network clinical practice guidelines for multiple myeloma (version 4.2024 – April 26, 2024) recommend Elrexio as a “Preferred Regimen” for the treatment of relapsed or refractory multiple myeloma in patients who have received at least four prior lines of therapy including an anti-CD38 monoclonal antibody, a proteasome inhibitor, and an immunomodulatory agent (category 2A).^{2,3}

Safety

Elrexio has a Boxed Warning for cytokine release syndrome (CRS) and neurologic toxicity including immune effector cell-associated neurotoxicity syndrome (ICANS).¹ In addition, Elrexio was approved with a Risk Evaluation and Mitigation Strategy (REMS) program due to the risk of CRS and neurologic toxicity, including ICANS.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Elrexio. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Elrexio as well as the monitoring required for adverse events and long-term efficacy, approval requires Elrexio to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Elrexio is recommended in those who meet the following criteria:

FDA-Approved Indication

11. Multiple Myeloma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has tried at least four systemic regimens; AND
- C) Among the previous regimens tried, the patient has received at least one drug from each of the following classes (i, ii, and iii):
 - i. Proteasome inhibitor; AND

09/11/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Note: Examples include bortezomib, Kyprolis (carfilzomib intravenous infusion), and Ninlaro (ixazomib capsules).

ii. Immunomodulatory drug; AND

Note: Examples include lenalidomide, Pomalyst (pomalidomide capsules), and Thalomid (thalidomide capsules).

iii. Anti-CD38 monoclonal antibody; AND

Note: Examples include Darzalex (daratumumab intravenous infusion), Darzalex Faspro (daratumumab and hyaluronidase-fihj subcutaneous injection), and Sarclisa (isatuximab-irfc intravenous infusion).

D) The medication will be prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Elrexfio is not recommended in the following situations:

37. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Elzonris Prior Authorization Policy

- Elzonris™ (tagraxofusp-erzs intravenous infusion – Stemline)

REVIEW DATE: 01/10/2024

OVERVIEW

Elzonris is indicated for the treatment of blastic plasmacytoid dendritic cell neoplasm in patients ≥ 2 years of age.¹

Elzonris is a CD-123 directed cytotoxin, consisting of recombinant human interleukin-3 (IL-3) fused with truncated diphtheria toxin and is produced by recombinant DNA technology in *Escherichia coli* cells.¹ Elzonris inhibits protein synthesis and causes cell death in cells expressing CD-123.

Guidelines

The National Comprehensive Cancer Network clinical practice guidelines for **Acute Myeloid Leukemia** (version 6.2023 – October 24, 2023) recommend Elzonris as a single agent for the treatment of blastic plasmacytoid dendritic cell neoplasm.^{2,3}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Elzonris. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Elzonris as well as the monitoring required for adverse events and long-term efficacy, approval requires Elzonris to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Elzonris is recommended in those who meet the following criteria:

FDA-Approved Indication

12. Blastic Plasmacytoid Dendritic Cell Neoplasm. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 2 years of age; AND
- B) Elzonris is prescribed by or consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Elzonris is not recommended in the following situations:

38. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Empliciti Prior Authorization Policy

- Empliciti® (elotuzumab intravenous infusion – Bristol-Myers Squibb)

REVIEW DATE: 04/24/2024

OVERVIEW

Empliciti, a SLAMF7 (signaling lymphocytic activation molecule family member 7)-directed immunostimulatory antibody, is indicated in **multiple myeloma**, in the following situations:¹

- in patients who have received one to three prior therapies, in combination with lenalidomide and dexamethasone.
- in patients who have received at least two prior therapies (including lenalidomide and a proteasome inhibitor), in combination with Pomalyst® (pomalidomide capsules) and dexamethasone.

Guidelines

The National Comprehensive Cancer Network (NCCN) Multiple Myeloma clinical practice guidelines (version 3.2024 – March 8, 2024) recommend Empliciti in treatment regimens for patients who were previously treated for multiple myeloma.³ In this population, Empliciti/Pomalyst/dexamethasone is recommended for lenalidomide-refractory patients as a “Preferred” regimen (category 2A). Empliciti/lenalidomide/dexamethasone and Empliciti/bortezomib/dexamethasone are listed under “Other Recommended Regimens” (category 1).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Empliciti. Because of the specialized skills required for evaluation and diagnosis of patients treated with Empliciti as well as the monitoring required for adverse events and long-term efficacy, approval requires Empliciti to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Empliciti is recommended in those who meet the following criteria:

FDA-Approved Indication

- 23. Multiple Myeloma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- 30.** Patient is ≥ 18 years of age; AND
- 31.** Patient has tried at least one other regimen for multiple myeloma; AND
- Note: Examples of agents used in other regimens include bortezomib, lenalidomide, cyclophosphamide, Darzalex (daratumumab intravenous infusion).
- 32.** Empliciti is used in combination with at least one other agent; AND
- Note: Examples of agents that may be used in combination with Empliciti include lenalidomide, bortezomib, and Pomalyst (pomalidomide capsules).

04/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

33. Empliciti is prescribed by or in consultation with an oncologist or a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Empliciti is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Enhertu Prior Authorization Policy

- Enhertu® (fam-trastuzumab deruxtecan-nxki intravenous infusion – Daiichi Sankyo and AstraZeneca)

REVIEW DATE: 02/28/2024; selected revision 06/05/2024, 12/04/2024

OVERVIEW

Enhertu is a human epidermal growth factor receptor 2 (HER2)-directed antibody and topoisomerase inhibitor conjugate indicated for the following uses:¹

- **Breast cancer:**
 - Treatment of unresectable or metastatic **HER2-positive disease** (immunohistochemistry [IHC] 3+ or in situ hybridization [ISH] positive) in adults who have received a prior anti-HER2-based regimen either in the metastatic setting or in the neoadjuvant or adjuvant setting and have developed disease recurrence during or within six months of completing therapy.
 - Treatment of unresectable or metastatic **HER2-low** (IHC 1+ or IHC 2+/ ISH negative) breast cancer, as determined by an FDA approved test, in adults who have received prior chemotherapy in the metastatic setting or developed disease recurrence during or within 6 months of completing adjuvant chemotherapy.
- **Gastric or gastroesophageal junction adenocarcinoma**, treatment of locally advanced or metastatic HER2-positive disease (IHC 3+ or IHC 2+/ISH positive), in adults who have received a prior trastuzumab-based regimen.
- **Non-small cell lung cancer**, treatment of unresectable or metastatic disease in adults whose tumors have an activating HER2 (erb-b2 receptor tyrosine kinase 2 [*ERBB2*]) mutation, as detected by an FDA-approved test, and who have received a prior systemic therapy.
- **Solid tumors**, treatment of unresectable or metastatic HER2-positive (IHC 3+) solid tumors in adults who have received prior systemic treatment and have no satisfactory alternative treatment options.

Enhertu cannot be substituted for or with trastuzumab or Kadcyra® (ado-trastuzumab emtansine intravenous infusion).

Guidelines

Enhertu is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Breast Cancer:** NCCN guidelines (version 6.2024 – November 11, 2024) recommend Enhertu as a “Preferred” second-line therapy regimen for the treatment of recurrent, unresectable (local or regional), or Stage IV metastatic disease that is HER2-positive (category 1).^{2,3} The guidelines note that Enhertu may be considered in the first-line setting as an option for select patients (i.e., those with rapid progression within 6 months of neoadjuvant or adjuvant therapy [12 months for Perjeta® {pertuzumab intravenous infusion}-containing regimens]) [category 2A]. The guidelines recommend Enhertu as a “Preferred” single-agent for recurrent unresectable (local or regional) or stage IV HER2 IHC 1+, or 2+ and ISH negative disease that is HR negative or HR positive with visceral crisis or endocrine therapy refractory (category 1 as second-line; category 2A as later-line therapy). The NCCN compendium recommends Enhertu for brain metastases in patients with HER2 positive breast cancer.²
- **Esophageal and Esophagogastric Junction Cancers:** NCCN guidelines (version 4.2023 – January 26, 2024) recommend Enhertu as a “Preferred Regimen” for second-line or subsequent

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

therapy for unresectable locally advanced, recurrent, or metastatic disease (where local therapy is not indicated) for HER2 overexpression positive adenocarcinoma (category 2A).⁴

- **Gastric Cancer:** NCCN guidelines (version 3.2023 – January 26, 2024) recommend Enhertu as a “Preferred Regimen” for second-line or subsequent therapy for unresectable locally advanced, recurrent, or metastatic disease (where local therapy is not indicated) for HER2 overexpression positive adenocarcinoma (category 2A).⁷ Trastuzumab is recommended as a “Preferred Regimen” in addition to first-line chemotherapy (fluorouracil or capecitabine + oxaliplatin [category 2A] or cisplatin [category 1]) in HER2 overexpression positive adenocarcinoma.^{2,5}
- **Non-Small Cell Lung Cancer:** NCCN guidelines (version 2.2023 – February 17, 2023) support use of Enhertu as a “Preferred” single-agent subsequent therapy for *ERBB2* or HER2 mutation positive recurrent, advanced, or metastatic disease.^{2,6}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Enhertu. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Enhertu as well as the monitoring required for adverse events and long-term efficacy, approval requires Enhertu to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Enhertu is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Breast Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has recurrent or metastatic breast cancer; AND
 - C) Patient meets ONE of the following (i or ii):
 - i. Patient has human epidermal growth factor receptor 2 (HER2)-positive disease (immunohistochemistry [IHC] 3+ or in situ hybridization [ISH] positive); OR
 - ii. Patient has HER2-low disease as shown by HER2 IHC 1+, or IHC 2+ and ISH negative disease and meets ONE of the following (a or b):
 - a) Patient has hormone receptor (HR) positive disease with visceral crisis or is refractory to endocrine therapy; OR
Note: Visceral crisis is defined as severe organ dysfunction, as assessed by signs and symptoms, laboratory studies, and rapid disease progression.
 - b) Patient has HR negative disease; AND
 - D) Patient meets ONE of the following (i or ii):
 - i. Patient has tried at least one prior regimen in the metastatic setting; OR
 - ii. Patient has had disease recurrence during or within 6 months of completing neoadjuvant or adjuvant therapy (within 12 months for Perjeta [pertuzumab injection]-containing regimens) and the medication is used as first-line therapy; AND
 - E) The medication is prescribed by or in consultation with an oncologist.

2. **Gastric or Gastroesophageal Junction Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease (immunohistochemistry [IHC] 3+ or IHC 2+/in situ hybridization [ISH] positive); AND
 - C) Patient has received at least one prior trastuzumab-based regimen; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
3. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has unresectable or metastatic disease; AND
 - C) The disease has activating human epidermal growth factor receptor 2 (HER2) mutations; AND
 - D) Patient has tried at least one prior systemic therapy; AND
 - E) The medication is prescribed by or in consultation with an oncologist.
4. **Solid Tumors.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):
- Note: Examples include bladder cancer, biliary tract cancer, cervical cancer, colorectal cancer, endometrial cancer, ovarian cancer, pancreatic cancer, salivary gland tumors.
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has unresectable or metastatic disease; AND
 - C) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease (immunohistochemistry [IHC] 3+); AND
 - D) Patient has received prior systemic treatment; AND
 - E) According to the prescriber, there are no satisfactory alternative treatment options; AND
 - F) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Enhertu is not recommended in the following situations.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Epkinly Prior Authorization Policy

- Epkinly™ (epcoritamab-bysp subcutaneous injection – Genmab)

REVIEW DATE: 06/12/2024

OVERVIEW

Epkinly, a bispecific CD20-directed CD3 T-cell engager, is indicated for the treatment of relapsed or refractory **diffuse large B-cell lymphoma** (DLBCL), not otherwise specified, including DLBCL arising from indolent lymphoma, and high-grade B-cell lymphoma, in adults after two or more lines of systemic therapy.¹

Guidelines

Epkinly has been addressed by National Comprehensive Cancer Network. The **B-cell lymphoma** clinical practice guidelines (version 2.2024 – April 30, 2024) recommend Epkinly for the third-line and subsequent treatment of classic follicular lymphoma, DLBCL, histologic transformation of indolent lymphomas to DLBCL, high-grade B-cell lymphomas, human immunodeficiency virus (HIV)-related B-cell lymphomas, and post-transplant lymphoproliferative disorders.^{2,3}

Safety

Epkinly has Boxed Warnings for cytokine release syndrome and immune effector cell-associated neurotoxicity syndrome.¹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Epkinly. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Epkinly as well as the monitoring required for adverse events and long-term efficacy, approval requires Epkinly to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Epkinly is recommended in those who meet the following criteria:

FDA-Approved Indication

13. Diffuse Large B-Cell Lymphoma: Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

Note: Diffuse large B-cell lymphoma (DLBCL) includes DLBCL not otherwise specified, DLBCL arising from indolent lymphoma, and high-grade B-cell lymphoma.

A) Patient is ≥ 18 years of age; AND

B) Patient has received two or more lines of systemic therapy; AND

06/12/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Note: Examples of systemic therapy include RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone) and DHA (dexamethasone, cytarabine) + platinum (carboplatin, cisplatin, or oxaliplatin) ± rituximab.

- C) Medication is given as a single agent; AND
- D) Medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

14. Classic Follicular Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has received two or more lines of systemic therapy; AND

Note: Examples of systemic therapy include CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) plus rituximab or Gazyva (Obinutuzumab intravenous infusion) and CVP (cyclophosphamide, vincristine, prednisone) plus rituximab or Gazyva.

- C) Medication is given as a single agent; AND
- D) Medication is prescribed by or in consultation with an oncologist.

15. Human Immunodeficiency Virus (HIV)-Related B-Cell Lymphomas. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

Note: HIV-related B-cell lymphomas includes HIV-related diffuse large B-cell lymphoma (DLBCL), primary effusion lymphoma, and human herpes virus-8 (HHV8) positive DLBCL.

- A) Patient is ≥ 18 years of age; AND
- B) Patient has received two or more lines of systemic therapy; AND

Note: Examples of systemic therapy include RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone) and R-EPOCH (rituximab, etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin).

- C) Medication is given as a single agent; AND
- D) Medication is prescribed by or in consultation with an oncologist.

16. Post-Transplant Lymphoproliferative Disorders. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has received two or more lines of systemic therapy; AND

Note: Examples of systemic therapy include RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone) and RCEPP (rituximab, cyclophosphamide, etoposide, prednisone, procarbazine).

- C) Medication is given as a single agent; AND
- D) Medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Epkinly is not recommended in the following situations:

39. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Erbitux Prior Authorization Policy

- Erbitux® (cetuximab intravenous infusion – ImClone/Eli Lilly)

REVIEW DATE: 08/07/2024

OVERVIEW

Erbitux, an epidermal growth factor receptor (EGFR) chimeric monoclonal antibody, is indicated for the following uses:¹

- **Colorectal cancer (CRC)**, *KRAS* wild-type, EGFR-expressing, metastatic CRC as determined by an FDA-approved test for the following uses:
 - In combination with FOLFIRI (irinotecan, 5-fluorouracil [5-FU], leucovorin) for first-line treatment.
 - In combination with irinotecan in patients who are refractory to irinotecan-based chemotherapy.
 - As a single agent in patients who have failed oxaliplatin- and irinotecan-based chemotherapy or who are intolerant to irinotecan.

Limitation of use: Erbitux is not indicated for treatment of *RAS*-mutant CRC or when the results of the *RAS* mutation tests are unknown.

- **CRC**, metastatic, *BRAF V600E* mutation-positive, as detected by an FDA-approved test, in combination with Braftovi® (encorafenib capsules) for adults after prior therapy.
- **Squamous Cell Carcinoma of the Head and Neck:**
 - In combination with radiation therapy for the initial treatment of locally or regionally advanced disease.
 - In combination with platinum-based therapy with 5-FU for the first-line treatment of patients with recurrent locoregional or metastatic disease.
 - As a single agent in patients with recurrent or metastatic disease for whom prior platinum-based therapy has failed.

Guidelines

Erbitux is addressed in a number of National Comprehensive Cancer Network (NCCN) guidelines:

- **Colon and Rectal Cancer:** Guidelines for colon cancer (version 4.2024 – July 3, 2024) recommend Erbitux as primary therapy for unresectable, advanced, or metastatic *KRAS/NRAS/BRAF* wild-type gene and left-sided tumors only, in combination with irinotecan, FOLFOX (5-FU, leucovorin, oxaliplatin), FOLFIRI, or CapeOX (capecitabine and oxaliplatin) regimens in patients who can tolerate intensive therapy or as a single agent in patients who cannot tolerate intensive therapy.^{2,6} Reference to left-sided only disease refers to a primary tumor that originated in the left side of the colon. For the initial treatment of unresectable metachronous metastases, NCCN recommends Erbitux in combination with irinotecan or FOLFIRI for *KRAS/NRAS/BRAF* wild-type; in combination with Braftovi for *BRAF V600E* mutation positive disease; or in combination with Lumakras (sotorasib tablets) or Krazati (adagrasib tablets) for *KRAS G12C* mutation positive tumors. Therapies recommended after first progression vary depending on the initial treatment regimen (i.e., 5-FU/leucovorin-based or capecitabine-based therapy) that was used. The NCCN guidelines recommend Erbitux, in combination with irinotecan, FOLFOX, CapeOX, or FOLFIRI for the subsequent treatment of *KRAS/NRAS/BRAF* wild-type tumors; in combination with Braftovi for the subsequent treatment of *BRAF V600E* positive disease; or in combination with Lumakras or Krazati for *KRAS G12C* positive tumors. The NCCN

08/07/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

rectal cancer guidelines (version 3.2023 – May 26, 2023) make the same recommendations for Erbitux for the treatment of rectal cancer.^{3,6}

- **Head and Neck Cancer:** Guidelines (version 4.2024 – May 15, 2023) recommend Erbitux in combination with radiation therapy, with a platinum agent (cisplatin or carboplatin) with or without 5-FU, with a platinum agent plus either docetaxel or paclitaxel, with paclitaxel, with Keytruda® (pembrolizumab intravenous infusion) or Opdivo® (nivolumab intravenous infusion), or as a single agent.^{4,6}
- **Non-Small Cell Lung Cancer:** Guidelines (version 7.2024 – June 26, 2024) recommend Erbitux in combination with Gilotrif® (afatinib tablets) as subsequent therapy for recurrent, advanced, or metastatic disease in patients with a known sensitizing *EGFR* mutation who have progressed on *EGFR* tyrosine kinase inhibitor (TKI) therapy, and have multiple symptomatic systemic lesions; or with a known sensitizing *EGFR* mutation who have progressed on *EGFR* TKI therapy and have asymptomatic disease, symptomatic brain lesions, or isolated symptomatic lesions.^{5,6}
- **Penile Cancer:** Guidelines (version 1.2024 – October 25, 2023) recommend Erbitux as a single agent for the subsequent treatment of patients with recurrent or metastatic disease.^{6,7}
- **Squamous Cell Skin Cancer:** Guidelines (version 1.2024 – November 9, 2024) recommend Erbitux in combination with radiation therapy for unresectable, inoperable, or incompletely resected regional disease, or metastatic disease; or as systemic therapy alone or in combination with carboplatin and paclitaxel in patients ineligible for or progressed on checkpoint inhibitors with unresectable, inoperable, or incompletely resected regional disease, or regional recurrence or distant metastases.^{6,8}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Erbitux. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Erbitux as well as the monitoring required for adverse events and long-term efficacy, approval requires Erbitux to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Erbitux is recommended in those who meet one of the following criteria:

FDA-Approved Indications

24. **Colon and Rectal Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
34. Patient is ≥ 18 years of age; AND
35. Patient meets ONE of the following (i, ii, or iii):
 - A) Patient has unresectable synchronous liver and/or lung metastases and meets ALL of the following (a, b, c, and d):
 - i. Metastases are *KRAS/NRAS/BRAF* wild-type; AND
Note: The metastases are *KRAS/NRAS/BRAF* mutation negative.
 - ii. The primary tumor originated on the left side of the colon; AND
Note: Primary tumor originated from the splenic flexure to the rectum.
 - iii. Medication is used for primary treatment; AND
 - iv. Medication is used in combination with FOLFOX or FOLFIRI; OR

08/07/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Note: FOLFOX includes 5-fluorouracil, leucovorin, and oxaliplatin and FOLFIRI includes fluorouracil, leucovorin, and irinotecan.

B) Patient has unresectable metachronous metastases and meets ONE of the following (a, b, or c):

i. Patient meets ALL of the following [(1), (2), and (3)]:

(1) Metastases are *KRAS/NRAS/BRAF* wild-type; AND

Note: The metastases are *KRAS/NRAS/BRAF* mutation negative.

(2) Medication is used for initial treatment; AND

(3) Medication is used in combination with irinotecan or FOLFIRI; OR

Note: FOLFIRI includes fluorouracil, leucovorin, and irinotecan.

ii. Patient meets ALL of the following [(1), (2), and (3)]:

(1) Metastases are *BRAF V600E* mutation positive; AND

(2) Medication is used for initial treatment; AND

(3) Medication is used in combination with Braftovi (encorafenib capsules); OR

iii. Patient meets ALL of the following [(1), (2), and (3)]:

(1) Metastases are *KRAS G12C* mutation positive; AND

(2) Medication is used for initial treatment; AND

(3) Medication is used in combination with Lumakras (sotorasib tablets) or Krazati (adagrasib tablets); OR

C) Patient has advanced or metastatic disease and meets ONE of the following (a, b, c, or d):

i. Patient meets ALL of the following [(1), (2), (3), and (4)]:

(1) Tumor or metastases are *KRAS/NRAS/BRAF* wild-type; AND

Note: The tumor or metastases are *KRAS/NRAS/BRAF* mutation negative.

(2) The primary tumor originated on the left side of the colon; AND

Note: Primary tumor originated from the splenic flexure to the rectum.

(3) Medication is used for initial treatment; AND

(4) Medication is used in combination with FOLFOX, CapeOX, or FOLFIRI; OR

Note: FOLFOX includes 5-fluorouracil; leucovorin, and oxaliplatin; CapeOX included capecitabine and oxaliplatin; and FOLFIRI includes 5-fluorouracil, leucovorin, and irinotecan.

ii. Patient meets ALL of the following [(1), (2), and (3)]:

(1) Tumor or metastases are *KRAS/NRAS/BRAF* wild-type; AND

Note: The tumor or metastases are *KRAS/NRAS/BRAF* mutation negative.

(2) Medication is used for subsequent treatment; AND

(3) Medication is used as a single agent or in combination with irinotecan, FOLFOX, CapeOX, or FOLFIRI; OR

Note: FOLFOX includes 5-fluorouracil; leucovorin, and oxaliplatin; CapeOX included capecitabine and oxaliplatin; and FOLFIRI includes 5-fluorouracil, leucovorin, and irinotecan.

iii. Patient meets ALL of the following [(1), (2), and (3)]:

(1) Tumor or metastases are *BRAF V600E* mutation-positive; AND

(2) Medication is used for subsequent treatment; AND

(3) Medication is used in combination with Braftovi; OR

iv. Patient meets ALL of the following [(1), (2), and (3)]:

(1) Tumor or metastases are *KRAS G12C* mutation positive; AND

(2) Medication is used for subsequent therapy; AND

(3) Medication is used in combination with Lumkras or Krazati; AND

C) Erbitux is prescribed by or in consultation with an oncologist.

25. Head and Neck Squamous Cell Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

08/07/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- B) Patient meets ONE of the following (i, ii, iii, iv, or v):
- iii. Erbitux will be used in combination with radiation therapy; OR
 - iv. Erbitux will be used in combination with platinum-based therapy; OR
Note: Examples of platinum chemotherapy include cisplatin and carboplatin.
 - v. Erbitux will be used in combination with paclitaxel or docetaxel; OR
 - vi. Erbitux will be used in combination with Keytruda (pembrolizumab intravenous infusion) or Opdivo (nivolumab intravenous infusion); OR
 - vii. Erbitux will be used as a single agent; AND
- C) Erbitux is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

26. Appendiceal Adenocarcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has advanced or metastatic disease and meets ONE of the following (i or ii):
- i. Patient meets ALL of the following (a, b, and c):
 - a) Tumor or metastases are *BRAF V600E* mutation-positive; AND
 - b) Medication is used for subsequent treatment; AND
 - c) Medication is used in combination with Braftovi (encorafenib capsules); OR
 - ii. Patient meets ALL of the following (a, b, and c):
 - a) Tumor or metastases are *KRAS G12C* mutation positive; AND
 - b) Medication is used for subsequent therapy; AND
 - c) Medication is used in combination with Lumakras (sotorasib tablets) or Krazati (adagrasib tablets); AND
- C) Erbitux is prescribed by or in consultation with an oncologist.

27. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has recurrent, advanced, or metastatic non-small cell lung cancer; AND
- C) Patient has a known sensitizing epidermal growth factor receptor (*EGFR*) mutation; AND
Note: Examples of *EGFR* mutations include *EGFR* exon 19 deletion, or exon 21 *L858R*, or *EGFR S768I*, *L861Q*, and/or *G719X* mutation positive.
- D) Patient has received at least ONE tyrosine kinase inhibitor; AND
Note: Examples of tyrosine kinase inhibitors include erlotinib tablets, Iressa (gefitinib tablets), or Gilotrif (afatinib tablets).
- E) Erbitux will be used in combination with Gilotrif (afatinib tablets); AND
- F) Erbitux is prescribed by or in consultation with an oncologist.

28. Penile Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has recurrent or metastatic disease; AND
- C) Erbitux will be used as subsequent therapy; AND
- D) Erbitux will be used as a single agent; AND
- E) Erbitux is prescribed by or in consultation with an oncologist.

29. Squamous Cell Skin Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND

- B)** Patient meets ONE of the following (i, ii, iii, or iv):
- i.** Patient has locally advanced, high-risk, or very high-risk disease; OR
 - ii.** Patient has unresectable, inoperable, or incompletely resected regional disease; OR
 - iii.** Patient has local or regional recurrence; OR
 - iv.** Patient has distant metastases; AND
- C)** Erbitux is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Erbitux is not recommended in the following situations:

- 40.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Fulvestrant Prior Authorization Policy

- Faslodex® (fulvestrant intramuscular injection – AstraZeneca; generic)

REVIEW DATE: 06/12/2024

OVERVIEW

Fulvestrant, an estrogen receptor antagonist, is indicated for breast cancer in the following situations:¹

- As monotherapy:
 - Hormone receptor-positive (HR+) [i.e., estrogen receptor-positive (ER+) or progesterone receptor-positive (PR+)], human epidermal growth factor receptor 2 (HER2)-negative advanced breast cancer in postmenopausal women not previously treated with endocrine therapy.
 - HR+ advanced breast cancer in postmenopausal women with disease progression following endocrine therapy.
- Combination therapy:
 - HR+, HER2-negative advanced or metastatic breast cancer in postmenopausal women, in combination with Kisqali® (ribociclib tablets), as initial endocrine based therapy or following disease progression on endocrine therapy.
 - HR+, HER2-negative advanced or metastatic breast cancer, in combination with Ibrance® (palbociclib capsules) or Verzenio® (abemaciclib tablets), in women with disease progression after endocrine therapy.

Fulvestrant binds to the estrogen receptor in a competitive manner.¹ Its affinity to the estrogen receptor is comparable to that of estradiol. By binding to the estrogen receptor, fulvestrant downregulates the estrogen receptor protein in human breast cancer cells.

Guidelines

Fulvestrant is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **Breast Cancer:** NCCN guidelines (version 2.2024 – March 11, 2024) recommend fulvestrant as monotherapy and in combination with other agents for the treatment of HR+ breast cancer in postmenopausal women or premenopausal women receiving ovarian ablation or suppression.² Fulvestrant is recommended for use as monotherapy or in combination with trastuzumab in women with HR+, HER2-positive breast cancer (category 2A). In women with HR+, HER2-negative breast cancer, fulvestrant is recommended as a first-line, “Preferred” regimen with a CDK4/6 inhibitor (Kisqali, Verzenio) [both category 1]. It is a category 2A regimen for fulvestrant use in combination with Ibrance. Fulvestrant is recommended as one of the “Other Recommended Regimens” in combination with a non-steroidal aromatase inhibitor (anastrozole, letrozole). Fulvestrant monotherapy is also recommended as first- and subsequent-line therapy as “Other Recommended Regimens” (category 2A). In these women, fulvestrant is recommended in the second- and subsequent-line setting in combination with CDK4/6 inhibitor (if a CDK4/6 inhibitor was not previously used) [category 1], everolimus (category 2A), or Piqray® (alpelisib tablets) [if the patient has a phosphatidylinositol 4,5-bisphosphate 3-kinase catalytic subunit alpha (*PIK3CA*)-activating mutation] {category 1}. Fulvestrant in combination with Truqap™ (capivasertib tablets) is a “Preferred Regimen” for second or subsequent-line therapy in patients with *PIK3CA*/serine/threonine protein kinase 1 (*AKT1*)/phosphatase and tensin homolog (*PTEN*)-alterations after progression or recurrence after one or more prior lines of endocrine therapy,

06/12/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

including one line containing a CDK 4/6 inhibitor. Men with breast cancer should be treated similarly to postmenopausal women, except that the use of an aromatase inhibitor is ineffective without concomitant suppression of testicular steroidogenesis. Fulvestrant with or without Nerlynx® (neratinib tablets) is listed as “Useful in Certain Circumstances” for patients with estrogen receptor-positive (ER+)/HER2-negative disease who have already received CDK4/6 inhibitor therapy (category 2B).

- **Ovarian Cancer, including Fallopian Tube Cancer and Primary Peritoneal Cancer:** NCCN guidelines (version 2.2024 – May 13, 2024) recommend single-agent fulvestrant as “Useful in Certain Circumstances” for the treatment of low-grade serous carcinoma for recurrence therapy in platinum-sensitive and platinum-resistant disease (category 2A).³ Fulvestrant is also recommended under “Other Recommended Regimens” (category 2B) for primary therapy.
- **Uterine Neoplasms:** NCCN guidelines (version 2.2024 – March 6, 2024) recommend fulvestrant under “Other Recommended Regimens” for recurrent or metastatic endometrial carcinoma and for uterine sarcoma (low-grade endometrial stromal sarcoma, adenocarcinoma without sarcomatous overgrowth, or HR+ uterine sarcoma preferably in patient with small tumor volume or an indolent growth pace).⁴ Both settings are category 2A recommendations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of fulvestrant. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with fulvestrant, as well as the monitoring required for adverse events and long-term efficacy, approval requires fulvestrant to be prescribed by or in consultation with a physician who specializes in the condition being treated.

In the approval indication, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: men/males are defined as individuals with the biological traits of a man, regardless of the individual’s gender identity or gender expression. Female/women are defined as individuals with the biological traits of a woman, regardless of the individual’s gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of fulvestrant is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 30. Breast Cancer – Fulvestrant Monotherapy.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- 36.** Patient has recurrent or metastatic hormone receptor (HR)-positive (i.e., estrogen receptor [ER]- or progesterone receptor [PR]-positive) disease; AND
- 37.** Patient meets ONE of the following (i or ii):
 - A)** Patient is a postmenopausal female* or a male*; OR
 - B)** Patient is pre/perimenopausal female* and meets ONE of the following (a or b):
 - a)** Patient is receiving ovarian suppression/ovarian ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR

Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), or Zoladex (goserelin acetate subcutaneous implant).

b) Patient has had surgical bilateral oophorectomy or ovarian irradiation; AND

38. The medication is prescribed by or in consultation with an oncologist.

* Refer to the Policy Statement.

31. Breast Cancer – Fulvestrant Combination Therapy. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

K) Patient has recurrent or metastatic hormone receptor (HR)-positive (i.e., estrogen receptor [ER]- or progesterone receptor [PR]-positive) disease; AND

L) Patient meets ONE of the following (i or ii):

i. Patient is a postmenopausal female* or a male*; OR

ii. Patient is pre/perimenopausal female* and meets ONE of the following (a or b):

a) Patient is receiving ovarian suppression/ovarian ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR

Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), or Zoladex (goserelin acetate subcutaneous implant).

b) Patient has had surgical bilateral oophorectomy or ovarian irradiation; AND

M) Patient meets ONE of the following (i or ii):

a. Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer and meets ONE of the following (a or b):

i. Patient has progressed on or after at least one prior endocrine-based therapy and patient meets ONE of the following [(1), (2), or (3)]:

Note: Examples of endocrine therapy are tamoxifen, anastrozole, letrozole, exemestane.

1. Patient has a phosphatidylinositol 4,5-bisphosphate 3-kinase catalytic subunit alpha (*PIK3CA*)-mutated tumor and the medication is used in combination with Piqray (alpelisib tablets); OR

2. Patient meets ALL of the following [(i), (ii), and (iii)]:

(i) Patient has at least ONE of *PIK3CA*, serine/threonine protein kinase (*AKT1*), or phosphatase and tensin homolog (*PTEN*)-alteration; AND

(ii) The medication is used in combination with Truqap (capivasertib tablets); AND

(iii) The patient has had disease progression on a CDK4/6 inhibitor; OR

3. The medication will be used in combination with everolimus; OR

ii. The medication will be used in combination with a cyclin dependent kinase 4/6 (CDK 4/6) inhibitor or a non-steroidal aromatase inhibitor (i.e., anastrozole or letrozole); OR

Note: Examples of CDK4/6 inhibitors are Kisqali (ribociclib tablets), Ibrance (palbociclib capsules), Verzenio (abemaciclib tablets).

b. Patient has human epidermal growth factor receptor 2 (HER2)-positive breast cancer and the medication is used in combination with a trastuzumab product; AND

N) The medication is prescribed by or in consultation with an oncologist.

* Refer to the Policy Statement.

Other Uses with Supportive Evidence

32. Endometrial Carcinoma. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

33. Ovarian/Fallopian Tube/Primary Peritoneal Cancer. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient has recurrent low-grade serous carcinoma; AND
- B) The medication is prescribed by or in consultation with an oncologist.

34. Uterine Sarcoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient meets ONE of the following (i, ii, or iii):
 - i. Patient has low-grade endometrial stromal sarcoma; OR
 - ii. Patient has adenosarcoma without sarcomatous overgrowth; OR
 - iii. Patient has hormone receptor positive uterine sarcoma; AND
- B) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of fulvestrant is not recommended in the following situations:

- 2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Fyarro Prior Authorization Policy

- Fyarro™ (sirolimus protein-bound particles [albumin bound] intravenous infusion – Aadi Bioscience)

REVIEW DATE: 01/17/2024

OVERVIEW

Fyarro, a mammalian target of rapamycin (mTOR) inhibitor, is indicated for the treatment of locally advanced unresectable or metastatic **malignant perivascular epithelioid cell tumor (PEComa)** in adults.¹

In preclinical studies in athymic mice with human tumor xenografts, intravenous administration of Fyarro resulted in higher tumor accumulation of sirolimus, inhibition of an mTOR target in the tumor, and tumor growth inhibition compared with oral sirolimus at the same total weekly dose.

Disease Overview

PEComas are rare mesenchymal tumors composed of histologically and immunohistochemically distinctive perivascular cells.^{2,3} Most PEComas are benign; however, malignant PEComa is locally aggressive or metastatic.² Malignant PEComa is a type of soft tissue sarcoma with a $\leq 1:1,000,000$ annual incidence. The most frequent sites are renal, uterine, and gastrointestinal; more females than males are affected. Some patients with PEComas have responded to mTOR inhibitors (sirolimus, everolimus, or temsirolimus), although these data are limited to case reports and retrospective analyses.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines address Fyarro:

- **Soft Tissue Sarcoma:** Guidelines (version 3.2023 – December 12, 2023), recommend Fyarro as the “Preferred” regimen for malignant PEComa for locally advanced unresectable or metastatic disease (category 2A).³ Other recommended regimens include sirolimus, everolimus, and temsirolimus (category 2A for all).
- **Uterine Neoplasm:** Guidelines (version 1.2024 – September 20, 2023) recommend Fyarro as “Useful in Certain Circumstances” for first-line or second-line or subsequent therapy as clinically appropriate if not previously used in advanced, recurrent/metastatic, or inoperable disease; however, this recommendation only applies to PEComa.⁴

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Fyarro. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Fyarro as well as the monitoring required for adverse events and long-term efficacy, approval requires Fyarro to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Fyarro is recommended in those who meet the following criteria:

FDA-Approved Indication

17. Perivascular Epithelioid Cell Tumor (PEComa), Malignant. Approve for 1 year the patient meets the following (A, B, and C):

Note: Examples of possible sites of PEComa include, but are not limited to, the gastrointestinal tract, kidneys, and uterus.

A) Patient is ≥ 18 years of age; AND

B) Patient meets one of the following (i or ii):

i. Patient has locally advanced unresectable disease; OR

ii. Patient has metastatic disease; AND

C) Fyarro is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Fyarro is not recommended in the following situations:

41. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Gazyva Prior Authorization Policy

- Gazyva® (obinutuzumab intravenous infusion – Genentech)

REVIEW DATE: 12/04/2024

OVERVIEW

Gazyva, a CD20-directed antibody, is indicated for the treatment of:¹

- **Chronic lymphocytic leukemia**, in combination with chlorambucil in previously untreated patients.
- **Follicular lymphoma**, in combination with bendamustine followed by Gazyva monotherapy, for patients who relapse or are refractory to a rituximab containing regimen.
- **Follicular lymphoma, stage II bulky, III or IV**, in combination with chemotherapy, followed by Gazyva monotherapy for patients achieving at least a partial remission, in previously untreated patients.

Guidelines

Gazyva is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **B-cell lymphomas:** Guidelines (version 3.2024 – August 26, 2024) recommend Gazyva for the first-line and second-line treatment of follicular lymphoma or nodal marginal zone lymphoma in combination with CHOP (cyclophosphamide, doxorubicin, vincristine, and prednisone), CVP (cyclophosphamide, vincristine, and prednisone), bendamustine, or lenalidomide; as third-line and subsequent treatment in combination with Brukinsa® (zanubrutinib capsule); or as single agent maintenance treatment.^{2,4} The guidelines also recommend Gazyva as first-line treatment of nodal marginal zone lymphoma; second-line or maintenance therapy for nodal marginal zone lymphoma, extranodal marginal zone lymphoma of the stomach, extranodal marginal zone lymphoma of nongastric sites, and splenic marginal zone lymphoma. Gazyva, in combination with Venclexta® (venetoclax tablets) and Brukinsa, is recommended for the first-line treatment of mantle cell lymphoma with TP53 mutation; and can also be substituted for rituximab in mantle cell lymphoma. Gazyva is also recommended as a substitute for rituximab products (Rituxan, biosimilars) in patients with intolerance or experiencing rare complications, regardless of histology. Finally, Gazyva is recommended as pretreatment, 7 days prior to the administration of Columvi™ (glofitamab-gxbm intravenous infusion) for the treatment of diffuse large B-cell lymphoma (DLBCL) or histologic transformation of indolent lymphomas to DLBCL, high-grade B-cell lymphoma, HIV-related B-cell lymphoma, and post-transplant lymphoproliferative disorders.
- **Castleman Disease:** Guidelines (version 1.2024 – January 18, 2024) recommend Gazyva as a substitute for rituximab products (Rituxan, biosimilars) in patients with intolerance or experiencing rare complications.^{2,7}
- **Chronic lymphocytic leukemia/small lymphocytic lymphoma (CLL/SLL):** Guidelines (version 1.2025 – October 1, 2024) recommend Gazyva for the first-line treatment of CLL/SLL without del(17p)/TP53 mutation in patients with indications for treatment, Gazyva is recommended in combination with bendamustine, chlorambucil, Calquence® (acalabrutinib capsules), Venclexta, Imbruvica® (ibrutinib capsules and tablets), high-dose methylprednisolone; or as a single-agent.^{2,3} Gazyva is also recommended as a single agent or in combination with Venclexta, Calquence, or high-dose methylprednisolone for the first-line treatment of CLL/SLL with del(17p)/TP53 mutation; as second-line or subsequent treatment in combination with Venclexta for CLL/SLL with or without del(17p)/TP53 mutation; as a single agent or in combination with high-dose

12/04/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

methylprednisolone for relapsed or refractory CLL/SLL without del(17p)/TP53 mutation; in combination with high-dose methylprednisolone for relapsed or refractory CLL/SLL with del(17p)/TP53 mutation; and in combination with Venclexta for retreatment for late relapse after a period of remission in patients with or without del(17p)/TP53 mutations.

- **Hairy Cell Leukemia:** Guidelines (version 1.2025 – September 26, 2024) recommend Gazyva in combination with Zelboraf[®] (vemurafenib tablets) for initial treatment in patients who cannot tolerate purine analogs including frail patients and those with active infections.^{2,5}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Gazyva. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Gazyva as well as the monitoring required for adverse events and long-term efficacy, approval requires Gazyva to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gazyva is recommended in those who meet one of the following criteria:

FDA-Approved Indications

18. Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma. Approve for 6 months if the patient meets ALL of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) The medication is prescribed by or in consultation with an oncologist.

19. Follicular Lymphoma. Approve for 6 months if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Gazyva is used in ONE of the following situations (i, ii, iii, iv, v, or vi):
 - i. In combination with chemotherapy; OR
Note: Examples include CHOP (cyclophosphamide, doxorubicin, vincristine, and prednisone), CVP (cyclophosphamide, vincristine, and prednisone), or bendamustine.
 - ii. In combination with lenalidomide; OR
 - iii. As a single agent for second-line and subsequent therapy; OR
 - iv. In combination with Brukinsa (zanubrutinib capsules) for third-line and subsequent therapy; OR
 - v. For maintenance treatment following Gazyva in combination with chemotherapy; OR
 - vi. Patient experienced an adverse event or intolerance to a rituximab product; AND
Note: Examples of adverse events or intolerance includes paraneoplastic pemphigus, Stevens-Johnson syndrome, lichenoid dermatitis, vesiculobullous dermatitis, toxic epidermal necrolysis. Examples of rituximab products include Rituxan and biosimilars.
- C) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

12/04/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

20. Hairy Cell Leukemia. Approve for 6 months if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient is unable to tolerate purine analog therapy; AND
Note: Examples of purine analogs include cladribine and pentostatin.
- C) Gazyva is used as initial therapy; AND
- D) Gazyva is used in combination with Zelboraf (vemurafenib tablets); AND
- E) The medication is prescribed by or in consultation with an oncologist.

21. Marginal Zone Lymphoma. Approve for 6 months if the patient meets ALL of the following (A, B, and C):

Note: Includes nodal marginal zone lymphoma, splenic marginal zone lymphoma, extranodal marginal zone lymphoma of the stomach, or extranodal marginal zone lymphoma of nongastric sites (noncutaneous).

- A) Patient is ≥ 18 years of age; AND
- B) Gazyva is used in ONE of the following situations (i, ii, iii, or iv):
 - i. First-line therapy for nodal marginal zone lymphoma only; OR
 - ii. Second-line or subsequent therapy for recurrent or progressive disease; OR
 - iii. Maintenance therapy for rituximab refractory disease; OR
 - iv. Patient experienced an adverse event or intolerance to a rituximab product: AND

Note: Examples of adverse events or intolerance includes paraneoplastic pemphigus, Stevens-Johnson syndrome, lichenoid dermatitis, vesiculobullous dermatitis, toxic epidermal necrolysis. Examples of rituximab products include Rituxan and biosimilars.

- C) The medication is prescribed by or in consultation with an oncologist.

22. Mantle Cell Lymphoma. Approve for 6 months if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Gazyva is used in ONE of the following situations (i or ii):
 - i. Induction therapy for TP53 mutated disease in combination with Venclexta (venetoclax tablets) and Brukinsa (zanubrutinib capsules); OR
 - ii. Gazyva may be substituted for a rituximab product; AND
- C) The medication is prescribed by or in consultation with an oncologist.

23. Other B-Cell Lymphoma. Approve for 6 months if the patient meets ALL of the following (A, B, and C):

Note: Includes diffuse large B-cell lymphoma (DLBCL), histologic transformation of indolent lymphomas to DLBCL, high-grade B-cell lymphoma, Burkitt lymphoma, HIV-related B-cell lymphoma, post-transplant lymphoproliferative disorders, Castleman's disease.

- A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. A single dose of Gazyva is used as pretreatment before the first dose of Columvi (glofitamab-gxbm intravenous infusion); OR
 - ii. Patient experienced an adverse event or intolerance to a rituximab product: AND
- Note: Examples of adverse events or intolerance includes paraneoplastic pemphigus, Stevens-Johnson syndrome, lichenoid dermatitis, vesiculobullous dermatitis, toxic epidermal necrolysis. Examples of rituximab products include Rituxan and biosimilars.
- C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Gazyva is not recommended in the following situations:

42. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Oncology (Injectable) – Gonadotropin-Releasing Hormone Analogs Prior Authorization Policy
- Camcevi™ (leuprolide subcutaneous injection – Accord BioPharma)
 - Eligard® (leuprolide acetate subcutaneous injection – Tolmar)
 - Firmagon® (degarelix subcutaneous injection – Ferring)
 - Leuprolide Depot (leuprolide acetate 22.5 mg for depot suspension [formerly Lutrate Depot] – Cipla USA)
 - Trelstar® (triptorelin pamoate intramuscular injection – Verity)

REVIEW DATE: 01/17/2024

OVERVIEW

Camcevi, Eligard, Leuprolide Depot (formerly Lutrate Depot), Firmagon, and Trelstar are all indicated for the treatment of advanced **prostate cancer**.^{1-4,8} Camcevi, Eligard, Leuprolide Depot, and Trelstar are gonadotropin-releasing hormone (GnRH) agonists, whereas Firmagon is a GnRH antagonist.

Guidelines

The GnRH analogs have been addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **Head and Neck Cancer:** NCCN guidelines (version 2.2024 – December 8, 2023) recommend androgen receptor therapy (e.g., leuprolide and bicalutamide) for patients with recurrent, unresectable, or metastatic androgen receptor positive salivary gland tumors.^{5,6}
- **Prostate Cancer:** NCCN guidelines (version 4.2023 – September 7, 2023) note androgen deprivation therapy as primary systemic therapy for regional or advanced disease and as neoadjuvant/concomitant/adjuvant therapy in combination with radiation in localized or locally advanced prostate cancers. Many drugs can be used as androgen deprivation therapy, including Camcevi, Eligard, Firmagon, and Trelstar.⁷

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Camcevi, Eligard, Leuprolide Depot, Firmagon, and Trelstar. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Camcevi, Eligard, Leuprolide Depot, Firmagon, and Trelstar as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Camcevi, Eligard, Leuprolide Depot, Firmagon, or Trelstar is recommended in those who meet one of the following criteria:

01/17/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indication

24. Prostate Cancer. Approve Camcevi, Eligard, Leuprolide Depot, Firmagon, or Trelstar for 1 year if prescribed by or in consultation with an oncologist or urologist.

Other Uses with Supportive Evidence

25. Head and Neck Cancer – Salivary Gland Tumors. Approve Camcevi or Eligard for 1 year if the patient meets the following (A, B, and C):

- A) Patient has recurrent, unresectable, or metastatic disease; AND
- B) Patient has androgen receptor-positive disease; AND
- C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Camcevi, Eligard, Leuprolide Depot, Trelstar, or Firmagon is not recommended in the following situations:

43. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Halaven Prior Authorization Policy

- Halaven® (eribulin mesylate intravenous infusion– Eisai)

REVIEW DATE: 03/20/2024

OVERVIEW

Halaven, a microtubule inhibitor, is indicated for the following uses:¹

- **Breast cancer**, metastatic, in patients who have previously received at least two chemotherapeutic regimens for the treatment of metastatic disease. Prior therapy should have included an anthracycline and a taxane in either the adjuvant or metastatic setting.
- **Liposarcoma**, for the treatment of unresectable or metastatic disease in patients who have received a prior anthracycline-containing regimen.

Guidelines

Halaven has been addressed in National Comprehensive Cancer Network (NCCN) guidelines:²⁻⁵

- **Breast Cancer:** Guidelines (version 2.2024 – March 11, 2024) list Halaven as one of the preferred single-agent regimens for patients with human epidermal growth factor receptor-2 (HER2)-negative recurrent or metastatic breast cancer.² Halaven, in combination with trastuzumab or Margenza® (margetuximab-cmkb intravenous infusion) is also recommended (fourth line and beyond) for the treatment of recurrent or metastatic HER2-positive disease. Both of these are category 2A recommendations.
- **Soft Tissue Sarcoma:** Guidelines (version 3.2023 – December 12, 2023) list Halaven as a subsequent line of treatment of advanced or metastatic soft tissue sarcoma.³ Halaven is a category 1 recommendation for liposarcoma and category 2A for other subtypes. The NCCN compendium recommends Halaven for the following soft tissue sarcoma subtypes: extremity/body wall, head/neck, retroperitoneal/intra-abdominal, solitary fibrous tumor, and pleomorphic rhabdomyosarcoma.⁴
- **Uterine Neoplasms:** Guidelines (version 2.2024 – March 6, 2024) list Halaven under “other recommended regimens” as second-line or subsequent therapy for the treatment of patients with recurrent or metastatic uterine sarcoma (category 2B).⁵

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Halaven. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Halaven as well as the monitoring required for adverse events and long-term efficacy, approval requires Halaven to be prescribed by or in consultation with a prescriber who specializes in the condition being treated.

Automation: None.

03/20/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Halaven is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Breast Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has recurrent or metastatic disease; AND
 - C) Patient meets ONE of the following (i, ii, or iii):
 - i. Patient has human epidermal growth factor receptor 2 (HER2)-negative and hormone-receptor (HR)-positive disease and meets ONE of the following (a, b, or c):
 - a) The medication will be used in the first-line setting and the tumor has no germline *BRCA* mutation; OR
 - b) The medication will be used second-line because the patient is not a candidate for Enhertu (fam-trastuzumab deruxtecan-nxki intravenous infusion) therapy; OR
 - c) The medication will be used after at least two prior chemotherapy regimens; OR

Note: Examples of chemotherapy regimens include doxorubicin, epirubicin, paclitaxel, docetaxel, Abraxane (albumin-bound paclitaxel intravenous infusion).
 - ii. Patient has triple-negative breast cancer and meets one of the following (a or b):
 - a) The medication will be used in the first-line setting if the programmed death ligand-1 (PD-L1) combined positive score (CPS) < 10 and there is no germline *BRCA* mutation; OR
 - b) The medication is used as subsequent therapy (second-line or beyond); OR
 - iii. Patient has human epidermal growth factor receptor 2 (HER2)-positive disease and meets both of the following (a and b):
 - a) The medication will be used in fourth-line therapy or beyond; AND
 - b) The medication will be used in combination with Margenza (margetuximab-cmkb intravenous infusion) or trastuzumab; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
2. **Soft Tissue Sarcoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has unresectable, progressive, or advanced/metastatic disease; AND
 - C) Patient has been treated with at least one prior anthracycline-containing chemotherapy regimen; AND
 - Note: Examples of chemotherapy regimens include doxorubicin and dacarbazine, doxorubicin with ifosfamide and mesna, epirubicin with ifosfamide and mesna.
 - D) Patient has ONE of the following subtypes (i, ii, iii, iv, or v):
 - i. Liposarcoma; OR
 - ii. Pleomorphic rhabdomyosarcoma; OR
 - iii. Retroperitoneal/intra-abdominal soft tissue sarcoma; OR
 - iv. Soft tissue sarcoma of the extremity/body wall; OR
 - v. Soft tissue sarcoma of the head/neck; AND
 - E) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

3. **Uterine Sarcoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has recurrent or metastatic disease; AND

03/20/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- C) Patient has been treated with at least one prior chemotherapy regimen; AND
Note: Examples of chemotherapy regimens include doxorubicin, docetaxel, gemcitabine, ifosfamide, dacarbazine, epirubicin.
- D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Halaven is not recommended in the following situations:

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Herceptin Hylecta Prior Authorization Policy

- Herceptin Hylecta™ (trastuzumab and hyaluronidase-oyks subcutaneous injection – Genentech)

REVIEW DATE: 03/20/2024

OVERVIEW

Herceptin Hylecta is indicated for the following uses:¹

- **Breast Cancer, adjuvant treatment** in tumors with human epidermal growth factor receptor 2 (HER2) overexpressing node positive or node negative (estrogen receptor [ER]-/progesterone receptor [PR]-negative or with one high risk feature) breast cancer in adults:
 - a) As part of a treatment regimen consisting of doxorubicin, cyclophosphamide, and either paclitaxel or docetaxel.
 - b) As part of a treatment regimen with docetaxel and carboplatin.
 - c) As a single agent following multi-modality anthracycline based therapy.
- **Breast Cancer, metastatic**, in adults with HER2-overexpressing disease:
 - a) In combination with paclitaxel for first-line treatment.
 - b) As a single agent for the treatment of patients who have received one or more chemotherapy regimens for metastatic disease.

Guidelines

The National Comprehensive Cancer Network (NCCN) breast cancer clinical practice guidelines (version 2.2024 – March 11, 2024) state that Herceptin Hylecta may be substituted for trastuzumab intravenous and used as a single-agent or in combination with other systemic therapies.^{2,3} The guidelines note the different dose and dosage form of Herceptin Hylecta compared with trastuzumab. It is also noted that Herceptin Hylecta cannot be substituted for Kadcyra® (ado-trastuzumab emtansine intravenous infusion) or Enhertu® (fam-trastuzumab deruxtecan-nxki intravenous infusion). Trastuzumab is recommended as part of a preferred regimen in the preoperative, adjuvant, and metastatic setting for HER2-positive disease.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Herceptin Hylecta. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Herceptin Hylecta as well as the monitoring required for adverse events and long-term efficacy, approval requires Herceptin Hylecta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Herceptin Hylecta is recommended in those who meet the following criteria:

FDA-Approved Indication

4. **Breast Cancer.** Approve for the duration noted below if the patient meets ALL of the criteria (A, B, C, and D):

03/20/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- A) Patient is ≥ 18 years of age; AND
- B) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- C) Patient meets ONE of the following (i or ii):
 - i. Approve for up to 1 year (total) if the medication is used for adjuvant treatment; OR
 - ii. Approve for 1 year if the medication is used for recurrent or metastatic disease; AND
- D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Herceptin Hylecta is not recommended in the following situations:

- 3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Imdelltra Prior Authorization Policy

- Imdelltra™ (tarlatamab-dlle intravenous infusion – Amgen)

REVIEW DATE: 05/22/2024; selected revision 06/19/2024

OVERVIEW

Imdelltra, a bispecific delta-like ligand 3 (DLL3)-directed CD3 T-cell engager, is indicated for the treatment of **extensive stage small cell lung cancer** (ES-SCLC) with disease progression on or after platinum-based chemotherapy in adults.¹ This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial(s).

Guidelines

The National Comprehensive Cancer Network (NCCN) Small Cell Lung Cancer guidelines (version 3.2024 – June 11, 2024) recommend Imdelltra as a single agent for the subsequent treatment of extensive stage small cell lung cancer with disease progression on or after platinum-based chemotherapy for primary progressive disease or relapse following complete or partial response or stable disease with primary treatment (category 2A).^{2,3} Imdelltra is a “Preferred Regimen” if the chemotherapy-free interval (CTFI) is ≤ 6 months and an “Other Recommended Regimen” if the CTFI is > 6 .^{2,3}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Imdelltra. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Imdelltra as well as the monitoring required for adverse events and long-term efficacy, approval requires Imdelltra to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Imdelltra is recommended in those who meet the following:

FDA-Approved Indication

26. Small Cell Lung Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed or refractory extensive stage disease; AND
 - C) Patient has previously received platinum-based chemotherapy; AND
- Note: Examples of platinum medications include cisplatin and carboplatin.
- D) Imdelltra is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

05/22/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Coverage of Imdelltra is not recommended in the following situations:

44. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Imjudo Prior Authorization Policy

- Imjudo® (tremelimumab-actl intravenous infusion – AstraZeneca)

REVIEW DATE: 10/16/2024

OVERVIEW

Imjudo, a cytotoxic T-lymphocyte-associated antigen 4 (CTLA-4) monoclonal antibody, is indicated for the following uses:¹

- **Hepatocellular carcinoma**, in combination with Imfinzi® (durvalumab intravenous infusion), for the treatment of adults with unresectable disease.
- **Non-small cell lung cancer** (NSCLC), in combination with Imfinzi and platinum-based chemotherapy, for the treatment of adults with metastatic disease and no epidermal growth factor receptor (*EGFR*) mutations or anaplastic lymphoma kinase (*ALK*) genomic tumor aberrations.

Guidelines

Imjudo is addressed in the National Comprehensive Cancer Network guidelines.

- **Esophageal and Esophagogastric Junction Cancers:** The guidelines (version 4.2024 – July 30, 2024) recommend Imjudo in combination with Imfinzi for the neoadjuvant treatment of microsatellite instability-high (MSI-H) or deficient mismatch repair (dMMR) adenocarcinoma in patients who are medically fit for surgery.^{2,5}
- **Gastric Cancer:** The guidelines (version 4.2024 – August 12, 2024) recommend Imjudo in combination with Imfinzi for the neoadjuvant treatment of microsatellite instability-high (MSI-H) or deficient mismatch repair (dMMR) locoregional disease in patients who are medically fit for surgery.^{2,6}
- **Hepatocellular Carcinoma:** The guidelines (version 3.2024 – September 24, 2024) recommend Imjudo as a preferred first-line treatment in combination with Imfinzi for liver-confined, unresectable disease in patients deemed ineligible for transplant or extrahepatic/metastatic hepatocellular carcinoma in patients who are not eligible for resection, transplant, or locoregional therapy.^{2,3}
- **Non-Small Cell Lung Cancer:** The guidelines (version 10.2024 – September 23, 2024) recommend Imjudo, in combination with Imfinzi, plus chemotherapy for the first-line treatment of recurrent, advanced, or metastatic disease with programmed death-ligand 1 (PD-L1) expression $\geq 1\%$ and negative for actionable molecular markers.^{2,4} The guidelines also recommend Imjudo in combination with Imfinzi plus chemotherapy for disease with PD-L1 expression $< 1\%$, and for disease that is positive for a variety of molecular markers.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Imjudo. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Imjudo as well as the monitoring required for adverse events and long-term efficacy, approval requires Imjudo to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

10/16/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Coverage of Imjudo is recommended in those who meet one of the following criteria:

FDA-Approved Indications

27. Hepatocellular Carcinoma. Approve for 30 days if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. Patient has liver-confined unresectable disease and according to the prescriber, the patient is deemed ineligible for transplant; OR
 - ii. Patient has extrahepatic or metastatic disease and according to the prescriber, the patient is deemed ineligible for resection, transplant, or locoregional therapy; AND
- C) Imjudo is used as first-line systemic therapy; AND
- D) Imjudo is used in combination with Imfinzi (durvalumab intravenous infusion); AND
- E) The medication is prescribed by or in consultation with an oncologist.

28. Non-Small Cell Lung Cancer. Approve for 6 months if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has recurrent, advanced, or metastatic disease; AND
- C) Imjudo is used in combination with Imfinzi (durvalumab intravenous infusion); AND
- D) Patient meets ONE of the following (i, ii, iii, or iv):
 - i. Patient meets BOTH of the following (a and b):
 - a) The tumor is negative for actionable molecular markers; AND
Note: Examples of actionable molecular markers include epidermal growth factor receptor (*EGFR*) mutations, anaplastic lymphoma kinase (*ALK*) genomic tumor aberrations, *ROS1*, *BRAF*, *NTRK1/2/3*, *MET*, *RET*, and *ERBB2 (HER2)*. Patient may be *KRAS G12C* mutation positive.
 - b) Imjudo is used as first-line therapy; OR
 - ii. Patient meets BOTH of the following (a and b):
 - a) The tumor is positive for ONE of the following [(1), (2), or (3)]:
 - (1) Epidermal growth factor receptor (*EGFR*) exon 20 mutation positive; OR
 - (2) *ERBB2 (HER2)* mutation positive; AND
 - b) Imjudo is used as first-line therapy; OR
 - iii. Patient meets BOTH of the following (a and b):
 - a) The tumor is positive for ONE of the following [(1), (2), (3), or (4)]:
 - (1) *BRAF V600E* mutation positive; OR
 - (2) *NTRK1/2/3* gene fusion positive; OR
 - (3) *MET* exon 14 skipping mutation positive; OR
 - (4) *RET* rearrangement positive; AND
 - b) Imjudo is used as first-line or subsequent therapy; OR
 - iv. Patient meets ALL of the following (a, b, and c):
 - a) The tumor is positive for ONE of the following [(1), (2), (3), or (4)]:
 - (1) *EGFR* exon 19 deletion or exon 21 L858R mutation positive; OR
 - (2) *EGFR S768I*, *L861Q*, and/or *G719X* mutation positive; OR
 - (3) *ALK* rearrangement positive; OR
 - (4) *ROS1* rearrangement; AND
 - b) The patient has received targeted drug therapy for the specific mutation; AND
Note: Examples of targeted drug therapy include Gilotrif (afatinib tablets), Tagrisso (osimertinib tablets), erlotinib, Iressa (gefitinib tablets), Xalkori (crizotinib capsules),

Zykadia (ceritinib capsules), Alecensa (alectinib capsules), Alunbrig (brigatinib tablets), Lorbrena (lorlatinib tablets), Rozlytrek (entrectinib capsules), or Vizimpro (dacomitinib tablets).

- c) Imjudo is used as subsequent therapy; AND
- E) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

29. Esophageal and Esophagogastric Junction Cancers. Approve for 30 days if the patient meets ALL of the following (A, B, C, D, E, F, and G):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has adenocarcinoma tumor; AND
- C) Patient has microsatellite instability-high (MSI-H) or deficient mismatch repair (dMMR) disease; AND
- D) Imjudo is used as neoadjuvant therapy; AND
- E) Imjudo is used in combination with Imfinzi (durvalumab intravenous infusion); AND
- F) According to the physician, the patient is medically fit for surgery; AND
- G) The medication is prescribed by or in consultation with an oncologist.

30. Gastric Cancer. Approve for 30 days if the patient meets ALL of the following (A, B, C, D, E, F, and G):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has locoregional disease; AND
- C) Patient has microsatellite instability-high (MSI-H) or deficient mismatch repair (dMMR) disease; AND
- D) Imjudo is used as neoadjuvant therapy; AND
- E) Imjudo is used in combination with Imfinzi (durvalumab intravenous infusion); AND
- F) According to the physician, the patient is medically fit for surgery; AND
- G) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Imjudo is not recommended in the following situations:

- 45. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Imlygic Prior Authorization Policy

- Imlygic® (talimogene laherparepvec intralesional injection – Amgen)

REVIEW DATE: 04/10/2024

OVERVIEW

Imlygic is an oncolytic viral therapy indicated for the local treatment of unresectable cutaneous, subcutaneous, and nodal lesions in patients with **melanoma** recurrent after initial surgery.¹ Limitation of use: Imlygic has not been shown to improve overall survival or have an effect on visceral metastases. Safety and efficacy have not been established in patients < 18 years of age.

Dosing

In the pivotal trial, the initial dose of Imlygic was administered at 10⁶ plaque forming units (PFU)/mL (to seroconvert herpes simplex virus-seronegative patients).¹ Subsequent doses were 10⁸ PFU/mL administered 3 weeks after the first dose, then every 2 weeks. Total volume of Imlygic was up to 4.0 mL per treatment session. It may not be possible to inject all lesions at each treatment visit or over the full course of treatment. Previously injected and/or uninjected lesions may be injected at subsequent treatment visits. Continue treatment for at least 6 months unless other treatment is required or until there are no injectable lesions to treat. Imlygic may be reinitiated if new unresectable cutaneous, subcutaneous, or nodal lesions appear after a complete response.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for melanoma (version 2.2024 – April 3, 2024) list Imlygic as an option in multiple treatment situations, including for Stage III melanoma; for recurrent disease (including nodal recurrence); for disseminated metastatic disease; for metastatic or unresectable disease following disease progression or maximal clinical benefit from BRAF targeted therapy (category 1 as initial or subsequent therapy for stage III disease; all others category 2A), and in combination with Yervoy (ipilimumab intravenous infusion) for metastatic or unresectable disease as second-line or subsequent therapy for disease progression (category 2B).⁴

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Imlygic. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Imlygic as well as the monitoring required for adverse events and long-term efficacy, approval requires Imlygic to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indication

04/10/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

1. **Melanoma.** Approve for the duration noted if the patient meets ONE of the following (A or B):
 - A) **Initial Therapy** (This includes reinitiation in patients with new lesions following a complete response). Approve for 6 months if the patient meets ALL of the following (i, ii, and iii):
 - i. Patient is ≥ 18 years of age; AND
 - ii. Imlygic will be directly injected into advanced, metastatic, recurrent, or unresectable cutaneous, subcutaneous, or nodal lesions; AND
 - iii. Imlygic will be administered by or under the supervision of an oncologist, dermatologist, or surgeon.
 - B) **Patient is Currently Receiving Imlygic.** Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):
 - i. Patient has remaining injectable lesions for treatment; AND
 - ii. According to the prescriber, the patient has not experienced clinically relevant disease progression (e.g., disease progression associated with a decline in performance status and/or alternative therapy was needed); AND
 - iii. Imlygic will be administered by or under the supervision of an oncologist, dermatologist, or surgeon.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Imlygic is not recommended in the following situations:

1. **Concurrent Use with Anti-Herpetic Viral Agents.** Imlygic is a genetically modified, live, attenuated herpes simplex virus-1 that is sensitive to acyclovir. Anti-herpetic viral agents (e.g., acyclovir, valacyclovir, famciclovir) may interfere with efficacy.¹
2. **Immunocompromised Patients.** Imlygic is contraindicated in patients who are immunocompromised, including those with a of primary or acquired immunodeficient states, leukemia, lymphoma, acquired immunodeficiency syndrome, or other clinical manifestations of infection with human immunodeficiency viruses, and those on immunosuppressive therapy.¹
3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Ixempra Prior Authorization Policy

- Ixempra® (ixabepilone intravenous infusion – R-Pharm US)

REVIEW DATE: 12/20/2023

OVERVIEW

Ixempra, a microtubule inhibitor, is indicated in combination with capecitabine for the treatment of patients with metastatic or locally advanced **breast cancer** resistant to treatment with an anthracycline and a taxane, or whose cancer is taxane resistant and for whom further anthracycline therapy is contraindicated.¹ Ixempra is indicated as monotherapy for the treatment of metastatic or locally advanced breast cancer in patients whose tumors are resistant or refractory to anthracyclines, taxanes, and capecitabine.

Anthracycline resistance is defined as progression while on therapy or within 6 months in the adjuvant setting or 3 months in the metastatic setting.¹ Taxane resistance is defined as progression while on therapy or within 12 months in the adjuvant setting or 4 months in the metastatic setting.

Guidelines

The National Comprehensive Cancer Network (NCCN) **breast cancer** (version 5.2023 – December 5, 2023) clinical practice guidelines and Compendium recommend Ixempra as a single agent for invasive recurrent unresectable locoregional or invasive stage IV human epidermal growth factor receptor 2 (HER2)-negative disease and in combination with trastuzumab for HER2-positive disease.^{2,3} Ixempra is recommended for inflammatory disease as a single agent for patients with no response to preoperative systemic therapy, or recurrent unresectable locoregional or stage IV HER2-negative disease and in combination with trastuzumab for HER2-positive disease.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ixempra. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ixempra as well as the monitoring required for adverse events and long-term efficacy, approval requires Ixempra to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ixempra is recommended in those who meet the following criteria:

FDA-Approved Indication

31. Breast Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i, ii, or iii):
 - i. Patient has recurrent unresectable local or regional disease; OR
 - ii. Patient has metastatic disease; OR
 - iii. Patient has no response to preoperative systemic therapy; AND
- C) Ixempra is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ixempra is not recommended in the following situations:

- 46.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Jevtana Prior Authorization Policy

- Jevtana® (cabazitaxel intravenous infusion – Sanofi-Aventis)

REVIEW DATE: 03/06/2024

OVERVIEW

Jevtana, a microtubule inhibitor, is indicated in combination with prednisone for the treatment of **metastatic castration-resistant prostate cancer (CRPC)** in patients who were previously treated with a docetaxel-containing treatment regimen.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) prostate cancer guidelines (version 1.2024 – February 27, 2024) list Jevtana, in combination with a steroid, as a “Preferred” regimen for patients who have received prior docetaxel and novel hormone therapy (category 1) with visceral metastases.^{2,3} Jevtana in combination with a steroid is a “Preferred” regimen for patients who have received prior docetaxel without prior novel hormone therapy (category 2A). The guidelines note that Jevtana (in combination with steroid) can also be considered in patients who are not candidates for docetaxel or are intolerant to docetaxel (category 2A). Jevtana in combination with carboplatin is “Useful in Certain Circumstances” in patients who have received prior docetaxel and/or novel hormone therapy. In addition, Jevtana in combination with carboplatin and a steroid (category 2A) is recommended for the treatment of small cell/neuroendocrine prostate cancer in fit patients with aggressive variant prostate cancer or in patients with unfavorable genomics defined as having defects in at least two of the following: phosphatase and tensin homolog (*PTEN*), tumor protein p53 (*TP53*), and retinoblastoma transcriptional corepressor 1 (*RB1*).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Jevtana. Because of the specialized skills required for evaluation and diagnosis of patients treated with Jevtana as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Jevtana is recommended in those who meet the following criteria:

FDA-Approved Indication

2. **Prostate Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient has metastatic castration-resistant prostate cancer; AND
 - B) The medication will be used in combination with a systemic corticosteroid (e.g., prednisone); AND
 - C) Patient meets ONE of the following (i, ii, iii, or iv):
 - i. Patient has small cell/neuroendocrine prostate cancer and meets ONE of the following (a or b):
 - a) According to the prescriber, the patient is fit and has aggressive variant disease; OR

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Kadcyła Prior Authorization Policy

- Kadcyła® (ado-trastuzumab emtansine intravenous infusion – Genentech)

REVIEW DATE: 08/28/2024

OVERVIEW

Kadcyła, a human epidermal growth factor receptor 2 (HER2)-targeted antibody and microtubule inhibitor conjugate, is indicated for the treatment of patients with HER2-positive breast cancer as a single agent for the following uses:¹

- **Early breast cancer**, for the adjuvant treatment in patients who have residual invasive disease after neoadjuvant taxane and trastuzumab-based treatment.
- **Metastatic breast cancer**, in patients who previously received trastuzumab and a taxane, separately or in combination. Patients should have either received prior therapy for metastatic disease or developed disease recurrence during or within 6 months of completing adjuvant therapy.

Guidelines

Kadcyła is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Breast Cancer:** NCCN guidelines (version 4.2024 – July 3, 2024) recommend Kadcyła as a “Preferred” adjuvant therapy in patients who have residual disease after receiving neoadjuvant (preoperative) therapy (category 1).²⁻³ Kadcyła is also recommended for the treatment of HER2-positive recurrent unresectable (local or regional) or Stage IV metastatic disease as a preferred second line regimen (category 2A).
- **Head and Neck Cancers:** NCCN guidelines (version 4.2024 – May 1, 2024) recommend Kadcyła as a systemic therapy option for recurrent, unresectable, or metastatic salivary gland tumors (under “Useful in Certain Circumstances”) for HER2 positive tumors (category 2A).^{3,4}
- **Non-Small Cell Lung Cancer:** NCCN guidelines (version 7.2024 – June 26, 2024) recommend Kadcyła for erb-b2 receptor tyrosine kinase 2 (ERBB2) or HER2 mutations (category 2A).^{3,5}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Kadcyła. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kadcyła, as well as the monitoring required for adverse events and long-term efficacy, approval requires Kadcyła to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kadcyła is recommended in those who meet one of the following criteria:

08/28/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indication

5. **Breast Cancer.** Approve if the patient meets ALL of the following (A, B, C, and D):
- H) Patient is ≥ 18 years of age; AND
 - I) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - J) Patient meets ONE of the following (i or ii):
 - i. Approve for 1 year if Kadcyra is used for recurrent or metastatic breast cancer; OR
 - ii. Approve for 1 year (total) if Kadcyra will be used as adjuvant therapy; AND
 - K) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

6. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has metastatic disease; AND
 - C) The disease has activating human epidermal growth factor receptor 2 (HER2)-mutations; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
7. **Salivary Gland Tumor.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has recurrent, unresectable, or metastatic disease; AND
 - C) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kadcyra is not recommended in the following situations:

- 2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Kimmtrak Prior Authorization Policy

- Kimmtrak® (tebentafusp-tebn intravenous infusion – Immunocore)

REVIEW DATE: 02/07/2024

OVERVIEW

Kimmtrak, a bispecific gp100 peptide-human leukocyte antigen (HLA)-directed CD3 T cell engager, is indicated for the treatment of adults with HLA-A*02:01-positive, unresectable or metastatic uveal melanoma.¹

Guidelines

The National Comprehensive Cancer Network melanoma: uveal (version 1.2023 – May 4, 2023) clinical practice guidelines recommend Kimmtrak as a preferred regimen for patients with metastatic or unresectable disease who are HLA-A*02:01 positive (category 1).^{2,3}

Safety

Kimmtrak has a Boxed Warning for cytokine release syndrome which may be serious or life-threatening.¹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Kimmtrak. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kimmtrak as well as the monitoring required for adverse events and long-term efficacy, approval requires Kimmtrak to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kimmtrak is recommended in those who meet the following criteria:

FDA-Approved Indication

32. Uveal Melanoma. Approve for 1 year if the patient meets the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has unresectable or metastatic disease; AND
- C) The tumor is HLA-A*02:01 positive; AND
- D) The medication is prescribed by or in consultation with an oncologist.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Kyprolis Prior Authorization Policy

- Kyprolis (carfilzomib intravenous infusion – Amgen/Onyx)

REVIEW DATE: 04/24/2024

OVERVIEW

Kyprolis, a proteasome inhibitor, is approved for **multiple myeloma** in the following situations:¹

- for relapsed or refractory disease, in combination with dexamethasone ± lenalidomide or Darzalex® (daratumumab intravenous infusion)/dexamethasone, Darzalex Faspro® (daratumumab and hyaluronidase-fihj subcutaneous injection)/dexamethasone, or with Sarclisa® (isatuximab-irfc intravenous infusion)/dexamethasone in patients who have received one to three lines of previous therapy.
- for relapsed or refractory disease, as a single agent in those who have received one or more lines of therapy.

Guidelines

Kyprolis is discussed in guidelines from the National Comprehensive Cancer Network (NCCN).²

- **Multiple Myeloma:** The NCCN guidelines (version 3.2024 – March 8, 2024) recommend multiple therapeutic regimens that may be used for primary therapy and previously treated multiple myeloma.³ For transplant candidates, Kyprolis/lenalidomide/dexamethasone is recommended as a “Preferred” regimen for primary treatment (category 2A), and Kyprolis/cyclophosphamide/dexamethasone is among the regimens that are useful in certain circumstances (category 2A). Additionally, Kyprolis/Darzalex/lenalidomide/dexamethasone (category 2A) is listed as useful in certain circumstances as primary therapy for transplant candidates. Kyprolis/lenalidomide is recommended as maintenance therapy under “Useful in Certain Circumstances” (category 2A). For previously treated multiple myeloma, Kyprolis/lenalidomide/dexamethasone is listed under “Other Recommended Regimens” (category 2A) for primary therapy in non-transplant candidates. In this setting, Kyprolis/cyclophosphamide/dexamethasone is recommended under “Useful in Certain Circumstances” (category 2A). Multiple “Preferred” regimens are listed for relapsed/refractory disease (after 1 to 3 prior therapies), including Kyprolis/lenalidomide/dexamethasone, Kyprolis/Sarclisa/dexamethasone, and Kyprolis/Darzalex/dexamethasone (all category 1). Kyprolis/Pomalyst® (pomalidomide capsules)/dexamethasone is also recommended in this setting (category 2A). Additionally, there are multiple Kyprolis-containing regimens recommended as “Other Recommended Regimens” or “Useful in Certain Circumstances” for relapsed/refractory disease.
- **Systemic Light Chain Amyloidosis:** The NCCN guidelines (version 2.2024 – December 12, 2023) recommend Kyprolis + dexamethasone (category 2A) under “Other Recommended Regimens” for primary therapy in patients with significant neuropathy.⁶ The guidelines also list Kyprolis ± dexamethasone as a therapy for previously treated disease, for patients with non-cardiac amyloidosis. Of note, cardiac toxicity and hypertension are among the Warnings listed for Kyprolis.¹
- **Waldenstrom’s Macroglobulinemia/Lymphoplasmacytic Lymphoma:** In NCCN guidelines (version 2.2024 – December 5, 2023), Kyprolis/rituximab/dexamethasone (category 2A) is listed among “Other Recommended Regimens” for primary treatment of Waldenstrom’s Macroglobulinemia/lymphoplasmacytic lymphoma.⁴

04/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Kyprolis. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kyprolis as well as the monitoring required for adverse events and long-term efficacy, approval requires Kyprolis to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kyprolis is recommended in those who meet one of the following criteria:

FDA-Approved Indication

- 35. Multiple Myeloma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- 39.** Patient is ≥ 18 years of age; AND
 - 40.** Patient meets ONE of the following (i or ii):
 - A)** Kyprolis will be used in combination with lenalidomide or cyclophosphamide and dexamethasone; OR
 - B)** Patient has tried at least ONE prior regimen for multiple myeloma; AND
 - Note:** Examples include bortezomib, lenalidomide, cyclophosphamide, Darzalex (daratumumab intravenous infusion), Ninlaro (ixazomib capsules).
 - 41.** The medication is prescribed by or in consultation with an oncologist or a hematologist.

Other Uses with Supportive Evidence

- 36. Systemic Light Chain Amyloidosis.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- D)** Patient is ≥ 18 years of age; AND
 - E)** Patient meets ONE of the following (i or ii):
 - i.** The medication will be used in combination with dexamethasone for newly diagnosed disease; OR
 - ii.** The patient meets BOTH of the following (a and b):
 - a)** The patient has non-cardiac amyloidosis; AND
 - b)** Patient has received at least one other regimen for this condition; AND
 - Note:** Examples of agents used in other regimens include bortezomib, lenalidomide, cyclophosphamide, and melphalan.
 - F)** The medication is prescribed by or in consultation with an oncologist or a hematologist.
- 37. Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A)** Patient is ≥ 18 years of age; AND
 - B)** The medication will be used in combination with a rituximab product and dexamethasone; AND
 - C)** The medication is prescribed by or in consultation with an oncologist or a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kyprolis is not recommended in the following situations:

04/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

48. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Oncology (Injectable) – Levoleucovorin Products Prior Authorization Policy
- Fusilev® (levoleucovorin intravenous infusion – Spectrum)
 - Khapzory™ (levoleucovorin intravenous infusion – Spectrum)
 - Levoleucovorin intravenous infusion – various manufacturers

REVIEW DATE: 06/26/2024

OVERVIEW

Levoleucovorin (Fusilev, Khapzory, generic) is indicated for the following uses:^{1,2}

- **Colorectal cancer**, in advanced metastatic disease for use in combination chemotherapy with 5-fluorouracil.
- **Impaired methotrexate elimination** or overdosage of folic acid antagonists.
- **Osteosarcoma**, for rescue after high-dose methotrexate therapy.

Levoleucovorin is the pharmacologically active, levo-isomer of racemic *d,l*-leucovorin.^{1,2} Levoleucovorin is a chemically reduced derivative of folic acid, which can counteract the toxic and therapeutic effects of folic acid antagonists, such as methotrexate. In addition, levoleucovorin can enhance the therapeutic and toxic effects of fluoropyrimidines used in oncology.

Guidelines

The National Comprehensive Cancer Network (NCCN) Drugs & Biologics Compendium recommends levoleucovorin use in combination with methotrexate for the treatment of gestational trophoblastic neoplasia, T-cell lymphomas, central nervous system cancers, B-cell lymphomas, chronic lymphocytic leukemia/small lymphocytic lymphoma, acute lymphoblastic leukemia, pediatric aggressive mature B-cell lymphomas, blastic plasmacytoid dendritic cell neoplasm, osteosarcoma, and Waldenstrom macroglobulinemia.³ The NCCN Compendium recommends levoleucovorin use in combination with fluorouracil-based chemotherapy for the treatment of occult primary cancer, neuroendocrine and adrenal tumors, biliary tract cancers, ovarian/fallopian tube/primary peritoneal cancer, thymomas and thymic carcinomas, esophageal and esophagogastric junction cancer, anal cancer, colon cancer, appendiceal adenocarcinoma, gastric cancer, small bowel adenocarcinoma, ampullary cancer, cervical cancer, vaginal cancer, rectal cancer, pancreatic adenocarcinoma, and bladder cancer.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of levoleucovorin. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with levoleucovorin as well as the monitoring required for adverse events and long-term efficacy, approval requires levoleucovorin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

06/26/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of levoleucovorin is recommended in those who meet one of the following:

FDA-Approved Indications

33. Colon or Rectal Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Levoleucovorin is used in combination with fluorouracil-based chemotherapy; AND
- B) Levoleucovorin is prescribed by or in consultation with an oncologist.

34. Methotrexate Overdosage, or Impaired Methotrexate Elimination. Approve for 1 month.

35. Osteosarcoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Levoleucovorin is used in combination with high-dose methotrexate; AND
- B) Levoleucovorin is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

36. Cancer Diagnosis Currently Being Treated With Methotrexate. Approve for 1 year if levoleucovorin is prescribed by or in consultation with an oncologist.

Note: Examples include T-cell lymphoma, B-cell lymphoma, gestational trophoblastic neoplasm, central nervous system cancer.

37. Cancer Diagnosis Currently Being Treated With 5-Fluorouracil. Approve for 1 year if levoleucovorin is prescribed by or in consultation with an oncologist.

Note: Examples include ovarian cancer, gastric cancer, cervical cancer.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of levoleucovorin is not recommended in the following situations:

49. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Lunsumio Prior Authorization Policy

- Lunsumio™ (mosunetuzumab-axgb intravenous infusion – Genentech)

REVIEW DATE: 01/10/2024

OVERVIEW

Lunsumio, a bispecific CD20-directed CD3 T-cell engager, is indicated for the treatment of adults with relapsed or refractory follicular lymphoma after two or more lines of systemic therapy.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) B-Cell Lymphoma (version 6.2023 – October 10, 2023) clinical practice guidelines recommend Lunsumio for the third-line and subsequent treatment of follicular lymphoma (category 2A).^{2,3}

Safety

Lunsumio has a Boxed Warning for cytokine release syndrome.¹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lunsumio. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Lunsumio as well as the monitoring required for adverse events and long-term efficacy, approval requires Lunsumio to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lunsumio is recommended in those who meet the following criteria:

FDA-Approved Indication

38. Follicular Lymphoma. Approve for 1 year if the patient meets the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has received $\geq$ two lines of systemic therapy; AND

Note: Examples of systemic therapy include CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) plus rituximab or Gazyva (obinutuzumab intravenous infusion) and CVP (cyclophosphamide, vincristine, prednisone) plus rituximab or Gazyva.

C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lunsumio is not recommended in the following situations:

01/10/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

50. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Lymphir Prior Authorization Policy

- Lymphir™ (denileukin diftitox-cxdl intravenous infusion – Citius)

REVIEW DATE: 10/23/2024

OVERVIEW

Lymphir, an interleukin (IL)-2 receptor directed cytotoxin, is indicated for the treatment of relapsed or refractory Stage I-III cutaneous T-cell lymphoma in adults after at least one prior systemic therapy.¹

Dosing

The recommended dose of Lymphir is 9 mcg/kg/day administered by intravenous infusion on the first 5 days of each 21-day cycle.¹ Treatment can continue until disease progression or unacceptable adverse events. Delay administration of Lymphir if the serum albumin is < 3 g/dL.

Guidelines

The National Comprehensive Cancer Network (NCCN) primary cutaneous lymphomas (version 3.2024 – August 22, 2024) guidelines recommend Lymphir for the primary and subsequent treatment of stage IIB mycosis fungoides/Sezary syndrome with generalized tumor lesions as a “Preferred Regimen” in combination with skin-directed therapy.^{2,3} NCCN also recommends Lymphir for the primary and subsequent treatment of stage IB to IIA and stage III mycosis fungoides/Sezary syndrome as “Useful in Certain Circumstances” in combination with skin-directed therapy and as “Useful in Certain Circumstances” for stage IIB with limited tumor lesions with or without skin-directed therapy. All recommendations are category 2A.

Safety

Lymphir has a Boxed Warning for capillary leak syndrome, including life-threatening or fatal reactions.¹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lymphir. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Lymphir as well as the monitoring required for adverse events and long-term efficacy, approval requires Lymphir to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lymphir is recommended in those who meet the following criteria:

FDA-Approved Indication

39. Cutaneous T-Cell Lymphoma. Approve for one year if the patient meets ALL of the following (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

10/23/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- B) Patient has Stage I to III disease; AND
- C) Serum albumin is ≥ 3 g/dL; AND
- D) Medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lymphir is not recommended in the following situations:

- 51. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

- 197. Lymphir intravenous infusion [prescribing information]. Cranford, NJ: Citius Pharmaceuticals; August 2024.

- 199. The NCCN Primary Cutaneous Lymphoma Clinical Practice Guidelines in Oncology (version 3.2024 – August 22, 2024). © 2024 National Comprehensive Cancer Network. Available at: <http://www.nccn.org>. Accessed October 15, 2024.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Margenza Prior Authorization Policy

- Margenza® (margetuximab-cmbk intravenous infusion – MacroGenics)

REVIEW DATE: 02/28/2024

OVERVIEW

Margenza, a human epidermal growth factor receptor 2 (HER2)/neu receptor antagonist, in combination with chemotherapy, is indicated for the treatment of metastatic human epidermal growth factor receptor 2 **(HER2)-positive breast cancer** in adults who have received two or more prior anti-HER2 regimens, at least one of which was for metastatic disease.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 1.2024 – January 25, 2024) recommend Margenza (category 2A) as a fourth-line and beyond treatment for recurrent unresectable (local or regional) or stage IV disease. Margenza should be used in combination with chemotherapy (capecitabine, eribulin, gemcitabine, or vinorelbine). Other fourth-line and beyond therapies include trastuzumab + docetaxel or vinorelbine; trastuzumab + paclitaxel ± carboplatin; capecitabine + trastuzumab or lapatinib; trastuzumab + lapatinib (without cytotoxic therapy); trastuzumab + other chemotherapy agents; and Nerlynx® (neratinib tablets) + capecitabine (all category 2A). NCCN recommends the following therapies as first-line: Perjeta® (pertuzumab intravenous infusion) + trastuzumab + docetaxel (category 1; Preferred); and Perjeta + trastuzumab + paclitaxel (category 2A; Preferred). Enhertu® (fam-trastuzumab deruxtecan-nxki intravenous infusion) is the recommended therapy for second-line use (category 1; Preferred). Recommended third-line therapies are Tukysa® (tucatinib tablets) + trastuzumab + capecitabine (category 1; Preferred) or Kadcyla® (ado-trastuzumab emtansine intravenous infusion) [category 2A].

Safety

Margenza has a Boxed Warning regarding left ventricular dysfunction and embryo-fetal toxicity.¹ Margenza may lead to reductions in left ventricular ejection fraction; treatment should be discontinued for a confirmed clinically significant decrease in left ventricular function. Exposure to Margenza during pregnancy can cause embryo-fetal harm; patients should be advised of the risk and need for effective contraception.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Margenza. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Margenza as well as the monitoring required for adverse events and long-term efficacy, approval requires Margenza to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

02/28/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Margenza is recommended in those who meet the following criteria:

FDA-Approved Indication

8. Breast Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, F, and G):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has recurrent or metastatic disease; AND
- C) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - D) Patient has tried at least three prior anti-HER2 regimens; AND
Note: Some examples of anti-HER2 regimens are Perjeta (pertuzumab intravenous infusion) + trastuzumab + docetaxel, Perjeta + trastuzumab + paclitaxel; Kadcyla (ado-trastuzumab emtansine intravenous infusion), Enhertu (fam-trastuzumab deruxtecan-nxki intravenous infusion), Tukysa (tucatinib tablets) + trastuzumab + capecitabine, trastuzumab + lapatinib, trastuzumab + docetaxel, trastuzumab + vinorelbine, Nerlynx (neratinib tablets) + capecitabine.
 - E) At least one of the prior anti-HER2 regimens was used for metastatic disease; AND
 - F) The medication is used in combination with chemotherapy; AND
Note: Examples of chemotherapy are capecitabine, eribulin, gemcitabine, vinorelbine.
 - G) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Margenza is not recommended in the following situations:

- 4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Monjuvi Prior Authorization Policy

- Monjuvi® (tafasitamab-cxix intravenous infusion – MorphoSys/Incyte)

REVIEW DATE: 09/04/2024

OVERVIEW

Monjuvi, a CD19-directed antibody-drug conjugate, is indicated in combination with lenalidomide for the treatment of relapsed or refractory **diffuse large B-cell lymphoma** (DLBCL) not otherwise specified, including DLBCL arising from low grade lymphoma, and who are not eligible for autologous stem cell transplant in adults.¹

Dosing Information

Monjuvi is administered as a weight-based intravenous infusion.¹ It should be given in combination with lenalidomide for a maximum of 12 cycles, then as monotherapy until disease progression or unacceptable toxicity.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for B-cell lymphomas (version 3.2024 – August 26, 2024) include Monjuvi + lenalidomide among the alternatives for second-line and subsequent therapy of DLBCL, histologic transformation of indolent lymphomas to DLBCL, human immunodeficiency virus (HIV)-related B-cell lymphoma, post-transplant lymphoproliferative disorders, and high-grade B-cell lymphoma.^{2,3} NCCN also notes that it is unclear if Monjuvi would have a negative impact on the efficacy of subsequent anti-CD19 CAR T-cell therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Monjuvi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Monjuvi as well as the monitoring required for adverse events and long-term efficacy, approval requires Monjuvi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Monjuvi is recommended in those who meet one of the following criteria:

FDA-Approved Indication

- 40. Diffuse Large B-Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has been treated with at least one prior chemotherapy regimen; AND
 - C)** According to the prescriber, the patient is not eligible for autologous stem cell transplant; AND
 - D)** Patient meets ONE of the following (i or ii):

09/04/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- i. Monjuvi will be used in combination with Revlimid (lenalidomide capsules); OR
 - ii. Patient has already received 12 cycles of Monjuvi; AND
- E) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

41. B-Cell Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
Note: Examples include high-grade B-cell lymphoma, HIV-related B-cell lymphoma, post-transplant lymphoproliferative disorders, histologic transformation of indolent lymphomas to diffuse large B-cell lymphoma.

G) Patient is ≥ 18 years of age; AND

H) Patient has been treated with at least one prior chemotherapy regimen; AND

Note: Examples of chemotherapy regimens include CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) plus rituximab or Gazyva (obinutuzumab intravenous infusion), CVP (cyclophosphamide, vincristine, prednisone) plus rituximab or Gazyva, or lenalidomide plus rituximab.

I) According to the prescriber, the patient is not eligible for autologous stem cell transplant; AND

J) Patient meets ONE of the following (i or ii):

- i. Monjuvi will be used in combination with Revlimid (lenalidomide capsules); OR

- ii. Patient has already received 12 cycles of Monjuvi; AND

K) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Monjuvi is not recommended in the following situations:

52. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Mylotarg Prior Authorization Policy

- Mylotarg™ (gemtuzumab ozogamicin intravenous infusion – Pfizer)

REVIEW DATE: 07/17/2024

OVERVIEW

Mylotarg, an antibody-drug conjugate directed towards the CD33 antigen, is indicated for the following:¹

- **CD33-positive acute myeloid leukemia (AML)**, newly diagnosed, in adults and pediatric patients ≥ 1 month of age; AND
- **CD33-positive AML**, relapsed or refractory, in adults and in pediatric patients ≥ 2 years of age.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for **AML** (version 3.2024 – May 17, 2024) recommend Mylotarg for induction therapy, post-remission therapy, and for relapsed/refractory CD33-positive AML.^{2,3} Mylotarg can be used as a single agent or in combination with cytarabine and daunorubicin. The NCCN guidelines for AML also recommend Mylotarg in patients ≥ 18 years of age for induction and consolidation therapy for acute promyelocytic leukemia, and for relapsed disease. Mylotarg can be used in combination with tretinoin and/or arsenic trioxide.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Mylotarg. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Mylotarg as well as the monitoring required for adverse events and long-term efficacy, approval requires Mylotarg to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mylotarg is recommended in those who meet one of the following criteria:

FDA-Approved Indication

- 38. Acute Myeloid Leukemia.** Approve for the duration noted if the patient meets ONE of the following (A or B):
- L) Newly diagnosed CD33-positive disease:** Approve for 1 year if the patient meets BOTH of the following (i and ii):
- i. Patient is ≥ 1 month of age; AND
 - ii. Mylotarg is prescribed by or in consultation with an oncologist; OR
- M) Relapsed or refractory CD33-positive disease:** Approve for 1 month if the patient meets BOTH of the following (i and ii):
- i. Patient is ≥ 2 years of age; AND
 - ii. Mylotarg is prescribed by or in consultation with an oncologist.

07/17/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Other Uses with Supportive Evidence

39. Acute Promyelocytic Leukemia. Approve for 6 months if the patient meets BOTH of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Mylotarg is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mylotarg is not recommended in the following situations:

53. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Oncaspar Prior Authorization Policy

- Oncaspar® (pegaspargase intramuscular or intravenous injection – Servier)

REVIEW DATE: 06/05/2024

OVERVIEW

Oncaspar a conjugate of *Escherichia coli*-derived L-asparaginase and monomethoxypolyethylene glycol (mPEG), is indicated as a component of a multi-agent chemotherapy regimen for first-line treatment of **acute lymphoblastic leukemia (ALL)** in pediatric and adult patients and patients with ALL with hypersensitivity to asparaginase.¹

Guidelines

Oncaspar is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **ALL:** The NCCN guidelines for **ALL** (version 4.2023 – February 5, 2024) and for **Pediatric ALL** (version 5.2024 – April 3, 2024) recommend pegaspargase as a component of a multi-agent chemotherapeutic regimen for induction/consolidation therapy for ALL, for induction therapy in Philadelphia chromosome-negative ALL in patients ≥ 65 years of age, for relapsed/refractory Philadelphia chromosome-negative ALL, and relapsed/refractory Philadelphia chromosome-positive ALL.^{2,3,5}
- **T-Cell Lymphomas:** The NCCN guidelines (version 4.2024 – May 28, 2024) recommend pegaspargase as a component of therapy for extranodal NK/T-cell lymphoma.^{3,4}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Oncaspar. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Oncaspar as well as the monitoring required for adverse events and long-term efficacy, approval requires Oncaspar to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Oncaspar is recommended in those who meet one of the following criteria:

FDA-Approved Indication

- 42. Acute Lymphoblastic Leukemia.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 1 month of age; AND
 - B) Oncaspar is prescribed by or consultation with an oncologist.

Other Uses with Supportive Evidence

06/05/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- 43. Extranodal NK/T-cell Lymphoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 8 years of age; AND
 - B) Oncaspar is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Oncaspar is not recommended in the following situations:

- 54.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Onivyde Prior Authorization Policy

- Onivyde® (irinotecan liposome intravenous infusion – Ipsen)

REVIEW DATE: 02/28/2024

OVERVIEW

Onivyde, a topoisomerase inhibitor, is indicated for the treatment of **metastatic pancreatic adenocarcinoma**.¹

- In combination with fluorouracil and leucovorin in adults after disease progression following gemcitabine-based therapy.
- In combination with oxaliplatin, fluorouracil, and leucovorin for first-line treatment of adults.

Limitation of use: Onivyde is not indicated as a single agent for the treatment of patients with metastatic pancreatic adenocarcinoma.

Guidelines

The National Comprehensive Cancer Network has addressed Onivyde for the following indications:

- **Ampullary adenocarcinoma:** Clinical practice guidelines (version 1.2024 – December 13, 2023) recommend Onivyde, in combination with fluorouracil and leucovorin, for the subsequent treatment of disease progression in patients with pancreatobiliary and mixed type disease with good performance status (defined as Eastern Cooperative Oncology Group [ECOG] performance status of 0 or 1, good biliary drainage, and adequate nutritional intake) [category 2A].^{3,4}
- **Biliary tract cancers:** Clinical practice guidelines (version 3.2023 – November 8, 2023) recommend Onivyde in combination with fluorouracil and leucovorin for the subsequent treatment of unresectable, resected gross residual, or metastatic biliary tract cancers (category 2B).^{3,5}
- **Pancreatic adenocarcinoma:** Clinical practice guidelines (version 1.2024 – December 13, 2023) recommend Onivyde, in combination with fluorouracil and leucovorin, for the first-line and subsequent treatment of locally advanced (category 2A), or metastatic (category 1) pancreatic adenocarcinoma in patients with ECOG performance status of 0 to 2.^{2,3}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Onivyde. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Onivyde as well as the monitoring required for adverse events and long-term efficacy, approval requires Onivyde to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Onivyde is recommended in those who meet one of the following criteria:

FDA-Approved Indication

02/28/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

44. Pancreatic Adenocarcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has locally advanced or metastatic disease; AND
- C) Onivyde will be used in combination with fluorouracil and leucovorin; AND
- D) Onivyde is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

45. Ampullary Adenocarcinoma. Approve for 1 year if the patient meets the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has tried at least ONE of the following chemotherapy regimens (i, ii, or iii):
 - i. Gemcitabine-based therapy; OR
 - ii. Fluoropyrimidine-based therapy, if no prior irinotecan; OR
 - iii. Oxaliplatin-based therapy, if no prior irinotecan; AND
- C) Onivyde will be used in combination with fluorouracil and leucovorin; AND
- D) Onivyde is prescribed by or in consultation with an oncologist.

46. Biliary Tract Cancer. Approve for 1 year if the patient meets the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has ONE of the following (i, ii, or iii):
 - i. Gallbladder cancer; OR
 - ii. Extrahepatic cholangiocarcinoma; OR
 - iii. Intrahepatic cholangiocarcinoma; AND
- C) Patient has disease progression on or after systemic therapy; AND
Note: Examples of systemic therapy include gemcitabine, cisplatin, fluorouracil, and capecitabine.
- D) Onivyde is used in combination with fluorouracil and leucovorin; AND
- E) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage for Onivyde is not recommended in the following situations:

- 55. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Padcev Prior Authorization Policy

- Padcev® (enfortumab vedotin-ejfv intravenous infusion – Astellas and Seagen)

REVIEW DATE: 01/10/2024

OVERVIEW

Padcev, an antibody-drug conjugate, is indicated for the treatment of locally advanced or metastatic **urothelial cancer** in adults who:¹

- Have previously received a programmed death receptor-1 (PD-1) or programmed death-ligand 1 (PD-L1) inhibitor, and platinum-containing chemotherapy, as a single agent.
- Are ineligible for cisplatin-containing chemotherapy and have previously received $\geq$ one prior line of therapy, as a single agent.
- In combination with Keytruda® (pembrolizumab intravenous infusion).

Guidelines

The National Comprehensive Cancer Network (NCCN) **bladder cancer** clinical practice guidelines (version 3.2023 – May 25, 2023) recommend Padcev for the subsequent treatment of locally advanced or metastatic urothelial carcinoma of the bladder, upper genitourinary tract, prostate, and urethra.^{2,3} Patients should have previously received platinum-containing chemotherapy, a checkpoint inhibitor, platinum-containing chemotherapy plus a checkpoint inhibitor, or first-line therapy with agents other than platinum or a checkpoint inhibitor. In addition, NCCN recommends Padcev, in combination with Keytruda, for the first-line and subsequent treatment of locally advanced or metastatic urothelial carcinoma of the bladder, upper genitourinary tract, prostate, and urethra.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Padcev. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Padcev as well as the monitoring required for adverse events and long-term efficacy, approval requires Padcev to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Padcev is recommended in those who meet the following criteria:

FDA-Approved Indication

- 47. Urothelial Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is $\geq$ 18 years of age; AND
 - B) Patient has locally advanced or metastatic disease; AND
 - C) Patient meets ONE of the following (i or ii):
 - i. Patient meets BOTH of the following (a and b):

01/10/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- a) Padcev is used as first-line therapy; AND
- b) Padcev is used in combination with Keytruda (pembrolizumab intravenous infusion); OR
- ii. Padcev is used as subsequent therapy; AND
- D) Padcev is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Padcev is not recommended in the following situations:

- 56. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Perjeta Prior Authorization Policy

- Perjeta® (pertuzumab intravenous infusion –Genentech)

REVIEW DATE: 08/07/2024

OVERVIEW

Perjeta, a human epidermal growth factor receptor 2 (HER2) antagonist, is indicated for the treatment of **HER2-positive breast cancer** for the following uses:¹

- **Adjuvant treatment**, of patients with early disease at high risk of recurrence, in combination with trastuzumab and chemotherapy.
- **Metastatic disease**, in combination with trastuzumab and docetaxel in patients who have not received prior anti-HER2 therapy or chemotherapy for metastatic disease.
- **Neoadjuvant treatment**, of patients with locally advanced, inflammatory, or early stage disease (either greater than 2 cm in diameter or node positive) as part of a complete treatment regimen for early breast cancer, in combination with trastuzumab and chemotherapy.

Guidelines

Perjeta is discussed in the guidelines from the National Comprehensive Cancer Network (NCCN):

- **Breast Cancer:** NCCN guidelines (version 4.2024 – July 3, 2024) recommend Perjeta in the preoperative/adjuvant and metastatic setting.^{2,3} For preoperative (neoadjuvant)/adjuvant therapy in HER2-positive disease, docetaxel + carboplatin + trastuzumab + Perjeta is a “Preferred Regimen” (category 1); doxorubicin + cyclophosphamide followed by paclitaxel + trastuzumab and Perjeta is recommended as “Useful in Certain Circumstances” (category 2A). Under “Other Recommended Regimens”, doxorubicin + cyclophosphamide followed by docetaxel + trastuzumab + Perjeta is also listed (category 2A). In the neoadjuvant/adjuvant setting, the chemotherapy agents in combination with trastuzumab + Perjeta are administered for usually four cycles, followed by trastuzumab ± Perjeta to complete 1 year of therapy. If no residual disease after preoperative therapy or no preoperative therapy, the guidelines recommends to complete up to one year of HER2 targeted therapy with trastuzumab ± Perjeta after completing planned chemotherapy regimen course. In the metastatic setting, the “Preferred Regimens” are Perjeta + trastuzumab + docetaxel (category 1) or Perjeta + trastuzumab + paclitaxel (category 2A). In this setting, chemotherapy + trastuzumab + Perjeta is continued until disease progression or unmanageable toxicity. It is noted in a footnote that maintenance trastuzumab/pertuzumab after response can be given, with concurrent endocrine therapy if estrogen receptor-positive and HER2+ metastatic disease. Under additional considerations, it is noted that patients previously treated with chemotherapy plus trastuzumab in the absence of pertuzumab in the metastatic setting may be considered for one line of therapy including both trastuzumab + pertuzumab in combination with or without cytotoxic chemotherapy. Due to these recommendations, the use of Phesgo in metastatic breast cancer setting has been simplified.
- **Colon Cancer/Rectal Cancer:** NCCN guidelines (version 4.2024 – July 3, 2024) for colon cancer and rectal cancer (version 3.2024 – July 3, 2024) recommend use of Perjeta + trastuzumab in patients with HER2-amplified, *RAS* and *BRAF* wild-type, colon and rectal cancer.³⁻⁵ Perjeta is recommended for use in a variety of therapy settings (e.g., adjuvant therapy, primary treatment, subsequent therapy) + trastuzumab, in patients who are not appropriate for intensive therapy and with no previous treatment with a HER2 inhibitor. It is a category 2A recommendation for primary and subsequent therapy settings; category 2B recommendation for adjuvant therapy.

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Head and Neck Cancers:** NCCN guidelines (version 4.2024 – May 1, 2024) recommend Perjeta + trastuzumab as a systemic therapy option for recurrent, unresectable, or metastatic salivary gland tumors, under “Useful in Certain Circumstances”, for HER2 positive tumors (category 2A).^{3,6}
- **Biliary Tract Cancers:** NCCN guidelines (version 3.2024 – July 2, 2024) recommend Perjeta + trastuzumab as subsequent treatment for biliary tract cancers for progression on or after systemic treatment for unresectable or metastatic disease that is HER2-positive as “Useful in Certain Circumstances” (category 2A).⁷

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Perjeta. All approvals are provided for the duration noted below. Because of the specialized skills required for the evaluation and diagnosis of patients treated with Perjeta, as well as the monitoring required for the adverse events and long-term efficacy, approval requires Perjeta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Perjeta is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 9. Breast Cancer – Neoadjuvant or Adjuvant Therapy.** Approve for 1 year (total) if the patient meets ALL of the following (A, B, C, D, and E):

 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - C) Patient meets ONE of the following (i or ii):
 - i. The medication will be used in combination with chemotherapy; OR
Note: Examples of chemotherapy include doxorubicin, cyclophosphamide, docetaxel, paclitaxel, carboplatin.
 - ii. The medication is continued after chemotherapy to complete 1 year of neoadjuvant or adjuvant therapy; AND
 - D) The medication will be used in combination with a trastuzumab product; AND
 - E) The medication is prescribed by or in consultation with an oncologist.
- 2. Breast Cancer – Metastatic Disease.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - C) The medication will be used in combination with trastuzumab; AND
 - D) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

3. **Biliary Tract Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - C) Patient has tried at least one systemic chemotherapy regimen; AND
Note: Examples of a systemic chemotherapy regimen include: gemcitabine and cisplatin; Imfinzi (durvalumab intravenous infusion) and gemcitabine, 5-fluorouracil and oxaliplatin, capecitabine and oxaliplatin, gemcitabine and cisplatin.
 - D) The medication will be used in combination with a trastuzumab product; AND
 - E) The medication is prescribed by or in consultation with an oncologist.
4. **Colon or Rectal Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - C) The medication is used in combination with trastuzumab; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
5. **Salivary Gland Tumor.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has recurrent, unresectable, or metastatic disease; AND
 - C) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - D) The medication is used in combination with trastuzumab; AND
 - E) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Perjeta is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Phesgo Prior Authorization Policy

- Phesgo® (pertuzumab, trastuzumab, and hyaluronidase-zzxf subcutaneous injection – Genentech)

REVIEW DATE: 08/07/2024

OVERVIEW

Phesgo, a combination of pertuzumab, trastuzumab, and hyaluronidase-zzxf, is indicated for the following uses:¹

- **Early breast cancer**, for use in combination with chemotherapy for the neoadjuvant treatment of adults with human epidermal growth factor receptor 2 (HER2)-positive, locally advanced, inflammatory, or early stage breast cancer (either > 2 cm in diameter or node positive) as part of a complete treatment regimen for early breast cancer. It is also indicated for the adjuvant treatment of adults with HER2-positive early breast cancer at high risk of recurrence.
- **Metastatic breast cancer**, for use in combination with docetaxel for the treatment of adults with HER2-positive disease who have not received prior anti-HER2 therapy or chemotherapy for metastatic disease.

Patients should be selected for therapy based on an FDA-approved companion diagnostic test.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for **breast cancer** (version 4.2024 – July 3, 2024) note that Phesgo may be substituted anywhere that the combination of Perjeta® (pertuzumab intravenous [IV] infusion) and trastuzumab IV are given as part of systemic therapy.² The guidelines note that Phesgo has different dosing and administration instructions compared with the IV products. For preoperative (neoadjuvant)/adjuvant therapy in HER2-positive disease, docetaxel + carboplatin + trastuzumab + Perjeta is a preferred regimen (category 2A). There are also other chemotherapy regimens listed that are used with trastuzumab + Perjeta. In the neoadjuvant/adjuvant setting, HER-2 targeted therapy is given for up to 1 year. In the recurrent unresectable (local or regional) or metastatic setting, the “Preferred Regimens” are Perjeta + trastuzumab + docetaxel (category 1) or Perjeta + trastuzumab + paclitaxel (category 2A). In this setting, chemotherapy + trastuzumab + Perjeta is continued until disease progression or unmanageable toxicity. It is noted in a footnote that maintenance trastuzumab/pertuzumab after response can be given, with concurrent endocrine therapy if estrogen receptor-positive and HER2+ metastatic disease. Under additional considerations, it is noted that patients previously treated with chemotherapy plus trastuzumab in the absence of pertuzumab in the metastatic setting may be considered for one line of therapy including both trastuzumab + pertuzumab in combination with or without cytotoxic chemotherapy. Due to these recommendations, the use of Phesgo in metastatic breast cancer setting has been simplified.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Phesgo. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Phesgo, as well as the monitoring required for adverse events and long-term efficacy, approval requires Phesgo to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Phesgo is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 10. Breast Cancer – Neoadjuvant or Adjuvant Therapy.** Approve for 1 year (total) if the patient meets ALL of the following (A, B, C, and D):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - C)** Patient meets ONE of the following (i or ii):
 - i.** The medication will be used in combination with chemotherapy; OR
Note: Examples of chemotherapy are doxorubicin, cyclophosphamide, docetaxel, paclitaxel, carboplatin.
 - ii.** The medication is continued after chemotherapy to complete 1 year of neoadjuvant or adjuvant therapy; AND
 - D)** The medication is prescribed by or in consultation with an oncologist.
- 2. Breast Cancer – Metastatic Disease.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - C)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Phesgo is not recommended in the following situations:

- 5.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Polivy Prior Authorization Policy

- Polivy® (polatuzumab vedotin-piiq intravenous infusion – Genentech)

REVIEW DATE: 06/26/2024

OVERVIEW

Polivy, a CD79b-directed antibody-drug conjugate, is indicated:¹

- For the treatment of relapsed or refractory **diffuse large B-cell lymphoma** (DLBCL), not otherwise specified, in combination with bendamustine and a rituximab product in adults after at least two prior therapies.
- For previously untreated **DLBCL**, not otherwise specified or **high-grade B-cell lymphoma**, in combination with a rituximab product, cyclophosphamide, doxorubicin, and prednisone (R-CHP) in adults with an International Prognostic Index (IPI) score of ≥ 2 .

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on **B-Cell Lymphomas** (version 2.2024 – April 30, 2024) recommend Polivy for the second-line or subsequent treatment of DLBCL, follicular lymphoma, histologic transformation of indolent lymphoma to DLBCL, HIV-related B-cell lymphoma, post-transplant lymphoproliferative disorders, and high-grade B-cell lymphoma.^{2,3} In addition, NCCN recommends Polivy for the first-line treatment of DLBCL in combination with R-CHP for patients with IPI ≥ 2 .

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Polivy. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Polivy as well as the monitoring required for adverse events and long-term efficacy, approval requires Polivy to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Polivy is recommended in those who meet one of the following:

FDA-Approved Indications

48. Diffuse Large B-Cell Lymphoma. Approve for 6 months if the patient meets ALL of the following (A, B, and C):

Note: Includes histologic transformation of indolent lymphomas to diffuse large B-cell lymphoma.

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i or ii):

i. Patient meets BOTH of the following (a and b):

a) Patient has an International Prognostic Index score of ≥ 2 ; AND

b) Polivy is used as first-line therapy; OR

06/26/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- ii. Patient has been treated with at least one prior chemotherapy regimen; AND
Note: Examples of chemotherapy regimens include RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone) and dose-adjusted EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin) plus rituximab.

C) Polivy is prescribed by or in consultation with an oncologist.

49. High-Grade B-Cell Lymphoma. Approve for 6 months if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i or ii):

i. Patient meets BOTH of the following (a and b):

a) Patient has an International Prognostic Index score of ≥ 2 ; AND

b) Polivy is used as first-line therapy; OR

ii. Patient has been treated with at least one prior chemotherapy regimen; AND

Note: Examples of chemotherapy regimens include RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone) and dose-adjusted EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin) plus rituximab.

C) Polivy is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

50. B-Cell Lymphoma. Approve for 6 months if the patient meets ALL of the following (A, B, and C):

Note: Examples include HIV-related B-cell lymphoma and post-transplant lymphoproliferative disorders.

A) Patient is ≥ 18 years of age; AND

B) Patient has been treated with at least one prior chemotherapy regimen; AND

Note: Examples of chemotherapy regimens include CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) plus rituximab or Gazyva (obinutuzumab intravenous infusion), CVP (cyclophosphamide, vincristine, prednisone) plus rituximab or Gazyva, or lenalidomide plus rituximab.

C) Polivy is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Polivy is not recommended in the following situations:

57. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Portrazza Prior Authorization Policy

- Portrazza® (necitumumab intravenous infusion – Eli Lilly)

REVIEW DATE: 01/24/2024

OVERVIEW

Portrazza is indicated for the first-line treatment of **metastatic squamous non-small cell lung cancer** (NSCLC) in combination with gemcitabine and cisplatin.¹ It has a limitation of use noted that it is not indicated for the treatment of non-squamous NSCLC.

Guidelines

The National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 1.2024 – December 21, 2023) no longer address Portrazza in the treatment algorithms. In the discussion section, it is noted that the NCCN Panel feels the addition of Portrazza to gemcitabine and cisplatin is not beneficial based on toxicity, cost, and limited improvement in efficacy when compared with cisplatin/gemcitabine alone.²

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Portrazza. Because of the specialized skills required for evaluation and diagnosis of patients treated with Portrazza as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Portrazza is recommended in those who meet the following criteria:

FDA-Approved Indication

42. Non-Small Cell Lung Cancer (NSCLC). Approve for 1 year if the patient meets the following (A, B, and C):

A) Patient has metastatic squamous NSCLC; AND

B) Portrazza will be used in combination with chemotherapy; AND

Note: Examples of chemotherapy are gemcitabine, cisplatin.

C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Portrazza is not recommended in the following situations:

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Poteligeo Prior Authorization Policy

- Poteligeo® (mogamulizumab-kpkc intravenous infusion – Kyowa Kirin)

REVIEW DATE: 09/04/2024

OVERVIEW

Poteligeo, a CC chemokine receptor 4 (CCR4)-directed monoclonal antibody, is indicated for the treatment of relapsed or refractory **mycosis fungoides** or **Sézary syndrome** in adults after at least one prior systemic therapy.¹

GUIDELINES

Poteligeo is addressed in the National Comprehensive Cancer Network (NCCN) guidelines:

- **Primary Cutaneous Lymphomas:** Guidelines (version 3.2024 – August 22, 2024) recommend Poteligeo for primary treatment and for treatment of relapsed/refractory mycosis fungoides/Sézary syndrome.^{2,3}
- **T-Cell Lymphomas:** Guidelines (version 4.2024 – May 28, 2024) recommend Poteligeo as a single agent for the second-line or subsequent treatment of relapsed/refractory adult T-cell leukemia/lymphoma; chronic high-risk, acute or lymphoma subtypes.^{3,4}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Poteligeo. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Poteligeo as well as the monitoring required for adverse events and long-term efficacy, approval requires Poteligeo to be prescribed by, or in consultation with, a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Poteligeo is recommended in those who meet one of the following criteria:

FDA-Approved Indication

3. **Mycosis Fungoides/Sézary Syndrome.** Approve for 1 year if Poteligeo is prescribed by or in consultation with an oncologist or dermatologist.

Other Uses With Supportive Evidence

4. **Adult T-cell Leukemia/Lymphoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient has relapsed or refractory disease; AND
 - B) Poteligeo is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

09/04/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Coverage of Poteligeo is not recommended in the following situations:

10. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Pralatrexate Products Prior Authorization Policy

- Folutyn® (pralatrexate intravenous infusion – Spectrum, generic)

REVIEW DATE: 06/05/2024

OVERVIEW

Folutyn, a dihydrofolate reductase inhibitor, is indicated for the treatment of relapsed or refractory **peripheral T-cell lymphoma**.¹ This indication is based on overall response rate. Continued approval for this indication may be contingent on verification and description of clinical benefit in a confirmatory trial.

Guidelines

Pralatrexate is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **Primary Cutaneous Lymphomas:** The NCCN clinical practice guidelines (version 2.2024 – May 6, 2024) recommend pralatrexate as systemic therapy for mycosis fungoides/Sezary syndrome with or without skin-directed therapy and as a single agent for primary cutaneous CD30+ T-cell lymphoproliferative disorders.^{2,3}
- **T-Cell Lymphomas:** The NCCN clinical practice guidelines (version 4.2024 – May 28, 2024) recommend pralatrexate as a single agent for the second-line or subsequent therapy of relapsed or refractory peripheral T-cell lymphomas including anaplastic large cell lymphoma, peripheral T-cell lymphoma not otherwise specified, angioimmunoblastic T-cell lymphoma, enteropathy-associated T-cell lymphoma, monomorphic epitheliotropic intestinal T-cell lymphoma, and nodal peripheral T-cell lymphoma with T-follicular helper phenotype; breast implant-associated anaplastic large cell lymphoma; adult T-cell leukemia/lymphoma; extranodal NK/T-cell lymphoma; and hepatosplenic T-cell lymphoma.^{3,4}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of pralatrexate. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with pralatrexate as well as the monitoring required for adverse events and long-term efficacy, approval requires pralatrexate to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of pralatrexate is recommended in those who meet one of the following criteria:

FDA-Approved Indication

51. T-Cell Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
Note: Examples of peripheral T-cell lymphoma include anaplastic large cell lymphoma, enteropathy-associated T-cell lymphoma, monomorphic epitheliotropic intestinal T-cell lymphoma, angioimmunoblastic T-cell lymphoma, peripheral T-cell lymphoma not otherwise specified.

A) Patient is ≥ 18 years of age; **AND**

06/05/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- B) Patient has peripheral disease; AND
- C) Patient has relapsed or refractory disease; AND
- D) The medication is used as a single agent; AND
- E) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

- 52. Adult T-Cell Leukemia/Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has acute or lymphoma subtype; AND
 - C) The medication is used as second-line or subsequent therapy; AND
 - D) The medication is used as a single agent; AND
 - E) The medication is prescribed by or in consultation with an oncologist.
- 53. Breast Implant-Associated Anaplastic Large Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed or refractory disease; AND
 - C) The medication is used as a single agent; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
- 54. Cutaneous CD30+ T-Cell Lymphoproliferative Disorders.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has ONE of the following diagnoses (i or ii):
 - i. Primary cutaneous anaplastic large cell lymphoma with multifocal lesions; OR
 - ii. Cutaneous anaplastic large cell lymphoma with regional nodes; AND
 - C) The medication is used as a single agent; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
- 55. Extranodal NK/T-Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed/refractory disease following combination, asparaginase-based chemotherapy; AND
 - C) The medication is used as a single agent; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
- 56. Hepatosplenic T-Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) The medication is used as second-line or subsequent therapy; AND
 - C) The medication is used as a single agent; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
- 57. Mycosis Fungoides/Sezary Syndrome.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) The medication is prescribed by or in consultation with an oncologist or dermatologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of pralatrexate is not recommended in the following situations:

58. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Proleukin Prior Authorization Policy

- Proleukin® (aldesleukin intravenous infusion – Prometheus Laboratories)

REVIEW DATE: 01/17/2024

OVERVIEW

Proleukin, a human recombinant interleukin-2 product, is indicated for the following:¹

- **Metastatic melanoma**, in adults.
- **Metastatic renal cell carcinoma**, in adults.

Guidelines

Proleukin is addressed in the following National Comprehensive Cancer Network guidelines:

- **Cutaneous melanoma** (version 3.2023 – October 27, 2023) clinical practice guidelines recommend Proleukin for unresectable or metastatic disease as a single agent for second-line or subsequent therapy for disease progression or after maximum clinical benefit from BRAF targeted therapy (category 2A).^{2,4} Proleukin may be considered for patients with small brain tumors and without significant peritumoral edema (category 2B) or for intralesional therapy as primary or second-line treatment of unresectable stage III disease with clinical or satellite/in-transit metastases, or local satellite/in-transit recurrence (category 2B).
- **Hematopoietic cell transplantation** (version 3.2023 – October 9, 2023) clinical practice guidelines recommend Proleukin as additional therapy, in combination with systemic corticosteroids, for steroid-refractory chronic graft-vs-host disease.^{2,5}
- **Kidney cancer** (version 2.2024 – January 3, 2024) clinical practice guidelines recommend Proleukin as a single agent for first-line (category 2B) and subsequent (category 2B) therapy for patients with relapsed or stage IV disease and clear cell histology.^{2,3}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Proleukin. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Proleukin as well as the monitoring required for adverse events and long-term efficacy, approval requires Proleukin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Proleukin is recommended in those who meet one of the following criteria:

FDA-Approved Indications

58. Cutaneous Melanoma. Approve for 1 year if the patient meets ONE of the following (A or B):

A) Intravenous Therapy. Approve if the patient meets the following (i, ii, iii, iv, and v):

- i. Patient is ≥ 18 years of age; AND
- ii. Patient has metastatic or unresectable disease; AND

01/17/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- iii. Patient has tried at least one other systemic therapy; AND
- iv. Proleukin will be used as a single agent; AND
- v. Proleukin is prescribed by or in consultation with an oncologist.
- B) Intralesional Therapy. Approve if the patient meets the following (i, ii, and iii):
 - i. Patient is ≥ 18 years of age; AND
 - ii. Proleukin will be directly injected into metastatic, recurrent, or unresectable cutaneous, subcutaneous, or nodal lesions; AND
 - iii. The medication is prescribed by or in consultation with an oncologist or dermatologist.

59. Kidney Cancer. Approve for 1 year if the patient meets the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has relapsed or metastatic disease; AND
- C) Patient has clear cell histology; AND
- D) Proleukin will be used as a single agent; AND
- E) Proleukin is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

60. Graft-Versus-Host Disease. Approve for 1 year if the patient meets the following (A, B, C, and D):

- A) Patient has chronic graft-versus-host disease; AND
- B) According to the prescriber, the patient has steroid-refractory disease; AND
- C) Proleukin will be used in combination with systemic corticosteroids; AND
- D) Proleukin will be prescribed by or in consultation with an oncologist or a physician associated with a transplant center.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Proleukin is not recommended in the following situations:

- 59.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Rituxan Hycela Prior Authorization Policy

- Rituxan Hycela® (rituximab and hyaluronidase human subcutaneous injection – Biogen and Genentech/Roche)

REVIEW DATE: 01/10/2024

OVERVIEW

Rituxan Hycela, a combination of rituximab and hyaluronidase human, is indicated for treatment of adults with the following indications:¹

- **Diffuse large B-cell lymphoma**, in combination with CHOP (cyclophosphamide, doxorubicin, vincristine, and prednisone) or other anthracycline-based chemotherapy regimens in patients with previously untreated disease.
- **Chronic lymphocytic leukemia**, in combination with FC (fludarabine + cyclophosphamide) for previously treated and previously untreated disease.
- **Follicular lymphoma**, as a single agent for relapsed or refractory disease; in previously untreated disease in combination with first-line chemotherapy; as single-agent maintenance therapy in patients achieving a complete or partial response to rituximab + chemotherapy; and as a single agent after first-line CVP (cyclophosphamide, vincristine, and prednisone) in non-progressing (including stable disease) disease.

Rituxan Hycela contains the identical molecular antibody of rituximab available in Rituxan intravenous, but hyaluronidase has been added to facilitate systemic delivery. Rituxan Hycela should be administered under the care of a healthcare professional with appropriate medical support to manage severe and potentially fatal reactions. The dose of Rituxan Hycela is fixed regardless of the patient's body surface area; dose reductions are not recommended. When given in combination with chemotherapy, reduce the dose of chemotherapeutic drugs to manage adverse events. Rituxan Hycela is not indicated for treatment of non-malignant conditions. Additionally, treatment should only be initiated after receiving at least one full dose of a rituximab product by intravenous infusion.

Guidelines

Rituximab features prominently in the National Comprehensive Cancer Network (NCCN) guidelines for multiple conditions. The following guidelines from NCCN have been updated to list Rituxan Hycela (noted as rituximab + hyaluronidase) in most clinical scenarios when the intravenous formulation is recommended if the patient has received the first full dose with rituximab intravenous.

- **B-cell Lymphomas:** In the guidelines (version 6.2023 – October 10, 2023), rituximab is included in multiple treatment regimens across the spectrum of disease.² For primary cutaneous B-cell lymphomas (version 1.2024 – December 21, 2023), rituximab is a treatment option for patients with primary cutaneous B-cell lymphoma.⁷
- **Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma:** Rituximab features prominently in the guidelines (version 1.2024 – November 03, 2023) and is included in multiple treatment regimens across the spectrum of disease.³
- **Hairy Cell Leukemia:** Guidelines (version 1.2024 – November 03, 2023) recommend rituximab in multiple regimens for relapsed/refractory disease, including in patients with progressive disease after relapsed/refractory therapy.⁴
- **Hodgkin Lymphoma:** Guidelines (version 1.2024 – October 12, 2023) recommend rituximab ± chemotherapy and/or radiation (depending on the clinical presentation) in the first-line setting for

01/10/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

nodular lymphocyte-predominant disease.⁸ Rituximab is also used for relapsed/refractory disease and for maintenance.

- **Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma:** Guidelines (version 2.2024 – December 5, 2023) include rituximab in regimens across the spectrum of disease (primary therapy, previously treated disease, and maintenance).⁵

Safety

There is a higher risk of hypersensitivity and other acute reactions during the first infusion.¹ Therefore, all patients must receive at least one full dose of rituximab intravenous, which allows for management by slowing or stopping the infusion, before receiving Rituxan Hycela. Patients who are unable to complete one full intravenous infusion should continue to receive subsequent cycles with Rituxan intravenous and should not switch to Rituxan Hycela until a full intravenous dose is successfully administered. Safety is otherwise comparable to rituximab intravenous.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rituxan Hycela. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Rituxan Hycela as well as the monitoring required for adverse events and long-term efficacy, approval requires Rituxan Hycela to be prescribed by or in consultation with a physician who specializes in the condition being treated.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rituxan Hycela is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 40. B-Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

Note: Examples of B-cell lymphomas include diffuse large B-cell lymphoma [DLBCL], follicular lymphoma, acquired immune deficiency [AIDS]-related B-cell lymphoma, Burkitt lymphoma, Castleman's disease, marginal zone lymphoma [e.g., extranodal or MALT {gastric or nongastric}, nodal, or splenic marginal zone lymphoma], primary mediastinal large B-cell lymphoma, mantle cell lymphoma, high grade B-cell lymphoma, histologic transformation of indolent lymphoma to DLBCL, post-transplant lymphoproliferative disorders, gray zone lymphoma, primary cutaneous B-cell lymphoma.

- A) Patient is ≥ 18 years of age; AND
 - B) Patient has already received at least one full dose of rituximab intravenous; AND
 - C) Rituxan Hycela is administered under the care of a healthcare professional; AND
 - D) The medication is being prescribed by or in consultation with an oncologist.
- 41. Chronic Lymphocytic Leukemia or Small Lymphocytic Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has already received at least one full dose of rituximab intravenous; AND
 - C) Rituxan Hycela is administered under the care of a healthcare professional; AND
 - D) The medication is being prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

42. Hairy Cell Leukemia. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has relapsed/refractory hairy cell leukemia; AND
- C) Patient has already received at least one full dose of rituximab intravenous; AND
- D) Rituxan Hycela is administered under the care of a healthcare professional; AND
- E) The medication is prescribed by or in consultation with an oncologist.

43. Hodgkin Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has nodular lymphocyte-predominant disease; AND
- C) Patient has already received at least one full dose of rituximab intravenous; AND
- D) Rituxan Hycela is administered under the care of a healthcare professional; AND
- E) The medication is prescribed by or in consultation with an oncologist

44. Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has already received at least one full dose of rituximab intravenous; AND
- C) Rituxan Hycela is administered under the care of a healthcare professional; AND
- D) The medication is being prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rituxan Hycela is not recommended in the following situations:

- 11. Granulomatosis with Polyangiitis (Wegener's granulomatosis) or Microscopic Polyangiitis.** Rituximab intravenous is indicated for treatment of these indications.⁶ Rituxan Hycela has not been evaluated and does not have established dosing in this setting.
- 12. Pemphigus Vulgaris.** Rituximab intravenous is indicated for treatment of pemphigus vulgaris.⁶ Rituxan Hycela has not been evaluated and does not have established dosing for pemphigus vulgaris.
- 13. Rheumatoid Arthritis.** Rituximab intravenous is indicated for treatment of rheumatoid arthritis.⁶ Rituxan Hycela has not been evaluated and does not have established dosing for rheumatoid arthritis.
- 14.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Romidepsin Products Prior Authorization Policy

- Istodax® (romidepsin intravenous infusion – Cellegene, generics)

REVIEW DATE: 06/12/2024

OVERVIEW

Romidepsin, a histone deacetylase inhibitor, is indicated for the treatment of **cutaneous T-cell lymphoma** in patients who have received at least one prior systemic therapy.¹

Guidelines

Romidepsin is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **Primary Cutaneous Lymphomas:** Guidelines (version 2.2024 – May 6, 2024) recommend romidepsin as systemic therapy for mycosis fungoides/Sezary syndrome with or without skin-directed therapy and as a single agent for relapsed or refractory primary cutaneous CD30+ T-cell lymphoproliferative disorders.^{2,3}
- **T-Cell Lymphomas:** Guidelines (version 4.2024 – May 28, 2024) recommend romidepsin as a single agent for the second-line or subsequent therapy of relapsed or refractory peripheral T-cell lymphomas including anaplastic large cell lymphoma; peripheral T-cell lymphoma not otherwise specified, angioimmunoblastic T-cell lymphoma, enteropathy-associated T-cell lymphoma, monomorphic epitheliotropic intestinal T-cell lymphoma, and nodal peripheral T-cell lymphoma with T-follicular helper (TFH) phenotype; follicular T-cell lymphoma; breast implant-associated anaplastic large cell lymphoma; extranodal NK/T-cell lymphoma; and hepatosplenic T-cell lymphoma.^{3,4}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of romidepsin. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with romidepsin as well as the monitoring required for adverse events and long-term efficacy, approval requires romidepsin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of romidepsin is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 61. Cutaneous CD30+ T-Cell Lymphoproliferative Disorders.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed or refractory disease; AND
 - C) Patient has one of the following diagnoses (i or ii):
 - i. Primary cutaneous anaplastic large cell lymphoma with multifocal lesions; OR

06/12/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- ii. Cutaneous anaplastic large cell lymphoma with regional nodes; AND
- D) Romidepsin is used as a single agent; AND
- E) Romidepsin is prescribed by or in consultation with an oncologist.

- 62. Mycosis Fungoides/Sezary Syndrome.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) The medication is prescribed by or in consultation with an oncologist or dermatologist.

Other Uses with Supportive Evidence

- 63. Breast Implant-Associated Anaplastic Large Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed or refractory disease; AND
 - C) Romidepsin is used as a single agent; AND
 - D) Romidepsin is prescribed by or in consultation with an oncologist.

- 64. Extranodal NK/T-Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has relapsed/refractory disease following combination asparaginase-based chemotherapy; AND
- Note: Examples of asparaginase-based chemotherapy include modified SMILE (steroid [dexamethasone], methotrexate, ifosfamide, pegaspargase, and etoposide), P-GEMOX (gemcitabine, pegaspargase, and oxaliplatin), and DDGP (dexamethasone, cisplatin, gemcitabine, pegaspargase).
- C) Romidepsin is used as a single agent; AND
 - D) Romidepsin is prescribed by or in consultation with an oncologist.

- 65. Hepatosplenic T-Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Romidepsin is used as subsequent therapy after two primary treatment regimens; AND
- Note: Examples of primary treatment regimens include ICE (ifosfamide, carboplatin, etoposide), DHAP (dexamethasone, cytarabine, cisplatin), DHAX (dexamethasone, cytarabine, oxaliplatin), IVAC (ifosfamide, etoposide, cytarabine).
- C) Romidepsin is used as a single agent; AND
 - D) Romidepsin is prescribed by or in consultation with an oncologist.

- 66. T-Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- Note: Examples of peripheral T-cell lymphoma include anaplastic large cell lymphoma, enteropathy-associated T-cell lymphoma, monomorphic epitheliotropic intestinal T-cell lymphoma, angioimmunoblastic T-cell lymphoma, peripheral T-cell lymphoma not otherwise specified.
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has peripheral disease; AND
 - C) Patient has relapsed or refractory disease; AND
 - D) Romidepsin is used as a single agent; AND
 - E) Romidepsin is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Rybrevant Prior Authorization Policy

- Rybrevant™ (amivantamab-vmjw intravenous infusion – Janssen)

REVIEW DATE: 03/13/2024; selected revision 08/28/2024

OVERVIEW

Rybrevant, a bispecific epidermal growth factor receptor (EGFR)-directed and mesenchymal epithelial transition (MET) receptor-directed antibody, is indicated for the treatment of locally advanced or metastatic **non-small cell lung cancer (NSCLC)**:¹

- In combination with Lazcluze™ (lazertinib tablets) for the first-line treatment of adults with *EGFR* exon 19 deletions, or exon 21 *L858R* substitution mutations, as detected by an FDA-approved test.
- In combination with carboplatin and pemetrexed for the first-line treatment of adults with *EGFR* exon 20 insertion mutations, as detected by an FDA-approved test.
- As a single agent, in adults with *EGFR* exon 20 insertion mutation, as detected by an FDA-approved test, whose disease has progressed on or after platinum-based chemotherapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) non-small cell lung cancer guidelines (version 8.2024 – August 23, 2024) recommend Rybrevant for the first-line treatment, in combination with carboplatin and pemetrexed and subsequent treatment, as a single agent, of *EGFR* exon 20 insertion mutation positive recurrent, advanced, or metastatic NSCLC.^{2,3} In addition, Rybrevant is recommended for the subsequent treatment of recurrent, advanced, or metastatic NSCLC with *EGFR* exon 19 deletion, exon 21 *L858R*, or *EGFR S768I*, *L861Q* and/or *G719X* mutation, in combination with carboplatin and pemetrexed, following disease progression on Tagrisso® (osimertinib tablets).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rybrevant. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Rybrevant as well as the monitoring required for adverse events and long-term efficacy, approval requires Rybrevant to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rybrevant is recommended in those who meet the following criteria:

FDA-Approved Indication

- 67. Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has locally advanced or metastatic disease; AND
 - C) Patient meets ONE of the following (i or ii):

03/13/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- i. Patient has ONE of the following (a, b, or c):
 - a) Epidermal growth factor receptor exon 20 insertion mutations, as detected by an approved test; OR
 - b) EGFR exon 19 deletions, as detected by an approved test; OR
 - c) EGFR exon 21 L858R substitution mutations, as detected by an approved test; OR
 - ii. Patient meets BOTH of the following (a and b):
 - a) Medication is used as subsequent therapy; AND
 - b) Patient has EGFR S768I, L861Q, and/or G719X mutation; AND
- D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rybrevant is not recommended in the following situations:

61. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Rylaze Prior Authorization Policy

- Rylaze™ (asparaginase erwinia chrysanthemi [recombinant]-rywn intramuscular injection – Jazz)

REVIEW DATE: 04/24/2024

OVERVIEW

Rylaze, asparaginase erwinia chrysanthemi (recombinant), is indicated as a component of a multi-agent chemotherapeutic regimen for the treatment of **acute lymphoblastic leukemia (ALL)** and **lymphoblastic lymphoma (LBL)** in adults and pediatric patients ≥ 1 month who have developed hypersensitivity to *E. coli*-derived asparaginase.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) has addressed Rylaze:

- **ALL** (version 4.2023 – February 5, 2024) and **Pediatric ALL** (version 5.2024 – April 3, 2024) guidelines recommend Rylaze for patients who develop a systemic allergic reaction or anaphylaxis to pegaspargase.²⁻⁴
- **T-Cell Lymphomas:** NCCN guidelines (version 3.2024 – April 11, 2024) recommend Rylaze for patients with extranodal NK/T-Cell lymphoma who develop a systemic allergic reaction or anaphylaxis to pegaspargase.^{2,5}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rylaze. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Rylaze as well as the monitoring required for adverse events and long-term efficacy, approval requires Rylaze to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rylaze is recommended in those who meet the following:

FDA-Approved Indication

68. Acute Lymphoblastic Leukemia/Lymphoblastic Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A)** Patient has a systemic allergic reaction or anaphylaxis to a pegylated asparaginase product; AND
- B)** Rylaze is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

69. Extranodal NK/T-Cell Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient has a systemic allergic reaction or anaphylaxis to a pegylated asparaginase product; AND
- B) Rylaze is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rylaze is not recommended in the following situations:

62. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Sarclisa Prior Authorization Policy

- Sarclisa® (isatuximab-irfc intravenous infusion – Sanofi-Aventis)

REVIEW DATE: 04/24/2024; selected revision 10/16/2024

OVERVIEW

Sarclisa, a CD38-directed monoclonal antibody, is indicated for **multiple myeloma** in adults, in the following situations:¹

- in combination with bortezomib, lenalidomide, and dexamethasone for the treatment of newly diagnosed multiple myeloma in adult patients who are not eligible for autologous stem cell transplant (ASCT).
- in combination with Pomalyst® (pomalidomide capsules) and dexamethasone in patients who have received at least two prior therapies, including lenalidomide and a proteasome inhibitor.
- in combination with Kyprolis® (carilzomib intravenous infusion) and dexamethasone in patients with relapsed or refractory disease who have received one to three prior lines of therapy.

Guidelines

Multiple Myeloma: Guidelines from the National Comprehensive Cancer Network (NCCN) [version 1.2025 – September 17, 2024] recommend Sarclisa/lenalidomide/bortezomib/dexamethasone as one of the “Other Recommended Regimens” (category 2A) for primary therapy in transplant candidates.^{2,3} Sarclisa/Kyprolis/lenalidomide/dexamethasone is recommended under “Useful in Certain Circumstances” (category 2A) in this setting (transplant; primary therapy). For non-transplant candidates, Sarclisa/bortezomib/lenalidomide/dexamethasone is recommended as one of the “Preferred Regimens” for primary therapy in patients < 80 years of age who are not frail (category 1). Sarclisa/Kyprolis/lenalidomide/dexamethasone is listed as “Useful in Certain Circumstances” (category 2B) in this setting (non-transplant; primary therapy). The guidelines include Sarclisa/Kyprolis/dexamethasone and Sarclisa/Pomalyst/dexamethasone (after two prior therapies, including lenalidomide and a proteasome inhibitor) among the preferred regimens (both combinations are category 1) for previously treated multiple myeloma, for early relapses (one to three prior therapies), in bortezomib- and lenalidomide-refractory disease.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Sarclisa. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Sarclisa as well as the monitoring required for adverse events and long-term efficacy, approval requires Sarclisa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sarclisa is recommended in those who meet the following criteria:

04/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indication

- 45. Multiple Myeloma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- 43.** Patient is ≥ 18 years of age; AND
- 44.** Patient meets ONE of the following (i, ii, or iii):
- A)** The medication will be used as primary therapy in ONE of the following combinations (a or b):
 - a)** The medication will be used in combination with bortezomib, lenalidomide, and dexamethasone; OR
 - b)** The medication will be used in combination with Kyprolis (carfilzomib intravenous infusion), lenalidomide, and dexamethasone; OR
 - B)** All of the following apply (a, b, c, and d):
 - a)** The medication will be used in combination with Pomalyst (pomalidomide capsules) and dexamethasone; AND
 - b)** Patient has tried at least TWO prior regimens for multiple myeloma; AND
Note: Examples include bortezomib/lenalidomide/dexamethasone, Kyprolis /lenalidomide/dexamethasone, Darzalex (daratumumab intravenous infusion)/bortezomib/melphalan/prednisone, Ninlaro (ixazomib capsules)/lenalidomide/dexamethasone, and Darzalex/lenalidomide/dexamethasone.
 - c)** A proteasome inhibitor was a component of at least one previous regimen; AND
Note: Examples of proteasome inhibitors include bortezomib, Kyprolis, Ninlaro.
 - d)** Lenalidomide was a component of at least one previous regimen; OR
 - C)** Patient meets BOTH of the following (a and b):
 - i.** The medication will be used in combination with Kyprolis and dexamethasone; AND
 - ii.** Patient has tried at least ONE prior regimen; AND
- 45.** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sarclisa is not recommended in the following situations:

- 63.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Sylvant Prior Authorization Policy

- Sylvant® (siltuximab intravenous infusion – EUA)

REVIEW DATE: 02/14/2024

OVERVIEW

Sylvant, an interleukin (IL)-6 antagonist, is indicated for treatment of **multicentric Castleman's disease** (MCD) in patients who are human immunodeficiency virus (HIV) negative and human herpesvirus-8 (HHV-8) negative.¹

Because Sylvant did not bind to virally produced IL-6 in a nonclinical study, Sylvant has not been studied in patients with MCD who are HIV positive or HHV-8 positive.¹ The pivotal trials showed a higher proportion of patients with durable tumor response (partial or complete response) and improvement in patient-reported outcomes (e.g., fatigue, physical function) with Sylvant vs. placebo. Patients were treated until treatment failure, defined as disease progression based on increased symptoms, radiologic progression, or deterioration in performance status.

Safety and efficacy has not been established in patients < 18 years of age.¹

Disease Overview

MCD is a rare disease that affects approximately 1,000 patients in the US.² It typically presents with lymphoid hyperplasia at multiple sites, including the peripheral lymph nodes, bone marrow, and multiple organs. Patients often have serious infections, fevers, weight loss, fatigue, night sweats, and nerve damage that can cause weakness and numbness. Persistent IL-6 production has been implicated in the development of various autoimmune, chronic, inflammatory diseases and cancers, including MCD. Sylvant, a human-mouse chimeric monoclonal antibody that is produced in Chinese hamster ovary cells, binds human IL-6 and prevents the binding of IL-6 to both soluble and membrane-bound IL-6 receptors.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for Castleman disease (version 1.2024 – January 18, 2024) list Sylvant as a treatment option for patients with relapsed/refractory unicentric Castleman disease that are HIV and HHV-8 negative and as first line therapy for patients with MCD who are HIV and HHV-8 negative.³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Sylvant. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Sylvant as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Sylvant to be prescribed by or in consultation with a physician who specializes in the condition being treated.

All reviews for use of Sylvant for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

02/14/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sylvant is recommended in those who meet the following criteria:

FDA-Approved Indication

2. **Castleman's Disease.** Approve for the duration noted if the patient meets ONE of the following (A or B):
 - A) Initial Therapy. Approve for 6 months if the patient meets ALL of the following (i, ii, iii, and iv):
 - i. Patient is ≥ 18 years of age; AND
 - ii. Patient is negative for the human immunodeficiency virus (HIV) and human herpesvirus-8 (HHV-8); AND
 - iii. Patient meets ONE of the following (a or b):
 - a) Patient has multicentric Castleman's disease; OR
 - b) Sylvant is being used for relapsed or refractory unicentric Castleman's disease; AND
 - iv. Sylvant is prescribed by or in consultation with an oncologist or hematologist.
 - B) Patient is Currently Receiving Sylvant. Approve for 1 year if the patient meets BOTH of the following (i and ii):
 - i. Patient has been established on therapy for at least 6 months; AND
Note: A patient who has received < 6 months of therapy or who is restarting therapy with this medication is reviewed under criterion A (Initial Therapy).
 - ii. Patient meets at least ONE of the following (a or b):
 - a) When assessed by at least one objective measure, patient experienced a beneficial clinical response from baseline (prior to initiating the requested drug); OR
Note: Examples of objective measures include clinically significant improvement or normalization of serum markers (e.g., C-reactive protein, erythrocyte sedimentation rate, fibrinogen, albumin, and/or hemoglobin), increased body mass index, and/or reduction in lymphadenopathy.
 - b) Compared with baseline (prior to initiating the requested drug), patient experienced an improvement in at least one symptom, such as improvement or resolution of constitutional symptoms (e.g., fatigue, physical function).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sylvant is not recommended in the following situations:

1. **COVID-19 (Coronavirus Disease 2019).** Forward all requests to the Medical Director.
Note: This includes requests for cytokine release syndrome associated with COVID-19.
2. **Multiple Myeloma.** Efficacy is not established. In a Phase II study (n = 286) evaluating patients with relapsed or refractory multiple myeloma, median progression-free survival was similar in patients treated with Velcade (bortezomib injection) + Sylvant (8.0 months) vs. in those treated with Velcade + placebo (7.6 months).⁴ Following 24.5 months of follow-up, there was not a significant difference between the groups in median overall survival (30.8 months in the group that received Velcade + Sylvant vs. 36.8 months in the Velcade + placebo group). There was not a significant difference in overall response rate or other secondary endpoints. Another Phase II study evaluated Sylvant in patients (n = 106) with previously untreated symptomatic multiple myeloma who were transplant-ineligible.⁶ There was not a significant difference in complete response rate or overall response rate in patients treated with Velcade/melphalan/prednisone (VMP) vs. those treated with VMP + Sylvant. Progression-

free survival and overall survival were the same in the two treatment groups. Another Phase II study in adults with relapsed or refractory multiple myeloma did not show any response with Sylvant monotherapy compared with 8% response rate in those who received Sylvant + dexamethasone.⁷

3. **Myelodysplastic Syndrome (MDS).** Efficacy is not established. A double-blind, placebo-controlled, Phase II study assigned adults with MDS (n = 76) to treatment with best supportive care in combination with Sylvant or placebo.⁵ There was not a significant difference in the proportion of patients with reduced transfusions to treat anemia (primary endpoint). The study was terminated early due to lack of efficacy.
4. **Prostate Cancer.** Efficacy is not established. An open-label Phase II study did not demonstrate added efficacy with Sylvant added on to mitoxantrone/prednisone vs. mitoxantrone/prednisone.⁸ Although the treatment groups were not balanced, progression-free survival was 97 days in the group that received Sylvant/mitoxantrone/prednisone vs. 228 days with mitoxantrone/prednisone. The study was stopped early.
5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Talvey Prior Authorization Policy

- Talvey™ (talquetamab-tgvs subcutaneous injection – Janssen Biotech)

REVIEW DATE: 09/11/2024

OVERVIEW

Talvey, a bispecific GPRC5D-directed CD3 T-cell engager, is indicated for the treatment of relapsed or refractory **multiple myeloma** in adults who have received at least four prior lines of therapy, including a proteasome inhibitor, an immunomodulatory agent, and an anti-CD38 monoclonal antibody.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) **multiple myeloma** (version 4.2024 – April 26, 2024) clinical practice guidelines recommend Talvey as a “Preferred Regimen” for the treatment of relapsed or refractory multiple myeloma in patients have received at least four prior lines of therapy including an anti-CD38 monoclonal antibody, a proteasome inhibitor, and an immunomodulatory agent (category 2A).^{2,3}

Safety

Talvey was approved with a Risk Evaluation and Mitigation Strategy (REMS) program due to the risk of cytokine release syndrome and neurotoxicity, including immune effector cell-associated neurotoxicity syndrome (ICANS).¹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Talvey. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Talvey as well as the monitoring required for adverse events and long-term efficacy, approval requires Talvey to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Talvey is recommended in those who meet the following criteria:

FDA-Approved Indication

- 46. Multiple Myeloma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- 46.** Patient is ≥ 18 years of age; AND
 - 47.** Patient has tried at least four systemic regimens; AND
 - 48.** Among the previous regimens tried, the patient has received at least one drug from each of the following classes (i, ii, and iii):
 - iv.** Proteasome inhibitor; AND
- Note: Examples include bortezomib, Kyprolis (carfilzomib intravenous infusion), Ninlaro (ixazomib capsules).

09/11/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- v. Immunomodulatory drug; AND

Note: Examples include lenalidomide, Pomalyst (pomalidomide capsules), Thalomid (thalidomide capsules).

- vi. Anti-CD38 monoclonal antibody; AND

Note: Examples include Darzalex (daratumumab intravenous infusion), Darzalex Faspro (daratumumab and hyaluronidase-fihj subcutaneous injection), or Sarclisa (isatuximab-irfc intravenous infusion).

D) The medication will be prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Talvey is not recommended in the following situations:

- 64.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Tecelra Prior Authorization Policy

- Tecelra® (afamitresgene autoleucel intravenous infusion – Adaptimmune)

REVIEW DATE: 08/07/2024

OVERVIEW

Tecelra, a melanoma-associated antigen A4 (MAGE-A4) directed genetically modified autologous T-cell immunotherapy, is indicated for the treatment of unresectable or metastatic **synovial sarcoma** in adults who have received prior chemotherapy, are human leukocyte antigen (HLA)-A*02:01P, HLA-A*02:02P, HLA-A*02:03P, or HLA-A*02:06P positive and whose tumor expresses MAGE-A4 antigen as determined by FDA-approved or cleared companion diagnostic devices.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) Soft Tissue Sarcoma (version 4.2024 – November 21, 2024) guidelines recommend Tecelra as a single agent for the subsequent treatment of advanced/metastatic synovial sarcoma with disseminated metastases and HLA-A*02:01P, HLA-A*02:02P, HLA-A*02:03P, or HLA-A*02:06P positive and whose tumor expresses MAGE-A4 antigen.^{2,3}

Safety

Tecelra has a boxed warning for cytokine release syndrome, which may be severe or life-threatening.¹ In addition, Tecelra is contraindicated in patients who are heterozygous or homozygous for HLA-A*02:05P.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tecelra. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tecelra as well as the monitoring required for adverse events and long-term efficacy, approval requires Tecelra to be prescribed by or in consultation with a physician who specializes in the condition being treated. The approval duration is 6 months to allow for an adequate time frame to prepare and administer 1 dose of therapy.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tecelra is recommended in those who meet the following criteria:

FDA-Approved Indication

- 70. Synovial Sarcoma.** Approve a single dose if the patient meets ALL of the following (A, B, C, D, E, F, G, H, and I):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has unresectable or metastatic disease; AND
 - C) Patient is human leukocyte antigen (HLA) positive for at least ONE of the following: HLA-A*02:01P, HLA-A*02:02P, HLA-A*02:03P, or HLA-A*02:06P; AND
 - D) Patient is NOT heterozygous or homozygous for HLA-A*02:05P; AND
 - E) Tumor expresses melanoma-associated antigen A4 (MAGE-A4); AND

08/07/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- F)** Patient has received prior chemotherapy; AND
- G)** Patient received or plans to receive lymphodepleting chemotherapy prior to Tecelra infusion; AND
- H)** Patient has not been previously treated with Tecelra; AND
- I)** Medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tecelra is not recommended in the following situations:

- 65.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Tecvayli Prior Authorization Policy

- Tecvayli™ (teclistamab-cqyv subcutaneous injection – Janssen Biotech)

REVIEW DATE: 11/13/2024

OVERVIEW

Tecvayli, a bispecific B-cell maturation antigen (BCMA)-directed CD3 T-cell engager, is indicated for the treatment of relapsed or refractory **multiple myeloma** in adults who have received at least four prior lines of therapy, including a proteasome inhibitor, an immunomodulatory agent, and an anti-CD38 monoclonal antibody.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) multiple myeloma (version 1.2025 – September 17, 2024) clinical practice guidelines recommend Tecvayli for relapsed or refractory disease in patients who have received at least four previous therapies including a proteasome inhibitor, an immunomodulatory agent, and an anti-CD38 monoclonal antibody.^{2,3}

Safety

Tecvayli was approved with a Risk Evaluation and Mitigation Strategy (REMS) program due to the risk of cytokine release syndrome and neurotoxicity, including immune effector cell-associated neurotoxicity syndrome (ICANS).¹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tecvayli. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tecvayli as well as the monitoring required for adverse events and long-term efficacy, approval requires Tecvayli to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tecvayli is recommended in those who meet the following criteria:

FDA-Approved Indication

47. **Multiple Myeloma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
49. Patient is ≥ 18 years of age; AND
50. Patient has tried at least four systemic regimens; AND
51. Among the previous regimens tried, the patient has received at least one drug from each of the following classes (i, ii, and iii):
 - vii. Proteasome inhibitor; AND

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Thiotepa Products Prior Authorization Policy

- Tepadina® (thiotepa intravenous, intracavitary, or intravesical injection – Adienne and Amneal, generic)

REVIEW DATE: 12/11/2024

OVERVIEW

Thiotepa is an alkylating agent indicated for:

- **Beta-thalassemia**, to reduce the risk of graft rejection when used in conjunction with high-dose busulfan and cyclophosphamide as a preparative regimen for allogeneic hematopoietic progenitor (stem) cell transplantation for pediatric patients with class 3 disease.¹
- **Bladder cancer**, for superficial papillary carcinoma of the urinary bladder.^{1,2}
- **Breast adenocarcinoma**.^{1,2}
- **Neoplastic diseases of various serosal cavities**, for controlling intracavitary effusions secondary to diffuse or localized disease.^{1,2}
- **Ovarian adenocarcinoma**.^{1,2}

Guidelines

Thiotepa is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **Bladder cancer:** Guidelines (version 5.2024 – October 28, 2024) state that intravesical thiotepa does not appear to be effective. NCCN recommends gemcitabine and mitomycin for intravesical chemotherapy.⁵
- **Breast cancer:** Guidelines (version 4.2024 – July 3, 2024) do not provide any recommendations on the use of thiotepa in the management of breast cancer.³
- **Central nervous system (CNS) cancers:** Guidelines (version 3.2024 – September 30, 2024) recommend thiotepa, in combination with methotrexate, cytarabine, and rituximab for induction therapy, in combination with other chemotherapy agents for relapsed or refractory disease, or in combination with carmustine or busulfan and cyclophosphamide, with stem cell rescue for consolidation therapy of primary CNS lymphoma.⁶ NCCN recommends intra-cerebrospinal fluid thiotepa for the treatment of leptomeningeal metastases.
- **Hematopoietic Cell Transplantation:** Guidelines (version 2.2024 – August 30, 2024) recommend thiotepa as a component of a variety of conditioning regimens for autologous, allogeneic, and umbilical cord blood transplants.^{7,8}
- **Neuroblastoma:** Guidelines (version 2.2024 – July 2, 2024) recommend thiotepa as standard consolidation therapy in combination with cyclophosphamide, carboplatin, etoposide, and melphalan with tandem autologous stem cell rescue and radiation therapy following induction therapy for high risk disease.^{7,9}
- **Ovarian cancer:** Guidelines (version 3.2024 – July 15, 2024) do not provide any recommendations on the use of thiotepa in the management of ovarian cancer.⁴

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of thiotepa. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with thiotepa as well as the monitoring required for adverse events and long-term efficacy, approval

12/11/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

requires thiotepa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of thiotepa is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 71. Beta-Thalassemia.** Approve for 1 month if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≤ 18 years of age; AND
 - B) Patient has class 3 beta-thalassemia; AND
 - C) Thiotepa will be used prior to allogeneic hematopoietic stem cell transplantation; AND
 - D) Thiotepa will be used in combination with high-dose busulfan and cyclophosphamide; AND
 - E) The medication is prescribed by or in consultation with an oncologist.
- 72. Bladder Cancer.** Approve for 1 month if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has superficial papillary carcinoma of the urinary bladder; AND
 - C) The medication is prescribed by or in consultation with an oncologist.
- 73. Breast Cancer.** Approve for 6 months if the patient meets BOTH of the following (A and B):
- A) The patient is ≥ 18 years of age; AND
 - B) The medication is prescribed by or in consultation with an oncologist.
- 74. Malignant Effusions.** Approve for 6 months if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has intracavitary effusions secondary to diffuse or localized neoplastic disease; AND
 - C) The medication is prescribed by or in consultation with an oncologist.
- 75. Ovarian Cancer.** Approve for 6 months if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

- 76. Hematopoietic Cell Transplantation.** Approve for 1 month if the patient meets ALL of the following (A and B):
- A) Patient is undergoing ONE of the following (i, ii, or iii):
 - i. Autologous transplant; OR
 - ii. Allogeneic transplant; OR
 - iii. Umbilical cord blood transplant; AND
 - B) The medication is prescribed by or in consultation with an oncologist.
- 77. Leptomeningeal Metastases.** Approve for 6 months if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND

B) The medication is prescribed by or in consultation with an oncologist.

78. Neuroblastoma. Approve for 1 month if the patient meets ALL of the following (A, B, C, and D):

- A) Thiotepea is used for consolidation therapy; AND
- B) Patient has high-risk disease; AND
- C) Patient will undergo tandem autologous stem cell rescue; AND
- D) The medication is prescribed by or in consultation with an oncologist.

79. Primary Central Nervous System Lymphoma. Approve for 3 months if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) If thiotepea is given as conditioning for hematopoietic stem cell transplantation, it is given prior to transplantation; AND
- C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of thiotepea is not recommended in the following situations:

67. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Tivdak Prior Authorization Policy

- Tivdak® (tisotumab vedotin-tftv intravenous infusion – Seagen and Genmab)

REVIEW DATE: 11/13/2024

OVERVIEW

Tivdak, a tissue factor-directed antibody and microtubule inhibitor conjugate, is indicated for the treatment of recurrent or metastatic **cervical cancer** in adults with disease progression on or after chemotherapy.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) has addressed Tivdak.

- **Cervical cancer** (version 4.2024 – September 24, 2024) clinical practice guidelines recommend Tivdak for the second-line or subsequent therapy as a single agent for local/regional recurrence, stage IVB, or distant metastatic disease.^{2,3}
- **Vaginal cancer** (version 2.2025 – August 8, 2024) clinical practice guidelines recommend Tivdak for the second-line and subsequent treatment of local/regional recurrence, stage IVB, or distant metastatic disease.^{2,4}

Safety

Tivdak has a Boxed Warning for ocular toxicity.¹ Tivdak can cause changes in corneal epithelium and conjunctiva resulting in changes in vision, including severe vision loss, and corneal ulceration. Withhold, reduce the dose, or permanently discontinue Tivdak depending on the severity of ocular toxicity.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tivdak. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tivdak as well as the monitoring required for adverse events and long-term efficacy, approval requires Tivdak to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tivdak is recommended in those who meet one of the following criteria:

FDA-Approved Indication

80. Cervical Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one chemotherapy agent; AND

Note: Examples of chemotherapy agents include cisplatin, carboplatin, paclitaxel, topotecan.

C) Medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

11/13/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

81. Vaginal Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one chemotherapy agent; AND

Note: Examples of chemotherapy agents include cisplatin, carboplatin, paclitaxel, topotecan.

C) Medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tivdak is not recommended in the following situations:

68. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Topotecan Products Prior Authorization Policy

- Hycamtin® (topotecan capsule – Novartis)
- Topotecan intravenous infusion (Hycamtin® – Novartis, generics)

REVIEW DATE: 01/17/2024

OVERVIEW

Topotecan injection, a topoisomerase inhibitor, is indicated for the treatment of:¹

- **Cervical cancer**, stage IV-B, recurrent, or persistent disease which is not amenable to curative treatment, in combination with cisplatin.
- **Metastatic ovarian cancer**, after disease progression on or after initial or subsequent chemotherapy, as a single agent.
- **Small cell lung cancer (SCLC)**, platinum-sensitive disease who progressed at least 60 days after initiation of first-line chemotherapy, as a single agent.

Topotecan capsule, a topoisomerase inhibitor, is indicated for the treatment of relapsed small cell lung cancer.²

Guidelines

Topotecan is included in a variety of National Comprehensive Cancer Network (NCCN) guidelines:

- **Bone cancer** (version 1.2024 – August 7, 2023) clinical practice guidelines recommend topotecan in combination with cyclophosphamide, as second-line therapy for patients with relapsed/refractory, or metastatic osteosarcoma and Ewing sarcoma (both category 2A), and dedifferentiated chondrosarcoma, high-grade undifferentiated pleomorphic sarcoma, and mesenchymal chondrosarcoma (category 2B).^{3,8}
- **Central nervous system cancers** (version 1.2023 – March 24, 2023) clinical practice guidelines recommend topotecan as a single agent for the treatment of brain metastases in patients with small cell lung cancer.^{3,9} In addition, the guidelines recommend intra-cerebrospinal fluid topotecan for the treatment of leptomeningeal metastases.
- **Cervical cancer** (version 1.2024 – September 20, 2023) clinical practice guidelines recommend topotecan as first-line, second-line, or subsequent therapy for patients with local/regional recurrence, stage IV-B disease, or distant metastases in combination with paclitaxel and bevacizumab (category 1), or in combination with paclitaxel or cisplatin (category 2A); or as a single agent in second-line and subsequent therapy.^{3,6} It is also recommended as first-line, second-line and subsequent therapy for patients with persistent, recurrent, or metastatic small cell neuroendocrine carcinoma of the cervix (NECC) in combination with paclitaxel and bevacizumab. Topotecan can be used in combination with paclitaxel or cisplatin, or as a single agent (category 2A) for second-line or subsequent therapy of NECC.
- **Merkel cell carcinoma** (version 1.2024 – November 22, 2023) clinical practice guidelines recommend topotecan as a treatment option for patients with distant metastatic disease who have contraindications to checkpoint immunotherapy (Bavencio® [avelumab intravenous infusion], Keytruda® [pembrolizumab intravenous infusion], and Opdivo® [nivolumab intravenous infusion]); or have progressed on checkpoint immunotherapy.^{3,10}
- **Ovarian cancer** (version 2.2023 – June 2, 2023) clinical practice guidelines recommend topotecan, as a single agent or in combination with bevacizumab or sorafenib, for the treatment of recurrent or persistent platinum-resistant epithelial ovarian cancer, fallopian tube cancer, and peritoneal

01/17/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

cancer.^{3,4} Treatment of clinical relapse is a category 2A recommendation and immediate treatment of biochemical relapse is category 2B recommendation.

- **SCLC** (version 2.2024 – November 21, 2023) clinical practice guidelines recommend topotecan as a single agent for patients with a performance status of 0-2 and relapse following complete or partial response, or stable disease with initial treatment; or for primary progressive disease.^{3,5}
- **Soft tissue sarcoma** (version 3.2023 – December 12, 2023) clinical practice guidelines recommend topotecan as a single agent or in combination with cyclophosphamide for the treatment of non-pleomorphic rhabdomyosarcoma.^{3,11}
- **Uterine cancer** (version 1.2024 – September 20, 2023) clinical practice guidelines recommend topotecan as a single agent for the treatment of recurrent, metastatic, or high-risk endometrial carcinoma.^{3,7}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of topotecan. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with topotecan as well as the monitoring required for adverse events and long-term efficacy, approval requires topotecan to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of topotecan is recommended in those who meet one of the following criteria:

FDA-Approved Indications

82. Cervical Cancer. Approve for 1 year if the patient meets the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets one of the following (i or ii):
 - i. Patient has persistent or recurrent disease; OR
 - ii. Patient has metastatic disease; AND
- C) Topotecan is prescribed by or in consultation with an oncologist.

83. Ovarian, Fallopian Tube, and Primary Peritoneal Cancer. Approve for 1 year if the patient meets the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has persistent or recurrent disease; AND
- C) The cancer is platinum-resistant; AND
- D) Topotecan is prescribed by or in consultation with an oncologist.

84. Small Cell Lung Cancer. Approve for 1 year if the patient meets the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets one of the following (i or ii):
 - i. Patient has relapsed disease; OR
 - ii. Patient has primary progressive disease; AND
- C) Topotecan will be used as a single agent; AND
- D) Topotecan is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

85. Bone Cancer. Approve for 1 year if the patient meets the following (A, B, C, D, and E):

- A) Patient has one of the following (i, ii, iii, iv, or v):
 - i. Osteosarcoma; OR
 - ii. Ewing sarcoma; OR
 - iii. Dedifferentiated chondrosarcoma; OR
 - iv. High-grade undifferentiated pleomorphic sarcoma; OR
 - v. Mesenchymal chondrosarcoma; AND
- B) Patient has relapsed, refractory, or metastatic disease; AND
- C) Topotecan is used second-line; AND
- D) Topotecan is used in combination with cyclophosphamide; AND
- E) Topotecan is prescribed by or in consultation with an oncologist.

86. Brain Metastases. Approve for 1 year if the patient meets the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has small cell lung cancer; AND
- C) Topotecan will be used as a single agent; AND
- D) Topotecan is prescribed by or in consultation with an oncologist.

87. Endometrial Carcinoma. Approve for 1 year if the patient meets the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has recurrent, metastatic, or high-risk disease; AND
- C) Topotecan will be used as a single agent; AND
- D) Topotecan is prescribed by or in consultation with an oncologist.

88. Leptomeningeal and Spinal Metastases. Approve for 1 year if the patient meets the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Topotecan will be administered intraventricularly; AND
- C) Topotecan is prescribed by or in consultation with an oncologist.

89. Merkel Cell Carcinoma. Approve for 1 year if the patient meets the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has distant metastatic disease; AND
- C) Patient meets ONE of the following (i or ii):
 - i. Patient has contraindications to checkpoint immunotherapy; OR
Note: Checkpoint immunotherapy includes Bavencio (avelumab intravenous infusion), Keytruda (pembrolizumab intravenous infusion), and Opdivo (nivolumab intravenous infusion).
 - ii. Patient has progressed on checkpoint immunotherapy; AND
Note: Checkpoint immunotherapy includes Bavencio, Keytruda, and Opdivo.
- D) Topotecan is prescribed by or in consultation with an oncologist.

90. Rhabdomyosarcoma. Approve for 1 year if the patient meets the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has non-pleomorphic rhabdomyosarcoma; AND
- C) Topotecan is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of topotecan is not recommended in the following situations:

01/17/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

69. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Torisel Prior Authorization Policy

- Torisel® (temsirolimus intravenous infusion – Wyeth)

REVIEW DATE: 12/11/2024

OVERVIEW

Torisel, an inhibitor of mammalian target of rapamycin (mTOR), is indicated for the treatment of **advanced renal cell carcinoma**.¹

Guidelines

Torisel is addressed in National Comprehensive Cancer Network guidelines:

- **Kidney cancer:** Guidelines (version 2.2025 – September 6, 2024) no longer recommend Torisel for the treatment of relapsed or stage IV renal cell carcinoma.^{2,3}
- **Soft tissue sarcoma:** Guidelines (version 4.2024 – November 21, 2024) recommend Torisel as a single agent for the treatment of perivascular epithelioid cell tumors (PEComas), lymphangioleiomyomatosis, and angiomyolipomas; and in combination with cyclophosphamide and vinorelbine for non-pleomorphic rhabdomyosarcoma.^{2,4}
- **Uterine neoplasms:** Guidelines (version 3.2024 – September 20, 2023) recommend Torisel as a single-agent for the treatment of advanced, recurrent, metastatic, or inoperable endometrial cancer.^{2,5}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Torisel. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Torisel as well as the monitoring required for adverse events and long-term efficacy, approval requires Torisel to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Torisel is recommended in those who meet one of the following criteria:

FDA-Approved Indication

- 91. Renal Cell Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced disease; AND
 - C) Torisel will be used as a single-agent; AND
 - D) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

12/11/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- 92. Endometrial Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced, recurrent, metastatic, or inoperable disease; AND
 - C) Patient has ONE of the following (i or ii):
 - i. Endometrial carcinoma; OR
 - ii. Uterine perivascular epithelioid cell tumor (PEComa); AND
 - D) Torisel will be used as a single-agent; AND
 - E) The medication is prescribed by or in consultation with an oncologist.
- 93. Soft Tissue Sarcoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has ONE of the following (i, ii, iii, or iv):
 - i. Perivascular epithelioid cell tumors (PEComas); OR
 - ii. Lymphangioleiomyomatosis; OR
 - iii. Recurrent angiomyolipoma; OR
 - iv. Non-pleomorphic rhabdomyosarcoma; AND
 - C) Patient meets ONE of the following (i or ii):
 - i. Torisel will be used as a single-agent; OR
 - ii. Torisel will be used in combination with cyclophosphamide and vinorelbine; AND
 - D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Torisel is not recommended in the following situations:

- 70.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Oncology (Injectable) – Trastuzumab Products Prior Authorization Policy
- Herceptin[®] (trastuzumab intravenous infusion – Genentech)
 - Hercessi[™] (trastuzumab-strf intravenous infusion – Accord BioPharma)
 - Herzuma[®] (trastuzumab-pkrb intravenous infusion – Celltrion)
 - Kanjinti[™] (trastuzumab-anns intravenous infusion – Amgen)
 - Ogivri[®] (trastuzumab-dkst intravenous infusion – Mylan)
 - Ontruzant[®] (trastuzumab-dttb intravenous infusion – Merck)
 - Trazimera[™] (trastuzumab-qyyp intravenous infusion – Pfizer)

REVIEW DATE: 07/17/2024; selected revision 12/11/2024

OVERVIEW

Trastuzumab products are human epidermal growth factor receptor 2 (HER2)/neu receptor antagonists indicated for the following uses:¹

- **Breast cancer, adjuvant treatment** of HER2-overexpressing node positive or node negative (estrogen receptor [ER]/progesterone receptor [PR] negative or with one high risk feature) 1) as part of a treatment regimen consisting of doxorubicin, cyclophosphamide, and either paclitaxel or docetaxel; 2) as part of treatment regimen with docetaxel and carboplatin; or 3) as a single agent following multi-modality anthracycline based therapy.
- **Breast cancer, metastatic**, HER2-overexpressing, either in combination with paclitaxel for first-line treatment, or as a single agent in patients who have received one or more chemotherapy regimens for metastatic disease.
- **Gastric cancer or gastroesophageal junction adenocarcinoma, metastatic**, HER2-overexpressing, in combination with cisplatin and capecitabine or 5-fluorouracil (5-FU) who have not received prior treatment for metastatic disease.

Herzuma, Hercessi, Kanjinti, Ogivri, Ontruzant, and Trazimera are all approved biosimilars for Herceptin; all of the biosimilars have the same FDA-approved indications as Herceptin. For all indications, patients must be selected for therapy based on an FDA-approved companion diagnostic for trastuzumab. Tests are specific for breast cancer or gastric cancer.

Guidelines

Trastuzumab is discussed in guidelines from the National Comprehensive Cancer Network (NCCN)

- **Breast Cancer:** NCCN guidelines (version 4.2024 – July 3, 2024) recommend trastuzumab in combination with chemotherapy or endocrine therapy for adjuvant treatment of HER2-positive breast cancer (category 2A).^{2,10} Trastuzumab in combination with paclitaxel (category 2A) is a preferred preoperative/adjuvant therapy regimen. The guidelines also list other trastuzumab-containing regimens for preoperative and adjuvant therapy. The preferred first-line agents for HER2-positive recurrent or metastatic disease (either hormone receptor-negative or hormone receptor-positive and refractory to endocrine therapy) include: Perjeta[®] (pertuzumab intravenous infusion) plus trastuzumab plus docetaxel (category 1) or paclitaxel (category 2A). The guidelines list other trastuzumab-containing regimens for HER2-positive metastatic disease.
- **Colon and Rectal Cancer:** NCCN guidelines for colon cancer (version 4.2024 – July 3, 2024) and NCCN guidelines for rectal cancer (version 3.2024 – July 3, 2024) list trastuzumab in combination with Perjeta, Tukysa (tucatinib tablets), or lapatinib tablets in patients with HER2-amplified disease, RAS and BRAF wild-type disease.^{3-4,10}

07/17/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Gastric Cancer and Esophageal and Esophagogastric Junction Cancers:** NCCN guidelines for Gastric Cancer (version 2.2024 – May 29, 2024) and Esophageal and Esophagogastric Junction Cancers (version 3.2024 – April 26, 2024) state that for metastatic, locally advanced or recurrent disease (where local therapy is not indicated) trastuzumab should be added to first-line systemic chemotherapy for HER2-overexpressing adenocarcinoma.^{5,6,10} The recommended regimens for metastatic or locally advanced HER2-positive gastric, esophageal, or esophagogastric junction adenocarcinoma are trastuzumab in combination with cisplatin or oxaliplatin and a fluoropyrimidine (5-FU or capecitabine) [category 1] or trastuzumab in combination with other chemotherapy agents (category 2A/2B) [various regimens based on individual patient characteristics]. Trastuzumab is not recommended for use in combination with anthracyclines.
- **Head and Neck Cancers:** NCCN guidelines (version 4.2024 – May 1, 2024) recommend trastuzumab as a systemic therapy option for recurrent, unresectable, or metastatic salivary gland tumors, (useful in certain circumstances), for HER2-positive tumors as a single agent or in combination with Perjeta or docetaxel (category 2A).^{7,10}
- **Biliary Tract Cancers:** NCCN guidelines (version 3.2024 – July 2, 2024) recommend trastuzumab + Perjeta and trastuzumab + Tukyza as subsequent-line therapy options for biliary tract cancers for progression on or after systemic treatment for unresectable or metastatic disease that is HER2-positive (both category 2A).^{8,10}
- **Uterine Neoplasms:** NCCN guidelines (version 2.2024 – March 6, 2024) list the combination chemotherapy regimen of carboplatin/paclitaxel/trastuzumab as one of the recommended therapies for patients with HER2-positive endometrial carcinoma for stage III/IV or recurrent uterine serous carcinoma (category 2A).^{9,10}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of trastuzumab products. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with trastuzumab products, as well as the monitoring required for adverse events and long-term efficacy, approval requires trastuzumab products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of trastuzumab products is recommended in those who meet one of the following:

FDA-Approved Indications

1. **Breast Cancer.** Approve for the duration noted if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - C) Patient meets ONE of the following (i or ii):
 - i. Approve for 1 year (total) if trastuzumab is used for neoadjuvant (preoperative)/adjuvant therapy; OR
 - ii. Approve for 1 year if trastuzumab is used for recurrent or metastatic disease; AND
 - D) The medication is prescribed by or in consultation with an oncologist.
2. **Gastric, Esophageal, or Gastroesophageal Junction Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has locally advanced or metastatic disease; AND
 - C) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - D) Patient meets BOTH of the following (i and ii):
 - i. Trastuzumab will be used as first-line therapy; AND
 - ii. Trastuzumab will be used in combination with chemotherapy; AND

Note: Examples of chemotherapy are cisplatin, oxaliplatin, capecitabine, 5-fluorouracil (5-FU).
 - E) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

3. **Biliary Tract Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has unresectable or metastatic disease; AND
 - C) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - D) The medication will be used in combination with Perjeta (pertuzumab intravenous infusion) or Tukysa (tucatinib tablets); AND
 - E) The patient has tried one systemic regimen; AND

Note: Examples of a systemic regimen include: gemcitabine and cisplatin, 5-fluorouracil and oxaliplatin, capecitabine and oxaliplatin, or gemcitabine and oxaliplatin.

 - F) The medication is prescribed by or in consultation with an oncologist.
4. **Colon or Rectal Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced or metastatic disease; AND
 - C) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - D) The medication is used in combination with Perjeta (pertuzumab intravenous infusion), lapatinib or Tukysa (tucatinib tablets); AND
 - E) The medication is prescribed by or in consultation with an oncologist.

5. **Endometrial Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced or recurrent uterine serous carcinoma; AND
 - C) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - D) Trastuzumab will be used in combination with chemotherapy; AND
- Note: Examples of chemotherapy are carboplatin, paclitaxel.
- E) The medication is prescribed by or in consultation with an oncologist.
6. **Salivary Gland Tumor.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- F) Patient is ≥ 18 years of age; AND
 - G) Patient has recurrent, unresectable, or metastatic disease; AND
 - H) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
 - I) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of trastuzumab is not recommended in the following situations.

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Trodelvy Prior Authorization Policy

- Trodelvy® (sacituzumab govitecan-hziy intravenous infusion – Gilead)

REVIEW DATE: 12/20/2023

OVERVIEW

Trodelvy, a Trop-2-directed antibody and topoisomerase inhibitor conjugate, is indicated for the following uses in adults:¹

- **Breast cancer**, unresectable locally advanced or metastatic triple-negative disease in adults who have received two or more prior systemic therapies, at least one of them for metastatic disease.
- **Breast cancer**, unresectable locally advanced or metastatic hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative (immunohistochemistry [IHC] 0, IHC 1+ or IHC 2+/ISH-) breast cancer who have received endocrine based therapy and at least two additional systemic therapies in the metastatic setting.
- **Urothelial cancer**, locally advanced or metastatic disease in adults who have previously received a platinum-containing chemotherapy and either programmed death receptor-1 (PD-1) or programmed death-ligand 1 (PD-L1) inhibitor. This indication is approved under accelerated approval based on tumor response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

Guidelines

Trodelvy is addressed in National Comprehensive Cancer Network (NCCN) guidelines:

- **Bladder Cancer:** NCCN guidelines (version 3.2023 – May 25, 2023) list Trodelvy as an option for subsequent-line systemic therapy for locally advanced or metastatic disease (Stage IV) [Other Recommended Regimen; category 2A].² In cisplatin-eligible patients with locally advanced or metastatic disease, the first-line “Preferred Regimens” are gemcitabine and cisplatin or DDMVAC (dose-dense or accelerated course of methotrexate, vinblastine, doxorubicin, cisplatin) with growth factor support. Bavencio® (avelumab intravenous infusion) is the recommended maintenance regimen for either group.² For patients who are cisplatin ineligible, the “Preferred Regimens” are gemcitabine and carboplatin, followed by Bavencio for maintenance (category 1); and for patients whose tumors express PD-L1 or who are not eligible for any platinum-containing chemotherapy regardless of PD-L1 expression, the “Preferred Regimens” are Tecentriq® (atezolizumab intravenous infusion). Keytruda® (pembrolizumab intravenous infusion) is recommended for patients who are not eligible for any platinum-containing chemotherapy.
- **Breast Cancer:** NCCN guidelines (version 5.2023 – December 5, 2023) list Trodelvy as a “Preferred Regimen” for patients with metastatic triple-negative breast cancer who have received at least two prior therapies, with at least one for metastatic disease (category 1); it may be considered for later line if not used a second line therapy.³ Trodelvy is also a “Preferred Regimen” for patients with HR positive, HER2 negative cancers after prior treatment, including endocrine therapy, a cyclin dependent kinase (CDK) 4/6 inhibitor, and at least two lines of chemotherapy (one of which was a taxane, and at least one of which was in the metastatic setting) for advanced breast cancer (category 1). It may be considered for later line if not used a second-line therapy.

POLICY STATEMENT

12/20/2023

© 2023. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Prior Authorization is recommended for prescription benefit coverage of Trodelvy. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Trodelvy as well as the monitoring required for adverse events and long-term efficacy, approval requires Trodelvy to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Trodelvy is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 3. Breast Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has human epidermal growth factor receptor 2 (HER2)- negative breast cancer; AND
 - C)** Patient has recurrent or metastatic disease; AND
 - D)** Patient meets ONE of the following (i or ii):
 - i.** Patient meets BOTH of the following (a and b):
 - a)** Patient has hormone receptor (HR) negative disease; AND
 - b)** Patient has tried at least two systemic regimens; OR
Note: Examples of systemic regimens include: cisplatin, carboplatin, doxorubicin, liposomal doxorubicin, paclitaxel, capecitabine, gemcitabine, vinorelbine, Halaven (eribulin intravenous infusion), Keytruda (pembrolizumab intravenous infusion) + chemotherapy (Abraxane [albumin-bound paclitaxel intravenous infusion], paclitaxel, or gemcitabine and carboplatin).
 - ii.** Patient meets ALL of the following (a, b, c, and d):
 - a)** Patient has hormone receptor (HR) positive disease; AND
 - b)** Patient has tried endocrine therapy; AND
 - c)** Patient has tried a cyclin-dependent kinase (CDK) 4/6 inhibitor; AND
Note: Examples of CDK4/6 inhibitors include: Kisqali (ribociclib tablets), Ibrance (palbociclib capsules or tablets), or Verzenio (abemaciclib tablets).
 - d)** Patient has tried at least two systemic chemotherapy regimens; AND
Note: Examples of chemotherapy regimens include: paclitaxel, cisplatin, carboplatin, doxorubicin, liposomal doxorubicin, gemcitabine, vinorelbine, Halaven (eribulin intravenous infusion).
 - E)** The medication is prescribed by or in consultation with an oncologist.
- 2. Urothelial Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has locally advanced or metastatic urothelial cancer; AND
 - C)** Patient has tried at least one systemic chemotherapy; AND
Note: Examples of systemic chemotherapy include cisplatin, carboplatin, gemcitabine, paclitaxel, ifosfamide, doxorubicin.
 - D)** Patient has tried at least one programmed death receptor-1 (PD-1) or programmed death-ligand 1 (PD-L1) inhibitor; AND
Note: Examples of PD-1 and PD-L1 inhibitors include Bavencio (avelumab intravenous infusion), Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion), Tecentriq (atezolizumab intravenous infusion).

- E) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Trodelvy is not recommended in the following situations:

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Unituxin Prior Authorization Policy

- Unituxin® (dinutuximab intravenous infusion – United Therapeutics)

REVIEW DATE: 12/20/2023

OVERVIEW

Unituxin, a glycolipid disialoganglioside (GD2)-binding monoclonal antibody, is indicated for the treatment of pediatric patients with high-risk **neuroblastoma** who achieve at least a partial response to prior first-line multi-agent, multimodality therapy, in combination with granulocyte-macrophage colony-stimulating factor, interleukin-2, and 13-cis-retinoic acid.¹

Guidelines

Unituxin is not addressed in National Comprehensive Cancer Network treatment guidelines.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Unituxin. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Unituxin as well as the monitoring required for adverse events and long-term efficacy, approval requires Unituxin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Unituxin is recommended in those who meet the following criteria:

FDA-Approved Indication

94. Neuroblastoma. Approve for 6 months if the patient meets the following (A, B, and C):

- A) Patient is ≤ 18 years of age; AND
- B) Unituxin is used as subsequent therapy; AND
- C) Unituxin is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Unituxin is not recommended in the following situations:

- 71.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Vectibix Prior Authorization Policy

- Vectibix® (panitumumab intravenous infusion – Amgen)

REVIEW DATE: 08/07/2024

OVERVIEW

Vectibix, an epidermal growth factor receptor monoclonal antibody, is indicated for the treatment of wild-type RAS (defined as wild-type in both KRAS and NRAS as determined by an FDA-approved test for this use) **metastatic colorectal cancer** (mCRC) as:¹

- First-line therapy in combination with FOLFOX (5-fluorouracil [5-FU], leucovorin, oxaliplatin).
- Monotherapy following disease progression after prior treatment with fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy.

Limitation of Use: Vectibix is not indicated for the treatment of patients with RAS-mutant mCRC or for whom RAS mutation status is unknown.

Guidelines

The National Comprehensive Cancer Network (NCCN) **Colon Cancer** guidelines (version 4.2024 – July 3, 2024) recommend Vectibix as primary therapy for unresectable, advanced, or metastatic KRAS/NRAS/BRAF wild-type gene and left-sided tumors only in combination with irinotecan, FOLFOX, FOLFIRI (5-FU, leucovorin, irinotecan), or CapeOX (capecitabine and oxaliplatin) regimens in patients who can tolerate intensive therapy or as a single agent in patients who cannot tolerate intensive therapy.^{2,4} Reference to left-sided only disease refers to a primary tumor that originated in the left side of the colon. For the initial treatment of unresectable metachronous metastases, NCCN recommends Vectibix in combination with irinotecan or FOLFIRI for KRAS/NRAS/BRAF wild-type; in combination with Braftovi for BRAF V600E mutation positive disease; or in combination with Lumakras (sotorasib tablets) or Krazati (adagrasib tablets) for KRAS G12C mutation positive tumors. Therapies recommended after first progression vary depending on the initial treatment regimen (i.e., 5-FU/leucovorin-based or capecitabine-based therapy) that was used. The NCCN guidelines recommend Vectibix, in combination with irinotecan, FOLFOX, CapeOX, or FOLFIRI for the subsequent treatment of KRAS/NRAS/BRAF wild-type tumors; in combination with Braftovi® (encorafenib capsules) for the subsequent treatment of BRAF V600E mutation positive disease; or in combination with Lumakras or Krazati for KRAS G12C positive tumors. The NCCN **Rectal Cancer** guidelines (version 3.2024 – July 3, 2024) make the same recommendations for Vectibix for the treatment of rectal cancer.^{3,4}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vectibix. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Vectibix as well as the monitoring required for adverse events and long-term efficacy, approval requires Vectibix to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

08/07/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Coverage of Vectibix is recommended in those who meet one of the following criteria:

FDA-Approved Indication

48. Colon and Rectal Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i, ii, or iii):

i. Patient has unresectable synchronous liver and/or lung metastases and meets ALL of the following (a, b, c, and d):

a) Metastases are *KRAS/NRAS/BRAF* wild-type; AND

Note: The metastases are *KRAS/NRAS/BRAF* mutation negative.

b) The primary tumor originated on the left side of the colon; AND

Note: Primary tumor originated from the splenic flexure to the rectum.

c) Medication is used for primary treatment; AND

d) Medication is used in combination with FOLFOX or FOLFIRI; OR

Note: FOLFOX includes 5-fluorouracil, leucovorin, and oxaliplatin and FOLFIRI includes fluorouracil, leucovorin, and irinotecan.

ii. Patient has unresectable metachronous metastases and meets ONE of the following (a, b, or c):

a) Patient meets ALL of the following [(1), (2), and (3)]:

(1) Metastases are *KRAS/NRAS/BRAF* wild-type; AND

Note: The metastases are *KRAS/NRAS/BRAF* mutation negative.

(2) Medication is used for initial treatment; AND

(3) Medication is used in combination with irinotecan or FOLFIRI; OR

Note: FOLFIRI includes fluorouracil, leucovorin, and irinotecan.

b) Patient meets ALL of the following [(1), (2), and (3)]:

(1) Metastases are *BRAF V600E* mutation positive; AND

(2) Medication is used for initial treatment; AND

(3) Medication is used in combination with Braftovi (encorafenib capsules); OR

c) Patient meets ALL of the following [(1), (2), and (3)]:

(1) Metastases are *KRAS G12C* mutation positive; AND

(2) Medication is used for initial treatment; AND

(3) Medication is used in combination with Lumakras (sotorasib tablets) or Krazati (adagrasib tablets); OR

iii. Patient has advanced or metastatic disease and meets ONE of the following (a, b, c, or d):

a) Patient meets ALL of the following [(1), (2), (3), and (4)]:

(1) Tumor or metastases are *KRAS/NRAS/BRAF* wild-type; AND

Note: The tumor or metastases are *KRAS/NRAS/BRAF* mutation negative.

(2) The primary tumor originated on the left side of the colon; AND

Note: Primary tumor originated from the splenic flexure to rectum.

(3) Medication is used for initial treatment; AND

(4) Medication is used in combination with FOLFOX, CapeOX, or FOLFIRI; OR

Note: FOLFOX includes 5-fluorouracil, leucovorin, and oxaliplatin; CapeOX included capecitabine and oxaliplatin; and FOLFIRI includes 5-fluorouracil, leucovorin, and irinotecan.

b) Patient meets ALL of the following [(1), (2), and (3)]:

(1) Tumor or metastases are *KRAS/NRAS/BRAF* wild-type; AND

Note: The tumor or metastases are *KRAS/NRAS/BRAF* mutation negative.

(2) Medication is used for subsequent treatment; AND

- (3) Medication is used as a single agent or in combination with irinotecan, FOLFOX, CapeOX, or FOLFIRI; OR

Note: FOLFOX includes 5-fluorouracil; leucovorin, and oxaliplatin; CapeOX included capecitabine and oxaliplatin; and FOLFIRI includes 5-fluorouracil, leucovorin, and irinotecan.

- c) Patient meets ALL of the following [(1), (2), and (3)]:
- (1) Tumor or metastases are *BRAF V600E* mutation-positive; AND
 - (2) Medication is used for subsequent treatment; AND
 - (3) Medication is used in combination with Braftovi; OR
- d) Patient meets ALL of the following [(1), (2), and (3)]:
- (1) Tumor or metastases are *KRAS G12C* mutation positive; AND
 - (2) Medication is used for subsequent therapy; AND
 - (3) Medication is used in combination with Lumkras or Krazati; AND
- C) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

- 49. Appendiceal Adenocarcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):

C) Patient is ≥ 18 years of age; AND

D) Patient has advanced or metastatic disease and meets ONE of the following (i or ii):

iii. Patient meets ALL of the following (a, b, and c):

d) Tumor or metastases are *BRAF V600E* mutation-positive; AND

e) Medication is used for subsequent treatment; AND

f) Medication is used in combination with Braftovi (encorafenib capsules); OR

iv. Patient meets ALL of the following (a, b, and c):

d) Tumor or metastases are *KRAS G12C* mutation positive; AND

e) Medication is used for subsequent therapy; AND

f) Medication is used in combination with Lumakras (sotorasib tablets) or Krazati (adagrasib tablets); AND

D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vectibix is not recommended in the following situations:

72. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Vyloy Prior Authorization Policy

- Vyloy® (zolbetuximab-clzb intravenous infusion – Astellas)

REVIEW DATE: 10/30/2024

OVERVIEW

Vyloy, a claudin 18.2-directed cytolytic antibody, is indicated in combination with fluoropyrimidine- and platinum-containing chemotherapy for the first-line treatment of locally advanced unresectable or metastatic human epidermal growth factor receptor 2 (HER2)-negative gastric or gastrointestinal junction adenocarcinoma in adults in whose tumors are claudin 18.2 positive as determined by an FDA-approved test.¹

Guidelines

The National Comprehensive Cancer Network has not addressed Vyloy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vyloy. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Vyloy as well as the monitoring required for adverse events and long-term efficacy, approval requires Vyloy to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vyloy is recommended in those who meet the following criteria:

FDA-Approved Indication

95. Gastric or Gastroesophageal Junction Adenocarcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, F, and G):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has locally advanced unresectable or metastatic disease; AND
- C) Tumor is claudin 18.2 positive as determined by an approved test; AND
Note: Claudin 18.2 positivity is defined as $\geq 75\%$ of tumor cells demonstrating moderate to strong membranous claudin 18.2 immunohistochemical staining.
- D) Tumor is human epidermal growth factor receptor 2 (HER2)-negative; AND
- E) Medication is used for first-line treatment; AND
- F) Medication is used in combination with fluoropyrimidine- and platinum-containing chemotherapy; AND
Note: Examples of fluoropyrimidines include 5-fluorouracil and capecitabine. Examples of platinum chemotherapy agents include oxaliplatin.
- G) Medication is prescribed by or consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

PRIOR AUTHORIZATION POLICY

- POLICY:** Oncology (Injectable) – Vyxeos Prior Authorization Policy
- Vyxeos® (daunorubicin and cytarabine liposome intravenous infusion – Jazz)

REVIEW DATE: 12/18/2024

OVERVIEW

Vyxeos is a liposomal combination of daunorubicin, an anthracycline topoisomerase inhibitor, and cytarabine, a nucleoside metabolic inhibitor. It is indicated for the treatment of newly-diagnosed therapy-related **acute myeloid leukemia** (AML) or **AML with myelodysplasia-related changes** in patients ≥ 1 year of age.¹

Guidelines

The National Comprehensive Cancer Network guidelines for **acute myeloid leukemia** (version 3.2024 – May 17, 2024) recommend Vyxeos for induction and post-remission therapy for patients with therapy-related AML, antecedent myelodysplastic syndrome/chronic myelomonocytic leukemia, and AML with myelodysplasia-related changes.^{2,3}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vyxeos. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Vyxeos as well as the monitoring required for adverse events and long-term efficacy, approval requires Vyxeos to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vyxeos is recommended in those who meet the following criteria:

FDA-Approved Indication

- 96. Acute Myeloid Leukemia.** Approve for 6 months if the patient meets ALL of the following (A, B, and C):
- A)** Patient is ≥ 1 year of age; AND
 - B)** Patient meets ONE of the following (i or ii):
 - i.** Patient has therapy-related acute myeloid leukemia; OR
 - ii.** Patient has secondary acute myeloid leukemia; AND
Note: Examples include antecedent myelodysplastic syndrome/chronic myelomonocytic leukemia and acute myeloid leukemia with myelodysplasia-related changes.
 - C)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

12/18/2024

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Yervoy Prior Authorization Policy

- Yervoy® (ipilimumab intravenous infusion – Bristol-Myers Squibb)

REVIEW DATE: 12/04/2024

OVERVIEW

Yervoy, a human cytotoxic T-lymphocyte antigen 4 (CTLA-4)-blocking antibody, is indicated for the following uses:¹

- **Colorectal cancer, microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR)**, in combination with Opdivo® (nivolumab intravenous infusion) for the treatment of patients ≥ 12 years of age with metastatic disease that has progressed following treatment with a fluoropyrimidine, oxaliplatin, and irinotecan. This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in the confirmatory trials.
- **Esophageal cancer**, in combination with Opdivo for the first-line treatment of adults with unresectable advanced or metastatic esophageal squamous cell carcinoma.
- **Hepatocellular carcinoma**, in combination with Opdivo, for the treatment of adults who have been previously treated with Nexavar® (sorafenib tablets). This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in the confirmatory trials.
- **Malignant pleural mesothelioma**, in combination with Opdivo, for the first-line treatment of adults with unresectable disease.
- **Melanoma**, unresectable or metastatic disease in patients ≥ 12 years of age, as a single agent or in combination with Opdivo.
- **Melanoma**, for adjuvant treatment of cutaneous disease in patients with pathologic involvement of regional lymph nodes of > 1 mm who have undergone complete resection, including total lymphadenectomy.
- **Non-small cell lung cancer (NSCLC)**, in combination with Opdivo, for the first-line treatment of adults with metastatic disease whose tumors express programmed death ligand-1 (PD-L1) $[\geq 1\%]$, as determined by an FDA-approved test, with no epidermal growth factor receptor (*EGFR*) or anaplastic lymphoma kinase (*ALK*) genomic tumor aberrations.
- **NSCLC**, in combination with Opdivo and two cycles of platinum-doublet chemotherapy, for the first-line treatment of adults with metastatic or recurrent NSCLC, with no *EGFR* or *ALK* genomic tumor aberrations.
- **Renal cell carcinoma (RCC)**, advanced, in combination with Opdivo for the treatment of patients with intermediate or poor risk, previously untreated disease.

Guidelines

The National Comprehensive Cancer Network Compendium recommends Yervoy for the following conditions: melanoma (uveal, cutaneous, and brain metastases), bone cancer, small bowel adenocarcinoma, ampullary adenocarcinoma, kidney cancer, malignant pleural mesothelioma, colon and rectal cancer, gastric cancer, esophageal and esophagogastric junction cancer, hepatocellular carcinoma, biliary tract cancer, Kaposi sarcoma, Merkel cell carcinoma, soft tissue sarcoma, neuroendocrine tumors, and NSCLC.²

POLICY STATEMENT

12/04/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Prior Authorization is recommended for prescription benefit coverage of Yervoy. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Yervoy as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Yervoy is recommended in those who meet one of the following criteria:

FDA-Approved Indications

14. Colon, Rectal, or Appendiceal Cancer. Approve for 4 months if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 12 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. The tumor is microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); OR
 - ii. The tumor is polymerase epsilon/delta (POLE/POLD1) mutation positive; AND
- C) The medication is used in combination with Opdivo (nivolumab intravenous infusion); AND
- D) The medication is prescribed by or in consultation with an oncologist.

15. Esophageal and Esophagogastric Junction Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i or ii):
 - i. Patient meets ALL of the following (a, b, c, and d):
 - a) Patient has squamous cell carcinoma; AND
 - b) Patient has unresectable, advanced, or metastatic disease; AND
 - c) According to the prescriber, the patient is not a surgical candidate; AND
 - d) The medication will be used for first-line therapy; OR
 - ii. The tumor is microsatellite instability-high (MSI-H) or deficient mismatch repair (dMMR); AND
- C) The medication will be used in combination with Opdivo (nivolumab intravenous infusion); AND
- D) The medication is prescribed by or in consultation with an oncologist.

16. Hepatocellular Carcinoma. Approve for 4 months if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) According to the prescriber, the patient has ONE of the following (i or ii):
 - vii. Liver-confined, unresectable disease and is not a transplant candidate; OR
 - viii. Extrahepatic/metastatic disease and are deemed ineligible for resection, transplant, or locoregional therapy; AND
- C) The medication is used in combination with Opdivo (nivolumab intravenous infusion); AND
- D) The medication is used for subsequent therapy; AND
- E) The medication is prescribed by or in consultation with an oncologist.

17. Melanoma. Approve for the duration noted if the patient meets ALL of the following (A, B, and C):
Note: This includes cutaneous melanoma, brain metastases due to melanoma, and uveal melanoma.

A) Patient is ≥ 12 years of age; AND

B) Patient meets ONE of the following (i, ii, or iii):

i. Approve for 2 months if Yervoy is used as neoadjuvant treatment; OR

ii. Approve for 4 months if the patient has unresectable, recurrent, or metastatic melanoma; OR

iii. Approve for 1 year if Yervoy is used as adjuvant treatment; AND

Note: For example, in patients with cutaneous melanoma who have undergone complete resection, including total lymphadenectomy.

C) The medication is prescribed by or in consultation with an oncologist.

18. Mesothelioma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

a) Patient is ≥ 18 years of age; AND

b) Patient has ONE of the following (i, ii, iii, or iv):

(1) Malignant pleural mesothelioma; OR

(2) Malignant peritoneal mesothelioma; OR

(3) Pericardial mesothelioma; OR

(4) Tunica vaginalis testis mesothelioma; AND

c) The medication is used in combination with Opdivo (nivolumab intravenous infusion); AND

d) The medication is prescribed by or in consultation with an oncologist.

19. Non-Small Cell Lung Cancer (NSCLC). Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

a) Patient is ≥ 18 years of age; AND

b) Patient has recurrent, advanced, or metastatic disease; AND

c) Patient meets ONE of the following (i, ii, iii, or iv):

(1) Yervoy is used as first-line or continuation maintenance therapy and the patient meets BOTH of the following (a and b):

Note: This is regardless of PD-L1 status.

i. The medication will be used in combination with Opdivo (nivolumab intravenous infusion); AND

ii. The tumor is negative for actionable mutations; OR

Note: Examples of actionable mutations include sensitizing epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *NTRK* gene fusion-positive, *ROS1*, *BRAF V600E*, *MET 14* skipping mutation, *RET* rearrangement. The tumor may be *KRAS G12C* mutation positive.

(2) Yervoy is used as first-line therapy and the patient meets BOTH of the following (a and b):

a) The tumor is positive for ONE of the following mutations [(1) or (2)]:

(1) Epidermal growth factor receptor (*EGFR*) exon 20 mutation; OR

(2) *ERBB2* (HER2) mutation; AND

b) The medication will be used in combination with Opdivo (nivolumab intravenous infusion); OR

iii. Yervoy is used as first-line or subsequent therapy and the patient meets BOTH of the following (a and b):

a) The tumor is positive for ONE of the following mutations [(1), (2), (3), or (4)]:

(1) *BRAF V600E* mutation; OR

(2) *NTRK1/2/3* gene fusion; OR

(3) *MET* exon 14 skipping mutation; OR

(4) *RET* rearrangement; AND

- b) The medication will be used in combination with Opdivo (nivolumab intravenous infusion); OR
- iv. Yervoy is used as subsequent therapy and the patient meets ALL of the following (a, b, and c):
 - a) Tumor is positive for ONE of the following [(1), (2), (3), or (4)]:
 - (1) *EGFR* exon 19 deletion or exon 21 *L858R* mutation; OR
 - (2) *EGFR* *S768I*, *L861Q*, and/or *G719X* mutation; OR
 - (3) *ALK* rearrangement; OR
 - (4) *ROS1* rearrangement; AND
 - b) The patient has received targeted drug therapy for the specific mutation; AND
 Note: Examples of targeted drug therapy include Gilotrif (afatinib tablets), Tagrisso (osimertinib tablets), erlotinib, Iressa (gefitinib tablets), Xalkori (crizotinib capsules), Zykadia (ceritinib capsules), Alecensa (alectinib capsules), Alunbrig (brigatinib tablets), Lorbrena (lorlatinib tablets), Rozlytrek (entrectinib capsules), or Vizimpro (dacomitinib tablets).
 - c) Yervoy is used in combination with Opdivo (nivolumab intravenous infusion); AND
- D) The medication is prescribed by or in consultation with an oncologist.

- 20. Renal Cell Carcinoma.** Approve for 4 months if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced, relapsed, or metastatic disease; AND
 - C) The medication is used in combination with Opdivo (nivolumab intravenous infusion); AND
 - D) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

- 21. Ampullary Adenocarcinoma.** Approve for 4 months if the patient meets ALL of the following (A, B, C, D, E, and F):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has intestinal type disease; AND
 - C) Patient has progressive, unresectable, or metastatic disease; AND
 - D) The tumor is microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
 - E) The medication is used in combination with Opdivo (nivolumab intravenous infusion); AND
 - F) The medication is prescribed by or in consultation with an oncologist.
- 22. Biliary Tract Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient has unresectable, resected with gross residual, or metastatic disease; OR
 - ii. Patient meets ALL of the following (a, b, and c):
 - a) Patient has gall bladder cancer; AND
 - b) Patient has resectable locoregionally advanced disease; AND
 - c) The medication is used for neoadjuvant therapy; AND
 - C) Patient has tumor mutation burden-high (TMB-H) disease; AND
 Note: TMB-H is defined as 10 or more mutations per megabase.
 - D) Patient has ONE of the following (i, ii, or iii):
 - i. Gallbladder cancer; OR
 - ii. Intrahepatic cholangiocarcinoma; OR
 - iii. Extrahepatic cholangiocarcinoma; AND

- E) The medication is used in combination with Opdivo (nivolumab intravenous infusion); AND
- F) The medication is prescribed by or in consultation with an oncologist.

23. Bone Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, F, and G):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has unresectable or metastatic disease; AND
- C) Patient has progressed following prior treatment; AND
- D) Patient has tumor mutation burden-high (TMB-H) disease; AND
Note: TMB-H is defined as 10 or more mutations per megabase.
- E) Patient has ONE of the following (i, ii, iii, iv, or v):
 - i. Chondrosarcoma; OR
Note: Includes mesenchymal chondrosarcoma and dedifferentiated chondrosarcoma.
 - ii. Chordoma; OR
 - iii. Ewing sarcoma; OR
 - iv. High-grade undifferentiated pleomorphic sarcoma; OR
 - v. Osteosarcoma; AND
- F) The medication is used in combination with Opdivo (nivolumab intravenous infusion); AND
- G) The medication is prescribed by or in consultation with an oncologist.

24. Gastric Cancer. Approve for 4 months if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) The tumor is microsatellite instability-high (MSI-H) or deficient mismatch repair (dMMR); AND
- C) The medication is used in combination with Opdivo (nivolumab intravenous infusion); AND
- D) The medication is prescribed by or in consultation with an oncologist.

25. Kaposi Sarcoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has classic Kaposi sarcoma; AND
- C) Patient has relapsed or refractory disease; AND
- D) The medication is used in combination with Opdivo (nivolumab intravenous infusion); AND
- E) The medication is prescribed by or in consultation with an oncologist.

26. Merkel Cell Carcinoma. Approve for 4 months if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
- B) The medication is prescribed by or in consultation with an oncologist.

14. Neuroendocrine Tumors. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has advanced or metastatic disease; AND
- C) Patient meets ONE of the following (i, ii, iii, or iv):
 - i. Patient has well differentiated, Grade 3 disease; OR
 - ii. Patient has extrapulmonary poorly differentiated neuroendocrine carcinoma; OR
 - iii. Patient has large or small cell disease carcinoma; OR
 - iv. Patient has mixed neuroendocrine-non-neuroendocrine neoplasm; AND
- D) The medication is used in combination with Opdivo (nivolumab intravenous infusion); AND
- E) The medication is prescribed by or in consultation with an oncologist.

- 15. Small Bowel Adenocarcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced or metastatic disease; AND
 - C) Patient meets ONE of the following (i or ii):
 - i. The tumor is microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); OR
 - ii. The tumor is polymerase epsilon/delta (POLE/POLD1) mutation positive; AND
 - D) The medication is used in combination with Opdivo (nivolumab intravenous infusion); AND
 - E) The medication is prescribed by or in consultation with an oncologist.
- 16. Soft Tissue Sarcoma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced, unresectable, or metastatic disease; AND
 - C) Patient has ONE of the following (i, ii, iii, or iv)
 - i. Extremity/body wall, head/neck disease; OR
 - ii. Retroperitoneal/intra-abdominal disease; OR
 - iii. Rhabdomyosarcoma; OR
 - iv. Angiosarcoma; AND
 - D) The medication is used in combination with Opdivo (nivolumab intravenous infusion); AND
 - E) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Yervoy is not recommended in the following situations:

- 15.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Zaltrap Prior Authorization Policy

- Zaltrap® (ziv-aflibercept intravenous infusion – Regeneron/Sanofi-Aventis)

REVIEW DATE: 10/16/2024; selected revision 10/30/2024

OVERVIEW

Zaltrap, a vascular endothelial growth factor inhibitor, is indicated in combination with FOLFIRI (5-fluorouracil [5-FU], leucovorin, and irinotecan), for **metastatic colorectal cancer** in patients with disease that is resistant to or has progressed following an oxaliplatin-containing regimen.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) **colon cancer** guidelines (version 5.2024 – August 22, 2024) and **rectal cancer** guidelines (version 4.2024 – August 22, 2024) recommend Zaltrap as:²⁻⁴

- Initial treatment for patients with unresectable metachronous metastases and previous FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin) regimens within the past 12 months in combination with irinotecan OR with FOLFIRI, or
- Subsequent therapy after first progression of advanced or metastatic disease (proficient mismatch repair/microsatellite-stable or ineligible for or progressed on checkpoint inhibitor immunotherapy for deficient mismatch repair/microsatellite instability-high [dMMR/MSI-H] or polymerase epsilon/delta [POLE/POLD1] mutation positive disease) in combination with irinotecan or with FOLFIRI for disease not previously treated with an irinotecan-based regimen.

Both of these uses have a category 2A recommendation. Zaltrap has a category 2B recommendation for use as adjuvant therapy, in combination with FOLFIRI or irinotecan, for unresectable metachronous metastases (proficient mismatch repair/microsatellite-stable or ineligible for or progressed on checkpoint inhibitor immunotherapy for deficient mismatch repair/microsatellite instability-high [dMMR/MSI-H] or polymerase epsilon/delta [POLE/POLD1] mutation positive disease) that convert to resectable disease after primary treatment.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zaltrap. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zaltrap as well as the monitoring required for adverse events and long-term efficacy, approval requires Zaltrap to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zaltrap is recommended in those who meet the following criteria:

FDA-Approved Indication

97. Colon and Rectal Cancer, Appendiceal Adenocarcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

10/16/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

52. Patient is ≥ 18 years of age; AND
53. Patient meets ONE of the following (i or ii):
- A) Patient meets ALL of the following (a, b, c, and d):
 - i. Patient has unresectable metachronous metastases; AND
 - ii. Disease is proficient mismatch repair/microsatellite-stable (pMMR/MSS); AND
 - iii. Patient has been previously treated with FOLFOX or CapeOX; AND
Note: FOLFOX includes 5-fluorouracil (5-FU), leucovorin, and oxaliplatin and CapeOX includes capecitabine and oxaliplatin.
 - iv. Medication is used for initial therapy; OR
 - B) Patient meets ALL of the following (a, b, c, and d):
 - i. Patient has advanced or metastatic disease; AND
 - ii. Patient meets ONE of the following [(1) or (2)]:
 - i. Disease is proficient mismatch repair/microsatellite-stable (pMMR/MSS); OR
 - ii. Patient is ineligible for or progressed on checkpoint inhibitor therapy for deficient mismatch repair/microsatellite instability-high (dMMR/MSI-H) or polymerase epsilon/delta (POLE/POLD1) mutation positive; AND
Note: Examples of checkpoint inhibitors include Keytruda (pembrolizumab intravenous infusion) and Opdivo (nivolumab intravenous infusion).
 - iii. Patient has not previously been treated with irinotecan or FOLFIRI; AND
Note: FOLFIRI includes 5-fluorouracil (5-FU), leucovorin, and irinotecan.
 - iv. Medication is used for subsequent therapy; AND
54. Zaltrap will be used in combination with 5-fluorouracil (5-FU) and/or irinotecan; AND
55. The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zaltrap is not recommended in the following situations:

75. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Zepzelca Prior Authorization Policy

- Zepzelca™ (lurbinectedin intravenous infusion – Jazz)

REVIEW DATE: 06/26/2024

OVERVIEW

Zepzelca, an alkylating drug, is indicated for the treatment of metastatic **small cell lung cancer** in adults with disease progression on or after platinum-based chemotherapy.¹ This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial(s).

Guidelines

The National Comprehensive Cancer Network (NCCN) Small Cell Lung Cancer guidelines (version 3.2024 – June 11, 2024) recommend Zepzelca as a single agent for the treatment of relapsed disease following a complete or partial response, or stable disease with initial treatment, or for the treatment of primary progressive disease.^{2,3}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zepzelca. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zepzelca as well as the monitoring required for adverse events and long-term efficacy, approval requires Zepzelca to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zepzelca is recommended in those who meet the following:

FDA-Approved Indication

- 98. Small Cell Lung Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has metastatic disease; AND
 - C) Patient has previously received platinum-based chemotherapy; AND
- Note: Examples of platinum medications include cisplatin and carboplatin.
- D) Zepzelca is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zepzelca is not recommended in the following situations:

06/26/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

76. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Ziihera Prior Authorization Policy

- Ziihera® (zanidatamab-hrii intravenous infusion – Jazz)

REVIEW DATE: 12/04/2024

OVERVIEW

Ziihera, a bispecific human epidermal growth factor receptor 2 (HER2)-directed antibody, is indicated for the treatment of previously treated, unresectable or metastatic HER2-positive (immunohistochemistry [IHC] 3+) **biliary tract cancer**, as detected by an FDA-approved test in adults.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) biliary tract cancers (version 5.2024 – November 27, 2024) guidelines recommended Ziihera as “Useful in Certain Circumstances” for the subsequent treatment of unresectable, resected gross residual, or metastatic gallbladder cancer, intrahepatic cholangiocarcinoma, and extrahepatic cholangiocarcinoma that is HER2-positive (IHC3+) [category 2A].^{2,3}

Safety

Ziihera has a Boxed Warning for embryo-fetal toxicity.¹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ziihera. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ziihera as well as the monitoring required for adverse events and long-term efficacy, approval requires Ziihera to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ziihera is recommended in those who meet the following criteria:

FDA-Approved Indication

99. Biliary Tract Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, F, and G):

- A)** Patient is ≥ 18 years of age; AND
- B)** Patient has ONE of the following (i, ii, or iii):
 - i.** Gallbladder cancer; OR
 - ii.** Intrahepatic cholangiocarcinoma; OR
 - iii.** Extrahepatic cholangiocarcinoma; AND
- C)** Patient has unresectable, resected gross residual, or metastatic disease; AND
- D)** The tumor is human epidermal growth factor receptor 2 (HER2) positive with immunohistochemistry score of 3+ (IHC3+) as determined by an approved test; AND
- E)** The medication is used for subsequent therapy; AND

12/04/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- F)** The medication is used as a single agent; AND
- G)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ziihera is not recommended in the following situations:

- 77.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Zynlonta Prior Authorization Policy

- Zynlonta® (loncastuximab tesirine-lpyl intravenous infusion – Teva)

REVIEW DATE: 06/05/2024

OVERVIEW

Zynlonta, a CD19-directed antibody and alkylating agent conjugate, is indicated for the treatment of relapsed or refractory **large B-cell lymphoma** (including diffuse large B-cell lymphoma [DLBCL] not otherwise specified, DLBCL arising from low grade lymphoma, and high grade B-cell lymphoma) in adults, after two or more lines of systemic therapy.¹ Accelerated approval was granted for this indication based on overall response rate. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

Guidelines

Zynlonta is discussed in the guidelines from the National Comprehensive Cancer Network (NCCN):

- **B-Cell Lymphoma:** NCCN guidelines (version 2.2024 – April 30, 2024) recommend Zynlonta as a third-line and subsequent therapy option only after two or more lines of systemic therapy.² For second-line or subsequent treatment of relapsed or refractory DLBCL, a variety of chemotherapy-based regimens ± rituximab are preferred regimens. Allogeneic stem cell transplantation is also an option for selected patients, as consolidation after alternate second-line therapy. NCCN notes that it is unclear if any CD-19 therapy (including Zynlonta and Monjuvi® [tafasitamab intravenous infusion]) would have a negative impact on the clinical efficacy of subsequent anti-CD19 CAR T-cell therapy.^{2,3}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zynlonta. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zynlonta as well as the monitoring required for adverse events and long-term efficacy, approval requires Zynlonta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zynlonta is recommended in those who meet the following criteria:

FDA-Approved Indication

100. Large B-Cell Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

Note: This includes diffuse large B-cell lymphoma (DLBCL) not otherwise specified, DLBCL arising from low grade lymphoma, and high-grade B-cell lymphoma.

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least two systemic regimens; AND

06/05/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Note: Examples of systemic therapies containing one or more of the following products include gemcitabine, oxaliplatin, rituximab, Polivy (polatuzumab vedotin intravenous infusion), bendamustine, Monjuvi (tafasitamab-cxix intravenous infusion), or Revlimid (lenalidomide capsules). Autologous stem cell transplant and chimeric antigen receptor (CAR) T-cell therapy also count as a systemic regimen.

- C) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

- 101. Human Immunodeficiency Virus-Related B-Cell Lymphoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):

Note: This includes human immunodeficiency virus-related diffuse large B-cell lymphoma (DLBCL), primary effusion lymphoma, and human herpes virus 8 (HHV8)-positive DLBCL not otherwise specified.

- A) Patient is ≥ 18 years of age; AND

- B) Patient has tried at least two systemic regimens; AND

Note: Examples of systemic therapies include R-EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin, rituximab) and RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone).

- C) The medication is prescribed by or in consultation with an oncologist.

- 102. Post-Transplant Lymphoproliferative Disorders.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND

- B) Patient has tried at least two systemic regimens; AND

Note: Examples of systemic therapies include RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone), RCEPP (rituximab, cyclophosphamide, etoposide, prednisone, procarbazine), RCEOP (rituximab, cyclophosphamide, etoposide, vincristine, prednisone), and RCVP (rituximab, cyclophosphamide, vincristine, prednisone).

- C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zynlonta is not recommended in the following situations:

- 78.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Other) – Adstiladrin Prior Authorization Policy

- Adstiladrin® (nadofaragene firadenovec-vncg intravesical suspension – Ferring)

REVIEW DATE: 05/08/2024

OVERVIEW

Adstiladrin, a non-replicating adenoviral vector-based gene therapy, is indicated for the treatment of high-risk Bacillus Calmette-Guerin (BCG)-unresponsive non-muscle invasive **bladder cancer** (NMIBC) with carcinoma *in situ* (CIS) with or without papillary tumors in adults.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) **bladder cancer** clinical guidelines (version 3.2024 – April 16, 2024) recommend Adstiladrin for the treatment of BCG-unresponsive, high-risk NMIBC with CIS with or without papillary tumors (category 2A) and BCG-unresponsive, high-risk NMIBC with high-grade papillary Ta/T1 tumors without CIS (category 2B) as initial treatment or for cytology-positive, imaging- and cystoscopy-negative, recurrent or persistent disease.^{2,3}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Adstiladrin. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Adstiladrin as well as the monitoring required for adverse events and long-term efficacy, approval requires Adstiladrin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Adstiladrin is recommended in those who meet the following criteria:

FDA-Approved Indication

103. Non-Muscle Invasive Bladder Cancer. Approve for the duration noted if the patient meets ONE of the following (A or B):

- A) Initial Therapy:** Approve for 4 months to allow 2 doses to be given (3 months apart) if the patient meets ALL of the following (i, ii, iii, and iv):
- i.** Patient is ≥ 18 years of age; AND
 - ii.** Patient has high-risk, Bacillus Calmette-Guerin (BCG)-unresponsive disease; AND
 - iii.** Patient meets ONE of the following (a or b):
 - a)** Patient has carcinoma *in situ* (CIS) with or without high-grade papillary Ta/T1 tumors; OR
 - b)** Patient has high-grade papillary Ta/T1 tumors without CIS; AND
 - iv.** Medication is prescribed by or in consultation with a urologist or an oncologist.
- B) Patient is currently receiving Adstiladrin:** Approve for 3 months to allow a single dose to be administered 3 months after the most recent dose if the patient meets BOTH of the following (i and ii):

05/08/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- i. Patient meets ONE of the following (a or b):
 - a) Patient is in remission both on cytology and cystoscopic examination; OR
 - b) Patient has cytology-positive, imaging- and cystoscopy-negative, recurrent or persistent disease; AND
- ii. Medication is prescribed by or in consultation with a urologist or an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Adstiladrin is not recommended in the following situations:

- 79. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Other) – Anktiva Prior Authorization Policy

- Anktiva® (nogapendekin alfa inbakicept-pmln intravesical solution – ImmunityBio)

REVIEW DATE: 05/08/2024

OVERVIEW

Anktiva, an interleukin-15 (IL-15) receptor agonist, is indicated with Bacillus Calmette-Guerin (BCG) for the treatment of **BCG-unresponsive non-muscle invasive bladder cancer** (NMIBC) in adults with carcinoma in situ with or without papillary tumors.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) **bladder cancer** clinical guidelines (version 4.2024 – May 9, 2024) recommend Anktiva for the treatment of BCG-unresponsive, high-risk NMIBC with CIS with or without papillary tumors (category 2A) as initial treatment or for cytology-positive, imaging- and cystoscopy-negative, recurrent or persistent disease.^{3,4}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Anktiva. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Anktiva as well as the monitoring required for adverse events and long-term efficacy, approval requires Anktiva to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Anktiva is recommended in those who meet the following criteria:

FDA-Approved Indication

104. Non-Muscle Invasive Bladder Cancer. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy: Approve for 6 months if the patient meets ALL of the following (i, ii, iii, iv, and v):

Note: This allows enough time for a patient to complete two courses of induction therapy if needed.

- i.** Patient is ≥ 18 years of age; AND
- ii.** Patient has Bacillus Calmette-Guerin (BCG) unresponsive disease; AND
- iii.** Patient has carcinoma in situ with or without papillary tumors; AND
- iv.** Medication is used in combination with BCG; AND
- v.** Medication is prescribed by or in consultation with a urologist or an oncologist; OR

B) Maintenance Therapy: Approve for 3 months if the patient meets ALL of the following (i, ii, and iii):

- i.** Patient has an ongoing complete response defined as ONE of the following (a or b):

05/08/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- a) Patient has negative cystoscopy and meets ONE of the following [(1) or (2)]:
 - (1) Negative urine cytology; OR
 - (2) Malignant urine cytology if cancer found in the upper tract or prostatic urethra and random bladder biopsies are negative; OR
- b) Patient has positive cystoscopy with biopsy-proven benign or low-grade Ta non-muscle invasive bladder cancer and negative urine cytology; AND
- ii. Medication is used in combination with BCG; AND
- iii. Medication is prescribed by or in consultation with a urologist or an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Anktiva is not recommended in the following situations:

- 80.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Other) – Jelmyto Prior Authorization Policy

- Jelmyto® (mitomycin solution for pyelocalyceal administration – UroGen)

REVIEW DATE: 05/08/2024

OVERVIEW

Jelmyto, an alkylating agent, is indicated for the treatment of low-grade upper tract **urothelial cancer** in adults.¹

Dosing Information

Jelmyto is for pyelocalyceal use only.¹ The recommended dose is 4 mg/mL of mitomycin administered by ureteral catheter or a nephrostomy tube, with total instillation volume determined on volumetric measurements using pyelography, not to exceed 15 mL (60 mg of mitomycin). The dose is instilled once weekly for 6 weeks. In patients with a complete response 3 months after initiating Jelmyto, therapy can continue once a month for an additional 11 instillations.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for **bladder cancer** (version 3.2024 – April 16, 2024) recommend Jelmyto as a primary treatment for upper urinary tract tumors (category 2A).^{2,3} Jelmyto is recommended following complete or near complete endoscopic resection or ablation of a non-metastatic, residual, low-grade, low volume, solitary tumor in patients who are not a candidate for or are not seeking definitive treatment with nephroureterectomy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Jelmyto. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Jelmyto as well as the monitoring required for adverse events and long-term efficacy, approval requires Jelmyto to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Jelmyto is recommended in those who meet the following criteria:

FDA-Approved Indication

- 105. Upper Tract Urothelial Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has non-metastatic disease; AND
 - C) Patient has low-grade disease; AND
 - D) Patient has undergone endoscopic resection or ablation; AND
 - E) Jelmyto is prescribed by or in consultation with an oncologist or urologist.

05/08/2024

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Other) – Valrubicin Products Prior Authorization Policy

- Valstar® (valrubicin intravesical solution– Endo, generic)

REVIEW DATE: 12/18/2024

OVERVIEW

Valrubicin, an anthracycline topoisomerase inhibitor, is indicated for intravesical therapy of BCG-refractory **carcinoma *in situ* (CIS) of the urinary bladder** in patients for whom immediate cystectomy would be associated with unacceptable morbidity or mortality.¹

Guidelines

The National Comprehensive Cancer Network guidelines for **bladder cancer** (version 5.2024 – October 28, 2024) recommend intravesical valrubicin in the event of a Bacillus Calmette-Guerin (BCG) shortage and for BCG-refractory carcinoma *in situ* (Tis) disease as either initial therapy if high risk and BCG unresponsive or intolerant, or for refractory or persistent disease.^{2,3}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of valrubicin. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with valrubicin as well as the monitoring required for adverse events and long-term efficacy, approval requires valrubicin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of valrubicin is recommended in those who meet the following criteria:

FDA-Approved Indication

- 106. Bladder Cancer.** Approve for 2 months if the patient meets ALL of the following (A, B, and C):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient meets ONE of the following (i, ii, or iii):
 - i.** Patient has Bacillus Calmette-Guerin (BCG)-refractory carcinoma; OR
 - ii.** Patient is intolerant of Bacillus Calmette-Guerin (BCG); OR
 - iii.** According to the prescriber, valrubicin will be used due to a Bacillus Calmette-Guerin (BCG) shortage; AND
 - C)** The medication is prescribed by or in consultation with an oncologist.

12/18/2024

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Valchlor Prior Authorization Policy

- Valchlor® (mechlorethamine topical gel – Helsinn)

REVIEW DATE: 12/18/2024

OVERVIEW

Valchlor, a nitrogen mustard, is indicated for the topical treatment of Stage IA and IB **mycosis fungoides-type cutaneous T-cell lymphoma** in patients who have received prior skin-directed therapy.¹

Guidelines

Valchlor is addressed in National Comprehensive Cancer Network guidelines:

- **Histiocytic neoplasms:** Guidelines (version 2.2024 – July 19, 2024) recommend Valchlor for the topical treatment of unifocal Langerhans cell histiocytosis with isolated skin disease.^{2,5}
- **Primary cutaneous lymphomas:** Guidelines (version 1.2025 – November 11, 2024) recommend Valchlor for the topical treatment of primary cutaneous B-cell lymphoma, mycosis fungoides/Sezary syndrome, and primary cutaneous CD30+ T-cell lymphoproliferative disorders.^{2,3}
- **T-cell lymphomas:** Guidelines (version 1.2023 – January 5, 2023) recommend Valchlor for the topical treatment of adult T-cell leukemia/lymphoma – smoldering subtype.^{2,4}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Valchlor. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Valchlor is recommended in those who meet one of the following criteria:

FDA-Approved Indication

107. Cutaneous Lymphomas. Approve for 1 year if the patient is ≥ 18 years of age.

Note: Includes mycosis fungoides/Sezary syndrome, primary cutaneous B-cell lymphoma, primary cutaneous CD30+ T-cell lymphoproliferative disorders.

Other Uses with Supportive Evidence

108. Adult T-Cell Leukemia/Lymphoma. Approve for 1 year if the patient has smoldering subtype of adult T-cell leukemia/lymphoma.

109. Langerhans Cell Histiocytosis. Approve for 1 year if, according to the prescriber, patient has unifocal Langerhans cell histiocytosis with isolated skin disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

12/18/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Coverage of Valchlor is not recommended in the following situations:

- 83.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vanflyta Prior Authorization Policy

- Vanflyta® (quizartinib tablets – Daiichi Sankyo)

REVIEW DATE: 06/19/2024

OVERVIEW

Vanflyta, a kinase inhibitor, is indicated in combination with standard cytarabine and anthracycline induction and cytarabine consolidation, and as maintenance monotherapy following consolidation chemotherapy, for the treatment of **newly diagnosed acute myeloid leukemia (AML)** that is FMS-like tyrosine kinase 3 internal tandem duplication (**FLT3-ITD**)-**positive** as detected by an FDA-approved test in adults.¹

Limitation of use: Vanflyta is not indicated as maintenance monotherapy following allogeneic hematopoietic stem cell transplantation (HSCT) and improvement in overall survival with Vanflyta in this setting has not been demonstrated.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for AML (version 3.2024 – May 17, 2024) recommend Vanflyta in combination with standard 7+3 (cytarabine + daunorubicin or idarubicin) for patients with AML with *FLT3-ITD* mutation as induction therapy for those that are induction eligible (category 1).² Vanflyta in combination with chemotherapy is also recommended as re-induction after standard-dose induction and as consolidation therapy for patients with *FLT3-ITD* mutation (category 2A). Vanflyta is recommended as maintenance therapy for patients with *FLT3-ITD* mutation who have previously received Vanflyta and no allogeneic hematopoietic stem cell transplantation (HSCT) is planned (category 2A) or post allogeneic HSCT in remission (category 2B). Single-agent Vanflyta is recommended for relapsed/refractory disease for patients with *FLT3-ITD* mutation (category 2B).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vanflyta. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vanflyta is recommended in those who meet the following criteria:

FDA-Approved Indication

5. **Acute Myeloid Leukemia.** Approve for 1 year if the patient meets ALL of the following (A, B and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has *FLT3-ITD* mutation-positive disease as detected by an approved test; AND
 - C) This medication is being used for induction, re-induction, consolidation, or maintenance treatment.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

06/19/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Coverage of Vanflyta is not recommended in the following situations:

16. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

- Venclexta® (venetoclax tablets – AbbVie and Genentech)

REVIEW DATE: 06/12/2024; selected revision 12/18/2024

OVERVIEW

Venclexta, a B-cell lymphoma-2 inhibitor, is indicated in adults for the following uses:¹

- **Acute myeloid leukemia (AML)**, in combination with azacitidine or decitabine or low-dose cytarabine for newly diagnosed AML in patients ≥ 75 years of age or who have comorbidities that preclude use of intensive induction chemotherapy.
- **Chronic lymphocytic leukemia (CLL).**
- **Small lymphocytic lymphoma (SLL).**

Guidelines

Venclexta is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **Acute Lymphoblastic Leukemia (ALL):** NCCN pediatric ALL guidelines (version 5.2024 – April 3, 2024) recommend a Venclexta-containing regimen (i.e. Venclexta, vincristine, Oncaspar® [pegaspargase intravenous infusion or intramuscular injection] or Asparlas® [calaspargase pegol-mknl intravenous infusion], and prednisone or dexamethasone) for relapsed or refractory ALL as “other recommended regimens” (category 2A).² NCCN adult and adolescent ALL guidelines (version 4.2023 – February 5, 2024) recommend Venclexta + chemotherapy for relapsed or refractory ALL as “other recommended regimens” (category 2B).³
- **AML:** NCCN guidelines (version 3.2024 – May 17, 2024) recommend Venclexta (in combination with decitabine, azacitidine or low-dose cytarabine) in a variety of clinical scenarios, such as induction therapy, post induction therapy, and relapsed or refractory disease.⁴ The guidelines recommend Venclexta (in combination with decitabine, azacitidine, or low-dose cytarabine) for Blastic Plasmacytoid Dendritic Cell Neoplasm (BPDCN) for systemic disease treated with palliative intent (patients with low performance and/or nutritional status) or relapsed/refractory disease (category 2A).⁴
- **B-Cell Lymphomas:** NCCN guidelines (version 2.2024 – April 30, 2024) address mantle cell lymphoma.⁵ The guidelines cite Venclexta (continuous) $\pm$ rituximab and Venclexta + Imbruvica® (ibrutinib tablets, capsules, and oral solution) as second-line therapy and subsequent therapy as “useful in certain circumstances” (both category 2A).⁵ Venclexta in combination with Brukinsa (zanubrutinib capsules) and Gazyva® (obinutuzumab intravenous infusion) is also recommended as induction therapy for mantle cell lymphoma with a classical or indolent TP53 mutation (category 2A) in absence of a clinical trial.⁵
- **CLL/SLL:** NCCN guidelines (version 3.2024 – March 26, 2024) cite Venclexta in several scenarios.⁶ For patients without 17p deletion/TP53 mutation, Venclexta + Gazyva is listed as a “preferred” first-line therapy (category 1); Venclexta + rituximab is listed as a “preferred regimen” (category 1), single-agent Venclexta is listed as “other recommended regimen” (category 2A), and Venclexta $\pm$ anti-CD20 monoclonal antibody (Venclexta + Gazyva preferred) is listed as “useful in certain circumstances” (category 2A) for second-line or third-line therapy.⁶ For patients with 17p deletion/TP53 mutation, Venclexta + Gazyva is recommended as a “preferred regimen” first-line therapy (category 2A); Venclexta + rituximab (category 1), single-agent Venclexta (category 2A) are “preferred” and Venclexta $\pm$ anti-CD20 monoclonal antibody (Venclexta + Gazyva preferred) is listed as “useful in certain circumstances” (category 2A) for second-line and

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

subsequent therapy in this population. Venclexta is also recommended other clinical scenarios as well. Many other first-line options are recommended. CLL and SLL are different manifestations of the same disease which are managed similarly.

- **Hairy Cell Leukemia:** NCCN guidelines (version 2.2024 – April 22, 2024) recommend Venclexta ± rituximab for progressive disease after relapsed/refractory therapy in patients with disease resistant to *BRAF* inhibitor therapy as “useful in certain circumstances” (category 2A).⁷
- **Myelodysplastic Syndromes:** NCCN guidelines (version 1.2025 – November 15, 2024) recommend Venclexta for the management of higher-risk disease (i.e. International prognostic scoring system [IPSS-R] intermediate-, high-, or very-high risk disease) in combination with a hypomethylating agent (azacitidine or decitabine) and for the treatment of chronic myelomonocytic leukemia (CMML)-2 in combination with a hypomethylating agent (azacitidine or decitabine) [category 2A].⁸
- **Myeloproliferative Neoplasms:** NCCN guidelines (version 1.2024 – December 21, 2023) recommend Venclexta + hypomethylating agents (e.g. azacitidine or decitabine) for accelerated or blast phase myeloproliferative neoplasms as management of disease progression (category 2A).⁹
- **Multiple Myeloma:** NCCN guidelines (version 4.2024 – April 26, 2024) recommend Venclexta + dexamethasone ± Darzalex® (daratumumab intravenous infusion) for previously treated multiple myeloma for relapse or refractory disease for patients with t (11;14) translocation as “useful in certain circumstances” after 1-3 prior therapies) [category 2A].¹⁰
- **Systemic Light Chain Amyloidosis:** NCCN guidelines (version 2.2024 – December 12, 2023) list Venclexta ± dexamethasone as a therapy for previously treated disease for patients with t (11;14) translocation as “useful in certain circumstances” (category 2A).¹¹
- **Waldenström Macroglobulinemia/Lymphoplasmacytic Lymphoma:** NCCN guidelines (version 2.2024 – December 5, 2023) recommend single-agent Venclexta as “other recommended regimen” for previously treated disease (category 2A).¹²

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Venclexta. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Venclexta is recommended in those who meet one of the following criteria:

FDA-Approved Indications

6. **Acute Myeloid Leukemia.** Approve for 1 year if the patient meets BOTH of the following (A and B):

Note: Acute Myeloid Leukemia includes Blastic Plasmacytoid Dendritic Cell Neoplasm (BPDCN).

A) Patient is ≥ 18 years of age; AND

B) Venclexta is used in combination with either azacitidine, decitabine, or cytarabine.

7. **Chronic Lymphocytic Leukemia.** Approve for 1 year if the patient is ≥ 18 years of age.

8. **Small Lymphocytic Lymphoma.** Approve for 1 year if the patient is ≥ 18 years of age.

Other Uses with Supportive Evidence

06/12/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- 9. Acute Lymphoblastic Leukemia.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient has relapsed or refractory disease; AND
 - B) This medication will be used in combination with chemotherapy.
- 10. Hairy Cell Leukemia.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has disease resistance to *BRAF* inhibitor therapy.
Note: Examples of *BRAF* inhibitor therapy include Tafenlar (dabrafenib capsules and oral tablets for suspension) and Zelboraf (vemurafenib tablets).
- 11. Mantle Cell Lymphoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient has tried at least one systemic regimen; OR
Note: Examples of systemic regimens include those containing one or more of the following products: Imbruvica (ibrutinib tablets, capsules, and oral solution), rituximab, Calquence (acalabrutinib tablets), lenalidomide, dexamethasone, cytarabine, cisplatin, cyclophosphamide, doxorubicin, vincristine, high-dose methotrexate, cytarabine, or Treanda (bendamustine intravenous infusion).
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient has a *TP53* mutation; AND
 - b) The medication is used as induction therapy in combination with Brukinsa (zanubrutinib capsules) and Gazyva (obinutuzumab intravenous infusion).
- 12. Myelodysplastic Syndrome.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient has chronic myelomonocytic leukemia-2; OR
 - ii. Patient has higher risk disease; AND
Note: Higher risk disease includes patients who have an international prognostic scoring system (IPSS-R) intermediate-, high-, or very-high risk disease.
 - C) The medication is used in combination with azacitidine or decitabine.
- 13. Myeloproliferative Neoplasm.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has accelerated or blast phase disease; AND
 - C) The medication is used in combination with azacitidine or decitabine.
- 14. Multiple Myeloma.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has t (11;14) translocation; AND
 - C) Patient has tried at least one systemic regimen for multiple myeloma; AND

Note: Examples of systemic regimens include those containing one or more of the following products: bortezomib, Kyprolis (carfilzomib intravenous injection), lenalidomide, cyclophosphamide, or Ninlaro (ixazomib capsules).

D) Venclexta is used in combination with dexamethasone.

15. Systemic Light Chain Amyloidosis. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has t (11;14) translocation; AND

C) Patient has tried at least one systemic regimen.

Note: Examples of systemic regimens include those containing one or more of the following products: bortezomib, lenalidomide, cyclophosphamide, and melphalan.

16. Waldenström Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if the patient meets ALL of the following (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient has tried at least one systemic regimen.

Note: Examples of a systemic regimen contain one or more of the following products: Brukinsa (zanubrutinib capsules), Imbruvica (ibrutinib tablets, capsules, and oral solution), rituximab, bendamustine, cyclophosphamide, dexamethasone, bortezomib, fludarabine, or cladribine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Venclexta is not recommended in the following situations:

17. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Verzenio Prior Authorization Policy

- Verzenio® (abemaciclib tablets – Eli Lilly)

REVIEW DATE: 02/21/2024

OVERVIEW

Verzenio, a cyclin-dependent kinase (CDK) 4/6 inhibitor, is indicated for the treatment of hormone receptor-positive (HR+), human epidermal growth factor receptor 2 (HER2)-negative **breast cancer** in adults in the following settings:¹

- **Early breast cancer**, in combination with endocrine therapy (tamoxifen or an aromatase inhibitor [AI]) for adjuvant treatment for node-positive disease at high risk of recurrence.
- **Advanced or metastatic breast cancer:**
 - In combination with an AI as initial endocrine-based therapy.
 - In combination with fulvestrant for disease progression following endocrine therapy.
 - As monotherapy for disease progression following endocrine therapy and prior chemotherapy in the metastatic setting.

Guidelines

Verzenio is discussed in in guidelines from National Comprehensive Cancer Network (NCCN):

- **Breast cancer** (version 1.2024 – January 25, 2024) recommend Verzenio with AI (category 2A) or fulvestrant (category 1) as a first-line “Preferred Regimen” for recurrent unresectable (local or regional) or Stage IV HR+ and HER2-negative disease in postmenopausal women or premenopausal patient receiving ovarian ablation or suppression.^{2,3} The guidelines state in a footnote that in phase III randomized controlled trials, Kisqali® (ribociclib tablets) + endocrine therapy has shown overall survival benefit in the first-line setting. CDK4/6 inhibitor + fulvestrant is recommended for second- and subsequent-line therapy, if CDK4/6 inhibitor was not previously used (category 1) in this setting, which is a “Preferred Regimen”. The guidelines state in a footnote that in phase III randomized controlled trials, fulvestrant in combination with a CDK4/6 inhibitor has shown overall survival benefit in the second-line setting. In this setting, single-agent Verzenio is recommended as a “Useful In Certain Circumstances” therapy (for subsequent treatment) if there is progression on prior endocrine therapy and prior chemotherapy in the metastatic setting (category 2A). For men with breast cancer, the compendium recommends they be treated similarly to postmenopausal women, except that the use of an aromatase inhibitor is ineffective without concomitant suppression of testicular steroidogenesis.³ The guidelines also recommend Verzenio for 2 years as adjuvant therapy in combination with endocrine therapy in patients with HR+, HER2-negative, high risk (i.e., ≥4 positive lymph nodes, or 1-3 positive lymph nodes with either grade 3 disease or tumor size ≥5 cm, (category 1).
- **Endometrial Cancer:** NCCN uterine neoplasms guidelines (version 1.2024 – September 20, 2023) recommend Verzenio in combination with letrozole for recurrent or metastatic endometrial carcinoma for estrogen receptor (ER)-positive tumors (category 2A).⁵

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Verzenio. All approvals are provided for duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an

02/21/2024

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Verzenio is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1. Breast Cancer - Early.** Approve for 2 years if the patient meets the following (A, B, C, D, and E):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
 - C)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
 - D)** Patient has node-positive disease at high risk of recurrence; AND
Note: High risk includes patients with ≥ 4 positive lymph nodes, or 1-3 positive lymph nodes with grade 3 disease or tumor size ≥ 5 cm
 - E)** Patient meets ONE of the following (i or ii):
 - i.** Verzenio will be used in combination with anastrozole, exemestane, or letrozole AND patient meets one of the following (a ,b, or c):
 - a)** Patient is a postmenopausal woman*; OR
 - b)** Patient is a pre/perimenopausal woman* and meets one of the following [(1) or (2)]:
 - (1)** Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR
Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous injection).
 - (2)** Patient has had surgical bilateral oophorectomy or ovarian irradiation; OR
 - c)** Patient is a man* and patient is receiving a gonadotropin-releasing hormone (GnRH) analog; OR
Note: Examples of a GnRH analog include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous injection), Firmagon (degarelix acetate subcutaneous injection), Orgovyx (relugolix tablet).
 - ii.** Verzenio will be used in combination with tamoxifen AND patient meets one of the following (a or b):
 - a)** Patient is a postmenopausal woman* or man*; OR
 - b)** Patient is a pre/perimenopausal woman* and meets one of the following [(1) or (2)]:
 - (1)** Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR
Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous injection).
 - (2)** Patient has had surgical bilateral oophorectomy or ovarian irradiation.

* Refer to the Policy Statement.

02/21/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

2. Breast Cancer – Recurrent or Metastatic in Women*. Approve for 1 year if the patient meets the following (A, B, C, D, E, and F):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has recurrent or metastatic breast cancer; AND
- C) Patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
- D) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- E) Patient meets ONE of the following (i or ii):
 - i. Patient is postmenopausal OR
 - ii. Patient is pre/perimenopausal and meets one of the following (a or b):
 - a) Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist; OR
Note: Examples of a GnRH agonist include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant).
 - b) Patient has had surgical bilateral oophorectomy or ovarian irradiation; AND
- F) Patient meets ONE of the following (i, ii, or iii):
 - i. Verzenio will be used in combination with anastrozole, exemestane, or letrozole; OR
 - ii. Verzenio will be used in combination with fulvestrant; OR
 - iii. Patient meets the following conditions (a, b, and c):
 - a) Verzenio will be used as monotherapy; AND
 - b) Patient's breast cancer has progressed on at least one prior endocrine therapy; AND
Note: Examples of prior endocrine therapy include anastrozole, exemestane, letrozole, tamoxifen, toremifene, exemestane plus everolimus, fulvestrant, everolimus plus fulvestrant or tamoxifen, megestrol acetate, fluoxymesterone, ethinyl estradiol.
 - c) Patient has tried chemotherapy for metastatic breast cancer.

* Refer to the Policy Statement.

3. Breast Cancer - Recurrent or Metastatic in Men*. Approve for 1 year if the patient meets the following (A, B, C, D, and E):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has recurrent or metastatic breast cancer; AND
- C) Patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
- D) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- E) Patient meets ONE of the following (i, ii, or iii):
 - i. Patient meets BOTH of the following conditions (a and b):
 - a) Patient is receiving a gonadotropin-releasing hormone (GnRH) analog; AND
Note: Examples of a GnRH analog include leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Firmagon (degarelix acetate subcutaneous injection), Orgovyx (relugolix tablet).
 - b) Verzenio will be used in combination with anastrozole, exemestane, or letrozole; OR
 - ii. Verzenio will be used in combination with fulvestrant; OR
 - iii. Patient meets the following conditions (a, b, and c):
 - a) Verzenio will be used as monotherapy; AND
 - b) Patient's breast cancer has progressed on at least one prior endocrine therapy; AND

Note: Examples are anastrozole, exemestane, letrozole, tamoxifen, toremifene, exemestane plus everolimus, fulvestrant, everolimus plus fulvestrant or tamoxifen, megestrol acetate, fluoxymesterone, ethinyl estradiol.

- c) Patient has tried chemotherapy for metastatic breast cancer.

* Refer to the Policy Statement.

Other Uses with Supportive Evidence

4. **Endometrial Cancer.** Approve for 1 year if the patient meets the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has recurrent or metastatic disease; AND
- C) Patient has estrogen receptor (ER)-positive tumors; AND
- D) Patient will be using in combination with letrozole.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Verzenio is not recommended in the following situations:

18. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vistogard Prior Authorization Policy

- Vistogard® (uridine triacetate oral granules – Wellstat Therapeutics)

REVIEW DATE: 08/07/2024

OVERVIEW

Vistogard, a pyrimidine analog, is indicated for the emergency treatment of adult and pediatric patients for the following uses:¹

- **Fluorouracil or capecitabine overdose**, regardless of the presence of symptoms.
- **Early-onset, severe or life-threatening toxicity** affecting the cardiac or central nervous system, and/or early-onset, unusually severe adverse reactions (e.g., gastrointestinal toxicity, neutropenia) within 96 hours following the end of fluorouracil or capecitabine administration.

As a limitation of use, Vistogard is not recommended for the non-emergent treatment of adverse events associated with fluorouracil or capecitabine because it may diminish the efficacy of these drugs.¹ The safety and efficacy of Vistogard initiated more than 96 hours following the end of fluorouracil or capecitabine administration have not been established.

Disease Overview

Fluorouracil and capecitabine (a fluorouracil prodrug) are widely used chemotherapeutic agents with potential for significant toxicity. Exaggerated sensitivity to capecitabine or fluorouracil may occur due to genetic variations in certain enzymes, renal impairment, or other causes.² Toxicity results in tissue damage, often manifesting as ulcerative mucositis with neutropenia leading to sepsis, shock, and organ failure. Additionally, central neurotoxicity and cardiac toxicity may occur without any identifiable predisposing factors. Exogenous uridine competes with the toxic metabolite fluorouridine triphosphate for incorporation into RNA in normal tissues, thereby protecting the tissues from toxicity.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vistogard. All approvals are provided for the duration noted below.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vistogard is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Capecitabine or Fluorouracil Overdose.** Approve for 7 days.
2. **Capecitabine or Fluorouracil Toxicity, Severe or Life-Threatening.** Approve for 7 days.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vitrakvi Prior Authorization Policy

- Vitrakvi® (larotrectinib capsules and oral solution – Bayer)

REVIEW DATE: 02/07/2024

OVERVIEW

Vitrakvi, a kinase inhibitor, is indicated for the treatment of **solid tumors** in adult and pediatric patients that: have a **neurotrophic receptor tyrosine kinase (NTRK) gene fusion** without a known acquired resistance mutation; are metastatic or where surgical resection is likely to result in severe morbidity; and have no satisfactory alternative treatments or that have progressed following treatment .¹

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium notes Vitrakvi as an option for the treatment of the following cancers with *NTRK* gene fusion-positive tumors as category 2A recommendations: ampullary adenocarcinoma, breast cancer, central nervous system cancers, cervical cancer, cholangiocarcinoma (intrahepatic and extrahepatic), colon cancer, cutaneous melanoma, endometrial carcinoma, epithelial ovarian cancer/fallopian tube cancer/primary peritoneal cancer, Erdheim-Chester disease, esophageal and esophagogastric cancer, gallbladder cancer, gastric cancer, gastrointestinal stromal tumors, hepatocellular carcinoma, Langerhans Cell histiocytosis, neuroendocrine and adrenal tumors, non-small cell lung cancer, occult primary, pancreatic cancer, rectal cancer, Rosai-Dorfman disease, salivary gland tumors, small bowel adenocarcinoma, soft tissue sarcoma, thyroid carcinoma, uterine sarcoma, and vulvar cancer.²

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vitrakvi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vitrakvi is recommended in those who meet the following criteria:

FDA-Approved Indication

3. Solid Tumors. Approve for 1 year if the patient meets the following (A and B):

Note: Examples of solid tumors include breast cancer, colon cancer, hepatobiliary cancer, histiocytic neoplasm, ovarian cancer, pancreatic cancer, salivary gland tumors, thyroid cancer, and rectal cancer.

A) The tumor is positive for neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion; **AND**

B) Patient meets one of the following (i or ii):

i. The tumor is metastatic; **OR**

ii. Surgical resection of tumor will likely result in severe morbidity.

02/07/2024

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vizimpro Prior Authorization Policy

- Vizimpro® (dacomitinib tablets – Pfizer)

REVIEW DATE: 12/11/2024

OVERVIEW

Vizimpro, a tyrosine kinase inhibitor (TKI), is indicated for the first-line treatment of patients with metastatic **non-small cell lung cancer (NSCLC)** with epidermal growth factor receptor (*EGFR*) exon 19 deletion or exon 21 L858R substitution mutations as detected by an FDA-approved test.¹

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 11.2024 – October 15, 2024) recommend testing for sensitizing *EGFR* mutations in patients with metastatic disease.² Patients with sensitizing *EGFR* mutations have a significantly better response to the *EGFR* TKIs. The most common *EGFR* mutations are exon 19 deletions and exon 21 (L858R) substitution mutations. Other less common mutations that are also sensitive to *EGFR* TKIs include L861Q, G719X, and S768I; these mutations cumulatively account for approximately 10% of all *EGFR* mutations. NCCN recommends Vizimpro as first-line treatment under “Useful in Certain Circumstances” for patients with advanced or metastatic NSCLC with *EGFR* exon 19 deletions, exon 21 (L858R) substitution mutations (category 1); it is listed under “Other Recommended” first-line therapies for L861Q, G719X, and S768I mutations (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vizimpro. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vizimpro is recommended in those who meet the following criteria:

FDA-Approved Indication

3. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

G) Patient is ≥ 18 years of age; AND

H) Patient has advanced or metastatic disease; AND

I) Patient has sensitizing *EGFR* mutation-positive non-small cell lung cancer as detected by an approved test.

Note: Examples of sensitizing *EGFR* mutation-positive non-small cell lung cancer include the following: exon 19 deletions, exon 21 (L858R) substitution mutations, L861Q, G719X, and S768I.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vizimpro is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vonjo Prior Authorization Policy

- Vonjo™ (pacritinib capsules – CTI BioPharma/Sobi)

REVIEW DATE: 02/07/2024; selected revision 12/11/2024

OVERVIEW

Vonjo, an inhibitor of Janus Associated Kinase (JAK)2 and FMS-like tyrosine kinase, is indicated for the treatment of intermediate- or high-risk primary or secondary (post-polycythemia vera or post-essential thrombocythemia) myelofibrosis with a platelet count below $50 \times 10^9/L$ in adults.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for myeloproliferative neoplasms (version 2.2024 – August 8, 2024) classify risk stratification into two groupings: lower-risk disease and higher-risk disease.² NCCN guidelines recommend Vonjo for symptomatic lower-risk myelofibrosis if platelet count is $< 50 \times 10^9/L$ (category 2A) as “Useful in Certain Circumstances”. In this setting, Vonjo can also be used if the patient did not have a response or loss of response to initial therapy (e.g. Jakafi® [ruxolitinib tablets], Pegasys® [peginterferon alfa-2a subcutaneous injection], Ojjaara™ (momelotinib tablets), hydroxyurea if not previously used) [category 2A]. Vonjo is also recommended as “Preferred Regimen” for higher-risk myelofibrosis if the patient is not a transplant candidate or transplant is not currently feasible and platelet count is $< 50 \times 10^9/L$ (category 1). Vonjo is also recommended for higher-risk myelofibrosis if platelet count is $\geq 50 \times 10^9/L$ as initial therapy (category 2B) or in situations where the patient did not respond to or lost response to an alternative prior JAK inhibitor (Jakafi, Inrebic® [fedratinib capsules], or Ojjaara) [category 2B].² Vonjo is also recommended for the management of myelofibrosis-associated anemia with symptomatic splenomegaly and/or constitutional symptoms (category 2A) or without symptomatic splenomegaly and/or constitutional symptoms (category 2B).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vonjo. All approvals are provided for the duration noted below.

Automation: none

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vonjo is recommended in those who meet the following criteria:

FDA-Approved Indication

4. Myelofibrosis. Approve for 1 year if the patient meets ONE of the following (A and B):

Note: This includes Primary Myelofibrosis, Post-Polycythemia Vera Myelofibrosis, and Post-Essential Thrombocythemia Myelofibrosis

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following (i, ii or iii):

i. Patient has a platelet count of less than $50 \times 10^9/L$ ($< 50,000/mcL$) and meets ONE of the following (a or b):

02/07/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- a) Patient meets BOTH of the following (1 and 2):
 - (1) Patient has intermediate-risk or high-risk disease; AND
 - (2) Patient is not a candidate for transplant; OR
 - b) Patient has lower-risk disease; OR
- ii. Patient has a platelet count of greater than or equal to $50 \times 10^9/L$ ($\geq 50,000/mcL$) and meets ALL of the following (a, b, and c):
 - a) Patient has high-risk disease; AND
 - b) Patient is not a candidate for transplant; AND
 - c) Patient has symptomatic splenomegaly and/or constitutional symptoms; OR
- iii. Patient has myelofibrosis-associated anemia..

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vonjo is not recommended in the following situations:

- 20. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Voranigo Prior Authorization Policy

- Voranigo® (vorasidenib tablets – Servier Pharmaceuticals)

REVIEW DATE: 08/09/2024

OVERVIEW

Voranigo, an isocitrate dehydrogenase-1 (IDH1) and IDH2 inhibitor, is indicated for the treatment of Grade 2 astrocytoma or oligodendroglioma with a susceptible IDH1 or IDH2 mutation following surgery including biopsy, sub-total resection, or gross total resection, in adult and pediatric patients ≥ 12 years of age.¹

Disease Overview

Gliomas are the most common malignant primary brain tumor in adults. These are tumors that arise from glial or precursor cells within the central nervous system (CNS).^{2,3} The World Health Organization (WHO) classifies gliomas into distinct tumor subtypes and tumor grades based on histologic and molecular features. The adult-type diffuse gliomas are one of the four general groups of gliomas. Nearly all Grade 2 diffuse gliomas in adults have mutations in the genes encoding the IDH1 or IDH2 metabolic enzymes. Grade 2 diffuse gliomas are further sub-divided into three categories: astrocytoma, IDH-mutant (CNS WHO grades 2-4); oligodendroglioma, IDH-mutant and 1p19q-codeleted (CNS WHO grades 2-3); and glioblastoma, IDH-wildtype (CNS WHO grade 4).

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for Central Nervous System Cancers (version 2.2024 – July 25, 2024) have addressed the use of Voranigo, prior to its FDA approval.⁴ In a footnote, the guidelines note that the FDA approval process is ongoing for Voranigo; however, eligible patients with newly diagnosed WHO grade 2, IDH1 or IDH2 mutation-positive gliomas can obtain Voranigo through an expanded access program. This footnote is referenced under WHO grade 2 IDH-mutant astrocytoma with poor performance status and as a “Preferred” systemic therapy option for adjuvant treatment after surgery/biopsy for IDH-mutant oligodendroglioma (treatment with radiotherapy and chemotherapy is not preferred) and IDH-mutant astrocytoma (if residual disease is present) [all category 2A recommendations].

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Voranigo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Voranigo is recommended in those who meet the following criteria:

08/09/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indications

- 110. Gliomas.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 12 years of age; AND
 - B) Patient has a susceptible isocitrate dehydrogenase-1 (IDH1) or IDH2 mutation-positive disease; AND
 - C) Patient meets ONE of the following (i or ii):
 - i. Patient has Grade 2 oligodendroglioma; OR
 - ii. Patient has Grade 2 astrocytoma; AND
 - D) Patient has had prior surgery, including biopsy, sub-total resection, or gross total resection.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Voranigo is not recommended in the following situations:

- 84.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Welireg Prior Authorization Policy

- Welireg® (belzutifan tablets – Merck)

REVIEW DATE: 06/19/2024

OVERVIEW

Welireg, a hypoxia-inducible factor inhibitor, is indicated for the treatment of:

- **Renal cell carcinoma, advanced** following a programmed death receptor-1 (PD-1) or programmed death-ligand 1 (PD-L1) inhibitor and a vascular endothelial growth factor tyrosine kinase inhibitor (VEGF-TKI) in adults.
- **von Hippel-Lindau (VHL) disease**, in adults who require therapy for associated renal cell carcinoma, central nervous system (CNS) hemangioblastomas, or pancreatic neuroendocrine tumors, not requiring immediate surgery.¹

The pivotal trial for VHL disease included patients with VHL disease-associated renal cell carcinoma, CNS hemangioblastomas, pancreatic neuroendocrine tumor, and retinal hemangioblastoma.²

Guidelines

Welireg is discussed in guidelines from the National Comprehensive Cancer Network (NCCN):

- **CNS Cancers:** NCCN guidelines (version 1.2024 – May 31, 2024) recommend Welireg for VHL-associated CNS hemangioblastoma not requiring immediate surgery or those for whom surgery is contraindicated as “useful in certain circumstances” (category 2A).³
- **Kidney Cancer:** NCCN guidelines (version 4.2024 – May 30, 2024) recommend Welireg as a “preferred” regimen for VHL-associated renal cell carcinoma (category 2A). Welireg is also recommended as a single-agent therapy for relapse or stage IV disease as subsequent therapy for clear cell histology if prior includes immuno-oncology therapy (PD-1 or PD-L1 inhibitor) and a VEGF-TKI as “other recommended regimens” (category 2A) and as immuno-oncology therapy naive as “useful in certain circumstances” (category 2B).⁴
- **Neuroendocrine and Adrenal Tumors:** NCCN guidelines (version 1.2023 – August 2, 2023) list VHL disease as a hereditary endocrine neoplasia. Welireg is recommended in a variety of settings for pancreatic neuroendocrine tumors with germline VHL alteration (category 2A).⁵

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Welireg. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Welireg is recommended in those who meet the following criteria:

06/19/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indications

5. Renal Cell Carcinoma. Approved for 1 year if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has advanced disease; AND
- C) Patient has tried at least one programmed death receptor-1 (PD-1) or programmed death-ligand 1 (PD-L1) inhibitor; AND

Note: Examples of PD-1 inhibitor or PD-L1 inhibitor include: Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion), and Bavencio (avelumab intravenous infusion).

- D) Patient has tried at least one vascular endothelial growth factor tyrosine kinase inhibitor (VEGF-TKI).

Note: Examples of VEGF-TKI include Cabometyx (cabozantinib tablets), Lenvima (lenvatinib capsules), Inlyta (axitinib tablets), Fotivda (tivozanib capsules), pazopanib, sunitinib, and sorafenib

6. Von Hippel-Lindau Disease. Approve for 1 year if the patient meets ALL of the following (A, B, C and D):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has a von Hippel-Lindau (VHL) germline alteration as detected by genetic testing; AND
- C) Patient does not require immediate surgery; AND
- D) Patient requires therapy for ONE of the following conditions (i, ii, iii, or iv):
 - i. Central nervous system hemangioblastomas; OR
 - ii. Pancreatic neuroendocrine tumors; OR
 - iii. Renal cell carcinoma; OR
 - iv. Retinal hemangioblastoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Welireg is not recommended in the following situations:

- 21. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xalkori Prior Authorization Policy

- Xalkori® (crizotinib capsules and oral pellets – Pfizer)

REVIEW DATE: 01/17/2024

OVERVIEW

Xalkori, an oral kinase inhibitor, is indicated for the following uses:¹

- **Anaplastic large cell lymphoma (ALCL)**, treatment of relapsed or refractory, systemic ALCL that is anaplastic lymphoma kinase (*ALK*)-positive in pediatric patients ≥ 1 year of age and young adults.
- **Inflammatory Myofibroblastic tumor (IMT)**, treatment of unresectable, recurrent, or refractory IMT that is *ALK*-positive in patients ≥ 1 year of age.
- **Non-small cell lung cancer (NSCLC)**, metastatic, whose tumors are *ALK*-positive or *c-rOS* proto-oncogene 1 (*ROS1*)-positive as detected by an FDA-approved test in adults.

Guidelines

Xalkori has been addressed in National Comprehensive Cancer Network (NCCN) guidelines.⁵⁻⁸

- **Histiocytic Neoplasms:** Guidelines (version 1.2023 – August 11, 2023) recommend Xalkori as a “useful in certain circumstances” treatment option for the following types of histiocytic neoplasm with *ALK* rearrangement/fusion: Langerhans cell histiocytosis, Erdheim-Chester disease, and Rosai-Dorfman disease (category 2A).³
- **Inflammatory Myofibroblastic Tumor (IMT):** NCCN Soft Tissue Sarcoma guidelines (version 3.2023 – December 12, 2023) and NCCN Uterine Neoplasms guidelines (version 1.2024 – September 20, 2023) recommend Xalkori as a treatment option for IMT with *ALK* translocation.^{4,5}
- **Melanoma: Cutaneous:** Guidelines (version 3.2023 – October 27, 2023) recommend Xalkori as a treatment option for cutaneous melanoma with *ALK* or *ROS1* fusions.⁶ Case reports or limited clinical trial data have suggested activity for various gene fusions; Xalkori is noted for *ROS1* and *ALK* fusions.
- **NSCLC:** Guidelines (version 1.2024 – December 21, 2023) recommend Xalkori as a treatment option for *ROS1* rearrangement, *ALK* rearrangement-positive NSCLC, and as a treatment option for NSCLC with mesenchymal-epithelial transition (*MET*) exon 14 skipping mutation or high-level *MET* amplification.⁷
- **T-Cell Lymphoma:** Guidelines (version 1.2024 – December 21, 2023) recommend Xalkori as a treatment option for *ALK*-positive ALCL either as initial palliative-intent therapy or for relapsed or refractory disease.⁷ NCCN notes that Xalkori also demonstrated activity in adults with relapsed or refractory *ALK*-positive ALCL, after at least one line of prior cytotoxic therapy.⁸

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xalkori. All approvals are provided for the duration noted below.

Automation: None.

01/17/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xalkori is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Anaplastic Large Cell Lymphoma.** Approve for 1 year if the patient meets the following (A, B, and C):
 - A) Patient is ≥ 1 year of age; AND
 - B) Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND
 - C) Patient meets one of the following (i or ii):
 - i. The medication is used for palliative-intent therapy; OR
 - ii. Patient has relapsed or refractory disease.
2. **Inflammatory Myofibroblastic Tumor.** Approve for 1 year if the patient meets the following (A, B, and C):
 - A) Patient is ≥ 1 year of age; AND
 - B) Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND
 - C) Patient meets one of the following (i or ii):
 - i. Patient has advanced, recurrent, or metastatic disease; OR
 - ii. The tumor is inoperable.
3. **Non-Small Cell Lung Cancer – Anaplastic Lymphoma Kinase (*ALK*)-Positive.** Approve for 1 year if the patient meets the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced or metastatic disease; AND
 - C) Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND
 - D) The mutation was detected by an approved test.
4. **Non-Small Cell Lung Cancer – *ROS1* Rearrangement-Positive.** Approve for 1 year if the patient meets the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced or metastatic disease; AND
 - C) Patient has *ROS1* rearrangement-positive disease; AND
 - D) The mutation was detected by an approved test.

Other Uses with Supportive Evidence

5. **Histiocytic Neoplasm.** Approve for 1 year if patient meets the following (A, B, and C).
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has anaplastic lymphoma kinase (*ALK*) rearrangement/fusion-positive disease; AND
 - C) Patient meets one of the following (i, ii, or iii):
 - i. Patient has Langerhans cell histiocytosis; OR
 - ii. Patient had Erdheim-Chester disease; OR
 - iii. Patient has Rosai-Dorfman disease.

6. **Melanoma, Cutaneous.** Approve for 1 year if patient meets the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient meets one of the following (i or ii):
 - i. Patient has anaplastic lymphoma kinase (*ALK*) fusion disease; OR
 - ii. Patient has *ROS1* fusion disease.
7. **Non-Small Cell Lung Cancer with Mesenchymal Epithelial Transition (*MET*) Mutation.** Approve for 1 year if the patient meets the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient meets one of the following (i or ii):
 - i. Patient has non-small cell lung cancer with high level *MET* amplification; OR
 - ii. Patient has non-small cell lung cancer with *MET* exon 14 skipping mutation.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xalkori is not recommended in the following situations:

22. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xermelo Prior Authorization Policy

- Xermelo™ (telotristat ethyl tablets – Lexicon)

REVIEW DATE: 05/15/2024

OVERVIEW

Xermelo, an inhibitor of tryptophan hydroxylase, is indicated for the treatment of **carcinoid syndrome diarrhea** in combination with somatostatin analog therapy in adults inadequately controlled by somatostatin analog therapy.¹

The efficacy of Xermelo was evaluated in patients with metastatic neuroendocrine tumor and carcinoid syndrome diarrhea who were having between 4 to 12 daily bowel movements despite the use of somatostatin analog therapy at a stable dose for at least 3 months.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for treatment of neuroendocrine and adrenal tumors (version 1.2023 – August 2, 2023) state that Xermelo can be considered in combination with long-acting somatostatin analog (e.g. Sandostatin® LAR Depot [octreotide subcutaneous injection] or Somatuline® Depot [lanreotide subcutaneous injection]) for persistent diarrhea due to poorly controlled carcinoid syndrome.²

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xermelo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xermelo is recommended in those who meet the following criteria:

FDA-Approved Indication

7. **Carcinoid Syndrome Diarrhea.** Approve for 1 year if the patient meets ONE of the following (A or B):
 - A) **Initial Therapy.** Approve if the patient meets ALL of the following (i, ii, and iii):
 - i. Patient has been on a long-acting somatostatin analog therapy for at least 3 consecutive months; AND
Note: Examples of long-acting somatostatin analog therapy are Somatuline Depot (lanreotide subcutaneous injection) and Sandostatin LAR Depot (octreotide subcutaneous injection).
 - ii. While on a long-acting somatostatin analog therapy (prior to starting Xermelo), the patient continues to have at least four bowel movements per day; AND
 - iii. Xermelo will be used concomitantly with a long-acting somatostatin analog therapy.
 - B) **Patient is Currently Receiving Xermelo.** Approve if the patient is continuing to take Xermelo concomitantly with a long-acting somatostatin analog therapy for carcinoid syndrome diarrhea.

05/15/2024

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xospata Prior Authorization Policy

- Xospata® (gilteritinib tablets – Astellas)

REVIEW DATE: 01/17/2024

OVERVIEW

Xospata, an inhibitor of tyrosine kinases including FMS-like tyrosine kinase 3 (*FLT3*), is indicated for the treatment of relapsed or refractory **acute myeloid leukemia** in adults with an *FLT3* mutation as detected by an FDA-approved test.¹

Guidelines

Xospata is discussed in the National Comprehensive Cancer Network (NCCN) guidelines:

- **Acute Myeloid Leukemia:** Guidelines (version 6.2023 – October 24, 2023) recommend Xospata in patients with relapsed or refractory disease and *FLT3*-internal tandem duplication (*FLT3-ITD*) or *FLT3*-tyrosine kinase domain (*FLT3-TKD*) mutation (category 1 for both).² Xospata is also recommended as treatment induction for patients with a *FLT3* mutation who are not candidates for intensive induction therapy (category 2B); it is also recommended for follow-up after treatment induction and consolidation therapy in specific situations (category 2B) and as maintenance therapy for patients who are post-allogeneic hematopoietic stem cell transplantation in remission with a *FLT3* mutation (category 2B).
- **Myeloid/Lymphoid Neoplasms with Eosinophilia and Tyrosine Kinase Fusion Genes:** Guidelines (version 1.2024 – December 21, 2023) recommend Xospata for the treatment of myeloid/lymphoid neoplasms with eosinophilia and *FLT3* rearrangement in chronic phase or blast phase (category 2A). Xospata is also recommended in combination with acute lymphocytic leukemia- or acute myeloid leukemia-type induction chemotherapy followed by allogeneic hematopoietic stem cell transplantation (if eligible) for lymphoid, myeloid, or mixed lineage neoplasms with eosinophilia and *FLT3* rearrangement in blast phase (category 2A).³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xospata. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xospata is recommended in those who meet one of the following criteria:

FDA-Approved Indication

111. Acute Myeloid Leukemia. Approve for 1 year if the patient meets the following (A, B, and C).

- A) Patient is ≥ 18 years of age; AND
- B) Patient has relapsed or refractory disease; AND
- C) Disease is *FLT3*-mutation positive as detected by an approved test.

01/17/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Other Uses with Supportive Evidence

- 112. Myeloid/Lymphoid Neoplasms.** Approve for 1 year if the patient meets the following (A, B, and C):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has eosinophilia; AND
 - C)** Disease is *FLT3*-mutation positive as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xospata is not recommended in the following situations:

- 85.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available Condition.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xpovio Prior Authorization Policy

- Xpovio® (selinexor tablets – Karyopharm Therapeutics)

REVIEW DATE: 03/06/2024

OVERVIEW

Xpovio, a nuclear export inhibitor, is indicated for treatment of the following conditions:¹

- **Diffuse large B-cell lymphoma (DLBCL)**, not otherwise specified (including DLBCL arising from follicular lymphoma), for treatment of relapsed or refractory disease in adults, after at least two lines of systemic therapy.
- **Multiple myeloma:**
 - In combination with dexamethasone for treatment of relapsed or refractory disease in adults who have received at least four prior therapies and whose disease is refractory to at least two proteasome inhibitors, at least two immunomodulatory agents, and an anti-CD38 monoclonal antibody.
 - In combination with bortezomib and dexamethasone, in adults who have received at least one prior therapy.

For DLBCL, Xpovio was approved under accelerated approval based on response rate. Continued approval may be contingent upon verification in a confirmatory trial(s).

Guidelines

Xpovio is addressed in the following guidelines from the National Comprehensive Cancer Network (NCCN):

- **B-Cell Lymphoma:** NCCN guidelines (version 1.2024 – January 18, 2024) recommend Xpovio as third-line and subsequent therapy (category 2A) for DLBCL (including for histologic transformation of indolent lymphomas to DLBCL), after at least two lines of systemic therapy.³ This includes patients with disease progression after transplant or chimeric antigen receptor T-cell therapy.
- **Multiple Myeloma:** NCCN guidelines (version 2.2024 – November 1, 2023) recommend various regimens as primary therapy (transplant eligible and non-transplant candidates), maintenance therapy, and for previously treated multiple myeloma.² Xpovio/bortezomib/dexamethasone (once weekly) [category 1] is recommended as one of the “Preferred Regimens” for lenalidomide-refractory disease following one to three previous therapies. Xpovio/dexamethasone (category 2A) after at least four prior therapies and whose disease is refractory to at least two proteasome inhibitors, at least two immunomodulatory agents, and an anti-CD38 monoclonal antibody, is recommended for patients with late relapses (> three prior therapies). Xpovio/Darzalex® (daratumumab injection)/dexamethasone, Xpovio/Kyprolis® (carfilzomib intravenous infusion)/dexamethasone, and Xpovio/Pomalyst® (pomalidomide capsules)/dexamethasone are among the regimens (all category 2A) considered “Useful in Certain Circumstances” for previously treated multiple myeloma, for early relapses (one to three prior therapies).

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xpovio. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xpovio is recommended in those who meet one of the following criteria:

FDA-Approved Indications

50. Diffuse Large B-Cell Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

Note: This includes patients with histologic transformation of indolent lymphomas to diffuse large B-cell lymphoma.

- a. Patient is ≥ 18 years of age; AND
- b. Patient has been treated with at least two prior systemic therapies.

51. Multiple Myeloma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

56. Patient is ≥ 18 years of age; AND

57. The medication will be taken in combination with dexamethasone; AND

58. Patient meets one of the following (i, ii, or iii):

A) Patient has tried at least four prior regimens for multiple myeloma; OR

B) Patient meets both of the following (a and b):

i. Patient has tried at least one prior regimen for multiple myeloma; AND

ii. The medication will be taken in combination with bortezomib; OR

C) Patient meets both of the following (a and b):

i. Patient has tried at least one prior regimen for multiple myeloma; AND

Note: Examples of prior regimens include bortezomib/Revlimid (lenalidomide capsules)/dexamethasone, Kyprolis (carfilzomib intravenous infusion)/Revlimid/dexamethasone, Darzalex (daratumumab intravenous infusion)/bortezomib or Kyprolis/dexamethasone, or other regimens containing a proteasome inhibitor, immunomodulatory drug, and/or anti-CD38 monoclonal antibody.

ii. The medication will be taken in combination with Darzalex (daratumumab intravenous infusion), Darzalex Faspro (daratumumab and hyaluronidase-fihj subcutaneous injection), Kyprolis (carfilzomib intravenous infusion), or Pomalyst (pomalidomide capsules).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xpovio is not recommended in the following situations:

86. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xtandi Prior Authorization Policy

- Xtandi® (enzalutamide capsules and tablets – Astellas/Pfizer)

REVIEW DATE: 04/10/2024

OVERVIEW

Xtandi is an androgen receptor inhibitor indicated for the treatment of patients with **castration-resistant prostate cancer (CRPC)**, **metastatic castration-sensitive prostate cancer (mCSPC)**, and **non-metastatic castration-sensitive prostate cancer (nmCSPC)** with biochemical recurrence at high risk for metastasis (high-risk biochemical recurrence [high-risk BCR]).¹ For CRPC and mCSPC, patients should receive Xtandi with a concurrent gonadotropin-releasing hormone (GnRH) analog or should have had a bilateral orchiectomy. Patients with nmCSPC with high-risk BCR may be treated with or without a GnRH analog.

Guidelines

According to the National Comprehensive Cancer Network (NCCN) guidelines on prostate cancer (version 3.2024 – March 8, 2024), all patients with metastatic CRPC should continue androgen deprivation therapy to maintain castrate levels of serum testosterone (< 50 ng/dL).

- For patients with non-metastatic CRPC, if the prostate specific antigen doubling time is ≤ 10 months, Xtandi, Erleada® (apalutamide tablets), and Nubeqa® (darolutamide tablets) are all preferred category 1 recommended options.
- For patients with mCRPC adenocarcinoma, therapies are based on prior docetaxel or prior novel hormone therapy use.
 - No prior docetaxel and no prior novel hormone therapy: the preferred regimens are Xtandi (category 1), abiraterone (category 1 only if no visceral metastases), and docetaxel (category 1). Talzenna® (talazoparib capsules) + Xtandi is recommended for homologous recombination repair (HRR) mutation (category 1).
 - Prior docetaxel, but no prior novel hormone therapy: the preferred regimens include Xtandi or abiraterone (both category 1), and Jevtana® (cabazitaxel intravenous infusion) [category 2A]. Talzenna + Xtandi for HRR mutation is a category 2A recommendation.
 - Prior novel hormone therapy but no prior docetaxel: Xtandi, abiraterone, and abiraterone + dexamethasone are “other recommended regimens” (both category 2A). Talzenna + Xtandi for HRR mutation is a category 2B recommendation in this setting.
 - Prior docetaxel and prior novel hormone therapy: All systemic therapies are category 2B if visceral metastases are present. Preferred regimens are Jevtana (category 1) and docetaxel rechallenge. Xtandi, abiraterone, and other secondary hormone therapy are “other recommended regimens” (all category 2A).
- For progressive non-metastatic CSPC after maximal pelvic therapy, Xtandi ± leuprolide is recommended as “useful in certain circumstances” (category 2A). It is recommended in patients who have the following high-risk criteria: non-metastatic by conventional imaging; prostate-specific antigen (PSA) doubling time (PSADT) ≤ 9 month; PSA ≥ 2 ng/mL above nadir after radiotherapy or ≥ 1 ng/mL after radiotherapy with or without postoperative radiotherapy; and not considered a candidate for pelvic-directed therapy.
- For mCSPC androgen deprivation therapy in combination with Xtandi, abiraterone + steroid, Erleada, and docetaxel are all category 1 recommended preferred options. Yonsa® (abiraterone acetate) with methylprednisolone is a category 2B recommendation.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xtandi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xtandi is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 8. Prostate Cancer – Castration-Resistant (Metastatic or Non-Metastatic).** Approve for 1 year if the patient meets the following (A and B):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient meets ONE of the following (i or ii):
 - i.** The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog;
OR
Note: Examples are leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix subcutaneous injection), Orgovyx (relugolix tablets).
 - ii.** Patient has had a bilateral orchiectomy.
- 2. Prostate Cancer – Metastatic, Castration-Sensitive.** Approve for 1 year if the patient meets the following (A and B):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient meets ONE of the following (i or ii):
 - i.** The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog;
OR
Note: Examples are leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix subcutaneous injection), Orgovyx (relugolix tablets).
 - ii.** Patient has had a bilateral orchiectomy.
- 3. Prostate Cancer – Non-Metastatic, Castration-Sensitive.** Approve for 1 year if the patient meets the following (A and B):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has biochemical recurrence and is at high risk for metastasis.
Note: High-risk biochemical recurrence is defined as prostate-specific antigen (PSA) doubling time ≤ 9 months.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xtandi is not recommended in the following situations:

04/10/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

24. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Yonsa Prior Authorization Policy

- Yonsa® (abiraterone acetate tablets – Sun Pharmaceutical)

REVIEW DATE: 08/07/2024

OVERVIEW

Yonsa, an androgen biosynthesis inhibitor, is indicated in combination with methylprednisolone for the treatment of patients with **metastatic castration-resistant prostate cancer (CRPC)**.¹

Guidelines

The National Comprehensive Cancer Network guidelines on prostate cancer (version 4.2024 – May 17, 2024) recommend Yonsa for the following uses:²

- At initial diagnosis, for patients classified in the regional risk group (metastases in regional nodes [N1] with no distant metastases [M0]) and with a > 5 year expected patient survival, external beam radiation therapy (EBRT) + androgen deprivation therapy (ADT) [category 1] + Zytiga® (abiraterone acetate tablets) and prednisone (category 2A) or Yonsa and methylprednisolone (category 2B) are recommended options. ADT (without EBRT) ± Zytiga and prednisone is a category 2A recommended option in this setting; ADT + Yonsa and methylprednisolone is a category 2B recommendation.
- If patients are positive for distant metastasis (M1) and have castration-naïve disease, ADT + Zytiga and prednisone and ADT + docetaxel are both category 1 recommended options. ADT + Yonsa and methylprednisolone is a category 2B recommendation in this setting.
- For patients with metastatic CRPC and who have not received prior docetaxel or prior novel hormone therapy, Zytiga + prednisone (category 1 without visceral metastases and category 2A with visceral metastases) and Yonsa + methylprednisolone (category 2A) is recommended.
- For patients with metastatic CRPC who have received prior novel hormone therapy but no prior docetaxel, Zytiga + prednisone or Yonsa + methylprednisolone is recommended (category 2A); Zytiga + dexamethasone or Yonsa + dexamethasone is recommended in this setting if patients have had disease progression on either formulation of abiraterone (category 2A). If docetaxel was used previously but no prior hormone therapy, Zytiga + prednisone (category 1) or Yonsa + methylprednisolone (category 2A) is recommended. If docetaxel and prior novel hormone therapy were used, Zytiga + prednisone or Yonsa + methylprednisolone are recommended (category 2A without visceral metastases; category 2B with visceral metastases).
- In metastatic CRPC with *BRCA* mutation positive tumors, Yonsa can be used in combination with Lynparza® (olaparib tablets) [category 2A] or Zejula® (niraparib tablets) [category 2B].

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Yonsa. All approvals are provided for the duration noted below.

Automation: None.

08/07/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Yonsa is recommended in those who meet the following criteria:

FDA-Approved Indication

- 4. Prostate Cancer – Metastatic, Castration-Resistant.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A)** The medication is used in combination with methylprednisolone or dexamethasone; AND
- B)** Patient meets ONE of the following (i or ii):
- i.** The medication is concurrently used with a gonadotropin-releasing hormone (GnRH) analog;
OR
Note: Examples are leuprolide acetate, Lupron Depot (leuprolide acetate intramuscular injection), Trelstar (triptorelin pamoate intramuscular injection), Zoladex (goserelin acetate subcutaneous implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix subcutaneous injection), Orgovyx (relugolix tablets).
 - ii.** Patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Yonsa is not recommended in the following situations:

- 87.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zejula Prior Authorization Policy

- Zejula™ (niraparib capsules and tablets – GlaxoSmithKline)

REVIEW DATE: 02/07/2024; selected revision 06/05/2024

OVERVIEW

Zejula, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicated for **ovarian, fallopian tube, or primary peritoneal cancer** for the following uses:^{1,2}

- Maintenance treatment of advanced epithelial ovarian, fallopian tube, or primary peritoneal cancer in adults who are in a complete or partial response to first-line platinum-based chemotherapy.
- Maintenance treatment of deleterious or suspected deleterious germline BReast CAncer gene (*BRCA*)-mutated recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer in adults who are in a complete or partial response to platinum-based chemotherapy.

Guidelines

Zejula is discussed in the National Comprehensive Cancer Network (NCCN) guidelines:

- **Ovarian Cancer:** NCCN guidelines (version 2.2024 – May 13, 2024) recommend Zejula for for maintenance treatment.² Zejula is recommended following three or more lines of prior chemotherapy in patients whose cancer is associated with homologous recombination deficiency (HRD) defined by either a deleterious or suspected deleterious *BRCA* mutation or genomic instability and progression > 6 months after response to the last platinum-based chemotherapy. Zejula + bevacizumab (category 2B) is also listed under other recommended targeted therapy regimen for platinum-sensitive disease.² Maintenance recommendations following primary treatment apply to Stage II, III, or IV ovarian cancer after primary treatment if the patient is in complete or partial response. If bevacizumab was not used during primary therapy, Zejula is recommended (category 1 for *BRCA* mutation; category 2A for *BRCA* wild-type of unknown). If bevacizumab was used during primary therapy, Zejula is recommended for patients with a *BRCA* mutation as single agent and in combination with bevacizumab (if patient is unable to tolerate Lynparza) [category 2A] and Zejula is recommended for patients with HRD disease in combination with bevacizumab (if unable to tolerate Lynparza) [category 2A]. In patients with platinum-sensitive disease who have completed at least two lines of platinum-based therapy and have achieved a complete or partial response, Zejula, Rubraca, or Lynparza can be considered for maintenance therapy if PARP therapy has not previously been used (category 1) and if disease has not progressed during prior PARP inhibitor treatment (category 2A).² There is a footnote that states Zejula is limited to those with a deleterious or suspected deleterious germline *BRCA* mutation (category 1).
- **Uterine Neoplasms:** NCCN guidelines (version 1.2024 – September 20, 2023) recommend Zejula, Lynparza, and Rubraca as single-agent second-line or subsequent therapies for *BRCA2*-altered uterine leiomyosarcoma as “Useful in Certain Circumstances” (category 2A).⁴

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zejula. All approvals are provided for the duration noted below.

Automation: None.

02/07/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zejula is recommended in those who meet one of the following criteria:

FDA-Approved Indication

- 9. Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Maintenance Therapy.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient is in complete or partial response after a platinum-based chemotherapy regimen; AND
Note: Examples of chemotherapy regimens are carboplatin with gemcitabine, carboplatin with paclitaxel, cisplatin with gemcitabine.
 - C)** Patient meets ONE of the following (i or ii):
 - i.** Patient meets BOTH of the following (a and b):
 - a)** Patient has recurrent disease; AND
 - b)** Patient has a *BRCA* mutation; OR
 - ii.** Patient is in complete or partial response to first-line primary treatment.

Other Uses with Supportive Evidence

- 2. Uterine Leiomyosarcoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has a *BRCA2*-altered disease; AND
 - C)** Patient has tried one systemic regimen.
Note: Examples of a systemic regimen include one or more of the following products: dacarbazine, docetaxel, doxorubicin, gemcitabine, ifosfamide, Yondelis (trabectedin intravenous infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zejula is not recommended in the following situations:

- 25.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zelboraf Prior Authorization Policy

- Zelboraf® (vemurafenib tablets – Genentech/Daiichi Sankyo)

REVIEW DATE: 08/14/2024

OVERVIEW

Zelboraf, a BRAF inhibitor, is indicated in adults for the following indications:¹

- **Erdheim-Chester disease**, for treatment of patients with the *BRAF V600* mutation.
- **Melanoma**, for treatment of unresectable or metastatic disease with *BRAF V600E* mutation as detected by an FDA-approved test.

Of note, Cotellic® (cobimetinib tablets) is a MEK inhibitor that is indicated to be given in combination with Zelboraf in a similar patient population with melanoma. Zelboraf is not recommended for use in patients with wild-type BRAF melanoma.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use in multiple cancers.

- **Central Nervous System Cancers:** Guidelines (version 2.2024 – July 25, 2024) recommend a BRAF/MEK inhibitor combination (i.e., Tafinlar® [dabrafenib capsules]/Mekinist® [trametinib tablets] or Zelboraf/Cotellic) for treatment of *BRAF V600E* activation mutation in the following situations: adjuvant treatment (category 2A) of pilocytic astrocytoma, pleomorphic xanthoastrocytoma, or circumscribed ganglioglioma/neuroglioma/glioneuronal tumor; recurrent or progressive and recurrent glioblastoma (all category 2A).⁷ BRAF/MEK combination therapy is also recommended for melanoma with brain metastases. Guidelines for pediatric central nervous system (CNS) cancers (version 1.2024 – February 26, 2024) include targeted therapy with Zelboraf as adjuvant therapy or for recurrent or progressive disease for diffuse high-grade gliomas, if the cancer has a *BRAF V600E* mutation (both category 2A).⁸ In the adjuvant setting, Zelboraf is recommended under “other recommended regimens” for age < 3 years with BRAF V600E mutated disease.
- **Hairy Cell Leukemia:** Guidelines (version 2.2024 – April 22, 2024) for hairy cell leukemia list Zelboraf ± rituximab among the treatment options for relapsed or refractory disease and for progressive disease after relapsed/refractory therapy.³ For initial therapy, Zelboraf + Gazyva (obinutuzumab intravenous infusion) has been added as a category 2A recommendation under “useful in certain circumstances” with a qualifier that it can be considered for patients who are unable to tolerate purine analogs including frail patients and those with active infection (all category 2A).
- **Histiocytic Neoplasms:** Guidelines (version 2.2024 – July 19, 2024) recommend Zelboraf (preferred) or Tafinlar (other recommended regimen) for *BRAF V600E*-mutated Erdheim-Chester disease and for multisystem, pulmonary, or CNS Langerhans cell histiocytosis (all category 2A).⁶
- **Melanoma, Cutaneous:** Guidelines (version 2.2024 – April 3, 2024) for cutaneous disease recommend BRAF/MEK inhibitor combinations among the preferred therapies for first-line and subsequent treatment of metastatic or unresectable melanoma with a *V600*-activating mutation.² This combination is also recommended for adjuvant treatment (category 2B). While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor is an option, especially in patients who are not appropriate candidates for checkpoint

08/14/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

immunotherapy. Zelboraf + Cotellic + Tecentriq (atezolizumab intravenous infusion) is a recommended combination that is “useful in certain circumstances” (category 2A).

- **Non-Small Cell Lung Cancer:** Guidelines (version 7.2024 – June 26, 2024) list Zelboraf among the first-line options for tumors with a *BRAF* mutation (category 2A), particularly if combination therapy with Tafenlar + Mekinist is not tolerated.⁴
- **Thyroid Carcinoma:** Guidelines (version 3.2024 – June 18, 2024) list Zelboraf as a treatment option (category 2B) if cancer is not amenable to radioiodine treatment, for differentiated thyroid cancer (follicular, oncocytic, and papillary cancer subtypes) with a *BRAF* V600 mutation.⁵

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zelboraf. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zelboraf is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1) **Erdheim-Chester Disease.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has *BRAF* V600 mutation-positive disease.
- 2) **Melanoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has unresectable, advanced, or metastatic melanoma; AND
 - C) Patient has *BRAF* V600 mutation-positive disease.

Other Uses with Supportive Evidence

- 3) **Central Nervous System Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) The medication is being used for ONE of the following (i, ii, or iii):
 - i. Adjuvant treatment of ONE of the following (a, b, c, or d):
 - a) Pilocytic astrocytoma; OR
 - b) Pleomorphic xanthoastrocytoma; OR
 - c) Circumscribed ganglioglioma, or neuroglioma, or glioneuronal tumor; OR
 - d) Pediatric diffuse high-grade glioma; OR
 - ii. Recurrent or progressive disease for ONE of the following (a, b, or c):
 - a) High-grade glioma; OR
 - b) Circumscribed glioma; OR
 - c) Glioblastoma; OR
 - iii. Brain metastases due to melanoma; AND
 - B) Patient has *BRAF* V600 mutation-positive disease; AND
 - C) The medication is prescribed in combination with Cotellic (cobimetinib tablets).
- 4) **Hairy Cell Leukemia.** Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Patient has tried at least one other systemic therapy for hairy cell leukemia; OR
Note: Examples of other systemic therapies include cladribine, Nipent (pentostatin injection), rituximab, Intron A (interferon alpha-2b injection).
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient is unable to tolerate purine analogs (i.e., active infection, frail patients); AND
Note: Examples of purine analogs are cladribine, Nipent (pentostatin injection).
 - b) Zelboraf is used in combination with Gazyva (obinutuzumab intravenous infusion) as initial therapy.
- 5) **Histiocytic Neoplasm.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
Note: For Erdheim-Chester disease, refer to FDA-approved indication.
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has Langerhans cell histiocytosis and ONE of the following (i, ii, or iii):
 - i. Multisystem disease; OR
 - ii. Pulmonary disease; OR
 - iii. Central nervous system lesions; AND
 - C) Patient has *BRAF V600* mutation-positive disease.
- 6) **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has *BRAF V600E* mutation-positive disease.
- 7) **Thyroid Carcinoma, Differentiated.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has differentiated thyroid carcinoma; AND
Note: Examples of differentiated thyroid carcinoma include papillary, follicular, and oncocytic carcinoma (formerly Hürthle cell carcinoma).
 - C) Patient has disease that is refractory to radioactive iodine therapy; AND
 - D) Patient has *BRAF* mutation-positive disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zelboraf is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zolanza Prior Authorization Policy

- Zolanza® (vorinostat capsules – Merck)

REVIEW DATE: 07/31/2024

OVERVIEW

Zolanza, a histone deacetylase inhibitor, is indicated for the treatment of cutaneous manifestations of **cutaneous T-cell lymphoma** in patients who have progressive, persistent or recurrent disease on or following two systemic therapies.¹

Guidelines

The National Comprehensive Cancer Network (NCCN) clinical practice guidelines for **primary cutaneous lymphomas** (version 2.2024 – May 6, 2024) recommend Zolanza as a systemic therapy for mycosis fungoides/Sezary syndrome.^{2,3} Zolanza can be used for primary treatment or for relapsed, persistent, or refractory disease.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zolanza. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zolanza is recommended in those who meet the following criteria:

FDA-Approved Indication

113. Cutaneous T-Cell Lymphoma including Mycosis Fungoides/Sezary Syndrome. Approve for 1 year.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zolanza is not recommended in the following situations:

88. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zydelig Prior Authorization Policy

- Zydelig® (idelalisib tablets – Gilead)

REVIEW DATE: 06/12/2024

OVERVIEW

Zydelig, a phosphatidylinositol 3-kinase (PI3K) inhibitor, is indicated for relapsed **chronic lymphocytic leukemia (CLL)** in combination with rituximab, in patients for whom rituximab alone would be considered appropriate therapy due to other comorbidities.¹

Limitations of use: Zydelig is not indicated and is not recommended for first-line treatment of any patient, including patients with CLL, small lymphocytic lymphoma (SLL), follicular lymphoma (FL), and other indolent non-Hodgkin lymphomas. Zydelig is not indicated and is not recommended in combination with bendamustine and rituximab, or in combination with rituximab for the treatment of patients with FL, SLL, and other indolent non-Hodgkin lymphomas.¹

Guidelines

Zydelig is discussed in guidelines from the National Comprehensive Cancer Network (NCCN). NCCN **CLL/SLL** guidelines (version 3.2024 – March 26, 2024) recommend Zydelig with or without rituximab as “other recommended regimens” for relapsed or refractory disease after prior Bruton tyrosine kinase inhibitor and venetoclax-based regimens for patients with or without del(17p)/TP53 mutations.² Many other agents have a more prominent role in the first-line management of CLL. The guidelines note that CLL and SLL are different manifestations of the same condition and are treated similarly.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zydelig. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zydelig is recommended in those who meet one of the following:

FDA-Approved Indication

- 10. Chronic Lymphocytic Leukemia.** Approve for 1 year if the patient meets ALL of the following (A, B and C):
- C)** Patient is ≥ 18 years of age; AND
 - D)** Patient has tried at least one Bruton tyrosine kinase inhibitor; AND
Note: Examples of a Bruton tyrosine kinase inhibitor includes: Imbruvica (ibrutinib capsules, tablets, and oral solution); Brukinsa (zanubrutinib capsules), Calquence (acalabrutinib tablets), or Jaypirca (pirtobrutinib tablets).
 - E)** Patient has tried at least one Venclexta-based regimen.

06/12/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Other Uses with Supportive Evidence

11. Small Lymphocytic Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient has tried at least one Bruton tyrosine kinase inhibitor; AND
Note: Examples of a Bruton tyrosine kinase inhibitor includes: Imbruvica (ibrutinib capsules, tablets, and oral solution); Brukinsa (zanubrutinib capsules), Calquence (acalabrutinib tablets), or Jaypirca (pirtobrutinib tablets).
- C) Patient has tried at least one Venclexta-based regimen.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zydelig is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zykadia Prior Authorization Policy

- Zykadia® (ceritinib capsules and tablets – Novartis)

REVIEW DATE: 08/07/2024

OVERVIEW

Zykadia, a kinase inhibitor, is indicated for the treatment of metastatic **non-small cell lung cancer** (NSCLC) in adults whose tumors are anaplastic lymphoma kinase (*ALK*)-positive as detected by an FDA-approved test.¹

GUIDELINES

Zykadia is addressed in National Comprehensive Cancer Network (NCCN) guidelines:²⁻⁵

- **Histiocytic Neoplasms:** Guidelines (version 2.2024 – July 19, 2024) recommend Zykadia as a “Useful in Certain Circumstances” treatment option for *ALK*-positive Erdheim-Chester Disease (category 2A).³
- **Inflammatory Myofibroblastic Tumor (IMT):** NCCN Soft Tissue Sarcoma guidelines (version 2.2024 – July 31, 2024) recommend Zykadia as a “Preferred” treatment option for IMT with *ALK* translocation (category 2A). The NCCN Uterine Neoplasms guidelines (version 2.2024 – March 6, 2024) recommend Zykadia as “Useful in Certain Circumstances” for first-line therapy for advanced, recurrent/metastatic, or inoperable IMT with *ALK* translocation (category 2A) for uterine sarcoma.^{5,6}
- **NSCLC:** Guidelines (version 7.2024 – July 26, 2024) recommend testing for biomarkers (e.g., *ALK* rearrangement, *ROS* proto-oncogene 1 (*ROS1*) gene rearrangement) in eligible patients with NSCLC.⁴
 - *ALK* rearrangement-positive NSCLC: If *ALK* rearrangement is discovered prior to first-line systemic therapy, Zykadia is an “Other Recommended Regimen” (category 1). If *ALK* rearrangement is discovered during first-line systemic therapy, options are to complete the planned systemic therapy (including maintenance therapy) or to interrupt the systemic therapy and treat with Zykadia (category 2A) or another *ALK* inhibitor. NCCN recommendations for patients with disease progression often include continuing the first-line targeted therapy, depending on type of progression.
 - *ROS1* rearrangement-positive NSCLC: If *ROS1* rearrangement is discovered prior to first-line systemic therapy, Zykadia is an “Other Recommended” first-line treatment option (category 2A). If *ROS1* rearrangement is discovered during first-line systemic therapy, options are to complete the planned systemic therapy (including maintenance therapy) or interrupt and treat with Zykadia (category 2A). For patients who progress on treatment, if they are asymptomatic, they may continue to receive the treatment they were previously receiving (including Zykadia) or switch to Lorbrina® (lorlatinib tablets). There are different recommendations for patients who are symptomatic, depending on type of progression.
- **T-Cell Lymphomas:** Guidelines (version 4.2024 – May 28, 2024) recommend Zykadia for *ALK*-positive anaplastic large-cell lymphoma (ALCL) under “other recommended regimens” (category 2A) for initial palliative-intent therapy and for second-line/subsequent therapy (regardless of intention to transplant).

08/07/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zykadia. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zykadia is recommended in those who meet one of the following criteria:

FDA-Approved Indication

1. **Non-Small Cell Lung Cancer (NSCLC) – Anaplastic Lymphoma Kinase (ALK)-Positive.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced or metastatic disease; AND
 - C) Patient has anaplastic lymphoma kinase (ALK)-positive disease; AND
 - D) The mutation is detected by an approved test.

Other Uses with Supportive Evidence

2. **Erdheim-Chester Disease.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has anaplastic lymphoma kinase (ALK) rearrangement/fusion-positive disease.
3. **Inflammatory Myofibroblastic Tumor.** Approve for 1 year if the patients meets ALL of the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has anaplastic lymphoma kinase (ALK)-positive disease; AND
 - C) Patient meets ONE of the following (i or ii):
 - i. Patient has advanced, recurrent, or metastatic disease; OR
 - ii. The tumor is inoperable.
4. **Non-Small Cell Lung Cancer with ROS1 Rearrangement.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has advanced or metastatic disease; AND
 - C) Patient has ROS1 rearrangement-positive disease.
5. **Peripheral T-Cell Lymphomas.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has anaplastic lymphoma kinase (ALK)-positive anaplastic large cell lymphoma (ALCL).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zykadia is not recommended in the following situations:

26. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Ophthalmic – Glaucoma – Prostaglandins Prior Authorization Policy
- Bimatoprost 0.03% ophthalmic solution – generic only
 - Lumigan® (bimatoprost 0.01% ophthalmic solution – Allergan)
 - Rocklatan™ (netarsudil 0.02%/latanoprost 0.005% ophthalmic solution – Aerie)
 - Travatan® Z (travoprost 0.004% ophthalmic solution [benzalkonium chloride-free] – Novartis, generic)
 - Vyzulta™ (latanoprostene bunod 0.024% ophthalmic solution – Bausch + Lomb)
 - Xalatan® (latanoprost 0.005% ophthalmic solution – Pfizer, generic)
 - Xelpros™ (latanoprost 0.005% ophthalmic emulsion – Sun)
 - Zioptan® (tafluprost 0.0015% ophthalmic solution – Théa, generic)

REVIEW DATE: 05/15/2024

OVERVIEW

The various ophthalmic prostaglandin products are indicated for the reduction of elevated intraocular pressure (IOP) in patients with **open-angle glaucoma** or **ocular hypertension**.¹⁻⁸ All of these are single-entity products, except Rocklatan, which is a combination product containing a rho kinase inhibitor (netarsudil) and a prostaglandin analog (latanoprost). Bimatoprost 0.03% ophthalmic solution is also marketed as Latisse®, indicated to treat hypotrichosis of the eyelashes by increasing their growth including length, thickness, and darkness.⁹ Of note, Latisse is not included in this policy.

Glaucoma, a disease that damages the eye's optic nerve, is the leading cause of blindness in people > 60 years old.¹⁰ Reduction of IOP, regardless of the pretreatment IOP, reduces the risk of disease progression.¹¹ In addition, IOP reduction may prevent the onset to early glaucoma in patients with ocular hypertension.

Normal-tension glaucoma is a form of open-angle glaucoma with a presenting iOP in the normal range. IOP is generally between 11 and 12 mmHg; but a cut-off of 21 mmHg is often applied to define this condition.¹² Normal-tension glaucoma is also referred to as normal or low-pressure glaucoma. Additionally, the American Academy of Ophthalmology guidelines on primary open-angle glaucoma include normal-tension glaucoma in the recommendations for care, stating that lowering IOP reduces the risk of developing primary open-angle glaucoma and slows the progression of primary open-angle glaucoma, including normal-tension open-angle glaucoma.¹¹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of ophthalmic prostaglandins for patients < 60 years of age. This age edit (for patients < 60 years of age) is used to monitor for appropriate use and to screen for cosmetic use. Prescription benefit coverage of these products for cosmetic conditions is not recommended. All approvals are provided for the duration noted below. For patients ≥ 60 years of age, coverage will be approved at the point of service. Prior Authorization and prescription benefit coverage is not recommended for Latisse.

Automation: If the patient is < 60 years of age and does not have a of one ophthalmic glaucoma agent (e.g., beta blockers, alpha adrenergic agonists, carbonic anhydrase inhibitors) within the 720-day look-back period, coverage will be determined by Prior Authorization criteria.

RECOMMENDED AUTHORIZATION CRITERIA

05/15/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Coverage of ophthalmic prostaglandins is recommended in those who meet one of the following criteria:

FDA-Approved Indications

4. **Ocular Hypertension.** Approve for 1 year.

5. **Open-Angle Glaucoma.** Approve for 1 year.

Note: Open-angle glaucoma includes normal-tension glaucoma, which is also referred to as low-tension glaucoma or normal-pressure glaucoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of an ophthalmic prostaglandin is not recommended in the following situations:

27. **Cosmetic Conditions** (e.g., eyelash growth). Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.

28. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Ophthalmology – Dry Eye Disease – Cyclosporine Products Prior Authorization Policy
- Cequa™ (cyclosporine 0.09% ophthalmic solution – Sun Pharmaceuticals)
 - Restasis® (cyclosporine 0.05% ophthalmic emulsion – Allergan, generic)
 - Restasis Multidose™ (cyclosporine 0.05% ophthalmic emulsion – Allergan)
 - Vevye™ (cyclosporine 0.1% ophthalmic solution – Harrow)

REVIEW DATE: 04/10/2024

OVERVIEW

Ophthalmic cyclosporine products are indicated for the treatment of signs and symptoms of dry eye disease.¹⁻⁴ Specifically, ophthalmic cyclosporine emulsion products are indicated to increase tear production in patients whose tear production is presumed to be suppressed due to **ocular inflammation associated with keratoconjunctivitis sicca**.^{1,2} Cequa is indicated to increase tear production in patients with keratoconjunctivitis sicca (dry eye).³ Vevye is indicated for the treatment of the signs and symptoms of dry eye disease.⁴

Dry eye disease refers to a group of disorders of the tear film that are due to reduced tear production or tear instability and are associated with ocular discomfort and inflammatory disease of the ocular surface.⁵ Dry eye disease is also known as dry eye syndrome and keratoconjunctivitis sicca.

The safety and efficacy of Restasis have not been established in pediatric patients < 16 years of age.^{1,2} Although both Cequa and Vevye are approved for use in patients ≥ 18 years of age per product labeling, these products have the same chemical moiety as Restasis.¹⁻⁴

Guidelines

The American Academy of Ophthalmology (AAO) Dry Eye Syndrome Preferred Practice Pattern® [2024] notes dry eye syndrome is also known as dry eye disease or keratoconjunctivitis sicca.² Dry eye is generally classified according to both symptoms and signs (i.e., mild, moderate, or severe); however, there is an emphasis on symptoms over signs. Management of dry eye is listed as a four-step staged approach, but specific therapies may be chosen from any step, regardless of the level of disease severity, depending on provider experience and patient preference. Ophthalmic cyclosporine, as well as other FDA-approved therapies for dry eye disease (Miebo™ [perfluorohexyloctane ophthalmic solution], Tyrvaya® [varenicline nasal spray], and Xiidra® [lifitegrast ophthalmic solution], and Xiidra® [lifitegrast ophthalmic solution]), are noted as Step 2 options in the Preferred Practice Pattern. The AAO notes use of any of these FDA-approved products may lead to improvement of patient symptoms and/or signs but none has been proven more effective than the other in head-to-head trials; there are no direct comparisons in a prospective clinical trial in the literature. The AAO also notes that dry eye disease may develop as a result of systemic inflammatory diseases (e.g., Sjögren syndrome, autoimmune thyroid disease, or rheumatoid arthritis) and ocular surface disease (e.g., herpes simplex virus keratitis).

The AAO Blepharitis Preferred Practice Pattern® (2024) note that blepharitis can be classified according to anatomic location; anterior blepharitis affects the eyelid skin, base of the eyelashes and the eyelash follicles, whereas posterior blepharitis affects the meibomian glands. Blepharitis frequently leads to ocular surface inflammation, including conjunctivitis, functional tear deficiency, and keratitis and may exacerbate symptoms of coexisting ocular surface disease (including allergy and aqueous tear deficiency).⁶ Treatment

04/10/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

of blepharitis includes use of warm compresses, eyelid cleansing/eyelid massages, topical and/or systemic antibiotics, and ophthalmic anti-inflammatory agents (e.g., corticosteroids, cyclosporine).

The AAO Conjunctivitis Preferred Practice Pattern® guidelines for conjunctivitis (2024) note that dry eye and blepharitis are the most frequent causes of conjunctival inflammation.⁷ Ophthalmic cyclosporine can be used to treat dry eye syndrome associated with GVHD and different types of conjunctivitis.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of ophthalmic cyclosporine products. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of ophthalmic cyclosporine products is recommended in those who meet one of the following criteria:

FDA-Approved Indication

- 1. Dry Eye Disease.** Approve for 1 year if the patient is ≥ 16 years of age.

Note: Examples of dry eye disease include dry eye syndrome and keratoconjunctivitis sicca.

Other Uses with Supportive Evidence

- 2. Dry Eye Conditions due to Systemic Inflammatory Diseases.** Approve for 1 year if the patient is ≥ 16 years of age.

Note: Examples of systemic inflammatory diseases that could result in dry eye conditions include Sjögren syndrome, autoimmune thyroid disease, rheumatoid arthritis.

- 3. Dry Eye Conditions due to Ocular Surface Diseases.** Approve for 1 year if the patient is ≥ 16 years of age.

Note: Examples of ocular surface diseases that could result in dry eye conditions include blepharitis, conjunctivitis, herpes simplex keratitis, ocular graft-versus-host disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of cyclosporine ophthalmic products is not recommended in the following situations:

- 89. Concomitant Use with Another Ophthalmic Cyclosporine Product, Tyrvaya (varenicline nasal solution), or Xiidra (lifitegrast ophthalmic solution).** There are no data to support the concomitant use of two (or three) ophthalmic cyclosporine products or the concomitant use of an ophthalmic cyclosporine product with Tyrvaya, or Xiidra.

Note: Ophthalmic cyclosporine products are Cequa, Restasis, and Vevye.

- 90.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Dry Eye Disease – Eysuvis Prior Authorization Policy

- Eysuvis® (loteprednol etabonate 0.25% ophthalmic suspension – Alcon)

REVIEW DATE: 12/11/2024

OVERVIEW

Eysuvis, an ophthalmic corticosteroid, is indicated for the **short-term (up to 2 weeks) treatment of the signs and symptoms of dry eye disease.**¹

Guidelines

Eysuvis is not addressed in guidelines. The American Academy of Ophthalmology (AAO) Dry Eye Syndrome Preferred Practice Pattern® (2024) notes dry eye syndrome is also known as dry eye disease or keratoconjunctivitis sicca.² Dry eye is generally classified according to both symptoms and signs (i.e., mild, moderate, or severe); however, there is an emphasis on symptoms over signs. Management of dry eye is listed as a four-step staged approach, but specific therapies may be chosen from any step, regardless of the level of disease severity, depending on provider experience and patient preference. Ophthalmic corticosteroids, among other therapies, are helpful for the treatment of mild and moderate dry eye. Ophthalmic corticosteroids have reported to reduce ocular irritation symptoms. The PPP notes that commercially available loteprednol etabonate 0.25% was studied in a prospective randomized study over 2 weeks and demonstrated improvement in symptoms and conjunctival hyperemia. However, extending the treatment to 4 weeks did not provide further beneficial effects or increase adverse effects. Low-dose ophthalmic corticosteroids can be used at infrequent intervals for short periods of time (i.e., several weeks) to suppress ocular surface inflammation. Patients using ophthalmic corticosteroids should be monitored for adverse effects, such as increased intraocular pressure and cataract formation.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Eysuvis. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Eysuvis is recommended in those who meet the following criteria:

FDA-Approved Indication

114. Dry Eye Disease (Short-Term Treatment). Approve for 1 month if the patient has tried artificial tears.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Eysuvis is not recommended in the following situations:

- 91.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Dry Eye Disease – Lacrisert Prior Authorization Policy

- Lacrisert® (hydroxypropyl cellulose ophthalmic insert – Bausch & Lomb)

REVIEW DATE: 12/11/2024

OVERVIEW

Lacrisert, an ophthalmic insert made of hydroxypropyl cellulose, is indicated for **moderate to severe dry eye syndromes, including keratoconjunctivitis sicca**.¹ Lacrisert is indicated especially in patients who remain symptomatic after an adequate trial of therapy with artificial tear solutions. Lacrisert is also indicated for patients with: **exposure keratitis, decreased corneal sensitivity, and recurrent corneal erosions**.

Guidelines

The American Academy of Ophthalmology (AAO) Dry Eye Syndrome Preferred Practice Pattern® (2024) notes dry eye syndrome is also known as dry eye disease or keratoconjunctivitis sicca.² Dry eye is generally classified according to both symptoms and signs (i.e., mild, moderate, or severe); however, there is an emphasis on symptoms over signs. Management of dry eye is listed as a four-step staged approach, but specific therapies may be chosen from any step, regardless of the level of disease severity, depending on provider experience and patient preference. Artificial tears is a safe and effective modality for treating dry eye. The AAO PPP notes that slow-release hydroxypropyl cellulose inserts are occasionally helpful for patients who are unable to apply artificial tears.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lacrisert. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lacrisert is recommended in those who meet the following criteria:

FDA-Approved Indication

115. Ocular Conditions Associated with Moderate to Severe Dry Eye. Approve for 1 year if the patient has tried artificial tears.

Note: Examples of ocular conditions include decreased corneal sensitivity, dry eye syndrome, exposure keratitis, keratoconjunctivitis sicca, recurrent corneal erosions.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lacrisert is not recommended in the following situations:

92. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

339. Lacrisert® ophthalmic insert [prescribing information]. Bridgewater, NJ: Bausch & Lomb; October 2019.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Dry Eye Disease – Miebo Prior Authorization Policy

- Miebo™ (perfluorohexyloctane ophthalmic solution – Bausch & Lomb)

REVIEW DATE: 04/10/2024

OVERVIEW

Miebo, a semifluorinated alkane, is indicated for the treatment of the signs and symptoms of **dry eye disease** (DED).¹ The safety and effectiveness of Miebo in pediatric patients < 18 years of age have not been established.

Guidelines

The American Academy of Ophthalmology (AAO) Dry Eye Syndrome Preferred Practice Pattern® (2024) notes dry eye syndrome is also known as dry eye disease or keratoconjunctivitis sicca.² Dry eye is generally classified according to both symptoms and signs (i.e., mild, moderate, or severe); however, there is an emphasis on symptoms over signs. Management of dry eye is listed as a four-step staged approach, but specific therapies may be chosen from any step, regardless of the level of disease severity, depending on provider experience and patient preference. Miebo, as well as other FDA-approved therapies for dry eye disease (cyclosporine ophthalmic products, Tyrvaya® [varenicline nasal spray], and Xiidra® [lifitegrast ophthalmic solution]), are noted as Step 2 options in the Preferred Practice Pattern. The AAO notes use of any of these FDA-approved products may lead to improvement of patient symptoms and/or signs but none has been proven more effective than the other in head-to-head trials; there are no direct comparisons in a prospective clinical trial in the literature.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Miebo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Miebo is recommended in those who meet the following criteria:

FDA-Approved Indication

12. Dry Eye Disease. Approve for 1 year if the patient is ≥ 18 years of age.

Note: Examples of dry eye disease include dry eye syndrome and keratoconjunctivitis sicca.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Miebo is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Dry Eye Disease – Tyrvaya Prior Authorization Policy

- Tyrvaya® (varenicline nasal solution – Oyster Point)

REVIEW DATE: 04/10/2024

OVERVIEW

Tyrvaya, a cholinergic agonist, is indicated for the treatment of the signs and symptoms of **dry eye disease**.¹ The safety and efficacy of Tyrvaya in pediatric patients have not been established.

Guidelines

The American Academy of Ophthalmology (AAO) Dry Eye Syndrome Preferred Practice Pattern® (2024) notes dry eye syndrome is also known as dry eye disease or keratoconjunctivitis sicca.² Dry eye is generally classified according to both symptoms and signs (i.e., mild, moderate, or severe); however, there is an emphasis on symptoms over signs. Management of dry eye is listed as a four-step staged approach, but specific therapies may be chosen from any step, regardless of the level of disease severity, depending on provider experience and patient preference. Tyrvaya, as well as other FDA-approved therapies for dry eye disease (cyclosporine ophthalmic products, Miebo™ [perfluorohexyloctane ophthalmic solution], and Xiidra® [lifitegrast ophthalmic solution]), are noted as Step 2 options in the Preferred Practice Pattern. The AAO notes use of any of these FDA-approved products may lead to improvement of patient symptoms and/or signs but none has been proven more effective than the other in head-to-head trials; there are no direct comparisons in a prospective clinical trial in the literature.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tyrvaya. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tyrvaya is recommended in those who meet the following criteria:

FDA-Approved Indication

13. Dry Eye Disease. Approve for 1 year if the patient meets the ALL of the following (A, B, and C):

Note: Examples of dry eye disease include dry eye syndrome and keratoconjunctivitis sicca.

A) Patient is ≥ 18 years of age; AND

B) Patient has tried artificial tears; AND

C) The medication is prescribed by or in consultation with an ophthalmologist or optometrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tyrvaya is not recommended in the following situations:

- 93. Concomitant Use With An Ophthalmic Cyclosporine Product or Xiidra® (lifitegrast ophthalmic solution).** There are no data to support the concomitant use of Tyrvaya with an ophthalmic cyclosporine product or Xiidra.

Note: Ophthalmic cyclosporine products are Cequa, Restasis, and Vevye.

- 94.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Dry Eye Disease – Xiidra Prior Authorization Policy

- Xiidra® (lifitegrast ophthalmic solution – Novartis)

REVIEW DATE: 04/10/2024

OVERVIEW

Xiidra, a lymphocyte function-associated antigen-1 (LFA-1) antagonist, is indicated for the treatment of the signs and symptoms of **dry eye disease**.¹ The safety and efficacy of Xiidra in pediatric patients have not been established.

Guidelines

The American Academy of Ophthalmology (AAO) Dry Eye Syndrome Preferred Practice Pattern® (2024) notes dry eye syndrome is also known as dry eye disease or keratoconjunctivitis sicca.² Dry eye is generally classified according to both symptoms and signs (i.e., mild, moderate, or severe); however, there is an emphasis on symptoms over signs. Management of dry eye is listed as a four-step staged approach, but specific therapies may be chosen from any step, regardless of the level of disease severity, depending on provider experience and patient preference. Xiidra, as well as other FDA-approved therapies for dry eye disease (cyclosporine ophthalmic products, Miebo™ [perfluorohexyloctane ophthalmic solution], and Tyrvaya® [varenicline nasal spray]), and are noted as Step 2 options in the Preferred Practice Pattern. The AAO notes use of any of these FDA-approved products may lead to improvement of patient symptoms and/or signs but none has been proven more effective than the other in head-to-head trials; there are no direct comparisons in a prospective clinical trial in the literature.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xiidra. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xiidra is recommended in those who meet the following criteria:

FDA-Approved Indication

14. Dry Eye Disease. Approve for 1 year if the patient is ≥ 18 years of age.

Note: Examples of dry eye disease include dry eye syndrome and keratoconjunctivitis sicca.

04/10/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xiidra is not recommended in the following situations:

- 95. Concomitant Use with an Ophthalmic Cyclosporine Product or Tyrvaya (varenicline nasal solution).** There are no data to support the concomitant use of Xiidra with an ophthalmic cyclosporine product or Tyrvaya.

Note: Ophthalmic cyclosporine products are Cequa, Restasis, and Vevye.

- 96.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Durysta Prior Authorization Policy

- Durysta® (bimatoprost implant, for intracameral administration – Allergan)

REVIEW DATE: 02/21/2024

OVERVIEW

Durysta, a prostaglandin analog, is indicated for the reduction of intraocular pressure (IOP) in patients with **open-angle glaucoma** or **ocular hypertension**.¹

Disease Overview

Glaucoma, a disease that damages the eye's optic nerve, is the leading cause of blindness in people > 60 years of age.² Reduction of IOP, regardless of the pretreatment IOP, reduces the risk of disease progression.³ In addition, IOP reduction may prevent the onset of early glaucoma in patients with ocular hypertension.

Ophthalmic prostaglandins (e.g., bimatoprost, latanoprost), beta-blockers (e.g., levobunolol, timolol), alpha-agonist (brimonidine), carbonic anhydrase inhibitors (brinzolamide, dorzolamide), rho kinase inhibitor (netarsudil), and fixed combination products are used to treat glaucoma.^{3,4} The choice of product is influenced by potential cost, adverse event profile, dosing schedule, and the degree of pressure lowering needed.³

Dosing Considerations

Durysta, a biodegradable implant, is given as a single intracameral administration.¹ Durysta should not be re-administered to an eye that was previously treated with Durysta.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Durysta. All approvals are provided for one implant per treated eye (i.e., one implant per treated eye; maximum of two implants per patient). Note that a 1-month (30 days) approval duration is applied to allow for the one-time treatment of one or both eye(s). Because of the specialized skills required for evaluation and diagnosis of patients treated with Durysta as well as the monitoring required for adverse events and long-term efficacy, approval requires Durysta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Durysta is recommended in those who meet one of the following criteria:

02/21/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indications

1. **Ocular Hypertension.** Approve for a one-time use in each treated eye (i.e., one implant per treated eye; a total of two implants per patient) if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient is not receiving re-treatment of eye(s) previously treated with Durysta; AND
 - C) Patient meets BOTH of the following (i and ii):
 - i. Patient has tried at least two ophthalmic prostaglandins (either as monotherapy or as concomitant therapy) for the treatment of open-angle glaucoma or ocular hypertension; AND
Note: Examples of ophthalmic prostaglandins include bimatoprost 0.03% ophthalmic solution, latanoprost 0.005% ophthalmic solution, travoprost 0.004% ophthalmic solution; Lumigan (bimatoprost 0.01% ophthalmic solution), Vyzulta (latanoprostene bunod 0.024% ophthalmic solution), Xelpros (latanoprost 0.005% ophthalmic emulsion), and tafluprost 0.0015% ophthalmic solution), Iyuzeh (latanoprost 0.005% ophthalmic solution), and Omlonti (omidenepag isopropyl 0.002% ophthalmic solution).
 - ii. Patient has tried at least two other ophthalmic products (either as monotherapy or as concomitant therapy) from two different pharmacological classes for the treatment of open-angle glaucoma or ocular hypertension; AND
Note: Examples of pharmacological classes of ophthalmic products for the treatment of open-angle glaucoma or ocular hypertension include beta-blockers, alpha-agonist (brimonidine), carbonic anhydrase inhibitors, and rho kinase inhibitor (netarsudil).
 - D) For each of the ophthalmic medications that were tried, the patient meets ONE of the following (i or ii):
 - i. Patient has had inadequate efficacy to the previously tried ophthalmic products, according to the prescriber; OR
 - ii. Patient has experienced adverse event(s) severe enough to warrant discontinuation of the previously tried ophthalmic products, according to the prescriber; AND
 - E) The medication is administered by or under the supervision of an ophthalmologist.
2. **Open-Angle Glaucoma.** Approve for a one-time use in each treated eye (i.e., one implant per treated eye; a total of two implants per patient) if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient is not receiving re-treatment of eye(s) previously treated with Durysta; AND
 - C) Patient meets BOTH of the following (i and ii):
 - i. Patient has tried at least two ophthalmic prostaglandins (either as monotherapy or as concomitant therapy) for the treatment of open-angle glaucoma or ocular hypertension; AND
Note: Examples of ophthalmic prostaglandins include bimatoprost 0.03% ophthalmic solution, latanoprost 0.005% ophthalmic solution, travoprost 0.004% ophthalmic solution; Lumigan (bimatoprost 0.01% ophthalmic solution), Vyzulta (latanoprostene bunod 0.024% ophthalmic solution), Xelpros (latanoprost 0.005% ophthalmic emulsion), tafluprost 0.0015% ophthalmic solution, Iyuzeh (latanoprost 0.005% ophthalmic solution), and Omlonti (omidenepag isopropyl 0.002% ophthalmic solution).
 - ii. Patient has tried at least two other ophthalmic products (either as monotherapy or as concomitant therapy) from two different pharmacological classes for the treatment of open-angle glaucoma or ocular hypertension; AND
Note: Examples of pharmacological classes of ophthalmic products for the treatment of open-angle glaucoma or ocular hypertension include beta-blockers, alpha-agonist (brimonidine), carbonic anhydrase inhibitors, and rho kinase inhibitor (netarsudil).
 - D) For each of the ophthalmic medications that were tried, the patient meets ONE of the following (i or ii):

- i. Patient has had inadequate efficacy to the previously tried ophthalmic products, according to the prescriber; OR
 - ii. Patient has experienced adverse event(s) severe enough to warrant discontinuation of the previously tried ophthalmic products, according to the prescriber; AND
- E) The medication is administered by or under the supervision of an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Durysta is not recommended in the following situations:

- 97. Re-Treatment of Previously-Treated Eye(s).** Durysta is approved for a one-time use in each treated eye. Repeat administration in previously treated eye(s) is not approvable.
- 98. Concurrent use of Durysta with iDose TR (travoprost intracameral implant).** iDose TR is another intracameral implant and should not be used with Durysta.
- 99.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Gene Therapy – Luxturna Prior Authorization Policy

- Luxturna® (voretigene neparvovec-rzyl subretinal injection – Spark Therapeutics)

REVIEW DATE: 02/28/2024

OVERVIEW

Luxturna, an adeno-associated virus vector-based gene therapy, is indicated for the treatment of confirmed **biallelic human retinal pigment epithelial 65 kDa protein (RPE65) mutation-associated retinal dystrophy**.¹ Patients must have viable retinal cells as determined by the treating physician(s).

Luxturna is made up of a live, non-replicating adeno-associated virus serotype 2 which has been genetically modified to express the human RPE65 gene.¹ Luxturna is designed to deliver a normal copy of the gene encoding RPE65 to cells of the retina in patients with reduced or absent levels of biologically active RPE65. Treatment with Luxturna is not recommended for patients younger than 12 months of age, because the retinal cells are still undergoing cell proliferation, and Luxturna would potentially be diluted or lost during cell proliferation. The safety and effectiveness of Luxturna have not been established in geriatric patients. Clinical studies of Luxturna for this indication did not include patients ≥ 65 years of age.

Disease Overview

Inherited retinal dystrophies are a broad group of genetic retinal disorders that are associated with progressive visual dysfunction.² RPE65 mutation-associated retinal dystrophy is associated with numerous discrete gene mutations and affects 1,000 to 2,000 patients in the US. Mutations in the RPE65 gene lead to reduced or absent levels of RPE65 isomerohydrolase activity.¹ The absence of RPE65 leads to the accumulation of toxic precursors, damage to RPE-producing cells, and, over time, damage to photoreceptors, progressing to near total blindness in most patients.

Dosing Information

The recommended dose of Luxturna for each eye is 1.5×10^{11} vector genomes (vg) administered once per eye by subretinal injection.¹ After completing a vitrectomy (removal of the vitreous gel that fills the eye cavity) and under direct visualization, a small amount of Luxturna is injected slowly until an initial subretinal bleb is observed; the remaining volume is then injected slowly until the total 0.3 mL is delivered. Luxturna should be injected into each eye on separate days within a close interval, but no less than 6 days apart.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Luxturna. All approvals are provided for one injection per eye. Note: A 1-month (30 days) approval duration is applied to allow for the one-time treatment of both eyes. Because of the specialized skills required for evaluation and diagnosis of a patient treated with Luxturna as well as the specialized training required for administration of Luxturna, approval requires Luxturna to be administered by a retinal specialist.

All reviews (approvals and denials) will be forwarded to the Medical Director for evaluation. Some clients have elected Embarc Benefit Protection. For these clients, the Medical Director will coordinate with eviCore to ensure the Embarc Benefit Protection portion of the review has been completed. If the Embarc

Benefit Protection portion of the review has not been completed, the Medical Director will route to Embarc@eviCore.com prior to completing the review.

Documentation: Documentation is required for use of Luxturna as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts, and/or other information.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Luxturna is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Biallelic Human Retinal Pigment Epithelial 65 kDa Protein (RPE65) Mutation-Associated Retinal Dystrophy.** Approve for a one-time treatment course (i.e., a total of two injections, one injection in each eye) if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient has a genetically confirmed diagnosis of biallelic RPE65 mutation-associated retinal dystrophy **[documentation required]**; AND
 - B) Patient is ≥ 12 months of age and < 65 years of age **[documentation required]**; AND
 - C) Luxturna is administered by a retinal specialist **[documentation required]**; AND
 - D) Patient must have viable retinal cells as determined by the treating physician **[documentation required]**; AND
 - E) Patient is not receiving retreatment of eye(s) previously treated with Luxturna **[documentation required]**.

Dosing. Approve the following dosing regimen (A and B):

- A) One 1.5×10^{11} vector genomes (vg) injection administered by subretinal injection into each eye; AND
- B) The doses for the first eye and the second eye are separated by at least 6 days (i.e., injection of the second eye occurs 6 or more days after injection of the first eye).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Luxturna is not recommended in the following situations:

29. **Retreatment of previously treated eye(s).** Luxturna is for one time use in each eye. Repeat dosing in previously treated eye(s) is not approvable.
30. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Izervay Prior Authorization Policy

- Izervay™ (avacincaptad pegol intravitreal injection – Iveric)

REVIEW DATE: 08/28/2024

OVERVIEW

Izervay, a complement C5 inhibitor, is indicated for the treatment of **geographic atrophy (GA) secondary to age-related macular degeneration (AMD)**.¹

Izervay is given by intravitreal injection to each affected eye once monthly (approximately 28 ± 7 days) for up to 12 months.¹ In the Izervay clinical studies, patients had GA secondary to AMD with a best-corrected visual acuity (BCVA) between 20/25 and 20/320.^{2,3}

Disease Overview

AMD, a chronic, multifactorial, progressive central retinal disease, is the leading cause of irreversible blindness in the elderly population.^{4,5} There are two types of AMD: exudative or neovascular (“wet”) and nonexudative or (“dry”). GA, a chronic progressive degeneration of the macula, is an advanced stage of dry AMD.^{5,6} GA is characterized by localized atrophy of the outer retinal tissue and irreversible loss of photoreceptors, retinal pigment epithelium, and choriocapillaris.⁵⁻⁷ Initially, the GA lesions appear in the perifoveal macula but over time, the lesions often expand and coalesce to include the fovea.^{7,8} Area of the lesions is associated with a corresponding loss of visual function.⁸

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Izervay. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Izervay as well as the monitoring required for adverse events and long-term efficacy, approval requires Izervay to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Izervay is recommended in those who meet the following criteria:

FDA-Approved Indication

- 116. Geographic Atrophy.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- A) Patient has geographic atrophy secondary to age-related macular degeneration; AND
 - B) Patient has a best corrected visual acuity (BCVA) in the affected eye of between 20/25 and 20/320 letters; AND
 - C) The medication is administered by or under the supervision of an ophthalmologist.

POLICY: Ophthalmology – Oxervate Prior Authorization Policy

- Oxervate™ (cenegermin-bkbj ophthalmic solution – Dompé)

REVIEW DATE: 07/03/2024

OVERVIEW

Oxervate, a recombinant human nerve growth factor, is indicated for the treatment of **neurotrophic keratitis**.¹

Duration of Treatment

The recommended dosing regimen is one drop six times a day (at 2 hour intervals) for 8 weeks.¹ In one of the pivotal studies, five patients who experienced a recurrence of neurotrophic keratitis after an 8-week course of Oxervate were re-treated with another 8 weeks of Oxervate.² Four of these patients achieved corneal healing, which was maintained through the end of the follow-up period.

Disease Overview

Neurotrophic keratitis, a rare degenerative disease, is characterized by corneal epithelium breakdown, impairment of corneal healing, and development of corneal ulceration, melting, and perforation.^{3-6,9} Corneal epithelial cells release various neurotrophic growth factors, including nerve growth factors, which are important in maintaining the integrity and function of the ocular surface and in stimulating both epithelial and nerve fiber proliferation and survival.^{7,8} When corneal sensory innervation is impaired, reduction of both protective reflexes and trophic neuromodulators essential for the vitality, metabolism, and wound healing of the ocular surface tissues results. *In vivo* studies have shown that increasing nerve growth factor concentration after injury can accelerate healing.^{4,8}

Guidelines/Recommendations

Neurotrophic keratosis is classified into three stages: Stage 1 (mild), corneal epithelial changes; Stage 2 (moderate), corneal epithelial defect; Stage 3 (severe), corneal ulcer, perforation, melting.⁶ Prior to the approval of Oxervate, there were no approved pharmacologic therapies for the treatment of neurotrophic keratitis.³ If neurotrophic keratitis is left untreated, the condition can progress to anatomical loss of the eye; even with treatment, loss of vision is common.^{6,7} Treatment should target corneal sensory innervation impairment to restore corneal integrity; treatment goals are to stop progression and promote epithelial healing.

There are no formal clinical guidelines, although there are expert opinion on the diagnosis and treatment of neurotrophic keratitis.⁶ Optimal care requires identifying and treating the underlying causes of neurotrophic keratitis; for example, using antiviral medications for herpetic disease, correcting eyelid abnormalities, controlling hemoglobin A1c levels in patients with diabetes, and providing supportive therapy for limbal stem cell deficiency. For all stages, optimal care includes discontinuation of all preservative-containing ophthalmic medications to the extent possible and use of preservative-free tear substitutes or lubricants is recommended. For patients with Stage 2 disease, Oxervate, prophylactic ophthalmic preservative-free antibiotics, oral tetracyclines (e.g., doxycycline), corneal therapeutic contact lenses, and fresh-frozen self-retained amniotic membrane may be considered. For patients with Stage 3 disease, all of the listed options for Stage 2 disease as well as synthetic tissue adhesive, tarsorrhaphy, amniotic membrane transplant, and corneal neurotization are optimal treatments.

POLICY STATEMENT

07/03/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Prior Authorization is recommended for prescription benefit coverage of Oxervate. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Oxervate as well as the monitoring required for adverse events and long-term efficacy, approval requires Oxervate to be prescribed by a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Oxervate is recommended in those who meet the following criteria:

FDA-Approved Indication

- 1. Neurotrophic Keratitis.** Approve if the patient meets ONE of the following (A or B):

Note: The initial course is 8 weeks of treatment with Oxervate in the affected eye. If the patient has not yet received a total of 8 weeks of treatment in the affected eye, review under Initial Course. If the patient has already received at least 8 weeks of treatment in the affected eye, review under Recurrence.

- A) Initial Course.** Approve up to 8 weeks per affected eye(s) if the patient meets BOTH of the following (i and ii):

Note: For example, if the patient has already received 2 weeks of treatment with Oxervate, an additional 6 weeks may be approved. This allows for a total of 8 weeks of treatment per affected eye(s).

i. Patient has previously received < 8 weeks of treatment in the affected eye(s); AND

ii. The medication is prescribed by an ophthalmologist or optometrist; OR

- B) Recurrence.** Approve up to 8 weeks per affected eye(s) if the patient meets BOTH of the following (i and ii):

Note: For example, if the patient has already received 8 weeks of treatment with Oxervate, an additional 8 weeks may be approved. This allows for a total of 16 weeks of treatment per affected eye(s).

i. Patient has previously received at least 8 weeks but less than 16 weeks of treatment per affected eye(s); AND

ii. The medication is prescribed by an ophthalmologist or optometrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Oxervate is not recommended in the following situations:

- 1. Treatment Duration of > 16 Weeks Per Affected Eye(s).** Available data supports use of Oxervate for up to 16 weeks.^{2,7}
- 2.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Syfovre Prior Authorization Policy

- Syfovre™ (pegcetacoplan intravitreal injection – Apellis)

REVIEW DATE: 03/13/2024

OVERVIEW

Syfovre, a complement 3 inhibitor, is indicated for the treatment of **geographic atrophy (GA) secondary to age-related macular degeneration (AMD)**.¹ Syfovre is administered by intravitreal injection to each affected eye.

In the pivotal studies (OAKS and DERBY), all eligible patients had a best-corrected visual acuity (BCVA) of 24 letters or better on Early Treatment Diabetic Retinopathy Study (ETDRS) charts (Snellen chart equivalent of 20/320 or better).²

Disease Overview

AMD, a chronic, multifactorial, progressive central retinal disease, is the leading cause of irreversible blindness in the elderly population.^{3,4} There are two types of AMD: exudative or neovascular (“wet”) and nonexudative or (“dry”). GA, a chronic progressive degeneration of the macula, is an advanced stage of dry AMD.^{4,5} GA is characterized by localized atrophy of the outer retinal tissue and irreversible loss of photoreceptors, retinal pigment epithelium, and choriocapillaris.⁴⁻⁶ Initially, the GA lesions appear in the perifoveal macula but over time, the lesions often expand and coalesce to include the fovea.^{6,7} Area of the lesions is associated with a corresponding loss of visual function.⁷

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Syfovre. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Syfovre as well as the monitoring required for adverse events and long-term efficacy, approval requires Syfovre to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Syfovre is recommended in those who meet the following criteria:

FDA-Approved Indication

- 117. Geographic Atrophy.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- D)** Patient has geographic atrophy secondary to age-related macular degeneration; AND
 - E)** Patient meets ONE of the following (i or ii):
 - i.** Patient has a best-corrected visual acuity (BCVA) of 24 letters or better using Early Treatment Diabetic Retinopathy Study (ETDRS) charts; OR

03/13/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- ii. Patient has a best-corrected visual acuity (BCVA) of 20/320 or better using the Snellen chart;
AND
- F) The medication is administered by or under the supervision of an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Syfovre is not recommended in the following situations:

- 101. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Tepezza Prior Authorization Policy

- Tepezza™ (teprotumumab intravenous infusion – Horizon)

REVIEW DATE: 02/07/2024

OVERVIEW

Tepezza, an insulin-like growth factor-1 receptor (IGF-1R) antagonist, is indicated for the treatment of **thyroid eye disease**, regardless of thyroid eye disease activity or duration.¹

Dosing Information

The recommended dose is 10 mg/kg administered by intravenous (IV) infusion for the initial dose, followed by 20 mg/kg administered IV once every 3 weeks for seven additional doses.¹

Disease Overview

Thyroid eye disease, a rare, serious, debilitating and painful autoimmune disease, is also known as thyroid-associated ophthalmopathy, Graves' ophthalmopathy, or Graves' orbitopathy.² Thyroid eye disease is most commonly related to Graves' disease; however, it can also develop in patients with other thyroid diseases (e.g., Hashimoto's thyroiditis). The prevalence is higher in females than males (16 per 100,000 vs. 3 per 100,000, respectively).³ Risk factors include female gender, middle age, and smoking.²

Most patients with thyroid eye disease develop eye disease while being treated for hyperthyroidism under the care of an endocrinologist.⁴ Thyroid eye disease is characterized by endomysial interstitial edema, expansion, and proliferation of cells within the fibrofatty compartment, resulting in clinical manifestations of periorbital edema, lid retraction, proptosis, diplopia, corneal breakdown and in rare cases, optic nerve compression. This disease is associated with major comorbidities that can lead to blindness.

Consensus Statement

The American Thyroid Association and the European Thyroid Association issued a consensus statement in 2022 for the management of thyroid eye disease.⁴ The Task Force notes "active" thyroid eye disease as disease with a clinical activity score (CAS) of ≥ 3 or if the patient has or documentation of progression of thyroid eye disease based on subjective or objective worsening of vision, soft tissue inflammation, motility, or proptosis. CAS assesses seven items (spontaneous retrobulbar pain, pain on attempted up or lateral gaze, redness of the eyelids, redness of the conjunctiva, swelling of the eyelids, inflammation of the caruncle and/or plica, and conjunctival edema); each item is given one point if present. The severity of disease is divided into three groups: mild (features of disease have a minor impact on daily life insufficient to justify treatment), moderate (patient does not have sight-threatening disease but disease has sufficient impact on daily life to justify the risks of medical or surgical intervention), or sight-threatening (patient with dysthyroid optic neuropathy and/or corneal breakdown and/or globe subluxation). Pharmacologic treatment includes oral or IV glucocorticoids; mycophenolate, rituximab, Tepezza, and Actemra (tocilizumab IV infusion). Tepezza is noted as a preferred treatment with the following goals: disease inactivation and diplopia; reduction of proptosis; and improvement of eye motility. It is an acceptable treatment for disease inactivation and reduction of soft tissue involvement.

02/07/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tepezza. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tepezza as well as the monitoring required for adverse events and long-term efficacy, approval requires Tepezza to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tepezza is recommended in those who meet the following criteria:

FDA-Approved Indication

118. Thyroid Eye Disease. Approve for 6 months if the patient meets the following (A, B, C, and D):

Note: Thyroid Eye Disease is also recognized as Graves' ophthalmopathy, Graves' orbitopathy, thyroid-associated ophthalmopathy, and thyroid orbitopathy.

A) Patient is ≥ 18 years of age; AND

B) Patient has been assessed as having at least moderate severity level of disease based on signs and symptoms, according to the prescriber; AND

Note: Examples of signs and symptoms of disease of at least moderate severity include the following: lid retraction ≥ 2 mm, moderate or severe soft tissue involvement, proptosis ≥ 3 mm above normal for race and sex, and diplopia (Gorman score 2 to 3).

C) Patient has not received 8 doses (total) of Tepezza; AND

Note: The maximum recommended treatment is for 8 doses. For a patient who has started therapy but has not completed 8 doses, approve the number of doses required for the patient to receive a total of 8 doses.

D) The medication is prescribed by or in consultation with an ophthalmologist, endocrinologist, or a physician who specializes in thyroid eye disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tepezza is not recommended in the following situations:

102. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Upneeq Prior Authorization Policy

- Upneeq® (oxymetazoline hydrochloride 0.1% ophthalmic solution –RVL Pharmaceuticals)

REVIEW DATE: 10/02/2024

OVERVIEW

Upneeq, an alpha-adrenergic agonist, is indicated for the treatment of **acquired blepharoptosis** in adults.¹

Disease Overview and Clinical Efficacy

Blepharoptosis, also known as ptosis, is a common condition defined by abnormal drooping of one or both upper eyelids.² Blepharoptosis is either congenital or acquired; acquired blepharoptosis can occur at any age but it is most commonly seen in older adults. Most cases of acquired blepharoptosis are of aponeurotic type.² Aponeurotic blepharoptosis, also commonly known as involutional ptosis, may be due to stretching, dehiscence, or disinsertion of the levator aponeurosis. Less frequent causes of acquired blepharoptosis are myogenic (e.g., associated with myasthenia gravis), neurogenic (e.g., associated with third nerve palsy), traumatic (e.g., due to eyelid laceration with transection of the upper eyelid elevators or disruption of the neural pathway), or mechanical (e.g., resulting from presence of eye mass, such as neurofibroma or hemangioma, or cicatrization secondary to inflammation or surgery). Blepharoptosis can cause significant psychosocial effects. Surgical interventions are the primary methods for management of blepharoptosis and can improve the patient's field of vision or for cosmetic reasons. Complications of surgery include bleeding, infection, undercorrection or overcorrection of the ptosis, eyelid asymmetry, granuloma formation, corneal foreign body sensation, and exposure keratopathy. Recurrent is not uncommon and some patients may require more than one surgical procedure. .

Guidelines

Upneeq is not addressed in guidelines. The American Academy of Ophthalmology issued a report (2011) detailing functional indications for upper eyelid ptosis and blepharoplasty surgery; various quantitative and qualitative criteria may be used to identify appropriate surgical candidates.³ Surgical techniques vary and outcomes data are limited to low-level evidence (case series). Some studies have demonstrated median improvements of 13 points in the Leicester Peripheral Field Test (LPFT) score following surgical interventions.

POLICY STATEMENT

Due to insufficient clinical efficacy data, **approval of Upneeq is not recommended**. Current Upneeq efficacy information is insufficient to determine if the medication demonstrates any clinically meaningful benefits.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Upneeq is not recommended in the following situations:

- 103. Blepharoptosis.** Due to insufficient clinical efficacy data, approval of Upneeq for treatment of blepharoptosis is not recommended. Upneeq was studied in two randomized, double-masked, placebo-controlled, multicenter Phase 3 studies (published) [n = 304].^{1,4} Patients with acquired ptosis and superior visual field deficit in at least one eye at screening were randomized 2:1 to Upneeq or vehicle. Study medication was self-administered as a single drop per eye, once daily in the morning for 42 days (6 weeks). The primary endpoint was change from baseline in number of points seen in the top four rows on the Leicester Peripheral Field test (LPFT), which assesses superior visual field deficits due to ptosis on Day 1 (6 hours after instillation) and Day 14 (2 hours after instillation). The secondary endpoint was change from baseline in marginal reflex distance 1 (MRD1), which is the distance between the center of the papillary light reflex and the upper eyelid margin with the eye in primary gaze, on Days 1 and 14. Although Upneeq provided a statistically significant incremental benefit over vehicle in LPFT, the difference between the groups was small compared with what is typically observed following surgical interventions. Significantly greater, but numerically small, changes in MRD1 from baseline were observed in the Upneeq group vs. vehicle. It is unclear if these incremental changes (between Upneeq and vehicle) would correspond with clinically meaningful improvement. In addition, the studies were 6 weeks in duration (primary and secondary endpoints were assessed on Days 1 and 14); there are no long-term efficacy data for Upneeq for this condition. Upneeq's role in the management of patients with blepharoptosis is not established. Another pooled analysis of the two Phase 3 studies showed that onset of action of Upneeq was rapid and sustained through Day 42; largest difference between Upneeq and vehicle was observed 2 to 6 hours after administration.⁵
- 104. Conjunctivitis.** Oxymetazoline solution 0.1% has not been evaluated for conjunctivitis.
- 105. Cosmetic uses.** Coverage of Upneeq for cosmetic uses (i.e., blepharoptosis when functional limitation is absent) is not recommended as cosmetic uses are excluded from coverage in a typical pharmacy benefit.
- 106.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Aflibercept Products Prior Authorization Policy

- Eylea® (aflibercept intravitreal injection – Regeneron)
- Eylea® HD (aflibercept intravitreal injection – Regeneron)
- Pavblu™ (aflibercept-ayyh intravitreal injection – Amgen)

REVIEW DATE: 10/30/2024

OVERVIEW

Aflibercept is a vascular endothelial growth factor (VEGF) inhibitor.¹⁻³ Ophthalmic aflibercept products, Eylea, Eylea HD, and Pavblu, are given intravitreally for the treatment of ophthalmic conditions. Pavblu is a biosimilar to Eylea.³

Eylea and Pavblu are indicated for the following uses:^{1,3}

- **Diabetic macular edema.**
- **Diabetic retinopathy.**
- **Macular edema following retinal vein occlusion.**
- **Neovascular (wet) age-related macular degeneration.**

Eylea is also indicated for the treatment of **retinopathy of prematurity**.¹

Eylea HD, a high dose aflibercept product, is indicated for the following uses:²

- **Diabetic macular edema.**
- **Diabetic retinopathy.**
- **Neovascular (wet) age-related macular degeneration.**

Other Uses with Supportive Evidence for Eylea and Pavblu

Overproduction of VEGF may lead to other eye conditions, including neovascular glaucoma and other retinal and choroidal neovascular conditions affecting the eye.^{4,5} The VEGF inhibitors have the potential to be used off-label to reduce or slow visual impairment or vision loss associated with other eye conditions related to increased VEGF production.^{4,6,7} The use of VEGF inhibitors have been shown to stop the angiogenic process, maintain visual acuity, and improve vision in patients with certain neovascular ophthalmic conditions. Therefore, research is rapidly evolving on the use of VEGF inhibitors in other neovascular ophthalmic conditions that threaten vision.^{6,7}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of the intravitreal aflibercept products (Eylea, Eylea HD, and Pavblu). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with the intravitreal aflibercept products as well as the monitoring required for adverse events and long-term efficacy, approval requires the intravitreal aflibercept products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

10/30/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

I. Coverage of Eylea and Pavblu is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 119. **Diabetic Macular Edema.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.
- 120. **Diabetic Retinopathy.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.
- 121. **Macular Edema Following Retinal Vein Occlusion.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.
- 122. **Neovascular (Wet) Age-Related Macular Degeneration.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.
- 123. **Retinopathy of Prematurity.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

Other Uses with Supportive Evidence

- 124. **Other Neovascular Diseases of the Eye.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

Note: Examples of other neovascular diseases of the eye include neovascular glaucoma, sickle cell neovascularization, and choroidal neovascular conditions.

II. Coverage of Eylea HD is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1. **Diabetic Macular Edema.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.
- 107. **Diabetic Retinopathy.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.
- 108. **Neovascular (Wet) Age-Related Macular Degeneration.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of the intravitreal aflibercept products is not recommended in the following situations:

- 1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Beovu Prior Authorization Policy

- Beovu® (brolucizumab-dblb intravitreal injection – Novartis)

REVIEW DATE: 11/20/2024

OVERVIEW

Beovu, a vascular endothelial growth factor (VEGF) inhibitor, is indicated for the following uses:¹

- **Diabetic macular edema.**
- **Neovascular (wet) age-related macular degeneration.**

Other Uses with Supportive Evidence

Overproduction of VEGF may lead to other eye conditions, including neovascular glaucoma, retinopathy of prematurity, and other retinal and choroidal neovascular conditions affecting the eye.^{2,3} The VEGF inhibitors have the potential to be used off-label to reduce or slow visual impairment or vision loss associated with other eye conditions related to increased VEGF production.^{2,4,5} The use of VEGF inhibitors have been shown to stop the angiogenic process, maintain visual acuity, and improve vision in patients with certain neovascular ophthalmic conditions. Therefore, research is rapidly evolving on the use of VEGF inhibitors in other neovascular ophthalmic conditions that threaten vision.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Beovu. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Beovu as well as the monitoring required for adverse events and long-term efficacy, approval requires Beovu to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Beovu is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Diabetic Macular Edema.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.
2. **Neovascular (Wet) Age-Related Macular Degeneration.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

11/20/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Other Uses with Supportive Evidence

3. **Other Neovascular Diseases of the Eye.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

Note: Examples of other neovascular diseases of the eye include neovascular glaucoma, retinopathy of prematurity, sickle cell neovascularization, choroidal neovascular conditions.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Beovu is not recommended in the following situations:

109. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Ranibizumab Products
Prior Authorization Policy

- Byooviz™ (ranibizumab-nuna intravitreal injection – Biogen)
- Cimerli™ (ranibizumab-eqrn intravitreal injection – Coherus)
- Lucentis® (ranibizumab intravitreal injection – Genentech)

REVIEW DATE: 11/20/2024

OVERVIEW

Ranibizumab is a vascular endothelial growth factor (VEGF) inhibitor.¹⁻³ There are two interchangeable biosimilars to Lucentis: Byooviz and Cimerli.

Lucentis and Cimerli are indicated for the following uses:^{1,3}

- **Diabetic macular edema.**
- **Diabetic retinopathy.**
- **Macular edema following retinal vein occlusion.**
- **Myopic choroidal neovascularization.**
- **Neovascular (wet) age-related macular degeneration.**

Byooviz is indicated for the following uses:²

- **Macular edema following retinal vein occlusion.**
- **Myopic choroidal neovascularization.**
- **Neovascular (wet) age-related macular degeneration.**

Other Uses with Supportive Evidence

Overproduction of VEGF may lead to other eye conditions, including neovascular glaucoma, retinopathy of prematurity, and other retinal and choroidal neovascular conditions affecting the eye.^{4,5} The VEGF inhibitors have the potential to be used off-label to reduce or slow visual impairment or vision loss associated with other eye conditions related to increased VEGF production.^{4,6,7} The use of VEGF inhibitors have been shown to stop the angiogenic process, maintain visual acuity, and improve vision in patients with certain neovascular ophthalmic conditions. Therefore, research is rapidly evolving on the use of VEGF inhibitors in other neovascular ophthalmic conditions that threaten vision.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of ranibizumab products. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with ranibizumab products as well as the monitoring required for adverse events and long-term efficacy, approval requires ranibizumab products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of ranibizumab products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Diabetic Macular Edema.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.
2. **Diabetic Retinopathy.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.
3. **Macular Edema Following Retinal Vein Occlusion.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.
4. **Myopic Choroidal Neovascularization.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.
5. **Neovascular (Wet) Age-Related Macular Degeneration.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

Other Uses with Supportive Evidence

6. **Other Neovascular Diseases of the Eye.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

Note: Examples of other neovascular diseases of the eye include neovascular glaucoma, retinopathy of prematurity, sickle cell neovascularization, choroidal neovascular conditions.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of ranibizumab products is not recommended in the following situations:

110. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Susvimo Prior Authorization Policy

- Susvimo™ (ranibizumab intravitreal injection via ocular implant – Genentech)

REVIEW DATE: 11/20/2024

OVERVIEW

Susvimo, a vascular endothelial growth factor (VEGF) inhibitor, is indicated for the treatment of patients with **neovascular (wet) age-related macular degeneration (AMD)** who have previously responded to at least two intravitreal injections of a VEGF inhibitor.¹ In contrast to the other VEGF inhibitor products which are administered as intravitreal injections, Susvimo is an intravitreal implant.

Safety

Susvimo has a Boxed Warning regarding endophthalmitis, which occurred at a 3-fold higher rate with Susvimo vs. ranibizumab intravitreal injection (Lucentis, biosimilars), 1.7% vs. 0.5%, respectively in active-controlled trials.¹ Additional Warnings/Precautions associated with the Susvimo implant and/or implant-related procedures include rhegmatogenous retinal detachment, implant dislocation, vitreous hemorrhage, conjunctival erosion or retraction, conjunctival bleb, postoperative decrease in visual acuity, air bubbles causing improper filling of the implant, and deflection of the implant.

POLICY STATEMENT

Due to the safety concerns, **approval of Susvimo is not recommended.** There are significant risks associated with use based on the Boxed Warning regarding endophthalmitis.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Susvimo is not recommended in the following situations:

111. Neovascular (Wet) Age-Related Macular Degeneration. Due to the safety data, approval of Susvimo is not recommended. In the pivotal trial, Susvimo demonstrated non-inferiority compared with ranibizumab intravitreal injection (Lucentis, biosimilars).¹⁻³ However, ocular adverse events were more frequent with Susvimo vs. ranibizumab intravitreal injection; patients treated with Susvimo require regular monitoring to evaluate for presence of these adverse events. Notably, Susvimo labeling includes a unique Boxed Warning regarding endophthalmitis, which was three times more frequent with Susvimo vs. ranibizumab intravitreal injection.

112. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Vabysmo Prior Authorization Policy

- Vabysmo® (faricimab-svoa intravitreal injection – Genentech)

REVIEW DATE: 11/20/2024

OVERVIEW

Vabysmo, a vascular endothelial growth factor (VEGF) and angiopoietin-2 (Ang-2) inhibitor, is indicated for the following uses:¹

- **Diabetic macular edema (DME).**
- **Macular edema following retinal vein occlusion (RVO).**
- **Neovascular (wet) age-related macular degeneration (nAMD).**

For the indication of macular edema following RVO, Vabysmo is recommended for use for 6 months.¹ The prescribing information does not note a duration of treatment for DME or nAMD.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vabysmo. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Vabysmo as well as the monitoring required for adverse events and long-term efficacy, approval requires Vabysmo to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vabysmo is recommended in those who meet one of the following criteria:

FDA-Approved Indications

6. **Diabetic Macular Edema.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.
7. **Macular edema following retinal vein occlusion.** Approve for 6 months if administered by or under the supervision of an ophthalmologist.
3. **Neovascular (Wet) Age-Related Macular Degeneration.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Verkazia Prior Authorization Policy

- Verkazia® (cyclosporine 0.1% ophthalmic emulsion – Santen)

REVIEW DATE: 01/24/2024

OVERVIEW

Verkazia, a calcineurin inhibitor immunosuppressant, is indicated for the treatment of **vernal keratoconjunctivitis (VKC)** in patients ≥ 4 years of age.¹

Disease Overview

VKC, a type of allergic conjunctivitis, is a recurrent, bilateral allergic inflammation of the conjunctiva and the superficial cornea.^{3,4} VKC is more common in males and is more prevalent in hot, dry climates and in tropical and sub-tropical countries.⁴ Common symptoms include itching, photophobia, burning, foreign body sensation, mucoid discharge, and tearing. It is thought that both immunoglobulin E (IgE)-mediated and cell-mediated immune mechanisms are responsible for exacerbations.

Treatment of VKC depends on the extent and severity of the disease at the time of presentation.^{3,4} First-line treatment are lubricating therapies, e.g., preservative-free artificial tears, gels, or ointments. Treatment of moderate cases includes use of ophthalmic mast cell stabilizers (e.g., cromolyn, nedocromil, lodoxamide) and ophthalmic antihistamines. Dual-action ophthalmic products that contain a mast cell stabilizer and an antihistamine are preferred for moderate to severe cases; these agents have a quick onset of action. Ophthalmic nonsteroidal anti-inflammatory agents and ophthalmic corticosteroids have also shown beneficial effects. Intraocular pressure should be monitored in patients receiving ophthalmic corticosteroids. Steroid-sparing agents such as topical immunomodulators (e.g., cyclosporine 0.05% to 2%) are safe alternatives for patients with recurrent episodes.

Guidelines

Verkazia is not addressed in guidelines. The American Academy of Ophthalmology Conjunctivitis Preferred Practice Pattern (PPP) recommendations (2018) note that ophthalmic cyclosporine products have shown to reduce signs and symptoms compared with placebo in patients with VKC.⁴ With regards to vernal/atopic conjunctivitis, the PPP notes ophthalmic mast cell stabilizers and ophthalmic antihistamines are efficacious. In addition, ophthalmic corticosteroids are usually necessary to control signs and symptoms of acute exacerbations of vernal/atopic conjunctivitis.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Verkazia. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Verkazia as well as the monitoring required for adverse events and long-term efficacy, approval requires Verkazia to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

01/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Verkazia is recommended in those who meet the following criteria:

FDA-Approved Indication

4. **Vernal Keratoconjunctivitis.** Approve for 1 year if the patient meets the following (A, B, C, and D):
- A) Patient is ≥ 4 years of age; AND
 - B) According to the prescriber, the patient has moderate to severe vernal keratoconjunctivitis; AND
 - C) Patient meets one of the following (i or ii):
 - i. Patient has tried two single-action ophthalmic medications (i.e., ophthalmic mast cell stabilizers or ophthalmic antihistamines) for the maintenance treatment of vernal keratoconjunctivitis; OR
Note: Examples of single-action ophthalmic medications for the maintenance treatment of vernal keratoconjunctivitis include ophthalmic mast cell stabilizers (e.g., cromolyn ophthalmic solution, Alomide (lodoxamide ophthalmic solution)) and ophthalmic antihistamines (e.g., Zerviate [cetirizine ophthalmic solution]).
 - ii. Patient has tried one dual-action ophthalmic mast-cell stabilizer/antihistamine product for the maintenance treatment of vernal keratoconjunctivitis; AND
Note: Examples of dual-action ophthalmic mast cell stabilizer/antihistamine products include azelastine ophthalmic solution, bepotastine ophthalmic solution, epinastine ophthalmic solution, Lastacraft, and olopatadine ophthalmic solution.
Note: An exception to the requirement for a trial of two single-action ophthalmic medications (i.e., ophthalmic mast cell stabilizers or ophthalmic antihistamines) or one dual-action ophthalmic mast cell stabilizer/antihistamine product for the maintenance treatment of vernal keratoconjunctivitis can be made if the patient has already tried at least one ophthalmic cyclosporine product (e.g., Cequa [cyclosporine 0.09% ophthalmic solution], Restasis [cyclosporine 0.05% ophthalmic emulsion], Vevye [cyclosporine 0.1% ophthalmic solution]) other than the requested medication.
 - D) The medication is prescribed by or in consultation with an optometrist or ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Verkazia is not recommended in the following situations:

114. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – iDose TR Prior Authorization Policy

- iDose TR[®] (travoprost implant, for intracameral administration – Glaukos)

REVIEW DATE: 02/14/2024

OVERVIEW

iDose TR, a prostaglandin analog, is indicated for the reduction of intraocular pressure (IOP) in **open-angle glaucoma** or **ocular hypertension**.¹

Disease Overview

Glaucoma, a disease that damages the eye's optic nerve, is the leading cause of blindness in people > 60 years of age.² Reduction of IOP, regardless of the pretreatment IOP, reduces the risk of disease progression.³ In addition, IOP reduction may prevent the onset of early glaucoma in patients with ocular hypertension.

Ophthalmic prostaglandins, beta-blockers, alpha-agonist (brimonidine), carbonic anhydrase inhibitors, rho kinase inhibitor (netarsudil), and fixed combination products are used to treat glaucoma.^{3,4} The choice of product is influenced by potential cost, adverse event profile, dosing schedule, and the degree of pressure lowering needed.³

Dosing Considerations

iDose TR, an intracameral implant, is given as a single intracameral administration.¹ iDose TR should not be re-administered to an eye that was previously treated with iDose TR.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of iDose TR. All approvals are provided for one implant per treated eye (i.e., one implant per treated eye; maximum of two implants per patient). Note that a 1-month (30 days) approval duration is applied to allow for the one-time treatment of one or both eye(s). Because of the specialized skills required for evaluation and diagnosis of patients treated with iDose TR as well as the monitoring required for adverse events and long-term efficacy, approval requires iDose TR to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of iDose TR is recommended in those who meet one of the following criteria:

02/14/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indications

3. **Ocular Hypertension.** Approve for a one-time use in each treated eye (i.e., one implant per treated eye; a total of two implants per patient) if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient is not receiving re-treatment of eye(s) previously treated with iDose TR; AND
 - C) Patient meets BOTH of the following criteria (i and ii):
 - i. Patient has tried at least two ophthalmic prostaglandins (either as monotherapy or as concomitant therapy) for the treatment of open-angle glaucoma or ocular hypertension; AND
Note: Examples of ophthalmic prostaglandins include bimatoprost 0.03% ophthalmic solution, latanoprost 0.005% ophthalmic solution, travoprost 0.004% ophthalmic solution; Lumigan (bimatoprost 0.01% ophthalmic solution), Vyzulta (latanoprostene bunod 0.024% ophthalmic solution), Xelpros (latanoprost 0.005% ophthalmic emulsion), tafluprost 0.0015% ophthalmic solution, Iyuzeh (latanoprost 0.005% ophthalmic solution), and Omlonti (omidenepag isopropyl 0.002% ophthalmic solution).
 - ii. Patient has tried at least two other ophthalmic products (either as monotherapy or as concomitant therapy) from two different pharmacological classes for the treatment of open-angle glaucoma or ocular hypertension; AND
Note: Examples of pharmacological classes of ophthalmic products for the treatment of open-angle glaucoma or ocular hypertension include beta-blockers, alpha-agonist (brimonidine), carbonic anhydrase inhibitors, and rho kinase inhibitor (netarsudil).
 - D) For each of the ophthalmic medications that were tried, the patient meets ONE of the following (i or ii):
 - i. Patient has had inadequate efficacy to the previously tried ophthalmic products, according to the prescriber; OR
 - ii. Patient has experienced adverse event(s) severe enough to warrant discontinuation of the previously tried ophthalmic products, according to the prescriber; AND
 - E) The medication is administered by or under the supervision of an ophthalmologist.
4. **Open-Angle Glaucoma.** Approve for a one-time use in each treated eye (i.e., one implant per treated eye; a total of two implants per patient) if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient is not receiving re-treatment of eye(s) previously treated with iDose TR; AND
 - C) Patient meets BOTH of the following criteria (i and ii):
 - i. Patient has tried at least two ophthalmic prostaglandins (either as monotherapy or as concomitant therapy) for the treatment of open-angle glaucoma or ocular hypertension; AND
Note: Examples of ophthalmic prostaglandins include bimatoprost 0.03% ophthalmic solution, latanoprost 0.005% ophthalmic solution, travoprost 0.004% ophthalmic solution; Lumigan (bimatoprost 0.01% ophthalmic solution), Vyzulta (latanoprostene bunod 0.024% ophthalmic solution), Xelpros (latanoprost 0.005% ophthalmic emulsion), tafluprost 0.0015% ophthalmic solution, Iyuzeh (latanoprost 0.005% ophthalmic solution), and Omlonti (omidenepag isopropyl 0.002% ophthalmic solution).
 - ii. Patient has tried at least two other ophthalmic products (either as monotherapy or as concomitant therapy) from two different pharmacological classes for the treatment of open-angle glaucoma or ocular hypertension; AND
Note: Examples of pharmacological classes of ophthalmic products for the treatment of open-angle glaucoma or ocular hypertension include beta-blockers, alpha-agonist (brimonidine), carbonic anhydrase inhibitors, and rho kinase inhibitor (netarsudil).
 - D) For each of the ophthalmic medications that were tried, the patient meets ONE of the following (i or ii):

- i. Patient has had inadequate efficacy to the previously tried ophthalmic products, according to the prescriber; OR
 - ii. Patient has experienced adverse event(s) severe enough to warrant discontinuation of the previously tried ophthalmic products, according to the prescriber; AND
- E) The medication is administered by or under the supervision of an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of iDose TR is not recommended in the following situations:

- 115. Re-Treatment of Previously-Treated Eye(s).** iDose TR is approved for a one-time use in each treated eye. Repeat administration in previously treated eye(s) is not approvable.
- 116. Concurrent use of iDose TR with Durysta (bimatoprost intracameral implant).** Durysta is another intracameral implant and should not be used with iDose TR.
- 117.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Opioids – Fentanyl Transmucosal Drugs Prior Authorization Policy
- Actiq® (oral transmucosal fentanyl citrate – Teva, generic)
 - Fentora® (fentanyl buccal tablet – Teva, authorized generic [brand obsolete])
 - Lazanda® (fentanyl nasal spray – West Therapeutic Development [obsolete as of 12/30/2022])
 - Subsys® (fentanyl sublingual spray – West Therapeutic Development [obsolete as of 6/1/2024])

REVIEW DATE: 11/13/2024

OVERVIEW

The transmucosal immediate-release fentanyl (TIRF) drugs are indicated only for the management of **breakthrough pain in patients with cancer** who are already receiving and who are tolerant to opioid therapy for their underlying persistent cancer pain.¹⁻⁵

Actiq (generic), Fentora, and Subsys are immediate-release oral transmucosal formulations of fentanyl citrate.¹⁻⁴ Lazanda is a nasal spray intended for intranasal transmucosal administration.⁵ Patients considered opioid tolerant are those who are taking at least 60 mg of oral morphine daily, at least 25 mcg of transdermal fentanyl/hour, at least 30 mg of oxycodone daily, at least 8 mg oral hydromorphone daily, at least 25 mg oral oxymorphone daily, or an equianalgesic dose of another opioid for one week or longer. The appropriate dosing and safety of Actiq (generic) in opioid-tolerant children with breakthrough cancer pain have not been established in those below 16 years of age.^{1,3} The safety and efficacy of Fentora, Subsys, and Lazanda have not been established in pediatric patients below 18 years of age.^{2,4,5}

The transmucosal fentanyl drugs are contraindicated in the management of acute or postoperative pain and in patients with known intolerance or hypersensitivity to any components or the drug fentanyl.¹⁻⁵ In addition, these products must not be used in patients who are not opioid tolerant (contraindicated). The transmucosal fentanyl drugs are approved for use only in the care of cancer patients and only by healthcare professionals¹⁻⁴ (oncologists and pain specialists)^{2,3,5} who are knowledgeable of and skilled in the use of Schedule II opioids to treat cancer pain. Because of the risk of misuse, abuse, addiction, and overdose, these products are available only through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called the TIRF REMS ACCESS program. Under the TIRF REMS ACCESS program, outpatients, prescribers who prescribe to outpatients, pharmacies, and distributors must enroll in the program.

On September 16, 2024, the FDA stated that according to manufacturers of TIRF medicines, **production of all TIRF medicines will be discontinued on September 30, 2024.** Due to this discontinuation, the TIRF REMS will no longer accept new enrollments for patients, prescribers, or pharmacies. As of September 16, 2024, there were fewer than 150 patients receiving treatment with TIRF medicines. Patients who are currently on a TIRF medicine may continue treatment under the REMS while TIRF medicine supply remains available. Prescribers should work with their patients to transition to other non-TIRF treatment. The TIRF REMS will remain in place as long as the manufacturers' new drug applications or abbreviated new drug applications are approved, regardless of the marketing status of the products. Of note, **the FDA did not request this discontinuation.**

POLICY STATEMENT

12/30/2022

© 2022. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Prior Authorization is recommended for prescription benefit coverage of fentanyl transmucosal drugs. All approvals are provided for the duration noted below.

Automation: If the patient has a prescription for a cancer medication (see Appendix A) within a 180-day period, the claim will adjudicate. When available, the ICD-10 codes for cancer will be used as part of automation to allow approval of the requested medication (see Appendix B).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of fentanyl transmucosal drugs is recommended for those who meet the following criteria:

FDA-Approved Indication

1. **Breakthrough Pain in a Patient with Cancer.** Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient meets ONE of the following conditions (i or ii):

- i. Patient is unable to swallow, has dysphagia, esophagitis, mucositis, or uncontrollable nausea/vomiting; OR

- ii. Patient is unable to take two other short-acting narcotics secondary to allergy or severe adverse events; AND

Note: Examples of short-acting narcotics include immediate-release formulations of oxycodone, morphine sulfate, hydromorphone, etc.

- B) Patient is on or will be on an oral or transdermal long-acting narcotic, or the patient is on an intravenous, subcutaneous, or spinal (intrathecal, epidural) narcotic.

Note: Examples of long-acting narcotics include Duragesic (fentanyl transdermal system), OxyContin (oxycodone extended-release tablets), and morphine extended-release. Examples of intravenous, subcutaneous, or spinal narcotics include morphine sulfate, hydromorphone, and fentanyl citrate.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of fentanyl transmucosal drugs is not recommended in the following situations:

1. **Acute and/or Postoperative Pain.** This includes surgery/post-surgery, trauma/post-trauma, acute medical illness (acute abdominal pain, pelvic pain, muscle spasm). Actiq (generic), Fentora, Lazanda, and Subsys are contraindicated for use in the management of acute or postoperative pain, including migraine headache pain.¹⁻⁵
2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Opioids – Long-Acting Products Prior Authorization Policy

Note: This is not an inclusive list. As new products become available, they will roll into this policy and the list will be updated periodically.

- Buprenorphine (i.e., Belbuca[®] buccal film, Butrans[®] transdermal patch)
- Fentanyl transdermal patch (Duragesic[®] [brand discontinued], generic)
- Hydrocodone extended-release capsules/tablets (e.g., Hysingla[®] ER, Zohydro[®] ER [brand discontinued])
- Hydromorphone extended-release tablets (e.g., generic to discontinued Exalgo[®])
- Morphine sulfate extended-release capsules/tablets (e.g., Arymo[®] ER [brand discontinued], Kadian[®] [brand discontinued], MS Contin[®], generic)
- Oxycodone extended-release capsules/tablets (e.g., Xtampza[®] ER, OxyContin[®])
- Oxymorphone extended-release tablets (e.g., generic [generic is not AB-rated to the discontinued Opana[®] ER formulation])
- Tapentadol extended-release tablets (e.g., Nucynta[®] ER)
- Tramadol extended-release capsules/tablets (e.g., Conzip[®], Ultram[®] ER [brand discontinued], generic)

REVIEW DATE: 01/17/2024

OVERVIEW

All of the long-acting (LA) opioids are indicated for the **management of severe and persistent pain that requires an extended treatment period with a daily opioid analgesic** and for which alternative treatment options are inadequate.¹⁻⁹ OxyContin is the only product specifically indicated in pediatric patients 11 years to 18 years of age.³ Nucynta ER is the only product also indicated for the management of neuropathic pain associated with diabetic peripheral neuropathy in adults.¹

The currently available LA opioids are buprenorphine, fentanyl, hydrocodone, hydromorphone, morphine sulfate, oxycodone, oxymorphone, tapentadol, and tramadol.¹⁻⁹

Guidelines

In 2022, the **Centers for Disease Control and Prevention (CDC)** published an updated guideline for prescribing opioids for pain.¹⁰ Nonopioid therapies are at least as effective as opioids for many common types of acute pain, and nonopioid therapies are preferred for subacute and chronic pain. Clinicians should maximize the use of nonpharmacologic and nonopioid pharmacologic therapies as appropriate for the specific condition and patient and only consider initiating opioid therapy if expected benefits for pain and function are anticipated to outweigh risks to the patient. Multiple noninvasive nonpharmacologic interventions (e.g., aerobic, aquatic, or resistance exercises, weight loss, psychological therapy, spinal manipulation, low-level laser therapy, massage, mindfulness-based stress reduction, yoga, tai chi, qigong, acupuncture, cognitive behavioral therapy, and spinal manipulation) are associated with improvements in pain, function, or both, that are sustained after treatment and are not associated with serious harms. Non-opioid drugs (e.g., tricyclic antidepressants, serotonin and norepinephrine reuptake inhibitor [SNRI] antidepressants, duloxetine, selected antiseizure medications (e.g., pregabalin, gabapentin, oxcarbazepine), capsaicin and lidocaine patches, and nonsteroidal anti-inflammatory drugs [NSAIDs]) are associated with small to moderate improvements in chronic pain and function for certain chronic pain conditions.

Before initiating opioid therapy for patients with pain, clinicians should discuss with patients the realistic benefits and known risks of opioid therapy.¹⁰ Before starting ongoing opioid therapy for patients with subacute or chronic pain, clinicians should work with patients to establish treatment goals for pain and function and consider how opioid therapy will be discontinued if benefits do not outweigh risks. When opioids are initiated, clinicians should prescribe the lowest effective dosage of immediate-release opioids for no longer than needed for the expected duration of pain severe enough to require opioids. During ongoing opioid therapy, clinicians should collaborate with patients to evaluate and carefully weigh the benefits and risks of continuing opioid therapy and exercise care when increasing, continuing, or reducing opioid dosage. The guideline recommends that clinicians should not initiate opioid treatment with LA opioids for patients who are opioid-naïve and should not prescribe LA opioids for intermittent use. LA opioids should be reserved for severe, continuous pain. Before starting and periodically during continuation of opioid therapy, clinicians should evaluate the risk for opioid-related harms and should work with patients to incorporate relevant strategies to mitigate risk, including offering naloxone and reviewing potential interactions with any other prescribed medications or substances used. When prescribing initial opioid therapy and periodically during opioid therapy, clinicians should review the patient's history of controlled substance prescriptions using state prescription drug monitoring program (PDMP) data to determine whether the patient is receiving opioid dosages or combinations that put the patient at high risk for overdose. When prescribing opioids for subacute or chronic pain, clinicians should consider the benefits and risks of toxicology testing to assess for prescribed medications as well as other prescribed and nonprescribed controlled substances.

The 2020 **American Society of Hematology** guideline for the management of acute and chronic pain in patients with sickle cell disease states that pain causes significant morbidity for those living with sickle cell disease and manifests as acute intermittent pain, chronic daily pain, and acute-on-chronic pain.¹¹ For adults and children with chronic pain who are receiving chronic opioid therapy, are functioning well, and have perceived benefit, the guideline suggests shared decision making for continuation of chronic opioid therapy. For adults and children with chronic pain who are receiving chronic opioid therapy, are functioning poorly, or are at high risk for aberrant opioid use or toxicity, the guideline suggests against continuation of chronic opioid therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of long-acting opioids. Long-acting opioids are controlled substances (CII with the exception of buprenorphine products which are CIII and tramadol-containing products which are CIV) which can be misused and abused. Because of the specialized skills required for evaluation and diagnosis of patients with sickle cell disease as well as the monitoring required for adverse events and long-term efficacy, approval requires LA opioids to be prescribed by or in consultation with a hematologist for patients with this diagnosis. All approvals are provided for the duration noted below.

Note: This policy includes long-acting formulations of the medications listed on page 1; the list is not inclusive. As new products become available, they will roll into this policy and the list will be updated periodically.

Automation: A patient with a history of a long-acting opioid within the 130-day look-back period is excluded from Prior Authorization. If the patient has a prescription for a cancer medication (see Appendix A) within a 180-day period, the claim will adjudicate. When available, the ICD-10 codes for cancer will be used as part of automation to allow approval of the requested medication (see Appendix B).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of long-acting opioids is recommended in those who meet the following criteria:

- I. Coverage of all long-acting opioids, except fentanyl transdermal products, is recommended in those who meet one of the following criteria:

FDA-Approved Indications

J) Pain Severe Enough to Require Daily, Around-the-Clock, Long-Term Opioid Treatment.

Approve for 1 year if the patient meets ONE of the following (A, B, C, or D):

- A) Patient has a cancer diagnosis; OR
- B) Patient is in a hospice program, end-of-life care, or palliative care; OR
- C) Patient meets BOTH of the following (i and ii):
 - i) Patient has diagnosis of sickle cell disease; AND
 - ii) Medication is prescribed by or in consultation with a hematologist; OR
- D) Patient meets ALL of the following (i, ii, iii, iv, v, vi, and vii):
 - i. Patient is not opioid-naïve; AND
 - ii. Non-opioid therapies have been optimized and are being used in conjunction with opioid therapy, according to the prescriber; AND
Note: Examples of non-opioid therapies include non-opioid medications (e.g., nonsteroidal anti-inflammatory drugs, tricyclic antidepressants, serotonin and norepinephrine reuptake inhibitors, antiseizure medications), physical therapy, exercise therapy, weight loss, and cognitive behavioral therapy.
 - iii. Patient's of controlled substance prescriptions has been checked using the state prescription drug monitoring program (PDMP), according to the prescriber; AND
 - iv. Risks (e.g., addiction, overdose) and realistic benefits of opioid therapy have been discussed with the patient, according to the prescriber; AND
 - v. Treatment plan (including goals for pain and function) is in place and reassessments (including pain levels and function) are scheduled at regular intervals, according to the prescriber.
 - vi. Need for a naloxone prescription has been assessed and naloxone has been ordered, if necessary, according to the prescriber; AND
 - vii. Need for periodic toxicology testing has been assessed and ordered, if necessary, according to the prescriber.

- II. Coverage of fentanyl transdermal products is recommended in those who meet the following criteria:

FDA-Approved Indication

1. Pain Severe Enough to Require Daily, Around-the-Clock, Long-Term Opioid Treatment.

Approve for 1 year if the patient has a cancer diagnosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of long-acting opioids is not recommended in the following situations:

31. **Acute Pain.** According to the CDC guideline for prescribing opioids for chronic pain, clinicians should not prescribe extended-release/long-acting opioids for the treatment of acute pain due to the longer half-lives and longer duration of effects (e.g., respiratory depression) with extended-release/long-acting opioids.¹⁷

32. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Opioids – Methadone Prior Authorization Policy

- Methadone dispersible tablets/oral solution/tablets (e.g., Diskets[®], Dolophine[®], Methadose[™], generic)

REVIEW DATE: 01/17/2024

OVERVIEW

Methadone is indicated for the treatment and maintenance treatment of opioid addiction (i.e., heroin or other morphine-like drugs).¹ Note that methadone products, when used for the treatment of opioid addiction in detoxification or maintenance programs, shall be dispensed only by opioid treatment programs (and agencies, practitioners, or institutions by formal agreement with the program sponsor) certified by the Substance Abuse and Mental Health Services Administration and approved by the designated state authority. Methadone is also used off-label for the management of severe and persistent pain that requires an extended treatment period with a daily opioid analgesic and for which alternative treatment options are inadequate.²

Guidelines

In 2022, the **Centers for Disease Control and Prevention (CDC)** published an updated guideline for prescribing opioids for pain.³ Nonopioid therapies are at least as effective as opioids for many common types of acute pain, and nonopioid therapies are preferred for subacute and chronic pain. Clinicians should maximize the use of nonpharmacologic and nonopioid pharmacologic therapies as appropriate for the specific condition and patient and only consider initiating opioid therapy if expected benefits for pain and function are anticipated to outweigh risks to the patient. Multiple noninvasive nonpharmacologic interventions (e.g., aerobic, aquatic, or resistance exercises, weight loss, psychological therapy, spinal manipulation, low-level laser therapy, massage, mindfulness-based stress reduction, yoga, tai chi, qigong, acupuncture, cognitive behavioral therapy, and spinal manipulation) are associated with improvements in pain, function, or both, that are sustained after treatment and are not associated with serious harms. Non-opioid drugs (e.g., tricyclic antidepressants, serotonin and norepinephrine reuptake inhibitor [SNRI] antidepressants, duloxetine, selected antiseizure medications (e.g., pregabalin, gabapentin, oxcarbazepine), capsaicin and lidocaine patches, and nonsteroidal anti-inflammatory drugs [NSAIDs]) are associated with small to moderate improvements in chronic pain and function for certain chronic pain conditions.

Before initiating opioid therapy for patients with pain, clinicians should discuss with patients the realistic benefits and known risks of opioid therapy.³ Before starting ongoing opioid therapy for patients with subacute or chronic pain, clinicians should work with patients to establish treatment goals for pain and function and consider how opioid therapy will be discontinued if benefits do not outweigh risks. When opioids are initiated, clinicians should prescribe the lowest effective dosage of immediate-release opioids for no longer than needed for the expected duration of pain severe enough to require opioids. During ongoing opioid therapy, clinicians should collaborate with patients to evaluate and carefully weigh the benefits and risks of continuing opioid therapy and exercise care when increasing, continuing, or reducing opioid dosage. The guideline recommends that clinicians should not initiate opioid treatment with LA opioids for patients who are opioid-naïve and should not prescribe LA opioids for intermittent use. LA opioids should be reserved for severe, continuous pain. Before starting and periodically during continuation of opioid therapy, clinicians should evaluate the risk for opioid-related harms and should work with patients to incorporate relevant strategies to mitigate risk, including offering naloxone and reviewing potential interactions with any other prescribed medications or substances used. When prescribing initial opioid therapy and periodically during opioid therapy, clinicians should review the patient's history of controlled

substance prescriptions using state prescription drug monitoring program (PDMP) data to determine whether the patient is receiving opioid dosages or combinations that put the patient at high risk for overdose. When prescribing opioids for subacute or chronic pain, clinicians should consider the benefits and risks of toxicology testing to assess for prescribed medications as well as other prescribed and nonprescribed controlled substances.

The 2020 **American Society of Hematology** guideline for the management of acute and chronic pain in patients with sickle cell disease states that pain causes significant morbidity for those living with sickle cell disease and manifests as acute intermittent pain, chronic daily pain, and acute-on-chronic pain.⁴ For adults and children with chronic pain who are receiving chronic opioid therapy, are functioning well, and have perceived benefit, the guideline suggests shared decision making for continuation of chronic opioid therapy. For adults and children with chronic pain who are receiving chronic opioid therapy, are functioning poorly, or are at high risk for aberrant opioid use or toxicity, the guideline suggests against continuation of chronic opioid therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of methadone. Methadone is a CII controlled substance which can be misused and abused. Because of the specialized skills required for evaluation and diagnosis of patients with sickle cell disease as well as the monitoring required for adverse events and long-term efficacy, approval requires methadone to be prescribed by or in consultation with a hematologist for patients with this diagnosis. All approvals are provided for the duration noted below.

Automation: A patient with a history of methadone within the 130-day look-back period is excluded from Prior Authorization. If the patient has a prescription for a cancer medication (see Appendix A) within a 180-day period, the claim will adjudicate. When available, the ICD-10 codes for cancer will be used as part of automation to allow approval of the requested medication (see Appendix B).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of methadone is recommended in those who meet the following criteria:

FDA-Approved Indications

K) Pain Severe Enough to Require Daily, Around-the-Clock, Long-Term Opioid Treatment.

Approve for 1 year if the patient meets ONE of the following (A, B, C, or D):

- E)** Patient has a cancer diagnosis; OR
- F)** Patient is in a hospice program, end-of-life care, or palliative care; OR
- G)** Patient meets BOTH of the following (i and ii):
 - i)** Patient has diagnosis of sickle cell disease; AND
 - ii)** Medication is prescribed by or in consultation with a hematologist; OR
- H)** Patient meets ALL of the following (i, ii, iii, iv, v, vi, and vii):
 - viii.** Patient is not opioid-naïve; AND
 - ix.** Non-opioid therapies have been optimized and are being used in conjunction with opioid therapy, according to the prescriber; AND

Note: Examples of non-opioid therapies include non-opioid medications (e.g., nonsteroidal anti-inflammatory drugs, tricyclic antidepressants, serotonin and norepinephrine reuptake inhibitors, antiseizure medications), physical therapy, exercise therapy, weight loss, and cognitive behavioral therapy.

- x. Patient's of controlled substance prescriptions has been checked using the state prescription drug monitoring program (PDMP), according to the prescriber; AND
 - xi. Risks (e.g., addiction, overdose) and realistic benefits of opioid therapy have been discussed with the patient, according to the prescriber; AND
 - xii. Treatment plan (including goals for pain and function) is in place and reassessments (including pain levels and function) are scheduled at regular intervals, according to the prescriber.
 - xiii. Need for a naloxone prescription has been assessed and naloxone has been ordered, if necessary, according to the prescriber; AND
 - xiv. Need for periodic toxicology testing has been assessed and ordered, if necessary, according to the prescriber.
2. **Opioid Addiction (Dependence).** Approve methadone for 1 year if the patient meets ONE of the following (A or B):
- A) Methadone is dispensed by an opioid treatment program certified by the Substance Abuse and Mental Health Services Administration and approved by the designated state authority; OR
 - B) Methadone is being prescribed during an emergency period of ≤ 3 days while definitive care for the addiction is being sought in an appropriately licensed facility.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of methadone is not recommended in the following situations:

33. **Acute Pain.** According to the CDC guideline for prescribing opioids for chronic pain, clinicians should not prescribe extended-release/long-acting opioids for the treatment of acute pain due to the longer half-lives and longer duration of effects (e.g., respiratory depression) with extended-release/long-acting opioids.¹⁷
34. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Opioids – Tramadol Extended-Release Products Prior Authorization Policy
- ConZip® (tramadol hydrochloride extended-release capsules – Vertical)
 - Tramadol extended-release capsules – various (brand products)
 - Tramadol hydrochloride extended-release tablets – generic to the discontinued product Ultram® ER
 - Tramadol hydrochloride extended-release tablets – generic to the discontinued product Ryzolt™

REVIEW DATE: 01/24/2024

OVERVIEW

Tramadol extended-release tablets, tramadol extended-release capsules, and ConZip are indicated for the **management of severe and persistent pain that requires an extended treatment period with a daily opioid analgesic** and for which alternative treatment options are inadequate.¹⁻³

Tramadol is a centrally acting synthetic opioid analgesic.¹⁻³ The extended-release tramadol products differ in their extended-release mechanism. ConZip contains a total dose of tramadol in a combination of immediate-release and extended-release components. However, ConZip is bioequivalent to a reference extended-release tramadol product under fasting conditions. Therefore, clinical efficacy was based on a reference extended-release tramadol product.

Guidelines

In 2022, the **Centers for Disease Control and Prevention (CDC)** published an updated guideline for prescribing opioids for pain.⁴ Nonopioid therapies are at least as effective as opioids for many common types of acute pain, and nonopioid therapies are preferred for subacute and chronic pain. Clinicians should maximize the use of nonpharmacologic and nonopioid pharmacologic therapies as appropriate for the specific condition and patient and only consider initiating opioid therapy if expected benefits for pain and function are anticipated to outweigh risks to the patient. Multiple noninvasive nonpharmacologic interventions (e.g., aerobic, aquatic, or resistance exercises, weight loss, psychological therapy, spinal manipulation, low-level laser therapy, massage, mindfulness-based stress reduction, yoga, tai chi, qigong, acupuncture, cognitive behavioral therapy, and spinal manipulation) are associated with improvements in pain, function, or both, that are sustained after treatment and are not associated with serious harms. Non-opioid drugs (e.g., tricyclic antidepressants, serotonin and norepinephrine reuptake inhibitor [SNRI] antidepressants, duloxetine, selected antiseizure medications (e.g., pregabalin, gabapentin, oxcarbazepine), capsaicin and lidocaine patches, and nonsteroidal anti-inflammatory drugs [NSAIDs]) are associated with small to moderate improvements in chronic pain and function for certain chronic pain conditions.

Before initiating opioid therapy for patients with pain, clinicians should discuss with patients the realistic benefits and known risks of opioid therapy.⁴ Before starting ongoing opioid therapy for patients with subacute or chronic pain, clinicians should work with patients to establish treatment goals for pain and function and consider how opioid therapy will be discontinued if benefits do not outweigh risks. When opioids are initiated, clinicians should prescribe the lowest effective dosage of immediate-release opioids for no longer than needed for the expected duration of pain severe enough to require opioids. During ongoing opioid therapy, clinicians should collaborate with patients to evaluate and carefully weigh the benefits and risks of continuing opioid therapy and exercise care when increasing, continuing, or reducing opioid dosage. The guideline recommends that clinicians should not initiate opioid treatment with long-

01/24/2024

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

acting (LA) opioids for patients who are opioid-naïve and should not prescribe LA opioids for intermittent use. LA opioids should be reserved for severe, continuous pain. Before starting and periodically during continuation of opioid therapy, clinicians should evaluate the risk for opioid-related harms and should work with patients to incorporate relevant strategies to mitigate risk, including offering naloxone and reviewing potential interactions with any other prescribed medications or substances used. When prescribing initial opioid therapy and periodically during opioid therapy, clinicians should review the patient's history of controlled substance prescriptions using state prescription drug monitoring program (PDMP) data to determine whether the patient is receiving opioid dosages or combinations that put the patient at high risk for overdose. When prescribing opioids for subacute or chronic pain, clinicians should consider the benefits and risks of toxicology testing to assess for prescribed medications as well as other prescribed and nonprescribed controlled substances.

The 2020 **American Society of Hematology** guideline for the management of acute and chronic pain in patients with sickle cell disease states that pain causes significant morbidity for those living with sickle cell disease and manifests as acute intermittent pain, chronic daily pain, and acute-on-chronic pain.⁵ For adults and children with chronic pain who are receiving chronic opioid therapy, are functioning well, and have perceived benefit, the guideline suggests shared decision making for continuation of chronic opioid therapy. For adults and children with chronic pain who are receiving chronic opioid therapy, are functioning poorly, or are at high risk for aberrant opioid use or toxicity, the guideline suggests against continuation of chronic opioid therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of tramadol extended-release products. Tramadol extended-release products are controlled substances (CIV) which can be misused and abused. Because of the specialized skills required for evaluation and diagnosis of patients with sickle cell disease as well as the monitoring required for adverse events and long-term efficacy, approval requires tramadol extended-release products to be prescribed by or in consultation with a hematologist for patients with this diagnosis. All approvals are provided for the duration noted below.

Automation: A patient with a history of a tramadol extended-release product within the 130-day look-back period is excluded from Prior Authorization. If a patient has a prescription for a cancer medication (see Appendix A) within a 180-day period, the claim will adjudicate. When available, the ICD-10 codes for cancer will be used as part of automation to allow approval of the requested medication (see Appendix B).

RECOMMENDED CRITERIA

Coverage of a tramadol extended-release product is recommended in those who meet the following criteria:

FDA-Approved Indication

L) Pain Severe Enough to Require Daily, Around-the-Clock, Long-Term Opioid Treatment.

Approve for 1 year if the patient meets ONE of the following (A, B, C, or D):

- ii. Patient has a cancer diagnosis; OR
- iii. Patient is in hospice program, end-of-life care, or palliative care; OR
- iv. Patient meets BOTH of the following criteria (i and ii):
 - i. Patient has diagnosis of sickle cell disease; AND
 - ii. Medication is prescribed by or in consultation with a hematologist; OR
- v. Patient meets all of the following (i, ii, iii, iv, v, vi, and vii):

- i. Patient is not opioid-naïve; AND
- ii. Non-opioid therapies have been optimized and are being used in conjunction with opioid therapy according to the prescriber; AND
Note: Examples of non-opioid therapies include non-opioid medications (e.g., nonsteroidal anti-inflammatory drugs, tricyclic antidepressants, serotonin and norepinephrine reuptake inhibitors, antiseizure medications), physical therapy, exercise therapy, weight loss, and cognitive behavioral therapy.
- iii. Patient's of controlled substance prescriptions has been checked using the state prescription drug monitoring program (PDMP), according to the prescriber; AND
- iv. Risks (e.g., addiction, overdose) and realistic benefits of opioid therapy have been discussed with the patient, according to the prescriber; AND
- v. Treatment plan (including goals for pain and function) is in place and reassessments (including pain levels and function) are scheduled at regular intervals, according to the prescriber; AND
- vi. Need for a naloxone prescription has been assessed and naloxone has been ordered, if necessary, according to the prescriber; AND
- vii. Need for periodic toxicology testing has been assessed and ordered, if necessary, according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of a tramadol extended-release product is not recommended in the following situations:

- 35. **Acute Pain.** According to the CDC guideline for prescribing opioids for chronic pain, clinicians should not prescribe extended-release/long-acting opioids for the treatment of acute pain due to the longer half-lives and longer duration of effects (e.g., respiratory depression) with extended-release/long-acting opioids.⁴
- 36. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Kynmobi Prior Authorization Policy

- Kynmobi™ (apomorphine sublingual film – Sunovion)

REVIEW DATE: 03/13/2024

OVERVIEW

Kynmobi, a non-ergoline dopamine agonist, is indicated for the acute, intermittent treatment of “off” episodes in patients with **Parkinson's disease**.¹

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).² Kynmobi is not addressed. The review categorically divides treatment recommendations by Parkinson's disease characteristics. Apomorphine subcutaneous is noted to be efficacious and clinically useful in treatment for motor fluctuations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Kynmobi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kynmobi as well as the monitoring required for adverse events and long-term efficacy, approval requires Kynmobi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kynmobi is recommended in those who meet the following criteria:

FDA-Approved Indication

5. **Parkinson's Disease.** Approve for 1 year if the patient meets all of the following (A, B, C, and D):
 - A) Patient is experiencing “off” episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
 - B) Patient is currently receiving carbidopa/levodopa therapy; AND
 - C) Patient has previously tried one other treatment for “off” episodes and meets ONE of the following (i or ii):
 - i. Patient had significant intolerance, according to the prescriber; OR
 - ii. Patient had inadequate efficacy, according to the prescriber; AND

Note: Examples of treatments for “off” episodes include entacapone, rasagiline, pramipexole, ropinirole, tolcapone, cabergoline, selegiline, Apokyn (apomorphine subcutaneous injection), Ongentys (opicapone capsules), or Xadago (safinamide tablets).
 - D) The medication is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

03/13/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Coverage of Kynmobi is not recommended in the following situations:

- 118. Concurrent Use with a Serotonin 5-HT₃ Antagonist.** Administration of Kynmobi in conjunction with a serotonin 5-HT₃ antagonist (e.g., ondansetron, granisetron, dolasetron, palonosetron, alosetron) can result in extreme lowering of blood pressure and loss of consciousness.¹
- 119.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Ogmentys Prior Authorization Policy

- Ogmentys® (opicapone capsules – Neurocrine Biosciences)

REVIEW DATE: 03/20/2024

OVERVIEW

Ogmentys, a peripheral, selective, and reversible catechol-o-methyltransferase (COMT) inhibitor, is indicated for adjunctive treatment to levodopa/carbidopa in patients with **Parkinson's disease** experiencing "off" episodes.¹

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).² The review categorically divides treatment recommendations by Parkinson's disease characteristics. Ogmentys is noted to be efficacious and clinically useful in treatment for motor fluctuations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ogmentys. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ogmentys as well as the monitoring required for adverse events and long-term efficacy, approval requires Ogmentys to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ogmentys is recommended in those who meet the following criteria:

FDA-Approved Indication

- 6. Parkinson's Disease.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A)** Patient is currently receiving carbidopa/levodopa therapy; AND
 - B)** The medication is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ogmentys is not recommended in the following situations:

- 120.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Amantadine Extended-Release Drugs Prior Authorization with Step Therapy Policy

- Gocovri® (amantadine extended-release capsules – Adamas)
- Osmolex® ER (amantadine extended-release tablets – Adamas)

REVIEW DATE: 03/13/2024

OVERVIEW

Gocovri, an extended-release capsule formulation of amantadine, is indicated for patients with **Parkinson's disease** for the following uses:¹

- **Dyskinesia**, in patients receiving levodopa-based therapy, with or without concomitant dopaminergic medications.
- **“Off” episodes**, as adjunctive treatment to levodopa/carbidopa.

Osmolex ER, an extended-release tablet formulation of amantadine, is indicated for the following uses:²

- **Drug-induced extrapyramidal reactions**, in adult patients.
- **Parkinson's disease**, in adult patients.

Amantadine hydrochloride is available as immediate-release capsules, tablets, and oral solution.³⁻⁵ The amantadine immediate-release products are indicated for the prophylaxis and treatment of signs and symptoms of infection caused by various strains of influenza A virus; idiopathic Parkinson's disease (paralysis agitans), post-encephalitic parkinsonism, symptomatic parkinsonism which may follow injury to the nervous system by carbon monoxide intoxication, and in those elderly patients believed to develop parkinsonism in association with cerebral arteriosclerosis; and drug-induced extrapyramidal reactions.

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018). Amantadine is addressed; however, specific formulations are not. The review categorically divides treatment recommendations by Parkinson's disease characteristics. Amantadine was noted to be likely efficacious and possibly useful in treatment for symptomatic monotherapy and symptomatic adjunct therapy in early or stable Parkinson's disease. For treatment of dyskinesia, amantadine was identified to be efficacious and clinically useful.

The Academy of Family Physicians published recommendations for practice for the treatment of Parkinson's Disease (2020).⁷ Amantadine is addressed; however, specific formulations are not. The review recommends amantadine for treatment of dyskinesias in patients with advanced disease (B recommendation). It is noted that amantadine may be most helpful for dyskinesias and as an add on to levodopa therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of amantadine extended-release products. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with amantadine extended-release products as well as the monitoring

03/13/2024

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

required for adverse events and long-term efficacy, approval requires amantadine extended-release products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for use of Gocovri and Osmolex ER as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts, and/or other information. For patient cases in which documentation is required, if this documentation has been previously received upon a prior coverage review, the documentation requirement is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Gocovri is recommended in those who meet the following criteria:

FDA-Approved Indication

15. **Parkinson's Disease.** Approve if patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following (i, ii, iii, and iv):

i. Patient meets ONE of the following (a or b):

a) Patient is experiencing dyskinesia; OR

b) Patient is experiencing “off” episodes; AND

Note: Examples of “off” episodes include muscle stiffness, slow movements, or difficulty starting movements.

ii. Patient is currently receiving levodopa-based therapy (e.g., carbidopa/levodopa); AND

iii. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following (a or b):

a) Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber **[documentation required]**; OR

b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber **[documentation required]**; AND

iv. The medication is prescribed by or in consultation with a neurologist.

B) Patients is Currently Receiving Gocovri. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):

i. Patient is currently receiving levodopa-based therapy (e.g., carbidopa/levodopa); AND

ii. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following (a or b):

a) Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber **[documentation required]**; OR

b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber **[documentation required]**; AND

iii. Patient has had a response to therapy (e.g., decrease in dyskinesia, decrease in “off” episodes), as determined by the prescriber; AND

Note: Examples of “off” episodes include muscle stiffness, slow movements, or difficulty starting movements.

iv. The medication is prescribed by or in consultation with a neurologist.

II. Coverage of Osmolex ER is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Drug-Induced Extrapyrasidal Reactions.** Approve if patient meets ONE of the following (A or B):
 - A) Initial Therapy. Approve for 3 months if the patient meets the following (i and ii):
 - i. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following (a or b):
 - a) Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber **[documentation required]**; OR
 - b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber **[documentation required]**; AND
 - ii. The medication is prescribed by or in consultation with a neurologist.
 - B) Patient is Currently Receiving Osmolex ER. Approve for 1 year if the patient meets the following (i, ii, and iii):
 - i. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following (a or b):
 - a) Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber **[documentation required]**; OR
 - b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber **[documentation required]**; AND
 - ii. Patient has had a response to therapy (e.g., decrease in extrapyramidal reactions), as determined by the prescriber; AND
 - iii. The medication is prescribed by or in consultation with a neurologist.
2. **Parkinson's Disease.** Approve if patient meets ONE of the following (A or B):
 - A) Initial Therapy. Approve for 3 months if the patient meets the following (i and ii):
 - i. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following (a or b):
 - a) Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber **[documentation required]**; OR
 - b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber **[documentation required]**; AND
 - ii. The medication is prescribed by or in consultation with a neurologist.
 - B) Patient is Currently Receiving Osmolex ER. Approve for 1 year if the patient meets the following (i, ii, and iii):
 - i. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following (a or b):
 - a) Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber **[documentation required]**; OR
 - b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber **[documentation required]**; AND
 - ii. Patient has had a response to therapy (e.g., decrease in dyskinesia), as determined by the prescriber; AND
 - iii. The medication is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of amantadine extended-release products is not recommended in the following situations:

- 121.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Carbidopa Prior Authorization Policy

- Lodosyn® (carbidopa tablets – Bausch Health, generic)

REVIEW DATE: 3/20/2024

OVERVIEW

Carbidopa, an aromatic amino acid decarboxylation inhibitor, is indicated for use with carbidopa-levodopa or with levodopa for the following uses:¹

- **Parkinson's disease**, idiopathic.
- **Postencephalitic parkinsonism**.
- **Symptomatic parkinsonism**, which may follow injury to the nervous system by carbon monoxide intoxication and/or manganese intoxication.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of carbidopa. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with carbidopa as well as the monitoring required for adverse events and long-term efficacy, approval requires carbidopa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of carbidopa is recommended in those who meet one of the following criteria:

FDA-Approved Indications

7. **Parkinson's Disease.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is currently receiving carbidopa/levodopa therapy; AND
 - B) The medication is prescribed by or in consultation with a neurologist.
8. **Postencephalitic Parkinsonism.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is currently receiving carbidopa/levodopa therapy; AND
 - B) The medication is prescribed by or in consultation with a neurologist.
9. **Symptomatic Parkinsonism.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is currently receiving carbidopa/levodopa therapy; AND
 - B) The medication is prescribed by or in consultation with a neurologist.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Duopa Prior Authorization Policy

- Duopa® (carbidopa and levodopa enteral suspension – AbbVie)

REVIEW DATE: 3/20/2024

OVERVIEW

Duopa, a combination enteral suspension of carbidopa and levodopa, is indicated for the treatment of motor fluctuations in patients with advanced **Parkinson's disease**.¹

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).² The review categorically divides treatment recommendations by Parkinson's disease characteristics. Duopa is noted to be efficacious and clinically useful for treatment of motor fluctuations, along with likely to be efficacious and clinically useful for dyskinesia.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Duopa. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Duopa as well as the monitoring required for adverse events and long-term efficacy, approval requires Duopa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Duopa is recommended in those who meet the following criteria:

FDA-Approved Indication

- 10. Parkinson's Disease.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A)** Patient is diagnosed with advanced Parkinson's disease; AND
 - B)** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
 - C)** Patient has tried an oral extended-release carbidopa/levodopa therapy and meets ONE of the following (i or ii):
 - i.** Patient had significant intolerance, according to the prescriber; OR
 - ii.** Patient had inadequate efficacy, according to the prescriber; AND
 - D)** Patient has previously tried THREE other treatments for "off" episodes; AND
Note: Examples of treatment for "off" episodes include entacapone, rasagiline, pramipexole, ropinirole, tolcapone, cabergoline, selegiline, Ongentys (opicapone capsules), or Xadago (safinamide tablets).
 - E)** The medication is prescribed by or in consultation with a neurologist.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Inbrija Prior Authorization Policy

- Inbrija® (levodopa inhalation powder – Acorda)

REVIEW DATE: 3/20/2024

OVERVIEW

Inbrija, an aromatic amino acid, is indicated for the intermittent treatment of “off” episodes in patients with **Parkinson's disease** treated with carbidopa-levodopa.¹

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).² The review categorically divides treatment recommendations by Parkinson's disease characteristics. Inbrija is not specifically addressed. However, the rapid-onset levodopa drug class is noted to have insufficient evidence and considered investigational for treatment of motor fluctuations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Inbrija. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Inbrija as well as the monitoring required for adverse events and long-term efficacy, approval requires Inbrija to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inbrija is recommended in those who meet the following criteria:

FDA-Approved Indication

- 11. Parkinson's Disease.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A)** Patient is currently taking carbidopa-levodopa; AND
 - B)** Patient is experiencing “off” episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
 - C)** Patient does not have asthma, chronic obstructive pulmonary disease, or other chronic underlying lung disease; AND
 - D)** Inbrija is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Inbrija is not recommended in the following situations:

09/20/2023

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Nourianz Prior Authorization Policy

- Nourianz® (istradefylline tablets – Kyowa Kirin)

REVIEW DATE: 03/20/2024

OVERVIEW

Nourianz, an adenosine receptor antagonist, is indicated as adjunctive treatment to carbidopa/levodopa in adults with **Parkinson's disease** experiencing "off" episodes.¹

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).² The review categorically divides treatment recommendations by Parkinson's disease characteristics. Nourianz is noted to be likely efficacious and possibly useful for treatment of motor fluctuations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nourianz. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nourianz as well as the monitoring required for adverse events and long-term efficacy, approval requires Nourianz to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nourianz is recommended in those who meet the following criteria:

FDA-Approved Indication

12. Parkinson's Disease. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- E) Patient is currently taking carbidopa/levodopa; AND
- F) Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- G) The medication is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nourianz is not recommended in the following situations:

125. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Nuplazid Prior Authorization Policy

- Nuplazid® (pimavanserin capsules and tablets – Acadia)

REVIEW DATE: 03/20/2024

OVERVIEW

Nuplazid, a selective serotonin 5-HT_{2A} inverse agonist, is indicated for the treatment of hallucinations and delusions associated with **Parkinson's disease psychosis**.¹

Safety

Nuplazid has a Boxed Warning regarding increased mortality in elderly patients with dementia-related psychosis.¹ Nuplazid is not approved for the treatment of patients with dementia-related psychosis unrelated to the hallucinations and delusions associated with Parkinson's disease psychosis.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nuplazid. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nuplazid as well as the monitoring required for adverse events and long-term efficacy, approval requires Nuplazid to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nuplazid is recommended in those who meet the following criteria:

FDA-Approved Indication

- 16. Parkinson's Disease Psychosis.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- M)** Patient has hallucinations and delusions associated with Parkinson's disease psychosis; AND
 - N)** Patient does not have dementia-related psychosis unrelated to the hallucinations and delusions associated with Parkinson's disease psychosis; AND
 - O)** The medication is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nuplazid is not recommended in the following situations:

- 126. Dementia-Related Psychosis.** Nuplazid prescribing information has a Boxed Warning regarding increased mortality in elderly patients with dementia-related psychosis.¹ Elderly patients with dementia-related psychosis treated with antipsychotic drugs are at an increased risk of death.
- 127.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Tolcapone Prior Authorization Policy

- Tasmar® (tolcapone tablets – Bausch Health, generic)

REVIEW DATE: 03/13/2024

OVERVIEW

Tolcapone, a catechol-O-methyltransferase (COMT) inhibitor, is indicated as an adjunct to levodopa and carbidopa for the treatment of signs and symptoms of idiopathic **Parkinson's disease**.¹

Safety

Tolcapone has a Boxed Warning regarding the risk of potentially fatal, acute fulminant liver failure and use should be reserved for patients who are experiencing symptom fluctuations and are not responding satisfactorily to or are not appropriate candidates for other adjunctive therapies.¹

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).² The review categorically divides treatment recommendations by Parkinson's disease characteristics. Tolcapone and entacapone, another COMT inhibitor, are noted to be efficacious and possibly useful for treatment of motor fluctuations.

The Academy of Family Physicians published recommendations for practice for the treatment of Parkinson's Disease (2020).³ The review recommends that tolcapone use should be limited due to the risks associated with fulminant hepatic failure.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of tolcapone. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with tolcapone as well as the monitoring required for adverse events and long-term efficacy, approval requires tolcapone to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of tolcapone is recommended in those who meet the following criteria:

FDA-Approved Indication

13. Parkinson's Disease. Approve for 1 year if the patient meets all of the following (A, B, and C):

- A) Patient is currently receiving carbidopa/levodopa therapy; AND
- B) Patient has tried an entacapone product or Ongentys (opicapone capsules) and meets ONE of the following (i or ii):
 - i. Patient had significant intolerance, according to the prescriber; OR
 - ii. Patient had inadequate efficacy, according to the prescriber; AND

03/13/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

C) The medication is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of tolcapone is not recommended in the following situations:

128. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Vyalev Prior Authorization Policy

- Vyalev™ (foscariidopa and foslevodopa subcutaneous injection – AbbVie)

REVIEW DATE: 10/30/2024

OVERVIEW

Vyalev, a combination continuous subcutaneous infusion of foscariidopa and foslevodopa, is indicated for the treatment of motor fluctuations in adults with advanced **Parkinson's disease**.¹

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).² The review categorically divides treatment recommendations by Parkinson's disease characteristics. Vyalev is not addressed in current guidelines.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vyalev. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Vyalev as well as the monitoring required for adverse events and long-term efficacy, approval requires Vyalev to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vyalev is recommended in those who meet the following criteria:

FDA-Approved Indication

14. Parkinson's Disease. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):

- A) Patient is diagnosed with advanced Parkinson's disease; AND
- B) Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- C) Patient has tried an oral carbidopa/levodopa therapy and meets ONE of the following (i or ii):
 - i. Patient had significant intolerance, according to the prescriber; OR
 - ii. Patient had inadequate efficacy, according to the prescriber; AND
- D) Patient has previously tried or currently receiving ONE other treatment for "off" episodes; AND
Note: Examples of treatment for "off" episodes include entacapone, rasagiline, pramipexole, ropinirole, tolcapone, cabergoline, selegiline, Ongentys (opicapone capsules), or Xadago (safinamide tablets).
- F) The medication is prescribed by or in consultation with a neurologist.

REVIEW DATE: 03/13/2024

OVERVIEW

Zelapar, an irreversible inhibitor of monoamine oxidase, is indicated in patients with **Parkinson's disease** as an adjunct to levodopa/carbidopa among patients who exhibit deterioration in the quality of their response to this therapy.¹

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).² The review categorically divides treatment recommendations by Parkinson's disease characteristics. Zelapar is noted to have insufficient evidence and be investigational for treatment of motor fluctuations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zelapar. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zelapar as well as the monitoring required for adverse events and long-term efficacy, approval requires Zelapar to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zelapar is recommended in those who meet the following criteria:

FDA-Approved Indication

- 15. Parkinson's Disease.** Approve for 1 year if the patient meets all of the following (A, B, C, and D):
- A)** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
 - B)** Patient is currently receiving carbidopa/levodopa therapy; AND
 - C)** Patient has tried one of oral selegiline tablets, selegiline capsules, or rasagiline tablets and meets ONE of the following (i or ii):
 - i.** Patient had significant intolerance, according to the prescriber; OR
 - ii.** Patient has difficulty swallowing tablets or capsules; AND
 - D)** Zelapar is being prescribed by or in consultation with a neurologist.

03/13/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zelapar is not recommended in the following situations:

- 130.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease –Apomorphine Subcutaneous Prior Authorization Policy

- Apokyn® (apomorphine hydrochloride subcutaneous injection – US WorldMeds, generic)

REVIEW DATE: 03/13/2024

OVERVIEW

Apomorphine, a non-ergoline dopamine agonist, is indicated for the acute, intermittent treatment of hypomobility, “off” episodes (“end-of-dose wearing off” and unpredictable “on/off” episodes) associated with advanced **Parkinson's disease**.¹

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018).² The review categorically divides treatment recommendations by Parkinson's disease characteristics. Apomorphine subcutaneous is noted to be efficacious and clinically useful in treatment for motor fluctuations, particularly for OFF periods that require rapid reversal.

The Academy of Family Physicians published recommendations for practice for the treatment of Parkinson's Disease (2020).³ The review recommends apomorphine subcutaneous and immediate release carbidopa/levodopa as treatment options for patients experiencing freezing episodes. Apomorphine subcutaneous will quickly resolve the freezing; however, it is poorly tolerated due to severe nausea, vomiting and orthostasis.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of apomorphine subcutaneous. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with apomorphine subcutaneous as well as the monitoring required for adverse events and long-term efficacy, approval requires apomorphine subcutaneous to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of apomorphine subcutaneous is recommended in those who meet the following criteria:

FDA-Approved Indication

P) Parkinson's Disease. Approve for 1 year if the patient meets the following (A, B, C, and D):

- i. Patient is experiencing “off” episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- ii. Patient is currently receiving carbidopa/levodopa therapy; AND
- iii. Patient has previously tried one other treatment for “off” episodes and meets ONE of the following (i or ii):

03/13/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- a) Patient had significant intolerance, according to the prescriber; OR
- b) Patient had inadequate efficacy, according to the prescriber; AND

Note: Examples of treatments for “off” episodes include entacapone, rasagiline, pramipexole, ropinirole, tolcapone, cabergoline, selegiline, Ongentys (opicapone capsules), or Xadago (safinamide tablets).

- iv. The medication is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of apomorphine subcutaneous is not recommended in the following situations:

131. Concurrent Use with a Serotonin 5-HT₃ Antagonist. Administration of apomorphine subcutaneous in conjunction with a serotonin 5-HT₃ antagonist (e.g., ondansetron, granisetron, dolasetron, palonosetron, alosetron) can result in extreme lowering of blood pressure and loss of consciousness, and is considered an absolute contraindication.¹

132. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Phenylketonuria – Palynziq Prior Authorization Policy

- Palynziq® (pegvaliase-pqpz subcutaneous injection – BioMarin)

REVIEW DATE: 08/28/2024

OVERVIEW

Palynziq, a phenylalanine-metabolizing enzyme, is indicated to reduce blood phenylalanine concentrations in adult patients with **phenylketonuria (PKU)** who have uncontrolled blood phenylalanine concentrations greater than 600 micromol/L on existing management.¹

Treatment with Palynziq should be managed by a healthcare provider experienced in the management of PKU. Baseline blood phenylalanine concentrations should be obtained before initiating treatment. Because of the risk of anaphylaxis, Palynziq is available only through a restricted Risk Evaluation and Mitigation Strategy (REMS) program.

Dose Titration

The recommended initial induction dosage for Palynziq is 2.5 mg subcutaneously (SC) for 4 weeks.¹ This dose is then titrated over a period of at least 5 weeks to a maintenance dose of 20 mg SC once daily (QD). The maintenance dose should be individualized to achieve blood phenylalanine control (blood phenylalanine concentration $\leq$ 600 micromol/L). Maintain the Palynziq 20 mg QD dose for at least 24 weeks. Consider increasing the Palynziq dose to 40 mg QD in a patient who has been on 20 mg QD for at least 24 weeks without achieving blood phenylalanine control. Consider increasing the Palynziq dose to a maximum of 60 mg QD in a patient who has been on 40 mg QD for at least 16 weeks without achieving blood phenylalanine control. Discontinue Palynziq in a patient who has not achieved an adequate response after continuous treatment with the maximum dose of 60 mg QD for 16 weeks. A dose titration schedule is outlined in Table 1. Therapeutic response may not be achieved until the patient is titrated to an effective maintenance dose.

Table 1. Palynziq Dose Titration.¹

* Additional time may be required prior to each dosage escalation based on patient tolerability; QD – Once daily.

It was unclear from the Palynziq clinical trials if all patients had tried and were non-responders to sapropterin.

Guidelines

Recommendations regarding use of Palynziq are not made in guidelines from the American College of Medical Genetics and Genomics (ACMG) [2014] or European guidelines (2017).^{2,3} However, a consensus statement regarding use of Palynziq in adults with PKU was published in 2019.⁴ Palynziq should be considered for all adults with PKU who have the ability to give informed consent and adhere to treatment. It is noted that some patients may show a response early on, whereas other may take 1 year or more from initiation of treatment before a reduction in blood phenylalanine concentration is observed. The definition of a “clinically meaningful” efficacy benefit should be determined by the treating clinician based on individual patient goals. Primarily, the efficacy benefit should be determined by a significant reduction in blood phenylalanine concentration from baseline.

08/28/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Although ACMG and European guidelines do not offer recommendations specific to Palynziq, they do provide general principles for PKU management. ACMG guidelines suggest a target blood phenylalanine level of 120 to 360 micromol/L for all patients.² However, European guidelines state that patients ≥ 12 years of age with blood phenylalanine concentration < 600 micromol/L do not require treatment, and the target range for patients ≥ 12 years of age receiving treatment is 120 to 600 micromol/L.³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Palynziq. Because of the specialized skills required for evaluation and diagnosis of patients treated with Palynziq as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Palynziq to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Palynziq is recommended in those who meet the following criteria:

FDA-Approved Indication

1. Phenylketonuria. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):

- i.** Patient is ≥ 18 years of age; AND
- ii.** Patient has uncontrolled blood phenylalanine concentrations greater than 600 micromol/L on at least one existing treatment modality; AND
Note: Examples of treatment modalities include restriction of dietary phenylalanine and protein intake and prior treatment with sapropterin (Kuvan, generic).
- iii.** The medication is prescribed by or in consultation with a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).

B) Patient is Currently Receiving Palynziq. Approve for 1 year if the patient meets BOTH of the following (i and ii):

Note: A patient who has received < 1 year of therapy or who is restarting therapy with Palynziq should be considered under Initial Therapy criteria.

- i.** Patient is ≥ 18 years of age; AND
- ii.** Patient meets ONE of the following (a or b):
 - a)** Patient meets BOTH of the following (1 and 2):
 - (1)** Patient is continuing to titrate Palynziq to an effective maintenance dose, per the prescriber; AND
 - (2)** If the patient is receiving a dose of Palynziq 60 mg once daily, the treatment duration at this dose has not exceeded 16 weeks; OR
 - b)** Patient meets BOTH of the following (1 and 2):
 - (1)** Patient meets ONE of the following (a or b):
 - (a)** Patient's blood phenylalanine concentration is ≤ 600 micromol/L; OR
 - (b)** Patient has achieved a $\geq 20\%$ reduction in blood phenylalanine concentration from pre-treatment baseline (i.e., blood phenylalanine concentration before starting Palynziq therapy); AND
 - (2)** Patient is not receiving concomitant therapy with sapropterin (Kuvan, generic).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Palynziq is not recommended in the following situations:

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Phenylketonuria – Sapropterin Prior Authorization Policy
- Kuvan™ (sapropterin dihydrochloride tablets and powder for oral solution – BioMarin, generic)
 - Javygtor™ (sapropterin dihydrochloride tablets and powder for oral solution – Dr. Reddy's Laboratories)

REVIEW DATE: 08/28/2024

OVERVIEW

Sapropterin (Kuvan, Javygtor, generic), a synthetic form of the cofactor for the enzyme phenylalanine hydroxylase, is indicated to reduce blood phenylalanine levels in patients one month of age and older with hyperphenylalaninemia due to tetrahydrobiopterin-responsive **phenylketonuria (PKU)**.¹

The medication should be used with a phenylalanine-restricted diet. Of note, some patients do not show a biochemical response to sapropterin. Per the prescribing information, biochemical response cannot generally be predetermined by laboratory testing and should be determined through a therapeutic trial (evaluation) of sapropterin response.

Dose Titration

The initial starting dose of sapropterin is either 10 mg/kg per day or 20 mg/kg per day. If a 10 mg/kg per day starting dose is used, the dose should be increased to 20 mg/kg if the patient's blood phenylalanine does not decrease after 1 month of treatment. If blood phenylalanine does not decrease after 1 month of treatment on 20 mg/kg per day, sapropterin should be discontinued.

Guidelines

According to the European guidelines for PKU (2017), there is consensus in the literature that patients with blood phenylalanine concentration > 600 micromol/L should be treated.⁸ There is also consensus that patients with blood phenylalanine concentration < 360 micromol/L can remain untreated, but should be monitored. Patients with blood phenylalanine concentration between 360 to 600 micromol/L should be treated until 12 years of age. Treatment for life is recommended for any patient with PKU; however, it is also noted that patients ≥ 12 years of age with blood phenylalanine concentration < 600 micromol/L do not require treatment. All adults with PKU should have lifelong systematic follow-ups in specialized metabolic centers, due to specific risks which may occur during adulthood. With regards to target phenylalanine levels, in treated PKU patients up to 12 years of age, the target levels should be 120 to 360 micromol/L; in treated PKU patients ≥ 12 years of age, the target levels should be 120 to 600 micromol/L.

The American College of Medical Genetics and Genomics (ACMG) published practice guidelines (2014) for the diagnosis and management of phenylalanine hydroxylase (PAH) deficiency.⁹ The guidelines recommend initiating treatment as early as possible, preferably within the first week of life with a goal of having blood phenylalanine levels in the treatment range within the first 2 weeks. Dietary restriction of phenylalanine intake is the mainstay of therapy for PKU. Blood phenylalanine levels in all patients should be maintained in the range of 120 to 360 micromol/L. The guidelines state that approximately 25% to 50% of patients with PAH deficiency are responsive to sapropterin. A significant decline in blood phenylalanine level is expected in responders once treatment is initiated (with phenylalanine-restricted diet); however, patients in the lower end of the treatment range (≤ 180 micromol/L) rarely show a decrease in blood phenylalanine level even if they are responsive to sapropterin. In these patients, responsiveness is

08/28/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

determined by adding phenylalanine to the diet in a stepwise method. An improvement in neuropsychiatric symptoms or increase in phenylalanine tolerance without a decrease in blood phenylalanine levels is sufficient reasoning to continue therapy. According to the guidelines, there is strong evidence to support life-long treatment and maintenance of metabolic control in patients with PAH deficiency.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of sapropterin (Kuvan, Javygtor, generic). Because of the specialized skills required for evaluation and diagnosis of patients treated with sapropterin as well as the monitoring required for adverse events and long-term efficacy, initial approval requires sapropterin to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of sapropterin (Kuvan, Javygtor, generic) is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Phenylketonuria.** Approve for the duration noted if the patient ONE of meets the following (A or B):
 - A) **Initial Therapy.** Approve for 12 weeks if the patient meets BOTH of the following (i and ii):
 - i. Sapropterin is prescribed in conjunction with a phenylalanine-restricted diet; AND
 - ii. The medication is prescribed by or in consultation with a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).
 - B) **Patients is Currently Receiving Sapropterin (Kuvan, Javygtor, generic).** Approve for 1 year if the patient meets BOTH of the following (i and ii):

Note: A patient who has received < 12 weeks of therapy or who is restarting therapy with sapropterin should be considered under Initial Therapy.

 - i. Patient meets ONE of the following (a, b, or c):
 - a) Patient has had a clinical response (e.g., cognitive and/or behavioral improvements) as determined by the prescriber; OR
 - b) Patient has achieved a $\geq 20\%$ reduction in blood phenylalanine concentration from pre-treatment baseline (i.e., blood phenylalanine concentration before starting sapropterin therapy); OR
 - c) Treatment with sapropterin has resulted in an increase in dietary phenylalanine tolerance, according to the prescriber; AND
 - ii. Patient is not receiving concomitant Palynziq (pegvaliase-pqpz subcutaneous injection) at a stable maintenance dose.

Note: Concomitant use with Palynziq is permitted during Palynziq dose titration.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of sapropterin (Kuvan, Javygtor, generic) is not recommended in the following situations:

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pheochromocytoma – Metirosine and Phenoxybenzamine (Oral) Prior Authorization Policy

- Demser® (metirosine capsules – Bausch Health, generic)
- Dibenzylamine® (phenoxybenzamine capsules – Concordia, generic)

REVIEW DATE: 09/25/2024

OVERVIEW

Metyrosine, a tyrosine hydroxylase inhibitor, is indicated for the treatment of patients with **pheochromocytoma** for the following uses:¹

- Preoperative preparation of patients for surgery.
- Management of patients when surgery is contraindicated.
- Chronic treatment of patients with malignant pheochromocytoma.

Phenoxybenzamine, a long-acting, adrenergic, alpha-receptor blocking agent, is indicated for the treatment of **pheochromocytoma** to control episodes of hypertension and sweating. If tachycardia is excessive, it may be necessary to use a beta-blocking agent concomitantly.²

Guidelines

A clinical practice guideline was published in 2014 from the Endocrine Society regarding pheochromocytoma and paraganglioma.³ The guidelines recommend a preoperative alpha₁-adrenergic receptor blocker as the first choice to control blood pressure and prevent a hypertensive crisis. Both selective and non-selective alpha-blockers have been used (e.g., phenoxybenzamine, doxazosin, prazosin, and terazosin). Calcium channel blockers are the most often used add-on drug class to further improve blood pressure control in patients already treated with alpha-adrenergic receptor blockers. Preoperative co-administration of a beta-adrenergic receptor blocker (e.g., atenolol, metoprolol, and propranolol) is utilized to control tachycardia after administration of an alpha-adrenergic receptor blocker. Metyrosine may be used in combination with an alpha-adrenergic receptor blocker for a short period before surgery to further stabilize blood pressure to reduce blood loss and volume depletion during surgery.

The National Comprehensive Cancer Network guidelines for neuroendocrine and adrenal tumors (version 2.2024 – August 01, 2024) address pheochromocytoma and paragangliomas.⁴ Alpha blockade (e.g., terazosin, doxazosin, and prazosin) is recommended first-line for all hormone-secreting pheochromocytomas and paragangliomas. After alpha blockade, if additional blood pressure support is required, the additional of dihydropyridine calcium channel blockers can be considered. Metyrosine can be used in addition to alpha blockade to stabilize blood pressure.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of metirosine and phenoxybenzamine. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with metirosine and phenoxybenzamine as well as the monitoring required for adverse events and long-term efficacy, approval requires metirosine and phenoxybenzamine to be prescribed by or in consultation with a physician who specializes in the condition being treated.

09/25/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Automation: None.

Documentation: Documentation will be required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, and prescription receipts.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of phenoxybenzamine is recommended in those who meet the following criteria:

FDA-Approved Indication

- 1. Pheochromocytoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A)** If brand Dibenzyline is requested, patient meets BOTH of the following (i and ii):
 - i.** Patient has tried generic phenoxybenzamine; AND
 - ii.** Patient cannot continue to use generic phenoxybenzamine due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product which, according to the prescriber, would result in a significant allergy or a serious adverse reaction **[documentation required]**; AND
 - B)** The medication is prescribed by or in consultation with an endocrinologist or a physician who specializes in the management of pheochromocytoma.

II. Coverage of metyrosine is recommended in those who meet the following criteria:

FDA-Approved Indication

- 1. Pheochromocytoma.** Approve for the duration noted if the patient meets ONE of the following (A or B):
 - A) Initial Therapy.** Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):
 - i.** Patient has tried a selective alpha blocker (e.g., doxazosin, terazosin, or prazosin); AND
 - ii.** Patient has tried phenoxybenzamine (brand or generic); AND
 - iii.** The medication is prescribed by, or in consultation with, an endocrinologist or a physician who specializes in the management of pheochromocytoma.
 - B) Patient is Currently Receiving Metyrosine.** Approve for 1 year if prescribed by or in consultation with an endocrinologist or a physician who specializes in the management of pheochromocytoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of metyrosine and phenoxybenzamine is not recommended in the following situations:

- 133.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pompe Disease – Enzyme Replacement Therapy – Lumizyme Prior Authorization Policy

- Lumizyme® (alglucosidase intravenous infusion – Genzyme)

REVIEW DATE: 05/08/2024

OVERVIEW

Lumizyme, a human hydrolytic lysosomal glycogen-specific enzyme (acid α -glucosidase), is indicated for patients with **Pompe disease** (acid α -glucosidase deficiency).¹ It is produced in a Chinese hamster ovary cell line via recombinant DNA technology. After administration of Lumizyme, it is internalized into cells and transported to lysosomes where it catalyzes the breakdown of glycogen to glucose.

Disease Overview

Pompe disease (glycogen storage disease type II, or acid maltase deficiency), is a rare lysosomal storage disorder characterized by a deficiency in acid α -glucosidase activity leading to the accumulation of glycogen, particularly in muscle.^{2,3} The onset, progression, and severity of Pompe disease is variable. Infantile-onset Pompe disease usually manifests in the first few months of life and death often occurs in the first year of life, if left untreated.² Clinical manifestations of infantile-onset Pompe disease includes hypotonia, difficulty feeding, and cardiopulmonary failure.⁴ Late-onset Pompe disease has a more variable clinical course, can manifest any time after 12 months of age, and patients typically present with progressive muscle weakness which can progress to respiratory insufficiency.^{3,4} The diagnosis of Pompe disease is established by demonstrating decreased acid α -glucosidase activity in blood, fibroblasts, or muscle tissue; or by genetic testing.^{3,4} Definitive treatment of Pompe disease consists of enzyme replacement therapy with Lumizyme.²⁻⁴

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lumizyme. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Lumizyme as well as the monitoring required for adverse events and long-term efficacy, approval requires Lumizyme to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lumizyme is recommended in those who meet the following criteria:

FDA-Approved Indication

16. Acid Alpha-Glucosidase Deficiency (Pompe Disease). Approve for 1 year if the patient meets BOTH of the following (A and B):

A) The diagnosis is established by ONE of the following (i or ii):

- i.** Patient has a laboratory test demonstrating deficient acid alpha-glucosidase activity in blood, fibroblasts, or muscle tissue; OR
- ii.** Patient has a molecular genetic test demonstrating biallelic pathogenic or likely pathogenic acid alpha-glucosidase (GAA) gene variants; AND

B) Lumizyme is prescribed by or in consultation with a geneticist, neurologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lumizyme is not recommended in the following situations:

134. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pompe Disease – Enzyme Replacement Therapy – Nexviazyme Prior Authorization Policy

- Nexviazyme® (avalglucosidase alfa-ngpt intravenous infusion – Genzyme)

REVIEW DATE: 05/08/2024

OVERVIEW

Nexviazyme, a hydrolytic lysosomal glycogen-specific recombinant human α -glucosidase enzyme, is indicated for **late-onset Pompe disease** (lysosomal acid α -glucosidase deficiency) in patients ≥ 1 year of age.¹

Disease Overview

Pompe disease (glycogen storage disease type II, or acid maltase deficiency), is a rare lysosomal storage disorder characterized by a deficiency in acid α -glucosidase activity leading to the accumulation of glycogen, particularly in muscle.^{2,3} The onset, progression, and severity of Pompe disease is variable. Infantile-onset Pompe disease usually manifests in the first few months of life and death often occurs in the first year of life, if left untreated.² Clinical manifestations of infantile-onset Pompe disease includes hypotonia, difficulty feeding, and cardiopulmonary failure.⁴ Late-onset Pompe disease has a more variable clinical course and can manifest any time after 12 months of age.^{3,4} Patients typically present with progressive muscle weakness which can progress to respiratory insufficiency. The diagnosis of Pompe disease is established by demonstrating decreased acid α -glucosidase activity in blood, fibroblasts, or muscle tissue; or by genetic testing.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nexviazyme. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nexviazyme as well as the monitoring required for adverse events and long-term efficacy, approval requires Nexviazyme to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nexviazyme is recommended in those who meet the following criteria:

FDA-Approved Indication

- 17. Acid Alpha-Glucosidase Deficiency (Pompe Disease).** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A)** Patient is ≥ 1 year of age; AND
 - B)** Patient has late-onset acid alpha-glucosidase deficiency (late-onset Pompe disease); AND
 - C)** The diagnosis is established by ONE of the following (i or ii):
 - i.** Patient has a laboratory test demonstrating deficient acid alpha-glucosidase activity in blood, fibroblasts, or muscle tissue; OR

05/08/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- ii. Patient has a molecular genetic test demonstrating biallelic pathogenic or likely pathogenic acid alpha-glucosidase (GAA) gene variants; AND
- D) The medication is prescribed by or in consultation with a geneticist, neurologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nexviazyme is not recommended in the following situations:

135. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pompe Disease – Enzyme Replacement Therapy – Pombiliti Prior Authorization Policy

- Pombiliti® (cipaglucosidase alfa-atga intravenous infusion – Amicus)

REVIEW DATE: 05/08/2024

OVERVIEW

Pombiliti, a hydrolytic lysosomal glycogen-specific recombinant human α -glucosidase enzyme, is indicated in combination with Opfolda® (miglustat capsules), an enzyme stabilizer, for **late-onset Pompe disease** (lysosomal acid α -glucosidase deficiency) in adults weighing ≥ 40 kg who are not improving on their current enzyme replacement therapy.¹

Disease Overview

Pompe disease (glycogen storage disease type II, or acid maltase deficiency), is a rare lysosomal storage disorder characterized by a deficiency in acid α -glucosidase activity leading to the accumulation of glycogen, particularly in muscle.^{2,3} The onset, progression, and severity of Pompe disease is variable. Infantile-onset Pompe disease usually manifests in the first few months of life and death often occurs in the first year of life, if left untreated.² Clinical manifestations of infantile-onset Pompe disease includes hypotonia, difficulty feeding, and cardiopulmonary failure.⁴ Late-onset Pompe disease has a more variable clinical course and can manifest any time after 12 months of age.^{3,4} Patients typically present with progressive muscle weakness which can progress to respiratory insufficiency. The diagnosis of Pompe disease is established by demonstrating decreased acid α -glucosidase activity in blood, fibroblasts, or muscle tissue; or by genetic testing.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Pombiliti. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Pombiliti as well as the monitoring required for adverse events and long-term efficacy, approval requires Pombiliti to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Pombiliti is recommended in those who meet the following criteria:

FDA-Approved Indication

- 18. Acid Alpha-Glucosidase Deficiency (Pompe Disease).** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):
- A) Patient is ≥ 18 year of age; AND
 - B) Patient weighs ≥ 40 kg; AND
 - C) The medication will be used in combination with Opfolda (miglustat capsules); AND
 - D) Patient has not demonstrated an improvement in objective measures after receiving ONE of the following for at least one year (i or ii):

05/08/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Note: Examples of objective measures include forced vital capacity (FVC) and six-minute walk test (6MWT).

- i. Lumizyme (alglucosidase alfa intravenous infusion); OR
 - ii. Nexvazyme (avalglucosidase alfa-ngpt intravenous infusion); AND
- E) Patient has late-onset acid alpha-glucosidase deficiency (late-onset Pompe disease) with diagnosis established by ONE of the following (i or ii):
 - i. Patient has a laboratory test demonstrating deficient acid alpha-glucosidase activity in blood, fibroblasts, or muscle tissue; OR
 - ii. Patient has a molecular genetic test demonstrating biallelic pathogenic or likely pathogenic acid alpha-glucosidase (GAA) gene variants; AND
- F) The medication is prescribed by or in consultation with a geneticist, neurologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Pombiliti is not recommended in the following situations:

- 136.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pompe Disease – Enzyme Stabilization Therapy – Opfolda Prior Authorization Policy

- Opfolda® (miglustat capsules – Amicus)

REVIEW DATE: 05/08/2024

OVERVIEW

Opfolda, an enzyme stabilizer, is indicated in combination with Pombiliti® (cipaglucosidase alfa intravenous infusion), a hydrolytic lysosomal glycogen-specific recombinant human α -glucosidase enzyme, for **late-onset Pompe disease** (lysosomal acid α -glucosidase deficiency) in adults weighing ≥ 40 kg and who are not improving on their current enzyme replacement therapy.¹ Opfolda binds with, stabilizes, and reduces inactivation of Pombiliti after infusion. Bound Opfolda dissociates from Pombiliti after it is internalized and transported into lysosomes. Opfolda as monotherapy has no pharmacological activity in Pompe disease.

Disease Overview

Pompe disease (glycogen storage disease type II, or acid maltase deficiency), is a rare lysosomal storage disorder characterized by a deficiency in acid α -glucosidase activity leading to the accumulation of glycogen, particularly in muscle.^{2,3} The onset, progression, and severity of Pompe disease is variable. Infantile-onset Pompe disease usually manifests in the first few months of life and death often occurs in the first year of life, if left untreated.² Clinical manifestations of infantile-onset Pompe disease includes hypotonia, difficulty feeding, and cardiopulmonary failure.⁴ Late-onset Pompe disease has a more variable clinical course and can manifest any time after 12 months of age.^{3,4} Patients typically present with progressive muscle weakness which can progress to respiratory insufficiency. The diagnosis of Pompe disease is established by demonstrating decreased acid α -glucosidase activity in blood, fibroblasts, or muscle tissue, or by genetic testing.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Opfolda. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Opfolda as well as the monitoring required for adverse events and long-term efficacy, approval requires Opfolda to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Opfolda is recommended in those who meet the following criteria:

FDA-Approved Indication

19. Acid Alpha-Glucosidase Deficiency (Pompe Disease). Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):

- A) Patient is ≥ 18 year of age; AND
- B) Patient weighs ≥ 40 kg; AND

05/08/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- C) The medication will be used in combination with Pombiliti; AND
- D) Patient has not demonstrated an improvement in objective measures after receiving ONE of the following for at least one year (i or ii):
Note: Examples of objective measures include forced vital capacity (FVC) and six-minute walk test (6MWT)
 - i. Lumizyme (alglucosidase alfa) intravenous infusion; OR
 - ii. Nexvzyme (avalglucosidase alfa-ngpt) intravenous infusion; AND
- E) Patient has late-onset acid alpha-glucosidase deficiency (late-onset Pompe disease) with diagnosis established by ONE of the following (i or ii):
 - i. Patient has a laboratory test demonstrating deficient acid alpha-glucosidase activity in blood, fibroblasts, or muscle tissue; OR
 - ii. Patient has a molecular genetic test demonstrating biallelic pathogenic or likely pathogenic acid alpha-glucosidase (GAA) gene variants; AND
- F) The medication is prescribed by or in consultation with a geneticist, neurologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Opfolda is not recommended in the following situations:

- 137. **Gaucher Disease.** An alternate dosage of miglustat is available for the treatment of Gaucher disease.⁵
- 138. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Proprotein Convertase Subtilisin Kexin Type 9 Inhibitors – Praluent Prior Authorization Policy

- Praluent® (alirocumab subcutaneous injection – Regeneron)

REVIEW DATE: 05/08/2024

OVERVIEW

Praluent, a proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitor antibody, is indicated for the following uses:¹

- **Established cardiovascular (CV) disease**, in adults to reduce the risk of myocardial infarction (MI), stroke, and unstable angina requiring hospitalization.
- **Primary hyperlipidemia** (including **heterozygous familial hypercholesterolemia [HeFH]**), in adults as an adjunct to diet, alone or in combination with other lipid-lowering therapies (e.g., statins, ezetimibe) to reduce low-density lipoprotein cholesterol (LDL-C).
- **Heterozygous familial hypercholesterolemia (HeFH)**, in pediatric patients ≥ 8 years of age, as an adjunct to diet and other LDL-C lowering therapies, to reduce LDL-C.
- **Homozygous familial hypercholesterolemia (HoFH)**, in adults as an adjunct to other LDL-C lowering therapies, to reduce LDL-C.

Repatha® (evolocumab subcutaneous injection) is another PCSK9 inhibitor.² Leqvio® (inclisiran subcutaneous injection), a small interfering ribonucleic acid (RNA) directed to PCSK9 messenger RNA, is a similar product.³

Guidelines

Many guidelines are available regarding the treatment of patients with dyslipidemia.⁴⁻¹¹ For patients with elevated LDL-C, statins are the cornerstone of therapy and recommended first-line to be used at maximally tolerated doses due to the established benefits regarding the reduction of CV risks. Atorvastatin 40 mg to 80 mg once daily (QD) and rosuvastatin 20 mg to 40 mg QD are considered high-intensity statins as they achieve LDL-C lowering of $\geq 50\%$. Ezetimibe is usually the next therapy added.

- The **American College of Cardiology (ACC) Expert Consensus Decision Pathway on the Role of Non-Statin Therapies** for LDL-Cholesterol Lowering in the Management of Atherosclerotic Cardiovascular Disease (ASCVD) Risk (2022) make several recommendations regarding PCSK9 inhibitors.⁴ For adults with clinical ASCVD at very high risk (e.g., patients with major ASCVD events, HeFH, diabetes) who are on statin therapy for secondary prevention, the general goal is $\geq 50\%$ LDL-C reduction and an LDL-C < 55 mg/dL (or non-high-density lipoprotein cholesterol [HDL-C] < 85 mg/dL) with maximally tolerated statin therapy. If the above goals are not achieved, the initial non-statin agents recommended include ezetimibe and/or a PCSK9 monoclonal antibody (i.e., Repatha or Praluent). For adults without clinical ASCVD or diabetes or LDL-C ≥ 190 mg/dL who have undergone subclinical atherosclerosis imaging, if the coronary artery calcium score is $\geq 1,000$ Agatston units, PCSK9 monoclonal antibodies (i.e., Repatha or Praluent) may be non-statin agents to consider following high-intensity statin therapy and ezetimibe to achieve the goal of a $\geq 50\%$ LDL-C reduction (and LDL-C threshold < 70 mg/dL).
- The **American Heart Association (AHA)/ACC guidelines on the management of blood cholesterol** (updated 2018) defines patients with ASCVD as those with an acute coronary syndrome, those with a history of MI, stable or unstable angina or coronary or other revascularizations, stroke, transient ischemic attack, or peripheral arterial disease.^{5,6} Although

05/08/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

LDL-C thresholds are not always recognized, in general, an LDL-C < 70 mg/dL is recommended for most patients with ASCVD to reduce CV risk. Use of a PCSK9 as an adjunct is justified if this goal is not met with maximally tolerated statins.^{5,6} Additionally, reviews have recognized that patients with an elevated coronary artery calcium or calcification score (e.g., ≥ 300 Agatston units) are at an increased risk of CV events.¹²⁻¹⁵

- The **American Diabetes Association Standards of Care for Diabetes** discuss CV disease and risk management (2024).⁸ For patients with diabetes who are 40 to 75 years of age at higher CV risk (including those with one or more ASCVD risk factors), it is recommended to use high-intensity statin therapy to reduce LDL-C by $\geq 50\%$ of baseline and to target an LDL-C of < 70 mg/dL. Also, for patients with diabetes who are 40 to 75 years of age at higher CV risk, especially those with multiple ASCVD risk factors and an LDL-C ≥ 70 mg/dL, it may be reasonable to add ezetimibe or a PCSK9 inhibitor to a maximum tolerated statin.
- Guidelines for **Chronic Coronary Disease from the AHA and ACC** (along with other organizations) [2023] state in such patients who are judged to be at very high risk and on maximally tolerated statin therapy and with an LDL-C ≥ 70 mg/dL, ezetimibe can be beneficial to further reduce the risk of a major adverse coronary event.⁹ Patients with chronic coronary disease who are considered to be at very high risk who have an LDL-C ≥ 70 mg/dL who are receiving maximally tolerated statins and ezetimibe, a PCSK9 monoclonal antibody can be beneficial to further reduce the risk of a major adverse coronary event.
- The **European Atherosclerosis Society Consensus Statement on HoFH** (2023) states that HoFH should be suspected if untreated LDL-C levels are > 400 mg/dL.⁷ Other suggestions of HoFH involve cutaneous or tendon xanthomas before 10 years of age and/or untreated elevated LDL-C levels consistent with HeFH in both parents. Of note, in the digenic form, one parent may have normal LDL-C levels and the other may have LDL-C levels consistent with HoFH. Lipid-lowering therapy should be initiated with high-intensity statin therapy and ezetimibe. A PCSK9 inhibitor can be added as well. If the patient does not achieve LDL-C goals, other agents can be added (e.g., Juxtapid® [lomitapide capsules], Evkeeza® [evinacumab-dgnb intravenous infusion]). Lipoprotein apheresis may also be considered. The goal is to reduce LDL-C to < 115 mg/dL in children and adolescents, < 70 mg/dL in adults if no major ASCVD risk factors are present, and < 55 mg/dL if patients have ASCVD or major ASCVD risk factors.
- A **Scientific Statement from the AHA on Familial Hypercholesterolemia** (2015),¹⁰ as well as other information,¹¹ provide additional guidance on diagnosing familial hypercholesterolemia (e.g., HoFH, HeFH). For HeFH, Dutch Lipid Network criteria scoring is used, as well as the Simon Broome criteria.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Praluent. All approvals are provided for the duration noted below. A patient who has previously met initial therapy criteria for Praluent for the requested indication under the Coverage Review Department and is currently receiving the requested therapy is only required to meet continuation of therapy criteria (i.e., currently receiving therapy). If past criteria have not been met under the Coverage Review Department and the patient is currently receiving Praluent, or is restarting Praluent, initial criteria must be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Praluent is recommended in those who meet the following criteria:

FDA-Approved Indications

17. Established Cardiovascular Disease.* Approve for 1 year if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve if the patient meets ALL of the following (i, ii, and iii):

- i.** Patient is ≥ 18 years of age; AND
- ii.** Patient has had ONE of the following conditions or diagnoses (a, b, c, d, e, or f):
 - a)** A previous myocardial infarction or a history of an acute coronary syndrome; OR
 - b)** Angina (stable or unstable); OR
 - c)** A past history of stroke or transient ischemic attack; OR
 - d)** Coronary artery disease; OR
 - e)** Peripheral arterial disease; OR
 - f)** Patient has undergone a coronary or other arterial revascularization procedure in the past; AND

Note: Examples include coronary artery bypass graft surgery, percutaneous coronary intervention, angioplasty, and coronary stent procedures.

iii. Patient meets ONE of the following (a or b):

- a)** Patient meets BOTH of the following [(1) and (2)]:
 - (1)** Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND
 - (2)** Low-density lipoprotein cholesterol level after this treatment remains ≥ 55 mg/dL; OR
- b)** Patient has been determined to be statin intolerant by meeting ONE of the following [(1) or (2)]:

(1) Patient experienced statin-related rhabdomyolysis; OR

Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).

(2) Patient meets ALL of the following [(a), (b), and (c)]:

(a) Patient experienced skeletal-related muscle symptoms; AND

Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND

(c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); OR

Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

B) Patient Currently Receiving Praluent. Approve if according to the prescriber, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received

approval of Praluent for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Praluent, Initial Therapy criteria must be met.

18. Heterozygous Familial Hypercholesterolemia (HeFH).* Approve for 1 year if the patient meets ONE the following (A or B):

A) Initial Therapy. Approve if the patient meets ALL of the following (i, ii, and iii):

i. Patient is ≥ 8 years of age; AND

ii. Patient meets ONE of the following (a, b, or c):

a) Patient has an untreated low-density lipoprotein cholesterol (LDL-C) level ≥ 190 mg/dL (prior to treatment with antihyperlipidemic agents); OR

b) Patient has phenotypic confirmation of heterozygous familial hypercholesterolemia; OR

Note: Examples include pathogenic variants at the low-density lipoprotein receptor (LDLR), apolipoprotein B (apo B), proprotein convertase subtilisin kexin type 9 (PCSK9) or low-density lipoprotein receptor adaptor protein (LDLRAP1) gene.

c) Patient has been diagnosed with heterozygous familial hypercholesterolemia meeting one of the following diagnostic criteria thresholds [(1) or (2)]:

(1) Prescriber confirms that the Dutch Lipid Network criteria score was > 5 ; OR

(2) Prescriber confirms that Simon Broome criteria met the threshold for “definite” or “possible (or probable)” familial hypercholesterolemia; AND

iii. Patient meets ONE of the following (a or b):

a) Patient meets BOTH of the following [(1) and (2)]:

(1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

(2) Low-density lipoprotein cholesterol level after this treatment remains ≥ 70 mg/dL; OR

b) Patient has been determined to be statin intolerant by meeting ONE of the following [(1) or (2)]:

(1) Patient experienced statin-related rhabdomyolysis; OR

Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [$a \geq 0.5$ mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).

(2) Patient meets ALL of the following [(a), (b), and (c)]:

(a) Patient experienced skeletal-related muscle symptoms; AND

Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND

(c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products), the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); OR

Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

B) Patient Currently Receiving Praluent. Approve if according to the prescriber, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels.

Also, if the patient is currently receiving the requested therapy but has not previously received approval of Praluent for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Praluent, Initial Therapy criteria must be met.

19. Homozygous Familial Hypercholesterolemia (HoFH).* Approve for 1 year if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve if the patient meets ALL of the following (i, ii, and iii):

i. Patient is ≥ 18 years of age; AND

ii. Patient meets ONE of the following (a, b, or c):

a) Patient has phenotypic confirmation of homozygous familial hypercholesterolemia; OR
Note: Examples include pathogenic variants at the low-density lipoprotein receptor (LDLR), apolipoprotein B (apo B), proprotein convertase subtilisin kexin type 9 (PCSK9) or low-density lipoprotein receptor adaptor protein (LDLRAP1) gene.

b) Patient has an untreated low-density lipoprotein (LDL-C) level > 400 mg/dL AND meets ONE of the following [(1) or (2)]:

Note: Untreated refers to prior therapy with any antihyperlipidemic agent.

(1) Patient had clinical manifestations of homozygous familial hypercholesterolemia before 10 years of age; OR

Note: Clinical manifestations of homozygous familial hypercholesterolemia are cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas, or xanthelasma.

(2) At least one parent of the patient had untreated LDL-C levels or total cholesterol levels consistent with familial hypercholesterolemia; OR

Note: An example of familial hypercholesterolemia is an untreated LDL-C level ≥ 190 mg/dL and/or an untreated total cholesterol level > 250 mg/dL.

c) Patient has a treated LDL-C level ≥ 300 mg/dL AND meets ONE of the following [(1) or (2)]:

Note: Treated refers to after therapy with at least one antihyperlipidemic agent. Some examples of antihyperlipidemic agents include statins (e.g., atorvastatin, rosuvastatin, lovastatin, simvastatin, pravastatin), ezetimibe, a PCSK9 inhibitor (e.g., Repatha [evolocumab subcutaneous injection]), Evkeeza (evinacumab-dgnb intravenous infusion), and Juxtapid (lomitapide capsules).

(1) Patient had clinical manifestations of homozygous familial hypercholesterolemia before 10 years of age; OR

Note: Examples of clinical manifestations of homozygous familial hypercholesterolemia are cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma.

(2) At least one parent of the patient had untreated LDL-C levels or total cholesterol levels consistent with familial hypercholesterolemia; AND

Note: An example of familial hypercholesterolemia is an untreated LDL-C ≥ 190 mg/dL and/or an untreated total cholesterol > 250 mg/dL.

iii. Patient meets ONE of the following (a or b):

a) Patient meets BOTH of the following [(1) and (2)]:

(1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

(2) LDL-C level after this treatment remains ≥ 70 mg/dL; OR

b) Patient has been determined to be statin intolerant by meeting ONE of the following [(1) or (2)]:

- (1) Patient experienced statin-related rhabdomyolysis; OR
Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [$a \geq 0.5$ mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR
- (2) Patient meets ALL of the following [(a), (b), and (c)]:
 - (a) Patient experienced skeletal-related muscle symptoms; AND
Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).
 - (b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND
 - (c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); OR
Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

B) Patient Currently Receiving Praluent. Approve if according to the prescriber, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Praluent for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Praluent, Initial Therapy criteria must be met.

20. Primary Hyperlipidemia.* Approve for 1 year if the patient meets ONE of the following (A or B):

Note: This is not associated with established cardiovascular disease, heterozygous familial hypercholesterolemia (HeFH), or homozygous familial hypercholesterolemia (HoFH) and may be referred to as combined hyperlipidemia, hypercholesterolemia (pure, primary), dyslipidemia, or increased/elevated low-density lipoprotein cholesterol (LDL-C) levels.

A) Initial Therapy. Approve if the patient meets ALL of the following (i, ii, and iii):

- i. Patient is ≥ 18 years of age; AND
- ii. Patient meets ONE of the following (a or b):
 - a) Patient has a coronary artery calcium or calcification score ≥ 300 Agatston units; OR
 - b) Patient has diabetes; AND
- iii. Patient meets ONE of the following (a or b):
 - a) Patient meets ALL of the following [(1), (2), and (3)]:
 - (1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]); AND
 - (2) Patient has tried the one high-intensity statin therapy above along with ezetimibe (as a single-entity or as a combination product) for ≥ 8 continuous weeks; AND
 - (3) LDL-C level after this treatment regimen remains ≥ 70 mg/dL; OR
 - b) Patient has been determined to be statin intolerant by meeting ONE of the following [(1) or (2)]:
 - (1) Patient experienced statin-related rhabdomyolysis; OR
Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal),

along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [$a \geq 0.5$ mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).

(2) Patient meets ALL of the following [(a), (b), and (c)]:

(a) Patient experienced skeletal-related muscle symptoms; AND

Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND

(c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); OR

Note: Examples of skeletal-related muscle symptoms include myopathy or myalgia.

B) Patient Currently Receiving Praluent. According to the prescriber, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Praluent for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Praluent, Initial Therapy criteria must be met.

Note:

* A patient may have a diagnosis that pertains to more than one FDA-approved indication, therefore, consider review under different approval conditions, if applicable (e.g., a patient with heterozygous familial hypercholesterolemia or homozygous familial hypercholesterolemia may have established cardiovascular disease, a patient with primary hyperlipidemia may have heterozygous familial hypercholesterolemia).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Praluent is not recommended in the following situations:

37. Concurrent use of Praluent with Repatha (evolocumab subcutaneous injection) or Leqvio (inclisiran subcutaneous injection). Repatha is another PCSK9 inhibitor and should not be used with Praluent.² Leqvio, a small interfering ribonucleic acid (RNA) directed to PCSK9 messenger RNA, is a similar product and should not be given with Praluent.³

38. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Proprotein Convertase Subtilisin Kexin Type 9 Inhibitors – Repatha Prior Authorization Policy

- Repatha® (evolocumab subcutaneous injection – Amgen)

REVIEW DATE: 05/08/2024

OVERVIEW

Repatha, a proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitor antibody, is indicated for the following uses:¹

- **Established cardiovascular (CV) disease**, in adults to reduce the risk of myocardial infarction (MI), stroke, and coronary revascularization.
- **Primary hyperlipidemia (including heterozygous familial hypercholesterolemia [HeFH])**, in adults as an adjunct to diet, alone or in combination with other low-density lipoprotein cholesterol (LDL-C)-lowering therapies to reduce LDL-C.
- **HeFH, in pediatric patients ≥ 10 years of age**, as an adjunct to diet and other LDL-C lowering therapies.
- **Homozygous familial hypercholesterolemia (HoFH), in patients ≥ 10 years of age**, as an adjunct to diet and other low-density lipoprotein (LDL)-lowering therapies (e.g., statins, ezetimibe, LDL apheresis) to reduce LDL-C.

The safety and effectiveness of Repatha have not been established in pediatric patients with HeFH or HoFH who are younger than 10 years of age.¹ Another PCSK9 inhibitor that is available is Praluent® (alirocumab subcutaneous injection).² Leqvio® (inclisiran subcutaneous injection), a small interfering ribonucleic acid (RNA) directed to PCSK9 messenger RNA, is a similar product.³

Guidelines

Many guidelines are available regarding the treatment of patients with dyslipidemia.⁴⁻¹⁰ For patients with elevated LDL-C, statins are the cornerstone of therapy and recommended first-line to be used at maximally tolerated doses due to the established benefits regarding the reduction of CV risks. Atorvastatin 40 mg to 80 mg once daily (QD) and rosuvastatin 20 mg to 40 mg QD are considered high-intensity statins as they achieve LDL-C lowering of ≥ 50%. Ezetimibe is usually the next therapy added.

- The **American College of Cardiology (ACC) Expert Consensus Decision Pathway on the Role of Non-Statin Therapies** for LDL-Cholesterol Lowering in the Management of Atherosclerotic Cardiovascular Disease (ASCVD) Risk (2022) make several recommendations regarding PCSK9 inhibitors.⁴ For adults with clinical ASCVD at very high risk (e.g., patients with major ASCVD events, HeFH, diabetes) who are on statin therapy for secondary prevention, the general goal is ≥ 50% LDL-C reduction and an LDL-C < 55 mg/dL (or non-high-density lipoprotein cholesterol [HDL-C] < 85 mg/dL) with maximally tolerated statin therapy. If the above goals are not achieved, the initial non-statin agents recommended include ezetimibe and/or a PCSK9 monoclonal antibody (i.e., Repatha or Praluent). For adults without clinical ASCVD or diabetes or LDL-C ≥ 190 mg/dL who have undergone subclinical atherosclerosis imaging, if the coronary artery calcium score is ≥ 1,000 Agatston units, PCSK9 monoclonal antibodies (i.e., Repatha or Praluent) may be non-statin agents to consider following high-intensity statin therapy and ezetimibe to achieve the goal of a ≥ 50% LDL-C reduction (and LDL-C threshold < 70 mg/dL).
- The **American Heart Association (AHA)/ACC guidelines on the management of blood cholesterol** (updated 2018) defines patients with ASCVD as those with an acute coronary

05/08/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

syndrome, those with a history of MI, stable or unstable angina or coronary or other revascularizations, stroke, transient ischemic attack, or peripheral arterial disease.^{5,6} Although LDL-C thresholds are not always recognized, in general, an LDL-C < 70 mg/dL is recommended for most patients with ASCVD to reduce CV risk. Use of a PCSK9 as an adjunct is justified if this goal is not met with maximally tolerated statins.^{5,6} Additionally, reviews have recognized that patients with an elevated coronary artery calcium or calcification score (e.g., ≥ 300 Agatston units) are at an increased risk of CV events.¹²⁻¹⁵

- The **American Diabetes Association Standards of Care for Diabetes** discuss CV disease and risk management (2024).⁸ For patients with diabetes who are 40 to 75 years of age at higher CV risk (including those with one or more ASCVD risk factors), it is recommended to use high-intensity statin therapy to reduce LDL-C by $\geq 50\%$ of baseline and to target an LDL-C of < 70 mg/dL. Also, for patients with diabetes who are 40 to 75 years of age at higher CV risk, especially those with multiple ASCVD risk factors and an LDL-C ≥ 70 mg/dL, it may be reasonable to add ezetimibe or a PCSK9 inhibitor to a maximum tolerated statin.
- Guidelines for **Chronic Coronary Disease from the AHA and ACC** (along with other organizations) [2023] state in such patients who are judged to be at very high risk and on maximally tolerated statin therapy and with an LDL-C ≥ 70 mg/dL, ezetimibe can be beneficial to further reduce the risk of a major adverse coronary event.⁹ Patients with chronic coronary disease who are considered to be at very high risk who have and LDL-C ≥ 70 mg/dL who are receiving maximally tolerated statins and ezetimibe, a PCSK9 monoclonal antibody can be beneficial to further reduce the risk of a major adverse coronary event.
- The **European Atherosclerosis Society Consensus Statement on HoFH** (2023), states that HoFH should be suspected if untreated LDL-C levels are > 400 mg/dL.⁷ Other suggestions of HoFH involve cutaneous or tendon xanthomas before 10 years of age and/or untreated elevated LDL-C levels consistent with HeFH in both parents. Of note, in the digenic form, one parent may have normal LDL-C levels and the other may have LDL-C levels consistent with HoFH. Lipid-lowering therapy should be initiated with high-intensity statin therapy and ezetimibe. A PCSK9 inhibitor can be added as well. If the patient does not achieve LDL-C goals, other agents can be added (e.g., Juxtapid® [lomitapide capsules], Evkeeza® [evinacumab-dgnb intravenous infusion]). Lipoprotein apheresis may also be considered. The goal is to reduce LDL-C to < 115 mg/dL in children and adolescents, < 70 mg/dL in adults if no major ASCVD risk factors are present, and < 55 mg/dL if patients have ASCVD or major ASCVD risk factors.
- A **Scientific Statement from the AHA on Familial Hypercholesterolemia** (2015),¹⁰ as well as other information,¹¹ provide additional guidance on diagnosing familial hypercholesterolemia (e.g., HoFH, HeFH). For HeFH, Dutch Lipid Network criteria scoring is used, as well as the Simon Broome criteria.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Repatha. All approvals are provided for the duration noted below. Only a patient who has previously met initial therapy criteria for Repatha for the requested indication under the Coverage Review Department and is currently receiving the requested therapy is only required to meet continuation of therapy criteria (i.e., currently receiving therapy). If past criteria have not been met under the Coverage Review Department and the patient is currently receiving Repatha, or is restarting Repatha, initial criteria must be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Repatha is recommended in those who meet the following criteria:

05/08/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indications

21. Established Cardiovascular Disease.* Approve for 1 year if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve if the patient meets ALL the following (i, ii, and iii):

i. Patient is ≥ 18 years of age; AND

ii. Patient has had ONE of the following conditions or diagnoses (a, b, c, d, e, or f):

a) A previous myocardial infarction or a history of an acute coronary syndrome; OR

b) Angina (stable or unstable); OR

c) A past of stroke or transient ischemic attack; OR

d) Coronary artery disease; OR

e) Peripheral arterial disease; OR

f) Patient has undergone a coronary or other arterial revascularization procedure in the past;
AND

Note: Examples include coronary artery bypass graft surgery, percutaneous coronary intervention, angioplasty, and coronary stent procedures.

iii. Patient meets ONE of the following (a or b):

a) Patient meets BOTH of the following [(1) and (2)]:

(1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

(2) Low-density lipoprotein cholesterol level after this treatment remains ≥ 55 mg/dL;
OR

b) Patient has been determined to be statin intolerant by meeting ONE of the following [(1) or (2)]:

(1) Patient experienced statin-related rhabdomyolysis; OR

Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [$a \geq 0.5$ mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR

(2) Patient meets ALL of the following [(a), (b), and (c)]:

(a) Patient experienced skeletal-related muscle symptoms; AND

Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products);
AND

(c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products), the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); OR

Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

D) Patient Currently Receiving Repatha. Approve if according to the prescriber, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received

approval of Repatha for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Repatha, Initial Therapy criteria must be met.

22. Heterozygous Familial Hypercholesterolemia (HeFH).* Approve for 1 year if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve if the patient meets ALL of the following (i, ii, and iii):

- i.** Patient is ≥ 10 years of age; AND
 - ii.** Patient meets ONE of the following (a, b, or c):
 - a)** Patient has an untreated low-density lipoprotein cholesterol (LDL-C) ≥ 190 mg/dL (prior to treatment with antihyperlipidemic agents); OR
 - b)** Patient has phenotypic confirmation of heterozygous familial hypercholesterolemia; OR
Note: Examples include pathogenic variants at the low-density lipoprotein receptor (LDLR), apolipoprotein B (apo B), proprotein convertase subtilisin kexin type 9 (PCSK9), or low-density lipoprotein receptor adaptor protein 1 (LDLRAP1) gene.
 - c)** Patient has been diagnosed with heterozygous familial hypercholesterolemia by meeting ONE of the following diagnostic criteria thresholds [(1) or (2)]:
 - (1)** Prescriber confirms that the Dutch Lipid Network criteria score was > 5 ; OR
 - (2)** Prescriber confirms that Simon Broome criteria met the threshold for “definite” or “possible (or probable)” familial hypercholesterolemia; AND
 - iii.** Patient meets ONE of the following (a or b):
 - a)** Patient meets BOTH of the following [(1) and (2)]:
 - (1)** Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND
 - (2)** Low-density lipoprotein cholesterol (LDL-C) level after this treatment remains ≥ 70 mg/dL; OR
 - b)** Patient has been determined to be statin intolerant by meeting ONE of the following [(1) or (2)]:
 - (1)** Patient experienced statin-related rhabdomyolysis; OR
Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).
 - (2)** Patient meets ALL of the following [(a), (b), and (c)]:
 - (a)** Patient experienced skeletal-related muscle symptoms; AND
Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).
 - (b)** The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND
 - (c)** When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products), the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); OR
Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.
- D) Patient Currently Receiving Repatha.** Approve if according to the prescriber, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Repatha for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Repatha, Initial Therapy criteria must be met.

23. Homozygous Familial Hypercholesterolemia (HoFH).* Approve for 1 year if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve if the patient meets ALL of the following (i, ii, and iii):

i. Patient is ≥ 10 years of age; AND

ii. Patient meets ONE of the following (a, b, or c):

a) Patient has phenotypic confirmation of homozygous familial hypercholesterolemia; OR

Note: Examples include pathogenic variants at the low-density lipoprotein receptor (LDLR), apolipoprotein B (apo B), proprotein convertase subtilisin kexin type 9 (PCSK9), or low-density lipoprotein receptor adaptor protein 1 (LDLRAP1) gene.

b) Patient has an untreated low-density lipoprotein cholesterol (LDL-C) level > 400 mg/dL AND meets ONE of the following [(1) or (2)]:

Note: Untreated refers to therapy with any antihyperlipidemic agent.

(1) Patient had clinical manifestations of homozygous familial hypercholesterolemia before 10 years of age; OR

Note: Clinical manifestations of homozygous familial hypercholesterolemia are cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas, or xanthelasma.

(2) At least one parent of the patient had untreated LDL-C levels or total cholesterol levels consistent with familial hypercholesterolemia; OR

Note: An example of familial hypercholesterolemia is an untreated LDL-C level ≥ 190 mg/dL and/or an untreated total cholesterol level > 250 mg/dL.

b) Patient has a treated LDL-C level ≥ 300 mg/dL AND meets ONE of the following [(1) or (2)]:

Note: Treated refers to after therapy with at least one antihyperlipidemic agent. Some examples of antihyperlipidemic agents include statins (e.g., atorvastatin, rosuvastatin, lovastatin, simvastatin, pravastatin), ezetimibe, a PCSK9 inhibitor (e.g., Praluent [alirocumab subcutaneous injection]), Evkeeza (evinacumab-dgnb intravenous infusion), or Juxtapid (lomitapide capsules).

(1) Patient had clinical manifestations of homozygous familial hypercholesterolemia before 10 years of age; OR

Note: Examples of clinical manifestations of homozygous familial hypercholesterolemia are cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma.

(2) At least one parent of the patient had untreated LDL-C levels or total cholesterol levels consistent with familial hypercholesterolemia; AND

Note: An example of familial hypercholesterolemia is an untreated LDL-C ≥ 190 mg/dL and/or an untreated total cholesterol > 250 mg/dL.

iii. Patient meets ONE of the following (a or b):

a) Patient meets BOTH of the following [(1) and (2)]:

(1) Patient has tried ONE high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

(2) LDL-C level after this treatment remains ≥ 70 mg/dL; OR

- b) Patient has been determined to be statin intolerant by meeting ONE of the following [(1) or (2)]:

- (1) Patient experienced statin-related rhabdomyolysis; OR

Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a $\geq$ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR

- (2) Patient meets ALL of the following [(a), (b), and (c)]:

- (a) Patient experienced skeletal-related muscle symptoms; AND

Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

- (b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND

- (c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); OR

Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

- D) Patient Currently Receiving Repatha. Approve if according to the prescriber, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Repatha for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Repatha, Initial Therapy criteria must be met.

- 24. Primary Hyperlipidemia.*** Approve for 1 year if the patient meets ONE of the following (A or B):

Note: This is not associated with established cardiovascular disease, heterozygous familial hypercholesterolemia (HeFH), or homozygous familial hypercholesterolemia (HoFH) and may be referred to as combined hyperlipidemia, hypercholesterolemia (pure, primary), dyslipidemia, or increased/elevated low-density lipoprotein cholesterol (LDL-C) levels.

- C) Initial Therapy. Approve if the patient meets ALL of the following (i, ii, and iii):

- i. Patient is $\geq$ 18 years of age; AND

- ii. Patient meets ONE of the following (a or b):

- a) Patient has a coronary artery calcium or calcification score $\geq$ 300 Agatston units; OR

- b) Patient has diabetes; AND

- iii. Patient meets ONE of the following (a or b):

- a) Patient meets ALL of the following [(1), (2), and (3)]:

- (1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin $\geq$ 40 mg daily; rosuvastatin $\geq$ 20 mg daily [as a single-entity or as a combination product]); AND

- (2) Patient has tried one high-intensity statin therapy above along with ezetimibe (as a single-entity or as a combination product) for $\geq$ 8 continuous weeks; AND

- (3) LDL-C level after this treatment regimen remains $\geq$ 70 mg/dL; OR

- b) Patient has been determined to be statin intolerant by meeting ONE of the following [(1) or (2)]:
- (1) Patient experienced statin-related rhabdomyolysis; OR
Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR
 - (2) Patient meets ALL of the following [(a), (b), and (c)]:
 - (a) Patient experienced skeletal-related muscle symptoms; AND
Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).
 - (b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND
 - (c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products), the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); OR
Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.
- D) Patient Currently Receiving Repatha. Approve if according to the prescriber, the patient has experienced a response to therapy.
Note: Examples of a response to therapy include decreasing low-density lipoprotein cholesterol (LDL-C), total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Repatha for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Repatha, Initial Therapy criteria must be met.

Note:

* A patient may have a diagnosis that pertains to more than one FDA-approved indication, therefore, consider review under different approval conditions, if applicable (e.g., a patient with heterozygous familial hypercholesterolemia or homozygous familial hypercholesterolemia may have established cardiovascular disease, a patient with primary hyperlipidemia may have heterozygous familial hypercholesterolemia).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Repatha is not recommended in the following situations:

39. **Concurrent use of Repatha with Praluent (alirocumab subcutaneous injection) or Leqvio (inclisiran subcutaneous injection).** Praluent is another PCSK9 inhibitor and should not be used with Repatha.² Leqvio, a small interfering ribonucleic acid (RNA) directed to PCSK9 messenger RNA, is a similar product and should not be given with Repatha.³
40. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Proprotein Convertase Subtilisin Kexin Type 9 Related Products – Leqvio Prior Authorization Policy

- Leqvio® (inclisiran subcutaneous injection – Novartis)

REVIEW DATE: 05/08/2024

OVERVIEW

Leqvio, a small interfering ribonucleic acid (RNA) directed to proprotein convertase subtilisin kexin type 9 (PCSK9) messenger RNA, is indicated as an adjunct to diet and statin therapy for the treatment of adults with primary hyperlipidemia, including heterozygous familial hypercholesterolemia (HeFH), to reduce low-density lipoprotein cholesterol (LDL-C).¹ The safety and effectiveness have not been established in pediatric patients.

Repatha® (evolocumab subcutaneous injection) and Praluent® (alirocumab subcutaneous injection) are PCSK9 inhibitor products.^{2,3}

Dosing Information

Leqvio is given as a subcutaneous injection and should be administered by a healthcare professional.¹ The dose is 284 mg given as a single subcutaneous injection initially, again at 3 months, and then once every 6 months.

Guidelines

Many guidelines are available regarding the treatment of patients with dyslipidemia which include the management of HeFH and atherosclerotic cardiovascular disease (ASCVD).⁴⁻⁹ For patients with elevated LDL-C, statins are the cornerstone of therapy and recommended first-line to be used at maximally tolerated doses due to the established benefits regarding the reduction of cardiovascular (CV) risks. Atorvastatin 40 mg to 80 mg once daily (QD) and rosuvastatin 20 mg to 40 mg QD are considered high-intensity statins as they achieve LDL-C lowering of $\geq 50\%$.

- The **American College of Cardiology (ACC) Expert Consensus Decision Pathway on the Role of Non-Statin Therapies** for LDL-Cholesterol Lowering in the Management of Atherosclerotic cardiovascular disease (ASCVD) Risk (2022) make several recommendations regarding PCSK9 inhibitors.⁴ For adults with clinical ASCVD at very high risk (e.g., patients with major ASCVD events, HeFH, diabetes) who are on statin therapy for secondary prevention, the general goal is $\geq 50\%$ LDL-C reduction and an LDL-C < 55 mg/dL with maximally tolerated statin therapy. If the above goals are not achieved, the initial non-statin agents recommended include ezetimibe and/or a PCSK9 monoclonal antibody (i.e., Repatha or Praluent). Leqvio may be considered. For adults without clinical ASCVD or diabetes or LDL-C ≥ 190 mg/dL who have undergone subclinical atherosclerosis imaging, if the coronary artery calcium score is $\geq 1,000$ Agatston units, PCSK9 monoclonal antibodies (i.e., Repatha or Praluent) may be non-statin agents to consider following high-intensity statin therapy and ezetimibe to achieve the goal of a $\geq 50\%$ LDL-C reduction (and LDL-C threshold < 70 mg/dL).
- The **American Heart Association (AHA)/ACC guidelines on the management of blood cholesterol** (updated 2018) defines ASCVD as an acute coronary syndrome, those with a history of myocardial infarction, stable or unstable angina or coronary or other revascularizations, stroke, transient ischemic attack, or peripheral arterial disease.^{5,6} Although LDL-C thresholds are not always recognized, in general, an LDL-C < 70 mg/dL is recommended for most patients with

05/08/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

ASCVD to reduce CV risk. Use of a PCSK9 as an adjunct is justified if this goal is not met with maximally tolerated statins.^{5,6} Additionally, reviews have recognized that patients with an elevated coronary artery calcium or calcification score (e.g., ≥ 300 Agatston units) are at an increased risk of CV events.¹¹⁻¹⁴

- The **American Diabetes Association Standards of Care for Diabetes** discuss CV disease and risk management (2024).⁷ For patients with diabetes who are 40 to 75 years of age at higher CV risk (including those with one or more ASCVD risk factors) it is recommended to use high-intensity statin therapy to reduce LDL-C by $\geq 50\%$ of baseline and to target an LDL-C of < 70 mg/dL. Also, for patients with diabetes who are 40 to 75 years of age at higher CV risk, especially those with multiple ASCVD risk factors and an LDL-C ≥ 70 mg/dL, it may be reasonable to add ezetimibe or a PCSK9 inhibitor to a maximum tolerated statin.
- Guidelines for **Chronic Coronary Disease from the AHA and ACC** (along with other organizations) [2023] state in such patients who are judged to be at very high risk and on maximally tolerated statin therapy and an LDL-C ≥ 70 mg/dL, ezetimibe can be beneficial to further reduce the risk of a major adverse coronary event.⁸ Patients with chronic coronary disease who are considered to be at very high risk who have and LDL-C ≥ 70 mg/dL who are receiving maximally tolerated statins and ezetimibe, a PCSK9 monoclonal antibody can be beneficial to further reduce the risk of a major adverse coronary event.
- A **Scientific Statement from the AHA on Familial Hypercholesterolemia** (2015),⁹ as well as other information,¹⁰ provide additional guidance on diagnosing familial hypercholesterolemia (e.g., HeFH). For HeFH, Dutch Lipid Network criteria scoring is used, as well the Simon Broome criteria.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Leqvio. All approvals are provided for the duration noted below. A patient who has previously met Initial Therapy criteria for Leqvio for the requested indication under the Coverage Review Department and is currently receiving Leqvio is only required to meet continuation of therapy criteria (i.e., currently receiving therapy). If past criteria have not been met under the Coverage Review Department and the patient is currently receiving Leqvio, or is restarting Leqvio, Initial Therapy criteria must be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Leqvio is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 25. Heterozygous Familial Hypercholesterolemia (HeFH).*** Approve for 1 year if the patient meets ONE of the following (A or B):
- A) Initial Therapy.** Approve if the patient meets ALL of the following (i, ii, and iii):
- i.** Patient is ≥ 18 years of age; AND
 - ii.** Patient meets ONE of the following (a, b, or c):
 - a)** Patient has an untreated low-density lipoprotein cholesterol (LDL-C) level ≥ 190 mg/dL (prior to treatment with antihyperlipidemic agents); OR
 - b)** Patient has phenotypic confirmation of heterozygous familial hypercholesterolemia; OR

Note: Examples include pathogenic variants at the low-density lipoprotein receptor (LDLR), apolipoprotein B (apo B), proprotein convertase subtilisin kexin type 9 (PCSK9), or low-density lipoprotein receptor adaptor protein 1 (LDLRAP1) gene.

- c) Patient has been diagnosed with heterozygous familial hypercholesterolemia meeting ONE of the following diagnostic criteria thresholds [(1) or (2)]:
 - (1) Prescriber confirms that the Dutch Lipid Network criteria score was > 5 ; OR
 - (2) Prescriber confirms that Simon Broome criteria met the threshold for “definite” or “possible (or probable)” familial hypercholesterolemia; AND

iii. Patient meets ONE of the following (a or b):

- a) Patient meets ALL of the following [(1), (2), and (3)]:
 - (1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single entity or as a combination product]); AND
 - (2) Patient has tried one high-intensity statin along with ezetimibe (as a single-entity or as a combination product) for ≥ 8 continuous weeks; AND
 - (3) LDL-C level after this treatment regimen remains ≥ 70 mg/dL; OR
- b) Patient has been determined to be statin intolerant by meeting ONE of the following [(1) or (2)]:
 - (1) Patient experienced statin-related rhabdomyolysis; OR
Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).
 - (2) Patient meets ALL of the following [(a), (b), and (c)]:
 - (a) Patient experienced skeletal-related muscle symptoms; AND
Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).
 - (b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND
 - (c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); OR
Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

E) Patient Currently Receiving Leqvio. Approve if according to the prescriber, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing LDL-C, total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Leqvio for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Leqvio, Initial Therapy criteria must be met.

26. Primary Hyperlipidemia.* Approve for 1 year if the patient meets ONE of the following (A or B): Note: This is not associated with established cardiovascular disease or heterozygous familial hypercholesterolemia (HeFH) and may be referred to as combined hyperlipidemia, hypercholesterolemia (pure, primary), dyslipidemia, or increased/elevated low-density lipoprotein cholesterol (LDL-C) levels.

A) Initial Therapy. Approve if the patient meets ALL of the following (i, ii, and iii):

- i. Patient is ≥ 18 years of age; AND

- ii. Patient meets ONE of the following (a or b):
 - a) Patient has a coronary artery calcium or calcification score ≥ 300 Agatston units; OR
 - b) Patient has diabetes; AND
- iii. Patient meets ONE of the following (a or b):
 - a) Patient meets ALL of the following [(1), (2), and (3)]:
 - (1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]); AND
 - (2) Patient has tried the one high-intensity statin therapy above along with ezetimibe (as a single-entity or as a combination product) for ≥ 8 continuous weeks; AND
 - (3) LDL-C level after this treatment regimen remains ≥ 70 mg/dL; OR
 - b) Patient has been determined to be statin intolerant by meeting ONE of the following [(1) or (2)]:
 - (1) Patient experienced statin-related rhabdomyolysis; OR
Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [$a \geq 0.5$ mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).
 - (2) Patient meets ALL of the following [(a), (b), and (c)]:
 - (a) Patient experienced skeletal-related muscle symptoms; AND
Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).
 - (b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND
 - (c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); OR
Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.
- B) Patient Currently Receiving Leqvio. Approve if according to the prescriber, the patient has experienced a response to therapy.
Note: Examples of a response to therapy include decreasing LDL-C, total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Leqvio for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Leqvio, Initial Therapy criteria must be met.

Other Uses with Supportive Evidence

- 3. **Established Cardiovascular Disease.*** Approve for 1 year if the patient meets ONE of the following (A or B):
 - E) Initial Therapy. Approve if the patient meets ALL of the following (i, ii, and iii):
 - i. Patient is ≥ 18 years of age; AND
 - ii. Patient has had ONE of the following conditions or diagnoses (a, b, c, d, e, or f):
 - a) A previous myocardial infarction or a history of an acute coronary syndrome; OR
 - b) Angina (stable or unstable); OR
 - c) A past of stroke or transient ischemic attack; OR
 - d) Coronary artery disease; OR
 - e) Peripheral arterial disease; OR

05/08/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- f) Patient has undergone a coronary or other arterial revascularization procedure in the past;
AND

Note: Examples include coronary artery bypass graft surgery, percutaneous coronary intervention, angioplasty, and coronary stent procedures.

iii. Patient meets ONE of the following (a or b):

- a) Patient meets ALL of the following [(1), (2), and (3)]:

- (1) Patient has tried one high-intensity statin therapy (i.e., atorvastatin $\geq$ 40 mg daily; rosuvastatin $\geq$ 20 mg daily [as a single entity or as a combination product]); AND
(2) Patient has tried one high-intensity statin along with ezetimibe (as a single-entity or as a combination product) for $\geq$ 8 continuous weeks; AND
(3) Low-density lipoprotein cholesterol (LDL-C) level after this treatment regimen remains $\geq$ 55 mg/dL; OR

- b) Patient has been determined to be statin intolerant by meeting ONE of the following [(1) or (2)]:

- (1) Patient experienced statin-related rhabdomyolysis; OR

Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [$a \geq 0.5$ mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).

- (2) Patient meets ALL of the following [(a), (b), and (c)]:

- (a) Patient experienced skeletal-related muscle symptoms; AND

Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

- (b) The skeletal-muscle related symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or combination products); AND

- (c) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); OR

Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

- F) Patient Currently Receiving Leqvio. Approve if according to the prescriber, the patient has experienced a response to therapy.

Note: Examples of a response to therapy include decreasing LDL-C, total cholesterol, non-high-density lipoprotein (non-HDL-C), or apolipoprotein B levels. Also, if the patient is currently receiving the requested therapy but has not previously received approval of Leqvio for this specific indication through the Coverage Review Department, review under criteria for Initial Therapy. If the patient is restarting therapy with Leqvio, Initial Therapy criteria must be met.

Note:

* A patient may have a diagnosis that pertains to more than one indication, therefore, consider review under different approval conditions, if applicable (e.g., a patient with heterozygous familial hypercholesterolemia may have established cardiovascular disease, a patient with primary hyperlipidemia may have heterozygous familial hypercholesterolemia).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Leqvio is not recommended in the following situations:

- 139. Concurrent use of Leqvio with Repatha (evolocumab subcutaneous injection) or Praluent (alirocumab subcutaneous injection).** Repatha and Praluent are PCSK9 inhibitors and should not be used with Leqvio due to a similar mechanism of action.¹ Patients receiving PCSK9 inhibitors were excluded from the pivotal trials with Leqvio.
- 140.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Psychiatry – Spravato Prior Authorization Policy

- Spravato® (esketamine nasal spray – Janssen)

REVIEW DATE: 04/24/2024

OVERVIEW

Spravato, a non-competitive N-methyl D-aspartate (NMDA) receptor antagonist, is indicated in conjunction with an oral antidepressant for the treatment of:¹

- Depressive symptoms in adults with **major depressive disorder (MDD) with acute suicidal ideation or behavior.**
- **Treatment-resistant depression (TRD)** in adults.

Limitation of Use: The effectiveness of Spravato in preventing suicide or in reducing suicidal ideation or behavior has not been demonstrated. Use of Spravato does not preclude the need for hospitalization if clinically warranted, even if patients experience improvement after an initial dose of Spravato. Spravato is not approved as an anesthetic agent. The safety and effectiveness of Spravato as an anesthetic agent have not been established.

Spravato should be administered in conjunction with an oral antidepressant.¹ For MDD with acute suicidal ideation or behavior, the recommended dosage is 84 mg twice weekly for 4 weeks. The dosage may be reduced to 56 mg twice weekly based on tolerability. After 4 weeks of treatment, evidence of therapeutic benefit should be evaluated to determine the need for continued treatment. The use of Spravato, in conjunction with an oral antidepressant, beyond 4 weeks has not been systematically evaluated in the treatment of depressive symptoms in patients with MDD with acute suicidal ideation or behavior. For treatment-resistant depression, the recommended dose is 56 mg intranasally on Day 1, followed by 56 mg or 84 mg intranasally twice weekly for Weeks 1 to 4. On Weeks 5 to 8, Spravato should be administered once weekly at a dose of 56 mg or 84 mg intranasally. On Week 9 and thereafter, the dosing frequency should be individualized to the least frequent dosing to maintain remission/response (either every 2 weeks or once weekly) at a dose of 56 mg or 84 mg. Spravato must be administered under the direct supervision of a healthcare provider.

Disease Overview

Major depressive disorder is a serious, life-threatening condition with high rates of morbidity and a chronic disease course.² Major depressive disorder is considered the leading cause of disability worldwide and is also associated with increased mortality rates.^{3,4} About 30% to 40% of patients with major depressive disorder fail to respond to first-line treatments including oral antidepressant medications of all classes (e.g., selective serotonin reuptake inhibitors [SSRIs], serotonin-norepinephrine reuptake inhibitors [SNRIs], tricyclic antidepressants [TCAs], bupropion) and/or psychotherapy.^{2,5} In addition, the onset of treatment response for these modalities, even when effective, often takes ≥ 4 weeks, leading to greater suffering, expense, and risk. For regulatory purposes, the FDA considers patients to have treatment-resistant depression if they have MDD and they have not responded to treatment despite trials of at least two antidepressants given at adequate doses for an adequate duration in the current episode.²

The available treatments for treatment-resistant depression are limited.² Prior to the approval of Spravato, only one medication was FDA-approved for treatment-resistant depression, Symbyax® (olanzapine and fluoxetine capsules). Symbyax is indicated for treatment-resistant depression (major depressive disorder

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

in patients who do not respond to two separate trials of different antidepressants of adequate dose and duration in the current episode) and acute depressive episodes in bipolar I disorder.⁶

Guidelines

In 2022, the U.S. Department of Veterans Affairs (VA) and U.S. Department of Defense (DoD) published a guideline for the management of MDD.⁷ The guideline divides treatment into uncomplicated MDD and MDD that is severe or has a partial or limited response to initial treatment. For uncomplicated MDD, the guideline recommends that MDD be treated with either psychotherapy (i.e., acceptance and commitment therapy, behavioral therapy/behavioral activation, cognitive behavioral therapy, interpersonal therapy, mindfulness-based cognitive therapy, problem-solving therapy, or short-term psychodynamic psychotherapy) or pharmacotherapy (i.e., bupropion, mirtazapine, selective serotonin reuptake inhibitors [SSRIs], serotonin–norepinephrine reuptake inhibitors [SNRIs], trazodone, vilazodone, or vortioxetine) as monotherapy, based on patient preference. Factors including treatment response, severity, and chronicity may lead to other treatment strategies, such as augmentation, combination treatment, switching of treatments, or use of non-first-line treatments. When choosing an initial pharmacotherapy, the guideline suggests against using esketamine, ketamine, monoamine oxidase inhibitors (MAOIs), nefazodone, or tricyclic antidepressants (TCAs). For the treatment of MDD that is severe or has a partial or limited response to initial treatment, the guideline recommends offering a combination of pharmacotherapy and evidence-based psychotherapy for MDD characterized as severe (e.g., nine-item patient health questionnaire [PHQ-9] score > 20), persistent (duration > 2 years), or recurrent ($\geq$ two episodes). For patients with MDD who have shown partial or no response to an adequate trial of initial pharmacotherapy, the guideline suggests switching to another antidepressant, switching to psychotherapy, augmenting with psychotherapy, or augmenting with a second-generation antipsychotic. For patients who have shown partial or no response to $\geq$ two adequate pharmacologic treatment trials, the guideline suggests offering repetitive transcranial magnetic stimulation for treatment. For patients with MDD who have not responded to several adequate pharmacologic trials, the guideline suggests ketamine or esketamine for augmentation. For patients with MDD who achieve remission with antidepressants, the guideline recommends continuation of antidepressants at the therapeutic dose for $\geq$ 6 months to decrease risk for relapse. For patients with MDD at high risk for relapse or recurrence (e.g., $\geq$ two prior episodes, unstable remission status), the guideline suggests offering a course of cognitive behavioral therapy, interpersonal therapy, or mindfulness-based cognitive therapy during the continuation phase of treatment (i.e., after remission is achieved).

Abuse and Misuse

Spravato contains esketamine, a Schedule III controlled substance (CIII), which may be subject to abuse and diversion.¹ Assess each patient's risk for abuse or misuse prior to prescribing Spravato. All patients receiving Spravato should be monitored for the development of these behaviors or conditions, including drug-seeking behavior, while on therapy. Patients with a history of drug abuse or dependence are at greater risk. Careful consideration should be given prior to prescribing Spravato to individuals with a history of substance use disorder.

Safety

Spravato labeling includes a Boxed Warning regarding sedation, dissociation, respiratory depression, abuse and misuse, and suicidal thoughts and behaviors in pediatric and young adult patients.¹ The most common psychological effects of Spravato were dissociative or perceptual changes (including distortion of time, space and illusions), derealization and depersonalization (61% to 84% of patients treated with Spravato developed dissociative or perceptual changes based on the Clinician-Administered Dissociative States Scale). Given its potential to induce dissociative effects, carefully assess patients with psychosis before administering Spravato; treatment should be initiated only if the benefit outweighs the risk.

Because of the risks of serious adverse outcomes resulting from sedation, dissociation, respiratory depression, and abuse and misuse, Spravato is only available through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS).¹ Healthcare settings must be certified in the program and ensure that Spravato is only dispensed in healthcare settings and administered to patients who are enrolled in the program, administered by patients under the direct observation of a healthcare provider, and that patients are monitored by a healthcare provider for at least 2 hours after administration of Spravato. Pharmacies must be certified in the REMS and must only dispense Spravato to healthcare settings that are certified in the program.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Spravato. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Spravato as well as the monitoring required for adverse events and efficacy, approval requires Spravato to be prescribed by a physician who specializes in the condition being treated.

Note: A 2-month approval duration is applied for the indication of MDD with Acute Suicidal Ideation or Behavior to allow time for the scheduling and administration of a 4-week course of therapy at a certified healthcare setting. If after completing the 4-week course of therapy for MDD with Acute Suicidal Ideation or Behavior, another request for Spravato is submitted and the patient meets the approval criteria, then another 4-week course of treatment (with a 2-month approval duration to complete the course of therapy) could be approved.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Spravato is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 4. Major Depressive Disorder with Acute Suicidal Ideation or Behavior.** Approve for 2 months if the patient meets ALL of the following (A, B, C, D, and E):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has major depressive disorder that is considered to be severe, according to the prescriber; AND
 - C)** Patient is concomitantly receiving at least one oral antidepressant; AND
Note: Antidepressants may include, but are not limited to, selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), mirtazapine, and bupropion.
 - D)** Patient has ONE of the following (i or ii):
 - i.** No history of psychosis; OR
 - ii.** History of psychosis and the prescriber believes that the benefits of Spravato outweigh the risks; AND
 - E)** The medication is prescribed by a psychiatrist.
- 5. Treatment-Resistant Depression.** Approve for 6 months if the patient meets ALL of the following (A, B, C, D, E, and F):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Patient meets BOTH of the following (i and ii):

- i. Patient has demonstrated nonresponse ($\leq 25\%$ improvement in depression symptoms or scores) to at least two different antidepressants, each from a different pharmacologic class, according to the prescriber; AND
Note: Different pharmacologic classes of antidepressants include selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), bupropion, mirtazapine, etc.
- ii. Each antidepressant was used at therapeutic dosages for at least 6 weeks in the current episode of depression, according to the prescriber; AND
- C) Patient is concomitantly receiving at least one oral antidepressant; AND
Note: Antidepressants may include, but are not limited to, selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), mirtazapine, and bupropion.
- D) Patient has ONE of the following (i or ii):
 - i. No history of psychosis; OR
 - ii. History of psychosis and the prescriber believes that the benefits of Spravato outweigh the risks; AND
- E) The patient's of controlled substance prescriptions has been checked using the state prescription drug monitoring program (PDMP), according to the prescriber; AND
- F) The medication is prescribed by a psychiatrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Spravato is not recommended in the following situations:

- 141. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Psychiatry – Zulresso Prior Authorization Policy

- Zulresso® (brexanolone intravenous infusion – Sage Therapeutics)

REVIEW DATE: 06/12/2024

OVERVIEW

Zulresso, a neuroactive steroid gamma-aminobutyric acid (GABA) A receptor positive modulator, is indicated for the **treatment of postpartum depression** in patients ≥ 15 years of age.¹

Disease Overview

Postpartum (or peripartum) depression is a major depressive episode with onset during pregnancy or within 4 weeks of delivery that can have serious effects on the maternal-infant bond and later infant development.³ Approximately 40% to 80% of cases of postpartum depression are considered moderate to severe.²

Clinical Efficacy

The efficacy of Zulresso was established in two Phase III, US-only, randomized, double-blind, placebo-controlled, multicenter, pivotal studies in patients with moderate to severe postpartum depression initiating treatment within 6 months of delivery.² Eligible patients were diagnosed with a major depressive episode, which had an onset no earlier than the third trimester of pregnancy and no later than 4 weeks after delivery.

Safety

Based on findings from animal studies of other drugs that enhance GABAergic inhibition, Zulresso may cause fetal harm.¹ Currently, there are no available data on Zulresso use in pregnant women to determine a drug-associated risk of major birth defects, miscarriage, or adverse maternal or fetal outcomes. A pregnancy exposure registry is available to monitor pregnancy outcomes in women exposed to antidepressants during pregnancy.

Zulresso has a Boxed Warning regarding excessive sedation and sudden loss of consciousness.¹ Because of the risk of serious harm, patients must be monitored for excessive sedation and sudden loss of consciousness and have continuous pulse oximetry monitoring. Patients must be accompanied during interactions with their children. During the infusion, patients must be monitored for sedative effects every 2 hours during planned non-sleep periods. If there are signs or symptoms of excessive sedation, the infusion must be stopped immediately. After symptom resolution, the infusion may be restarted at the same or a lower dose. Due to the risks of serious adverse events resulting from excessive sedation and sudden loss of consciousness, Zulresso is only available through a restricted distribution system under a Risk Evaluation and Mitigation Strategy program.^{1,5}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zulresso. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zulresso as well as the monitoring required for adverse events and long-term efficacy, approval requires Zulresso to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

06/12/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Note: A 1-month (30 days) approval duration is applied to allow for the scheduling and administration of the one-time, 60-hour infusion of Zulresso.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zulresso is recommended in those who meet the following criteria:

FDA-Approved Indication

- 6. Postpartum Depression.** Approve for 1 month if the patient meets the following (A, B, C, D, and E):
- A)** Patient is ≥ 15 years of age; AND
 - B)** Patient has been diagnosed with moderate to severe depression with symptom onset during the third trimester of pregnancy or up to 4 weeks post-delivery; AND
 - C)** Patient is ≤ 6 months postpartum; AND
 - D)** Patient is not currently pregnant; AND
 - E)** Zulresso is being prescribed by or in consultation with a psychiatrist or an obstetrician-gynecologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zulresso is not recommended in the following situations:

- 142. Previous Treatment with Zulresso during the Current Episode of Postpartum Depression.**
- 143.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Psychiatry – Zurzuvae Prior Authorization Policy

- Zurzuvae™ (zuranolone capsules – Sage Therapeutics/Biogen)

REVIEW DATE: 11/20/2024

OVERVIEW

Zuranolone, a neuroactive steroid gamma-aminobutyric acid (GABA) A receptor positive modulator, is indicated for the **treatment of postpartum depression in adults.**¹

Disease Overview

Postpartum (or peripartum) depression is a major depressive episode with onset during pregnancy or within 4 weeks of delivery that can have serious effects on the maternal-infant bond and later infant development.³ Approximately 40% to 80% of cases of postpartum depression are considered moderate to severe.²

Clinical Efficacy

The efficacy of Zurzuvae was established in two Phase III, randomized, double-blind, placebo-controlled, multicenter, pivotal studies in patients with severe postpartum depression initiating treatment within 6 or 12 months of delivery.^{2,3} Eligible patients were diagnosed with a major depressive episode, which had an onset no earlier than the third trimester of pregnancy and no later than 4 weeks after delivery.

Safety

Based on findings from animal studies, Zurzuvae may cause fetal harm.¹ Pregnant women should be advised of the potential risk to a fetus. Available data on Zurzuvae use in pregnant women from the clinical development program are insufficient to evaluate for a drug-associated risk of major birth defects, miscarriage, or adverse maternal or fetal outcomes. There is a pregnancy exposure registry that monitors pregnancy outcomes in women exposed to antidepressants, including Zurzuvae, during pregnancy.

Zurzuvae has a Boxed Warning regarding impairment in driving or engaging in other potentially hazardous activities due to central nervous system (CNS) depressant effects.¹ Warnings/Precautions for Zurzuvae also include suicidal thoughts and behaviors (which is similar to other antidepressants) and embryo-fetal toxicity.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zurzuvae. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zurzuvae as well as the monitoring required for adverse events and long-term efficacy, approval requires Zurzuvae to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zurzuvae is recommended in those who meet the following criteria:

FDA-Approved Indication

11/20/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

7. **Postpartum Depression.** Approve for 14 days if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient meets BOTH of the following (i and ii):
 - i. Patient has been diagnosed with severe depression; AND
 - ii. Symptom onset began during the third trimester of pregnancy or up to 4 weeks post-delivery; AND
 - C) Patient is ≤ 12 months postpartum; AND
 - D) Patient is not currently pregnant; AND
 - E) Zurzuva is being prescribed by or in consultation with a psychiatrist or an obstetrician-gynecologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zurzuva is not recommended in the following situations:

- 144. **Previous Treatment with Zurzuva during the Current Episode of Postpartum Depression.**
- 145. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Pulmonary – Corticosteroid/Long-Acting Beta₂-Agonist Combination Inhalers Prior Authorization Policy
- Advair Diskus[®] (fluticasone propionate/salmeterol inhalation powder – GlaxoSmithKline, generic [including Wixela Inhub[®]])
 - Advair[®] HFA (fluticasone propionate/salmeterol inhalation aerosol – GlaxoSmithKline, generic)
 - AirDuo[®] Digihaler[®] (fluticasone propionate/salmeterol inhalation powder – Teva) [discontinued]
 - AirDuo[®] RespiClick[®] (fluticasone propionate/salmeterol inhalation powder – Teva, generic)
 - Breo[®] Ellipta[®] (fluticasone furoate/vilanterol inhalation powder – GlaxoSmithKline, generic)
 - Dulera[®] (mometasone furoate/formoterol fumarate inhalation aerosol – Merck)
 - Symbicort[®] (budesonide/formoterol fumarate inhalation aerosol – AstraZeneca, generic [including Breyna[™]])

REVIEW DATE: 09/11/2024

OVERVIEW

The inhaled corticosteroid (ICS)/long-acting beta₂-agonist (LABA) combination inhalers are indicated for the treatment of asthma.¹⁻⁶ Age indications vary by agent. Fluticasone propionate and salmeterol inhalation powder (Advair Diskus, generics [including Wixela Inhub]), Breo Ellipta, and Symbicort (and authorized generic) are also indicated for the maintenance treatment of airflow obstruction and reducing exacerbations in patients with chronic obstructive pulmonary disease (COPD), including chronic bronchitis and/or emphysema.^{1,3,5} Advair HFA (and authorized generic) and Dulera are not FDA-approved for the treatment of COPD; however, both products have been studied for this use.^{2,4,7-9} AirDuo Digihaler [discontinued] and AirDuo RespiClick (and authorized generic) also have not specifically been studied in patients with COPD. However, these agents were filed as a New Drug Application under Section 505(b)(2) of the Federal Food, Drug, and Cosmetic Act.⁶ This approval pathway relies in part upon evidence not developed by the applicant. In the case of these agents, the literature and safety and effectiveness evidence supporting the approval and use of Advair Diskus (indicated in patients with COPD) are considered part of the evidence supporting the approval and use of the AirDuo products. Of note, another ICS/LABA inhaler, Symbicort Aerosphere[®] (budesonide/formoterol fumarate inhalation aerosol), was approved in 2023 for the maintenance treatment of patients with COPD. However, the manufacturer currently has no plans to launch this product in the US and this product is not targeted in this policy.

Guidelines

The 2024 Global Initiative for Chronic Obstructive Lung Disease (GOLD) guidelines for the diagnosis, management, and prevention of COPD support the use of ICS/LABA therapy (in combination with an inhaled long-acting muscarinic antagonist) in select highly symptomatic patients who are at high risk for COPD exacerbations.¹⁰ The ICS/LABAs are also featured prominently in the 2024 Global Initiative for Asthma (GINA) Global Strategy for Asthma Management and Prevention. They are recommended as part of the step-wise treatment algorithm for patients ≥ 6 years of age.¹¹ European Respiratory Society (ERS) guidelines on the diagnosis and treatment of chronic cough in adults and children (2020) recommend a short-term trial (2 to 4 weeks) of ICS and long-acting bronchodilator (e.g. a LABA) combination in adults with chronic cough and fixed airflow obstruction.¹²

09/11/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Other Uses with Supportive Evidence

There are also data to support the use of ICS/LABA inhalers in patients with postinfectious cough. Subacute postinfectious cough may have multiple possible underlying etiologies, including asthma.^{13,14} The underlying cause of the cough must be determined before making therapeutic decisions. In this situation, ICS/LABA combination therapy may be used as diagnostic empiric therapy in determining the cause of cough (i.e., rule out asthma). When a patient with subacute cough presents with wheezes, rhonchi, or crackles with a normal chest radiograph, it may be a reasonable option to consider therapy with an inhaled bronchodilator and ICS. If cough following an upper respiratory tract infection persists for > 8 weeks, diagnoses other than postinfectious cough should be considered.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of the Corticosteroid/Long-Acting Beta₂-Agonist Inhalers. The purpose of this policy is to support the use of the corticosteroid/long-acting beta₂-agonist combination inhalers in chronic conditions where the products are indicated or their use is appropriate. All approvals are provided for the duration listed below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: Prescription claims (prior 130 days) for respiratory medications (e.g., leukotriene receptor antagonists; xanthines; inhaled mast cell stabilizers; oral and inhaled beta-agonists; inhaled corticosteroids, inhaled anticholinergic agents) are used as a surrogate marker for a diagnosis of asthma or chronic obstructive pulmonary disease (COPD). If use of these medications is not met at the point-of-service, coverage will be determined by Prior Authorization criteria. When available, the ICD-10 codes for asthma and COPD (including chronic bronchitis/emphysema) will also be used in automation to generate an approval of the requested medication (see Appendix A).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of the Corticosteroid/Long-Acting Beta₂-Agonist Inhalers is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Asthma/Reactive Airway Disease.** Approve for 1 year.
2. **Chronic Obstructive Pulmonary Disease.** Approve for 1 year.
3. **Chronic Bronchitis.** Approve for 1 year.
4. **Emphysema.** Approve for 1 year.

Other Uses with Supportive Evidence

5. **Postinfectious Cough.** Approve for 2 months.

Note: Postinfectious cough is cough that persists after an acute respiratory infection has resolved.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of the Corticosteroid/Long-Acting Beta₂-Agonist Inhalers is not recommended in the following situations:

- 41. Acute Cough Associated with the Common Cold.** Note: This includes symptoms associated with a current rhinovirus infection.

There are no data to support the use of ICS/LABA combination therapy in treating this condition. American College of Chest Physicians (ACCP) guidelines for the treatment of acute cough associated with the common cold do not recommend using an ICS or a bronchodilator in treating this condition.^{11,15,16}

- 42. Chronic Cough due to Gastroesophageal Reflux Disease (GERD).** There are no data to support the use of ICS/LABA combination therapy in treating this condition. The ACCP guidelines for the management of chronic cough due to GERD recommend treatment of the underlying condition and do not mention the use of any inhaled therapies.^{17,18}

- 43. Acute Cough due to an Acute Respiratory Infection.** Note: Examples of an acute respiratory infection are acute bronchitis, sinusitis, influenza, or pneumonia. An acute exacerbation of chronic bronchitis is not the same as acute bronchitis.

ACCP guidelines for the management of acute cough due to acute bronchitis in immunocompetent adult outpatients do not recommend routine use of inhaled corticosteroids and inhaled beta-agonists.¹⁹ Current evidence is not sufficient to prove that these therapies are safe and effective at reducing the severity and duration of cough in this setting. Bronchodilators are also not a recommended therapeutic option in treating cough associated with acute bacterial sinusitis.¹⁴ Additional ACCP guidelines for the management of acute cough due to suspected pneumonia or influenza state that there is insufficient evidence on the use of nonantibiotic symptomatic therapies such as ICSs or bronchodilators.¹⁶ There are no data to support the use of ICS/LABA combination therapy in treating these conditions.

- 44. Chronic Cough due to Non-Asthmatic Eosinophilic Bronchitis (NAEB).** There are no data to support the use of ICS/LABA combination therapy in treating this condition. Per the guidelines for the management of chronic cough due to NAEB from ACCP, ICSs are the recommended first-line treatment.^{13,20} One of the clinical characteristics of NAEB is chronic cough without evidence of variable airflow obstruction or airway hyperresponsiveness. As a result, a beta-agonist bronchodilator would not be expected to be useful in treating this condition.

- 45. Chronic Cough due to Bronchiolitis.** The ACCP guidelines do not recommend bronchodilators as a therapeutic option in treating bronchiolitis.^{13,21} Use of asthma medications is discouraged unless other evidence of asthma is present. Guidelines from the American Academy of Pediatrics regarding the diagnosis and management of bronchiolitis (2014) also do not recommend that inhaled corticosteroids or bronchodilators be routinely used in the management of bronchiolitis.²²

- 46. Chronic Cough due to Bronchiectasis.** Limited data are available with budesonide/formoterol (foreign formulation of Symbicort) for the treatment of non-cystic fibrosis (CF) bronchiectasis.^{23,24} ACCP guidelines note that in patients with bronchiectasis due to CF or other causes, treatment of respiratory infections and airway clearance techniques are the mainstays of management.²⁵ In patients with airflow obstruction and/or bronchial hyperreactivity (e.g., asthma and/or COPD), bronchodilators may be of benefit.^{13,26} However, the ACCP guidelines and the British Thoracic Society (BTS) guidelines do not recommend treatment with ICSs. Bronchiectasis guidelines from the European Respiratory Society also recommend against offering ICSs to adult, adolescent, and patients with bronchiectasis.^{27,28} There may be a role for combination ICS/LABA therapy in patients with coexisting

asthma or COPD, but there is no evidence to support this therapy in patients without these concomitant conditions.²⁶⁻²⁸

- 47. Whooping Cough/Pertussis.** There are no data to support the use of ICS/LABA combination therapy in treating this condition. According to the ACCP guidelines, LABAs and inhaled corticosteroids should not be offered to patients with whooping cough as there is no evidence to suggest benefit.¹³ Although short-acting beta-agonists (SABA) [along with other treatments] have been proposed as standard treatment for whooping cough, one review article reported that treatment with the SABA salbutamol resulted in no change in coughing.²⁹
- 48. Angiotensin-Converting Enzyme (ACE) Inhibitor-Induced Cough.** There are no data to support the use of ICS/LABA combination therapy in treating this condition. Discontinuation of the ACE inhibitor is the only uniformly effective treatment for ACE inhibitor-induced cough. In those patients in whom the ACE inhibitor cannot be discontinued, pharmacologic therapy aimed at suppressing cough should be attempted. ICSs and beta-agonists are not recommended therapeutic options.¹³
- 49. Psychogenic Cough/Habit Cough/Tic Cough.** There are no data to support the use of ICS/LABA combination therapy in treating these conditions. Non-pharmacological therapies, such as behavior modification, hypnosis and psychiatric therapy are the mainstays of treatment.^{13,30}
- 50.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION WITH STEP THERAPY POLICY

POLICY: Pulmonary – Roflumilast Prior Authorization with Step Therapy Policy

- Daliresp® (roflumilast tablets – Astra Zeneca, generic)

REVIEW DATE: 01/17/2024

OVERVIEW

Roflumilast tablets (Daliresp, generic), a selective phosphodiesterase-4 inhibitor, is indicated as a treatment to reduce the risk of **chronic obstructive pulmonary disease (COPD)** exacerbations in patients with severe COPD associated with chronic bronchitis and a history of exacerbations.¹ Limitations of use: Roflumilast is not a bronchodilator and is not indicated for the relief of acute bronchospasm.

Clinical Efficacy

Roflumilast has been studied in patients currently receiving treatment with bronchodilators (e.g., long-acting beta₂-agonists [LABAs]) and inhaled corticosteroids (ICSs) with or without additional therapy with a long-acting muscarinic antagonist (LAMA).²⁻⁷ Five placebo-controlled clinical trials evaluated the effect of roflumilast on COPD exacerbations.¹⁻⁷ Two of these studies initially included patients with severe COPD with chronic bronchitis and/or emphysema; in both studies, roflumilast did not demonstrate a significant reduction in COPD exacerbation rates. An exploratory analysis of these trials found that in the subgroup of patients with severe COPD who had chronic bronchitis and exacerbations within the previous year, roflumilast resulted in better exacerbation reduction than in the overall population. Two subsequent trials were conducted involving patients with severe COPD, chronic bronchitis, and at least one COPD exacerbation within the previous year. In both trials, roflumilast demonstrated a significant reduction in the rate of moderate or severe exacerbations compared to placebo.

Guidelines

The Global Initiative for Chronic Obstructive Lung Disease guidelines for the diagnosis, management, and prevention of COPD (2024) recommend bronchodilators as initial pharmacologic treatment.⁸ Following initiation, therapies should be adjusted as needed based on symptom severity and exacerbation risk. ICSs are recommended for patients who continue to experience COPD exacerbations and who have elevated blood eosinophils. Roflumilast is listed as a possible therapeutic option in patients with chronic bronchitis who are receiving triple therapy with an ICS/LAMA/LABA, who have a forced expiratory volume in 1 second (FEV₁) < 50%, and who continue to experience exacerbations (especially if the patient has been hospitalized for one or more COPD exacerbations in the past year). This therapy is also recommended in patients who continue to experience exacerbations despite LAMA/LABA combination therapy and have a blood eosinophil level < 100 cells/microliter. Low blood eosinophils are predictive of an insufficient response to ICS therapy, thereby making roflumilast a more attractive option for add-on therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of roflumilast tablets (Daliresp, generic). This Prior Authorization Policy also contains a Step Therapy component. When clinically appropriate, the patient is directed to try generic roflumilast (Step 1) prior to brand Daliresp (Step 2). All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

01/17/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Coverage of roflumilast tablets (Daliresp, generic) is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Chronic Obstructive Pulmonary Disease (COPD).** Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
 - A) Patient has severe COPD or very severe COPD, according to the prescriber; AND
 - B) Patient has a of exacerbations; AND
 - C) Patient meets ONE of the following (i or ii):
 - i. Patient meets both of the following (a and b):
 - a) Patient has chronic bronchitis; AND
 - b) Patient has tried an inhaled long-acting beta₂-agonist, an inhaled long-acting muscarinic antagonist, and an inhaled corticosteroid concomitantly; OR
Note: Use of a combination inhaler containing multiple agents from the medication classes listed would fulfill the requirement. Refer to the [Appendix](#) for examples of inhaled therapies used for COPD.
 - ii. Patient meets both of the following (a and b):
 - a) Patient has a blood eosinophil level < 100 cells/microliter; AND
 - b) Patient has tried an inhaled long-acting muscarinic antagonist and long-acting beta₂-agonist concomitantly.
Note: Use of a combination inhaler containing multiple agents from the medication classes listed would fulfill the requirement. Refer to the [Appendix](#) for examples of inhaled therapies used for COPD.
 - D) If brand Daliresp is being requested, the patient meets both of the following criteria (i and ii):
 - i. Patient has tried generic roflumilast; AND
 - ii. Brand Daliresp is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of roflumilast tablets (Daliresp, generic) is not recommended for the following situations:

51. **Asthma.** The efficacy of roflumilast (formulation not specified) in patients with asthma⁹⁻¹¹, allergic asthma^{12,13}, and exercise-induced asthma¹⁴ has been evaluated. More data are needed to define the place in therapy of roflumilast in the treatment of asthma. Current asthma guidelines do not address roflumilast as a recommended therapy for asthma management.^{15,16}
52. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Adempas Prior Authorization Policy

- Adempas® (riociguat tablets – Bayer)

REVIEW DATE: 10/9/2024

OVERVIEW

Adempas, a soluble guanylate cyclase stimulator, is indicated for the treatment of adults with:¹

- **Chronic thromboembolic pulmonary hypertension (CTEPH)** [World Health Organization {WHO} Group 4], persistent/recurrent, after surgical treatment, or inoperable CTEPH, to improve exercise capacity and WHO functional class.
- **Pulmonary Arterial Hypertension (PAH) WHO Group 1**, to improve exercise capacity, WHO functional class, and to delay clinical worsening.

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.^{2,3} It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder, the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.^{2,3} Although the mean age of diagnosis is between 36 and 50 years, patients of any age may be affected, including pediatric patients. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.⁷ The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved.

CTEPH is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.^{4,5} It is classified within WHO Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy, including Adempas, may also be recommended. Anticoagulant therapy is also given.

Guidelines

Various guidelines are available for the management of pulmonary hypertension.

- **Pulmonary Arterial Hypertension:** The CHEST guideline and Expert Panel Report regarding therapy for PAH in adults (2019) cites Adempas as a vital therapy with several benefits in a variety of clinical scenarios. The European Society of Cardiology (ESC) and the European Respiratory Society (ERS) guidelines regarding the treatment of pulmonary hypertension (2022) also recognize Adempas as having a prominent role in the management of this condition, as monotherapy or in combination with other agents.
- **Chronic Thromboembolic Pulmonary Hypertension:** Guidelines from the ESC/ERS regarding the treatment of pulmonary hypertension (2022) recommended Adempas for patients who are symptomatic with inoperable CTEPH or persistent/recurrent pulmonary hypertension after pulmonary endarterectomy.⁶

POLICY STATEMENT

10/11/2023

© 2023. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Prior Authorization is recommended for prescription benefit coverage of Adempas. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Adempas as well as the monitoring required for adverse events and long-term efficacy, approval requires Adempas to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Adempas Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Adempas is recommended in those who meet one of the following criteria:

FDA-Approved Indications

6. **Chronic Thromboembolic Pulmonary Hypertension.** Approve for 1 year if prescribed by or in consultation with a pulmonologist or a cardiologist.
7. **Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1].** Approve for the duration noted if the patient meets ONE of the following (A or B):
 - A) **Initial Therapy.** Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):
 - i. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
 - b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
 - iii. Medication is prescribed by or in consultation with a cardiologist or a pulmonologist.
 - B) **Patient is Currently Receiving Adempas.** Approve for 1 year if the patient meets ALL of the following (i ii, and iii):
 - i. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient has had a right heart catheterization; AND

Note: This refers to prior to starting therapy with a medication for WHO Group 1 PAH.

 - b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
 - iii. Medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Adempas is not recommended in the following situations:

- 1. Concurrent Use with Phosphodiesterase Inhibitors Used for Pulmonary Hypertension or Other Soluble Guanylate Cyclase Stimulators.** Use of Adempas with phosphodiesterase inhibitors and/or with other soluble guanylate cyclase stimulators is a contraindication.¹
Note: Examples of phosphodiesterase inhibitors used for pulmonary hypertension include Revatio (sildenafil tablets, suspension, and intravenous injection), Adcirca (tadalafil tablets), Alyq (tadalafil tablets), Tadliq (tadalafil oral suspension) and Opsynvi (macitentan/tadaladil tablets). An example of a soluble guanylate cyclase stimulator is Verquvo (vericiguat tablets).
- 2.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Pulmonary Arterial Hypertension – Endothelin Receptor Antagonists
- Letairis® (ambrisentan tablets – Gilead, generic)
 - Opsumit® (macitentan tablets – Actelion/Janssen)
 - Opsynvi® (macitentan/tadalafil tablets – Actelion/Janssen)
 - Tracleer® (bosentan tablets and tablets for oral suspension – Actelion/Janssen, generic for tablets)

REVIEW DATE: 10/02/2024

OVERVIEW

Ambrisentan (Letairis, generic), Opsumit, and bosentan (Tracleer, generic [generic for tablets only]), oral endothelin receptor antagonists, are indicated for the treatment of **pulmonary arterial hypertension** (PAH), World Health Organization (WHO) Group 1.¹⁻³

- Ambrisentan is indicated to improve exercise ability and delay clinical worsening as well as for use in combination with tadalafil to reduce the risks of disease progression and hospitalization for worsening PAH, and to improve exercise ability.²
- Opsumit is noted to reduce the risks of disease progression and hospitalization for PAH.³
- Bosentan is indicated in adults to improve exercise ability and decrease the rate of clinical worsening and in pediatric patients ≥ 3 years of age with idiopathic or congenital PAH to improve pulmonary vascular resistance (PVR), which is expected to result in an improvement in exercise ability.¹

Opsynvi is a combination of macitentan, an endothelin receptor antagonist (ERA), and tadalafil, a phosphodiesterase 5 (PDE5) inhibitor, indicated for the treatment of **pulmonary arterial hypertension** in adult patients of WHO functional class II to III.²⁰

- Opsynvi may be initiated in PAH treatment-naïve patients or in those transitioning from an ERA, PDE5 inhibitor, or a combination of both agents. For treatment-naïve patients and those receiving an ERA only, Opsynvi is started at a low dose with subsequent increase to the maintenance dose once daily. For those transitioning from a PDE5 inhibitor monotherapy or combination ERA and PDE5 inhibitor, the maintenance dose of Opsynvi is initiated.

Clinical Efficacy

The BENEFiT (Bosentan Effects in iNoperable Forms of chronic Thromboembolic pulmonary hypertension) study was a double-blind trial involving patients with chronic thromboembolic pulmonary hypertension (CTEPH) who were randomized to Tracleer or placebo for 16 weeks (n = 156). Benefits were noted in some hemodynamic parameters (e.g., decreased PVR).⁴ Adempas® (riociguat tablets), a soluble guanylate cyclase stimulator, is the only agent indicated for the treatment of adults with CTEPH (WHO Group 4) after surgical treatment, or inoperable CTEPH, to improve exercise capacity and WHO functional class.⁵ The agent is also indicated for the treatment of adults with PAH (WHO Group 1). Adempas has a Boxed Warning regarding embryofetal toxicity and is contraindicated in patients using nitrates or nitric oxide donors in any forms, as well as in patients using phosphodiesterase inhibitors. The main adverse event associated with Adempas is symptomatic hypotension.

Tracleer has been used in patients with systemic sclerosis who have digital ulcers.⁶⁻¹³ In a prospective, multicenter, placebo-controlled, double-blind study patients (n = 122) with limited or diffuse systemic sclerosis (scleroderma) were randomized in a 2:1 ratio to receive Tracleer or placebo for 16 weeks.⁶ Patients receiving Tracleer had a 48% reduction in the mean number of new ulcerations (1.4 vs. 2.7 new ulcers; P

10/02/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

= 0.0083), the primary efficacy endpoint. The effect was more substantial in patients with digital ulcers at study entry. However, no differences were noted in the healing of established ulcers.⁶ Another trial showed a reduction in the occurrence of new digital ulcers in patients given Tracleer for 24 weeks.¹⁰

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.^{14,15} It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder, the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment. Although the mean age of diagnosis is between 36 and 50 years, patients of any age may be affected, including pediatric patients. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.¹⁹ The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved.

CTEPH is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.^{16,17} It is classified within Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy may also be recommended. Anticoagulant therapy is also given.

Guidelines

Various guidelines address endothelin receptor antagonists.

- **Pulmonary Arterial Hypertension (PAH):** The CHEST guideline and Expert Panel Report regarding therapy for PAH (2019) in adults details many medications. It was noted that ERAs and PDE5 inhibitors play a vital role and have various benefits in the management of PAH.¹⁵ The European Society of Cardiology and the European Respiratory Society guidelines regarding the treatment of pulmonary hypertension (2022) also recognize PDE5 inhibitors and ERAs as having a prominent role in the management of this condition, as monotherapy or in use as combination with other agents.¹⁸
- **Systemic Sclerosis:** In 2017, the European League Against Rheumatism (EULAR) updated recommendations for the treatment of systemic sclerosis.¹² Tracleer should be considered to reduce the number of new digital ulcers in systemic sclerosis, especially in patients who have multiple digital ulcers despite use of calcium channel blockers, phosphodiesterase type 5 inhibitors or iloprost therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of ambrisentan, Opsumit, Oprelvekin, and bosentan. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with these agents, as well as the monitoring required for adverse events and long-term efficacy, approval requires the agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for initiation of therapy as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for

WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Endothelin Receptor Antagonist Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

- I. Coverage of ambrisentan (Letairis, generic), Opsumit, Opsynvi, and bosentan (Tracleer, generic) is recommended in those who meet the following criteria:

FDA-Approved Indication

8. **Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1].** Approve for the duration noted if the patient meets ONE of the following (A or B):

- C) Initial Therapy. Approve for 1 year if the patient meets ALL of the following (i, ii, and iii).
- i. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
 - b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
 - iii. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.
- D) Patient is Currently Receiving the Requested Endothelin Receptor Antagonist (i.e., ambrisentan [Letairis, generic], Opsumit, or bosentan [Tracleer, generic]) or Opsynvi. Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):
- iv. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
 - v. Patient meets BOTH of the following (a and b):
 - a) Patient has had a right heart catheterization; AND
Note: This refers to prior to starting therapy with a medication for WHO Group 1 PAH
 - b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
 - vi. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

Other Uses with Supportive Evidence

- II. Coverage of bosentan (Tracleer, generic) is also recommended in those who meet the following criteria:

9. **Chronic Thromboembolic Pulmonary Hypertension (CTEPH).** Approve bosentan (Tracleer, generic) for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient meets ONE of the following (i, ii, or iii):
- i. Patient has tried Adempas; OR
 - ii. According to the prescriber, use of Adempas is contraindicated; OR
Note: Examples of contraindications to use of Adempas include that the patient is receiving nitrates or nitric oxide donors, the patient is receiving a phosphodiesterase inhibitor such as sildenafil or tadalafil, or that the patient is hypotensive or is at risk for hypotension.
 - iii. Patient is currently receiving bosentan (Tracleer, generic)
- B) The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

10. Digital Ulcers in a Patient with Systemic Sclerosis. Approve bosentan (Tracleer, generic) for 1 year if the patient meets ONE of the following (A or B):

A) Patient has tried one calcium channel blocker; OR

Note: Examples include amlodipine, felodipine and nifedipine.

B) Patient has tried one phosphodiesterase type 5 (PDE5) inhibitor.

Note: Examples include sildenafil, tadalafil and vardenafil.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

I. Coverage of ambrisentan (Letairis, generic), Opsumit, and bosentan (Tracleer, generic) is not recommended in the following situations:

53. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

II. Coverage of Opsynvi is not recommended in the following situations:

2. Concurrent Use With Guanylate Cyclase Stimulators. Use of Opsynvi with guanylate cyclase stimulators is contraindicated.¹

Note: An example of a guanylate cyclase stimulator is Adempas (riociguat tablets).

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Epoprostenol Products Prior Authorization Policy

- Flolan® (epoprostenol intravenous infusion – GlaxoSmithKline, generic)
- Veletri® (epoprostenol intravenous infusion – Actelion/Janssen)

REVIEW DATE: 10/09/2024

OVERVIEW

Epoprostenol intravenous infusion, a prostacyclin vasodilator, is indicated for the treatment of pulmonary arterial hypertension (PAH) [World Health Organization {WHO} Group 1] to improve exercise capacity.¹⁻³

Epoprostenol injection has been used with varying results in patients with chronic thromboembolic pulmonary hypertension (CTEPH).⁴⁻⁶ It is sometimes used as a bridge prior to surgery. Limited options are available for patients with CTEPH.

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.^{7,8} The estimated incidence of PAH is 2 cases per 1 million per year with a prevalence of 10.6 cases per 1 million adults.⁷ It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized.^{7,8} In this progressive disorder, the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment. In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness, and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions (e.g., connective tissue disease, HIV) or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.¹³ The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association system to evaluate activity tolerance.

CTEPH is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.^{9,10} It is classified within Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy may also be recommended. Anticoagulant therapy is also given.

Guidelines

Several guidelines address intravenous epoprostenol products in the management of pulmonary hypertension.^{8,11}

- **Pulmonary Arterial Hypertension:** The CHEST guidelines and Expert Panel Report regarding therapy for PAH in adults (2019) cites the many medications that have utility for this condition.⁸

10/09/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

In the absence of contraindications, patients with PAH should undergo acute vasoreactivity testing utilizing a short-acting agent (e.g., calcium channel blockers). For patients in Functional Class II, oral therapies are recommended such as endothelin receptor antagonists (ambrisentan, bosentan, Opsumit® [macitentan tablets]), phosphodiesterase type 5 inhibitors (tadalafil, sildenafil), and Adempas® (riociguat tablets). It is suggested that parenteral or inhaled prostanoids not be chosen as initial therapy for treatment naïve-patients with PAH with WHO Functional Class II symptoms or as second-line agents for patients with PAH with WHO Functional Class II who have not met their treatment goals. Parenteral prostanoids are recommended for patients with PAH in Functional Class III and IV.⁸ The European Society of Cardiology (ESC) and the European Respiratory Society (ERS) guidelines regarding the treatment of pulmonary hypertension (2022) also recognize intravenous epoprostenol as having a prominent role in the management of this condition, usually in later therapy stages and after other therapies.¹¹

- **Chronic Thromboembolic Pulmonary Hypertension:** Guidelines from the ESC/ERS regarding the treatment of pulmonary hypertension (2022) recommended to consider parenteral prostacyclin analogs for patients with inoperable CTEPH.¹¹

Safety

Epoprostenol should not be abruptly discontinued or have the dose rapidly decreased as rebound pulmonary hypertension may occur.¹⁻³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of epoprostenol injection. All approvals are provided for 1 year in duration unless otherwise noted below. Specifically, approvals will remain up to 14 days for patients currently receiving the agent for the indication of PAH (WHO Group 1) with inadequate information or if the criteria are not met. These cases are reviewed by a nurse or pharmacist. Because of the specialized skills required for evaluation and diagnosis of patients treated with epoprostenol injection as well as the monitoring required for adverse events and long-term efficacy, approval requires epoprostenol injection to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: In the *Pulmonary Arterial Hypertension – Epoprostenol Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Epoprostenol Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of epoprostenol injection is recommended in those who meet one of the following criteria:

FDA-Approved Indication

11. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1].

Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets ALL of the following (i, ii, iii, iv, and v):

i. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. Patient meets BOTH of the following (a and b):

a) Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iii. Patient meets ONE of the following (a or b):

a) Patient is in Functional Class III or IV; OR

b) Patient is in Functional Class II and meets ONE of the following [(1) or (2)]:

(1) Patient has tried or is currently receiving one oral agent for PAH; OR

Note: Examples of oral agents for PAH include bosentan, ambrisentan, Opsumit (macitentan tablets), Opsumvi (macitentan/tadalafil tablets), Adempas (riociguat tablets), sildenafil, tadalafil, Orenitram (treprostinil extended-release tablets), Alyq (tadalafil tablets), Tadliq (tadalafil oral suspension), and Uptravi (selexipag tablets).

(2) Patient has tried one inhaled or parenteral prostacyclin product for PAH; AND

Note: Examples of inhaled and parenteral prostacyclin products for PAH include Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation powder), Ventavis (iloprost inhalation solution), treprostinil injection, and epoprostenol injection.

iv. Patient with idiopathic PAH must meet ONE of the following (a, b, c, d, or e):

a) Patient must meet BOTH of the following [(1) and (2)]:

(1) According to the prescriber, the patient has had an acute response to vasodilator testing that occurred during the right heart catheterization; AND

Note: An example of a response can be defined as a decrease in mean pulmonary artery pressure of at least 10 mm Hg to an absolute mean pulmonary artery pressure of less than 40 mm Hg without a decrease in cardiac output.

(2) Patient has tried one oral calcium channel blocker (CCB) therapy; OR

Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets.

b) According to the prescriber, the patient did not have an acute response to vasodilator testing; OR

c) According to the prescriber, the patient cannot undergo a vasodilator test; OR

d) Patient cannot take CCB therapy; OR

Note: Examples of reasons a patient cannot take CCB therapy include right heart failure or decreased cardiac output.

e) Patient has tried one CCB; AND

Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets.

v. Medication is prescribed by or in consultation with a cardiologist or a pulmonologist; OR

B) Patient Currently Receiving Epoprostenol. Approve for the duration noted below if the patient meets ONE of the following (i or ii):

i. Approve for 1 year if the patient meets ALL of the following (a, b, and c):

a) Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

b) Patient meets BOTH of the following [(1) and (2)]:

(1) Patient has had a right heart catheterization; AND

Note: This refers to prior to starting therapy with a medication for WHO Group 1 PAH.

(2) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

- c) Medication is prescribed by or in consultation with a cardiologist or a pulmonologist; OR
- ii. Approve a short-term supply of epoprostenol for up to 14 days if the patient does not meet the criteria in 1Bi above or if there is insufficient information available. All approvals are reviewed by a nurse or pharmacist.

Note: A 14-day supply should be sufficient to address coverage issues. However, multiple short-term approvals are allowed if a coverage determination cannot be made. Abrupt discontinuation of epoprostenol therapy may have severe adverse consequences.

Other Uses with Supportive Evidence

12. Chronic Thromboembolic Pulmonary Hypertension (CTEPH). Approve for 1 year if prescribed by or in consultation with a pulmonologist or a cardiologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of epoprostenol injection is not recommended in the following situations:

- 1. Chronic Obstructive Pulmonary Disease (COPD) in a Patient Without PAH (WHO Group 1).** COPD is classified as Group 3 Pulmonary Hypertension (pulmonary hypertension associated with lung diseases and/or hypoxia). Pulmonary hypertension may develop late in the course of COPD, but medications used for the treatment of PAH (WHO Group 1) are not recommended therapies.¹²
- 2. Concurrent Use with Parenteral Treprostinil Products, Oral Prostacyclin Products, or Inhaled Prostacyclin Agents Used for Pulmonary Hypertension.**
Note: Examples of medications include Orenitram (treprostinil extended-release tablets), Uptravi (selexipag tablets and intravenous infusion), Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation powder), Ventavis (iloprost inhalation solution), and treprostinil subcutaneous injection and intravenous infusion (Remodulin, generic).
- 3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria.** Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Orenitram Prior Authorization Policy

- Orenitram® (treprostinil extended-release tablets – United Therapeutics)

REVIEW DATE: 10/09/2024

OVERVIEW

Orenitram, a prostacyclin mimetic, is indicated for the treatment of **pulmonary arterial hypertension (PAH) World Health Organization (WHO) Group 1** to delay disease progression and to improve exercise capacity.¹

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.^{2,3} It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder, the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment. Although the mean age of diagnosis is between 36 and 50 years, patients of any age may be affected, including pediatric patients. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.⁵ The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved.

Guidelines

Various guidelines address oral prostacyclin products.^{3,4} The CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension (2019) in adults details many medications.³ It was cited that many agents with varying mechanisms of action are used for the management of PAH. It was noted that the addition of an oral prostanoid product may be considered in patients with PAH who are in Functional Class III with evidence of rapid disease progression or a poor prognosis among those not willing or able to manage parenteral prostanoids. The European Society of Cardiology and the European Respiratory Society guidelines regarding the treatment of pulmonary hypertension (2022) also recognize Orenitram as having a role in therapy.⁴ It may be considered in select patients receiving monotherapy with an endothelin receptor antagonist, phosphodiesterase type 5 inhibitor, or soluble guanylate cyclase stimulator to reduce the risk of morbidity/mortality events.

Safety

Abrupt discontinuation or sudden large reductions in the dosage of Orenitram may cause PAH symptoms to worsen.¹ In the event of a planned short-term treatment interruption for patients unable to take oral medication, consider a temporary infusion of subcutaneous or intravenous treprostinil.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Orenitram. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Orenitram as well as the monitoring required for adverse events and long-term efficacy, approval requires Orenitram to be prescribed by or in consultation with a physician who specializes in the condition being treated.

10/09/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Documentation: Documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Orenitram Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Orenitram is recommended in those who meet the following criteria:

FDA-Approved Indication

13. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1].

Approve for the duration noted if the patient meets ONE of the following (A or B):

E) Initial Therapy. Approve for 1 year if the patient meets ALL of the following (i, ii, iii, and iv):

- i.** Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- ii.** Patient meets BOTH of the following (a and b):
 - a)** Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
 - b)** Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
- iii.** Patient meets ONE of the following (a or b):
 - a)** Patient has tried or is currently receiving at least one oral medication for PAH from the following different categories (either alone or in combination) each for ≥ 60 days: one phosphodiesterase type 5 (PDE5) inhibitor, one endothelin receptor antagonist (ERA), or Adempas (riociguat tablets); OR
Note: Examples of phosphodiesterase type 5 inhibitors include sildenafil and tadalafil. Examples of endothelin receptor antagonists include bosentan, ambrisentan, and Opsumit (macitentan tablets). Opsumvi (macitentan/tadalafil tablets) is a combination product containing a phosphodiesterase type 5 inhibitor and endothelin receptor antagonist.
 - b)** Patient is receiving or has received in the past one PAH prostacyclin therapy or a prostacyclin receptor agonist (i.e., Upravi [selexipag tablets]) for PAH; AND
Note: Examples of prostacyclin therapies for PAH include Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation), Ventavis (iloprost inhalation solution), treprostinil injection, and epoprostenol injection.
- iv.** Medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

F) Patient is Currently Receiving Orenitram. Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):

- vii.** Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- viii.** Patient meets BOTH of the following (a and b):
 - a)** Patient has had a right heart catheterization; AND
Note: This refers to prior to starting therapy with a medication for WHO Group 1 PAH.
 - b)** Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
- ix.** The medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Orenitram is not recommended in the following situations:

54. Concurrent Use with Uptravi (selexipag tablets and intravenous infusion), Inhaled Prostacyclin Products, or Parenteral Prostacyclin Agents Used for Pulmonary Hypertension.

Note: Examples of medications include Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation powder), Ventavis (iloprost inhalation solution), epoprostenol intravenous infusion, and treprostinil subcutaneous or intravenous infusion (Remodulin, generic).

55. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Phosphodiesterase Type 5 Inhibitors Prior Authorization Policy

- Adcirca® (tadalafil tablets – Eli Lilly/United Therapeutics, generic)
 - Alyq™ (tadalafil tablets – Teva, generic)
 - LiQrev® (sildenafil oral suspension – CMP)
 - Revatio® (sildenafil tablets and suspension – Pfizer, generic)
- Note: Revatio injection is not included in this policy
- Tadliq® (tadalafil oral suspension – CMP)

REVIEW DATE: 10/02/2024

OVERVIEW

Adcirca, Alyq, LiQrev, Revatio, and Tadliq are phosphodiesterase type 5 (PDE5) inhibitors indicated for the treatment of **pulmonary arterial hypertension (PAH)**.¹⁻⁴ Alyq is a generic to Adcirca.⁴

- Adcirca, Alyq, and Tadliq are indicated for the treatment of PAH (World Health Organization [WHO] Group I) to improve exercise ability.²⁻⁴
- Liqrev and Revatio are indicated for the treatment of PAH (WHO Group I) in adults to improve exercise ability and delay clinical worsening.^{1,16}
- Revatio is also indicated in pediatric patients 1 to 17 years old for the treatment of PAH to improve exercise ability and, in pediatric patients too young to perform standard exercise testing, pulmonary hemodynamics thought to underly improvements in exercise.¹

Tadalafil and sildenafil have some data in patients with Raynaud's phenomenon at doses provided in strengths used for PAH.⁵⁻⁸ In many situations, patients also had scleroderma. Benefits were noted, such as decrease frequency and shorter durations of attacks, as well as in selected parameters regarding digital ulceration.

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.^{9,10} It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder, the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment. Although the mean age of diagnosis is between 36 and 50 years, patients of any age may be affected, including pediatric patients. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.¹⁷ The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved.

Guidelines

Various guidelines address PDE5 inhibitors for the conditions cited above.

- **Pulmonary Arterial Hypertension:** The CHEST guideline and Expert Panel Report regarding therapy for PAH in adults (2019) details many medications. It was noted that PDE5 inhibitors play a vital role and have various benefits in the management of PAH.¹⁰ The European Society of Cardiology and the European Respiratory Society guidelines regarding the treatment of pulmonary hypertension (2022) also recognize PDE5 inhibitors as having a prominent role in the management of this condition, as monotherapy or in use as combination with other agents.¹¹

10/02/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Systemic Sclerosis:** In 2017, the European League Against Rheumatism updated recommendations for the treatment of systemic sclerosis.¹² Dihydropyridine calcium channel blockers, usually oral nifedipine, are recommended for first-line therapy of Raynaud phenomenon in patients with systemic sclerosis. PDE5 inhibitors should be considered in such clinical scenarios as well.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Adcirca, Alyq, Liquev, Revatio (tablets and suspension only), and Tadliq. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Adcirca, Alyq, Liquev, Revatio (tablets and suspension only), and Tadliq, as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for initiation of therapy as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Phosphodiesterase Type 5 Inhibitors Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Adcirca, Alyq, Liquev, Revatio, and Tadliq is recommended in those who meet the following criteria:

FDA-Approved Indication

14. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1].

Approve for the duration noted if the patient meets ONE of the following (A or B):

G) Initial Therapy. Approve for 1 year if the patient meets BOTH of the following (i and ii):

i. Patient meets BOTH of the following (a and b):

a) Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

ii. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

H) Patient is Currently Receiving the Requested Phosphodiesterase Type 5 (PDE5) Inhibitor. Approve for 1 year if the patient meets BOTH of the following (i and ii):

x. Patient meets BOTH of the following (a and b):

a) Patient has had a right heart catheterization; AND

Note: This refers to prior to starting therapy with a medication for WHO Group 1 PAH.

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

xi. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

Other Uses with Supportive Evidence

15. Raynaud's Phenomenon. Approve for 1 year if the patient meets ONE of the following (A or B):

A) Patient has tried one calcium channel blocker; OR

Note: Examples of calcium channel blockers include amlodipine, felodipine, and nifedipine.

B) According to the prescriber, use of a calcium channel blocker is contraindicated.

Note: Examples of reasons a patient cannot take calcium channel blocker therapy include right heart failure and decreased cardiac output.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Adcirca, Alyq, Liqrev, Revatio, and Tadalafil is not recommended in the following situations:

3. **Concurrent Use With Guanylate Cyclase Stimulators.** Use of Adcirca, Alyq, Liqrev, Revatio, and/or Tadalafil with guanylate cyclase stimulators is contraindicated.¹³
Note: An example of a guanylate cyclase stimulator is Adempas (riociguat tablets).
4. **Erectile Dysfunction.** Coverage is not recommended. Patients should use other phosphodiesterase type 5 (PDE5) inhibitors indicated for erectile dysfunction (i.e., Viagra [sildenafil tablets], Cialis [tadalafil tablets]).^{14,15}
5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Treprostinil Injection Prior Authorization Policy

- Remodulin® (treprostinil subcutaneous or intravenous infusion – United Therapeutics, generic)

REVIEW DATE: 10/09/2024

OVERVIEW

Treprostinil injection, a prostacyclin vasodilator, is indicated for the treatment of pulmonary arterial hypertension (PAH) [World Health Organization {WHO} Group 1] to:^{1,2}

- **Diminish symptoms associated** with exercise.
- **Reduce the rate of clinical deterioration** for patients who require transition from epoprostenol.

Treprostinil injection has been used with varying results in patients with chronic thromboembolic pulmonary hypertension (CTEPH).³⁻⁷ Benefits noted include improvement in functional class, six-minute walk distance, and in hemodynamic parameters. Treprostinil injection is sometimes used as a bridge prior to surgery. Limited options are available for patients with CTEPH.

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.^{8,9} The estimated incidence of PAH is 2 cases per 1 million per year with a prevalence of 10.6 cases per 1 million adults.⁸ It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized.^{8,9} In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment. In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness, and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease (e.g., connective tissue disease, HIV) that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.¹⁴ The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association system to evaluate activity tolerance.

CTEPH is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.^{10,11} It is classified within Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy may also be recommended. Anticoagulant therapy is also given.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Guidelines

Several guidelines address treprostinil injection in the management of pulmonary hypertension.^{9,12}

- **Pulmonary Arterial Hypertension:** An updated CHEST guideline and Expert Panel Report regarding therapy for PAH in adults (2019) provides the evidence for use of the many medications for this condition.⁹ In the absence of contraindications, patients with PAH should undergo acute vasoreactivity testing utilizing a short-acting agent (e.g., calcium channel blockers). For patients in Functional Class II, oral therapies are recommended such as endothelin receptor antagonists (ambrisentan, bosentan, Opsumit® [macitentan tablets]), phosphodiesterase type 5 inhibitors (tadalafil, sildenafil), and Adempas® (riociguat tablets). It is suggested that parenteral or inhaled prostanoids not be chosen as initial therapy for treatment naïve patients with PAH with WHO Functional Class II symptoms or as second-line agents for patients with PAH with WHO Functional Class II who have not met their treatment goals. Prostanoids may be considered in patients who have contraindications or difficulty tolerating phosphodiesterase type 5 inhibitors or endothelin receptor antagonists. Parenteral prostanoids are recommended for patients with PAH in Functional Class III and IV.⁹ The European Society of Cardiology (ESC) and the European Respiratory Society (ERS) guidelines regarding the treatment of pulmonary hypertension (2022) also recognize parenteral treprostinil as having a prominent role in the management of this condition, usually in later therapy stages and after other therapies.¹²
- **Chronic Thromboembolic Pulmonary Hypertension:** Guidelines from the ESC/ERS regarding the treatment of pulmonary hypertension (2022) recommended to consider parenteral prostacyclin analogs for patients with inoperable CTEPH.¹²

Safety

Treprostinil injection should not be abruptly discontinued or have the dose rapidly decreased as rebound pulmonary hypertension may occur.^{1,2}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of treprostinil injection. All approvals are provided for 1 year in duration unless otherwise noted below. Specifically, approvals will remain up to 14 days for patients currently receiving the agent for the indication of PAH (WHO Group 1) with inadequate information or if the criteria are not met. These cases are reviewed by a nurse or pharmacist. Because of the specialized skills required for evaluation and diagnosis of patients treated with treprostinil injection as well as the monitoring required for adverse events and long-term efficacy, approval requires treprostinil injection to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: In the *Pulmonary Arterial Hypertension – Treprostinil Injection Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory results. For a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Treprostinil Injection Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of treprostinil injection is recommended in those who meet one of the following criteria:

FDA-Approved Indication

16. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1].

Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets ALL of the following (i, ii, iii, iv, and v):

i. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. Patient meets BOTH of the following (a and b):

a) Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iii. Patient meets ONE of the following (a or b):

a) Patient is in Functional Class III or IV; OR

b) Patient is in Functional Class II and meets ONE of the following [(1) or (2)]:

(1) Patient has tried or is currently receiving one oral agent for PAH; OR

Note: Examples of oral agents for PAH include bosentan, ambrisentan, Opsumit (macitentan tablets), Opsumvi (macitentan/tadalafil tablets), Adempas (riociguat tablets), sildenafil, tadalafil, Alyq (tadalafil tablets), Tadliq (tadalafil oral suspension), Orenitram (treprostinil extended-release tablets) and Upravi (selexipag tablets).

(2) Patient has tried one inhaled or parenteral prostacyclin product for PAH; AND

Note: Examples of inhaled and parenteral prostacyclin products for PAH include Ventavis (iloprost inhalation solution), Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation powder), and epoprostenol intravenous infusion (Flolan, Veletri, generics).

iv. Patient with idiopathic PAH must meet ONE of the following (a, b, c, d, or e):

a) Patient meets BOTH of the following [(1) and (2)]:

(1) According to the prescriber, the patient has had an acute response to vasodilator testing that occurred during the right heart catheterization; AND

Note: An example of a response can be defined as a decrease in mean pulmonary artery pressure of at least 10 mm Hg to an absolute mean pulmonary artery pressure of less than 40 mm Hg without a decrease in cardiac output.

(2) Patient has tried one calcium channel blocker (CCB) therapy; OR

Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets.

b) According to the prescriber, the patient did not have an acute response to vasodilator testing; OR

c) According to the prescriber, the patient cannot undergo a vasodilator test; OR

d) Patient cannot take CCB therapy; OR

Note: Examples of reasons a patient cannot take CCB therapy include right heart failure or decreased cardiac output.

e) Patient has tried one CCB; AND

Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets.

v. Medication is prescribed by or in consultation with a cardiologist or a pulmonologist; OR

B) Patient Currently Receiving Treprostinil Injection. Approve for the duration noted below if the patient meets ONE of the following (i or ii):

iii. Approve for 1 year if the patient meets ALL of the following (a, b, and c):

- d) Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- e) Patient meets the following [(1) and (2)]:
 - (1) Patient has had a right heart catheterization; AND

Note: This refers to prior to starting therapy with a medication for WHO Group 1 PAH.
 - (2) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
- f) Medication is prescribed by or in consultation with a cardiologist or a pulmonologist; OR
 - iv. Approve a short-term supply of treprostinil injection for up to 14 days if the patient does not meet the criteria in 1Bi above or if there is insufficient information available. All approvals are reviewed by a nurse or pharmacist.

Note: A 14-day supply should be sufficient to address coverage issues. However, multiple short-term approvals are allowed if a coverage determination cannot be made. Abrupt discontinuation of treprostinil injection therapy may have severe adverse consequences.

Other Uses with Supportive Evidence

- 17. **Chronic Thromboembolic Pulmonary Hypertension (CTEPH).** Approve for 1 year if prescribed by or in consultation with a pulmonologist or a cardiologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of treprostinil injection is not recommended in the following situations:

- 4. **Chronic Obstructive Pulmonary Disease (COPD) in a Patient without PAH (WHO Group 1).** COPD is classified as Group 3 Pulmonary Hypertension (pulmonary hypertension associated with lung diseases and/or hypoxia). Pulmonary hypertension may develop late in the course of COPD, but medications used for the treatment of PAH (WHO Group 1) are not recommended therapies.¹³
- 5. **Concurrent Use with Parenteral Epoprostenol Products, Oral Prostacyclin Products, or Inhaled Prostacyclin Agents Used for Pulmonary Hypertension.**

Note: Examples of medications include Orenitram (treprostinil extended-release tablets), Uptravi (selexipag tablets and intravenous infusion), Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation powder), Ventavis (iloprost inhalation solution), and epoprostenol intravenous infusion (Flolan, Veletri, generic).
- 6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Uptravi Prior Authorization Policy

- Uptravi® (selexipag tablets – Actelion/Janssen)

Note: Uptravi injection is not included in this policy

REVIEW DATE: 10/09/2024

OVERVIEW

Uptravi, a prostacyclin receptor agonist, is indicated for the treatment of **pulmonary arterial hypertension (PAH) World Health Organization (WHO) Group 1** to delay disease progression and reduce the risk of hospitalization for PAH.¹

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.^{2,3} It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment. Although the mean age of diagnosis is between 36 and 50 years, patients of any age may be affected, including pediatric patients. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.⁵ The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved.

Guidelines

Various guidelines address oral prostacyclin products.^{3,4} The CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension (2019) in adults details many medications.³ It was cited that many agents with varying mechanisms of action are used for the management of PAH. It was noted that the addition of an oral prostanoid product is recommended in patients with PAH who are in Functional Class III without evidence of rapid disease progression or a poor prognosis among those not willing or able to manage parenteral prostanoids. The European Society of Cardiology and the European Respiratory Society guidelines regarding the treatment of pulmonary hypertension (2022) also recognize Uptravi as having a role in therapy, mainly as an agent to be added onto other PAH therapies.⁴

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Uptravi (tablets). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Uptravi as well as the monitoring required for adverse events and long-term efficacy, approval requires Uptravi tablets to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Uptravi Prior Authorization Policy* is considered to be met.

10/09/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Upravi tablets is recommended in those who meet the following criteria:

FDA-Approved Indication

18. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1].

Approve for the duration noted if the patient meets ONE of the following (A or B):

I) Initial Therapy. Approve for 1 year if the patient meets ALL of the following (i, ii, iii, and iv):

- i.** Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- ii.** Patient meets BOTH of the following (a and b):
 - a)** Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
 - b)** Results for the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
- iii.** Patient meets ONE the of following (a or b):
 - a)** Patient has tried or is currently receiving at least one oral medication for PAH from one of the three following different categories (either alone or in combination) each for ≥ 60 days: one phosphodiesterase type 5 (PDE5) inhibitor, one endothelin receptor antagonist (ERA), or Adempas (riociguat tablets); OR
Note: Examples of phosphodiesterase type 5 inhibitors include sildenafil and tadalafil. Examples of endothelin receptor antagonists include bosentan, ambrisentan, and Opsumit (macitentan tablets). Opsumvi (macitentan/tadalafil tablets) is a combination product containing a phosphodiesterase type 5 inhibitor and endothelin receptor antagonist.
 - b)** Patient is currently receiving, or has a of receiving, one prostacyclin therapy for PAH; AND
Note: Examples of prostacyclin therapies for PAH include Orenitram (treprostinil tablets), Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil inhalation solution), Ventavis (iloprost inhalation solution), treprostinil injection, and epoprostenol injection.
- iv.** The medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

J) Patient is Currently Receiving Upravi. Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):

- i.** Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- ii.** Patient meets BOTH of the following (a and b):
 - a)** Patient has had a right heart catheterization; AND
Note: This refers to prior to starting therapy with a medication for WHO Group 1 PAH.
 - b)** Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
- iii.** The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Upravi tablets is recommended in those who meet the following criteria:

56. Concurrent Use with Orenitram, Inhaled Prostacyclin Products, or Parenteral Prostacyclin Agents Used for Pulmonary Hypertension. Use in combination is not appropriate.

Note: Examples of medications include Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation powder), Ventavis (iloprost inhalation solution), epoprostenol intravenous infusion, and treprostinil subcutaneous or intravenous infusion (Remodulin, generic).

57. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Winrevair Prior Authorization Policy

- Winrevair™ (sotaterept-csrk subcutaneous injection – Merck)

REVIEW DATE: 04/10/2024

OVERVIEW

Winrevair, an activin signaling inhibitor, is indicated for the treatment of **pulmonary arterial hypertension (PAH)** [World Health Organization {WHO} Group 1] in adults to increase exercise capacity, improve WHO functional class (FC), and reduce the risk of clinical worsening events.

Disease Overview

PAH is a serious but rare condition with an estimated prevalence of 10.6 cases per 1 million adults in the US.² It is classified within WHO Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder, the small arteries in the lungs become narrowed, restricted, or blocked. This causes the heart to work harder to pump blood, leading to activity impairment. Although the mean age of diagnosis is between 36 and 50 years, patients of any age may be affected. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.^{3,4} Despite the introduction of many PAH-specific therapies, mortality associated with PAH remains high. When stratified into intermediate and high risk PAH, the 3-year mortality rate was reported as 18% to 20% for intermediate risk and 28% to 55% for high risk PAH.⁵

Guidelines

Various guidelines for PAH are available; however, none address Winrevair yet.

- In 2022, the European Society of Cardiology and the European Respiratory Society (ESC/ERS) updated guidelines on the diagnosis and management of PAH in adults.³ The treatment algorithm for PAH has been simplified, with a clear focus on individual risk assessment, cardiopulmonary comorbidities, and treatment goals. Generally, combination therapy with a phosphodiesterase type 5 inhibitor (PDE5i) and endothelin receptor antagonist (ERA) are recommended as initial therapy in patients considered low risk. If low-risk status is not achieved within 3 to 6 months, the addition of a prostacyclin analogue is recommended. Combination therapy including an intravenous (IV) prostacyclin analogue is recommended as initial therapy in patients considered high-risk.
- The CHEST guidelines (2019) use the patient's functional class (FC) to determine disease severity instead of the comprehensive risk assessment.⁶ The guidelines recommend initiating combination oral therapy with an ERA and a PDE5i for patients with mild or moderate disease (FC II or III) or IV prostacyclin therapy for patients with severe disease (FC III with rapid disease progression or FC IV). Patients who remain symptomatic despite initial treatment should be treated with a second or third agent. Those who fail to improve despite maximal medical therapy should be considered for lung transplant evaluation.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Winrevair. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with these products as well as the monitoring required for adverse events and

04/10/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for initiation of therapy as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Winrevair Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Winrevair is recommended in those who meet the following criteria:

FDA-Approved Indication

19. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1].

Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets ALL of the following (i, ii, iii, iv and v):

- i. Patients is ≥ 18 years of age; AND
- ii. Patient meets the following (a and b):
 - a) The patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
 - b) The results of the right heart catheterization confirmed the diagnosis of WHO Group 1 PAH; AND

iii. Patient is in Functional Class II or III; AND

iv. Patient meets ONE of the following (a or b):

- a) Patient is currently receiving at least two other PAH therapies from the following different pharmacologic categories each for ≥ 60 days: phosphodiesterase type 5 inhibitors (PDE5i), endothelin receptor antagonists (ERAs), soluble guanylate cyclase stimulator (sGCs), and prostacyclins; OR
- b) Patient is currently receiving at least one other PAH therapy for ≥ 60 days and is intolerant to combination therapy with a phosphodiesterase type 5 inhibitors (PDE5i), endothelin receptor antagonists (ERAs), soluble guanylate cyclase stimulator (sGCs), or prostacyclin; AND

Note: Examples of PDE5i include sildenafil and tadalafil. Examples of ERAs include bosentan, ambrisentan, and Opsumit (macitentan tablets). Example of sGCs includes Adempas (riociguat tablets). Examples of prostacyclins include Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil inhalation solution), Ventavis (iloprost inhalation solution), Orenitram (treprostinil tablets), Uptravi (selexipag tablets), treprostinil injection and epoprostenol injection.

v. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

B) Patient is Currently Receiving Winrevair. Approve for 1 year if the patient meets BOTH of the following (i and ii):

- i. Patient meets BOTH of the following (a and b):
 - a) Patient has had a right heart catheterization; AND

Note: This refers to prior to starting therapy with a medication for WHO Group 1 PAH.

- b) Results of the right heart catheterization confirmed the diagnosis of WHO Group 1 PAH;
AND
 - ii. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Winrevair is recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension and Related Lung Disease – Inhaled Prostacyclin Products Prior Authorization Policy

- Tyvaso® (treprostinil inhalation solution – United Therapeutics)
- Tyvaso DPI™ (treprostinil oral inhalation powder – MannKind/United Therapeutics)
- Ventavis® (iloprost inhalation solution – Actelion)

REVIEW DATE: 10/02/2024

OVERVIEW

Tyvaso, Tyvaso DPI, and Ventavis are inhaled prostacyclin vasodilators (prostacyclin mimetics) indicated for the treatment of:¹⁻³

- **Pulmonary arterial hypertension (PAH), World Health Organization (WHO) Group 1.** Tyvaso and Tyvaso DPI are specifically indicated to improve exercise ability whereas Ventavis is indicated to improve a composite endpoint consisting of exercise tolerance, symptoms, and lack of deterioration.

Tyvaso and Tyvaso DPI are also indicated for:^{1,2}

- **Pulmonary hypertension associated with interstitial lung disease (WHO Group 3).** Tyvaso and Tyvaso DPI are indicated to improve exercise ability for this population.

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US.^{4,5} It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder, the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment. Although the mean age of diagnosis is between 36 and 50 years, patients of any age may be affected, including pediatric patients. PAH is defined as a mean pulmonary artery pressure (mPAP) > 20 mmHg (at rest) with a pulmonary arterial wedge pressure (PAWP) ≤ 15 mmHg and a pulmonary vascular resistance > 2 Wood units measured by cardiac catheterization.¹¹ The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved.

Pulmonary hypertension due to interstitial lung disease (WHO Group 3) can complicate the condition and is associated with an increased need for supplemental oxygen, reduced mobility, and decreased survival.⁷⁻¹⁰ Over 80% of patients with interstitial lung disease can have pulmonary hypertension; patients tend to be older and male.⁶ Severe restrictions on pulmonary function tests and marked fibrosis on computed tomography scans are distinctions. The exact etiology is unknown. The symptoms are non-specific and include increased dyspnea on exertion, cough, fatigue, chest pain, and lower extremity edema. Tyvaso is the only medication indicated for this specific use. Randomized controlled trials utilizing other pulmonary vasodilators indicated for patients with WHO Group 1 PAH in patients with interstitial lung disease have not shown clear benefit and some studies suggest harm with use of some medications (e.g., sildenafil, Tracleer® [bosentan tablets], ambrisentan, Adempas® [riociguat tablets], and Opsumit® [macitentan tablets]).

Guidelines

Inhaled prostacyclin products are included in various guidelines regarding PAH (WHO Group 1). Tyvaso DPI is not addressed yet.

- **Pulmonary Arterial Hypertension (PAH):** The CHEST guideline and Expert Panel Report regarding therapy for PAH (2019) in adults details many medications.⁵ One recommendation is that parenteral or inhaled prostanoids should not be used as initial therapy for patients with PAH who are treatment naïve with WHO functional class II symptoms or as second-line agents for patients with PAH with WHO functional class II symptoms who have not met original treatment goals. In general, these agents are utilized in later stages of therapy. The European Society of Cardiology (ESC) and the European Respiratory Society (ERS) guidelines regarding the treatment of pulmonary hypertension (2022) recognize that inhaled prostacyclin products have a role in therapy, mainly as an agent to be added onto other PAH therapies.⁶
- **Pulmonary Hypertension due to Interstitial Lung Disease:** The ESC/ERS guidelines regarding the treatment of pulmonary hypertension (2022) recommend inhaled treprostinil (Tyvaso) for patients with pulmonary hypertension associated with interstitial lung disease.⁶

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tyvaso, Tyvaso DPI, and Ventavis. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with these products as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for initiation of therapy as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For the use of PAH (WHO Group 1), for a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension and Related Lung Disease – Inhaled Prostacyclin Products Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

- I. Coverage of Tyvaso, Tyvaso DPI, and Ventavis is recommended in those who meet the following criteria:

FDA-Approved Indication

20. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1].

Approve for the duration noted if the patient meets ONE of the following (A or B):

- C) Initial Therapy. Approve for 1 year if the patient meets ALL of the following (i, ii, iii, and iv):
 - vi. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
 - vii. Patient meets ONE of the following (a or b):
 - a) Patient is in Functional Class III or IV; OR
 - b) Patient is in Functional Class II and meets ONE of the following [(1) or (2)]:

10/02/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- (1) Patient has tried or is currently receiving one oral agent for PAH; OR
Note: Examples of oral agents for PAH include bosentan, ambrisentan, Opsumit (macitentan tablets), sildenafil, tadalafil, Adempas (riociguat tablets), Orenitram (treprostinil extended-release tablets), and Uptravi (selexipag tablets).
- (2) Patient has tried one inhaled or parenteral prostacyclin product for PAH; AND
Note: Examples of inhaled and parenteral prostacyclin products for PAH include Tyvaso (treprostinil inhalation solution), Tyvaso DPI (treprostinil oral inhalation powder), Ventavis (iloprost inhalation solution), treprostinil injection, and epoprostenol injection.
- viii. Patient meets BOTH of the following (a and b):
 - c) The patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
 - d) The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
- ix. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.
- D) Patient is Currently Receiving the Requested Inhaled Prostacyclin. Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):
- iii. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- iv. Patient meets BOTH the following (a and b):
 - c) Patient has had a right heart catheterization; AND
Note: This refers to prior to starting therapy with a medication for WHO Group 1 PAH.
 - d) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
- v. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

II. Coverage of Tyvaso and Tyvaso DPI is recommended in those who meet the following criteria:

FDA-Approved Indication

- 21. Pulmonary Hypertension Associated with Interstitial Lung Disease (World Health Organization [WHO] Group 3).** Approve for the duration noted if the patient meets ONE of the following (A or B):
Note: This involves diagnosis such as idiopathic interstitial pneumonia, combined pulmonary fibrosis and emphysema, WHO Group 3 connective disease, and chronic hypersensitivity pneumonitis.
- A) Initial Therapy. Approve for 4 months if the patient meets ALL of the following (i, ii, iii, iv, v, and vi):
 - i. Patient is ≥ 18 years of age; AND
 - ii. Patient has a diagnosis of World Health Organization (WHO) Group 3 pulmonary hypertension associated with interstitial lung disease; AND
 - iii. Patient with connective tissue disease is required to have a baseline forced vital capacity $< 70\%$; AND
 - iv. Patient has evidence of diffuse parenchymal lung disease on computed tomography of the chest; AND
 - v. Patient meets BOTH of the following (a and b):
 - a) Patient has had a right heart catheterization **[documentation required]**; AND
 - b) Results of the right heart catheterization confirm the diagnosis of WHO Group 3 pulmonary hypertension associated with interstitial lung disease; AND
 - vi. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.
 - B) Patient is Currently Receiving Tyvaso or Tyvaso DPI for pulmonary hypertension associated with interstitial lung disease. Approve for 1 year if the patient meets ALL of the following (i, ii, iii, iv and v):

10/02/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- i. Patient is ≥ 18 years of age; AND
- ii. Patient has a diagnosis of World Health Organization (WHO) Group 3 pulmonary hypertension associated with interstitial lung disease; AND
- iii. Patient meets BOTH of the following (a and b):
 - a) Patient has had a right heart catheterization; AND
Note: This refers to prior to starting therapy with a medication for WHO Group 3 PAH.
 - b) Results of the right heart catheterization confirm the diagnosis of World Health Organization (WHO) Group 3 pulmonary hypertension associated with interstitial lung disease; AND
- iv. According to the prescriber, patient has had a response to therapy; AND
Note: Examples of a response include an increase or maintenance in the six-minute walk distance from baseline, improved exercise capacity, decrease in N-terminal pro-B-type natriuretic peptide levels, lessened clinical worsening, and a reduced rate of exacerbations of underlying lung disease.
- v. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tyvaso, Tyvaso DPI, and Ventavis is not recommended in the following situations:

1. **Concurrent Use with Oral or Parenteral Prostacyclin Agents Used for Pulmonary Hypertension.**
 Concomitant use is not recommended.
Note: Examples of medications include Orenitram (treprostinil extended-release tablets), Uptravi (selexipag tablets and intravenous infusion), epoprostenol intravenous infusion, and treprostinil subcutaneous or intravenous infusion (Remodulin, generic).
2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Repository Corticotropin – Acthar Gel Prior Authorization Policy

- Acthar® Gel (repository corticotropin intramuscular and subcutaneous injection – Mallinckrodt)

REVIEW DATE: 05/01/2024

OVERVIEW

Acthar, an adrenocorticotrophic hormone (ACTH) analog, is indicated for the following uses:¹

- **Infantile spasms**, treatment of, in infants and children < 2 years of age as monotherapy.
- **Multiple sclerosis, treatment of exacerbations** in adults.

Although data are limited, the prescribing information notes that Acthar may also be used for the following disorders and diseases:¹

- **Allergic states**, such as serum sickness.
- **Collagen diseases**, during an exacerbation or as a maintenance therapy in selected cases of systemic lupus erythematosus and systemic dermatomyositis (polymyositis).
- **Dermatologic diseases**, such as severe erythema multiforme and Stevens-Johnson syndrome.
- **Edematous state** including to induce a diuresis or a remission of proteinuria in the nephrotic syndrome without uremia of the idiopathic type or that due to lupus erythematosus.
- **Respiratory diseases** such as symptomatic sarcoidosis.
- **Rheumatoid disorders**, as an adjunctive therapy for short-term administration (to tide the patient over an acute episode or exacerbation) in psoriatic arthritis, rheumatoid arthritis (including juvenile rheumatoid arthritis) [selected cases may require low-dose maintenance therapy], and ankylosing spondylitis.
- **Ophthalmic diseases** including severe acute and chronic allergic and inflammatory processes involving the eye and its adnexa such as keratitis, iritis, iridocyclitis, diffuse posterior uveitis and choroiditis, optic neuritis, chorioretinitis, and anterior segment inflammation.

The Acthar gel vial is for either intramuscular or subcutaneous injection.¹ Acthar gel single-dose pre-filled SelfJect injector is for subcutaneous administration by adults only (used to administered single doses of 40 units or 80 units only). For infantile spasms, doses must be given intramuscularly using the Acthar gel vial. The recommended dose for this use is 150 units/m² divided twice daily into two injections of 75 units/m². After 2 weeks of treatment dosing should be gradually tapered and discontinued over a 2-week period. Acthar gel single-dose prefilled SelfJect injector is not to be used for the treatment of infantile spasms.

Clinical Efficacy

A review regarding repository corticotropin found few randomized controlled trials supporting the clinical benefit of repository corticotropin or ACTH for various conditions (e.g., use in rheumatoid arthritis, ankylosing spondylitis, optic neuritis, systemic lupus erythematosus, and nephrotic syndrome).² Most data suggest that repository corticotropin or ACTH was not superior to corticosteroids for treating relapses in patients with multiple sclerosis.

Guidelines

Several guidelines discuss repository corticotropin or ACTH.

05/01/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- The **American Academy of Neurology** and the **Child Neurology Society** published an evidence-based guideline for the medical treatment of infantile spasms (2012).³ ACTH is a first-line agent for the short-term treatment of infantile spasms.
- **Infantile Spasms Working Group** published a US consensus report on infantile spasms in 2010.⁴ Most patients with this condition (90%) present within the first year of life. ACTH is an effective first-line therapy for infantile spasms.
- **Kidney Disease Improving Global Outcomes (KDIGO)** published clinical practice guidelines for the management of glomerular disease (2021).⁵ This includes diagnoses such as nephrotic syndrome, membranous nephropathy, immunoglobulin A nephropathy, minimal change disease, infection-related glomerulonephritis, focal segmental glomerulosclerosis, membranoproliferative glomerulonephritis, and lupus nephritis. ACTH is not prominent in the guidelines and there is a lack of quality evidence regarding ACTH. Updated KDIGO guidelines were published regarding the management of lupus nephritis (2024), as well as for the management of anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (2024).^{22,23} ACTH is not mentioned in the guidelines.
- The **National Multiple Sclerosis Society** has recommendations regarding corticosteroids in the management of multiple sclerosis relapses or exacerbations.⁶ High-dose corticosteroids are the accepted standard of care short-term. The most common regimen is 500 to 1,000 mg of intravenous methylprednisolone given daily for 3 to 5 days, with or without an oral steroid tapering regimen (most often prednisone) for 1 to 3 weeks. ACTH and high-dose intravenous methylprednisolone have been shown to possess similar efficacy in the management of multiple sclerosis relapses.⁷
- The **American College of Rheumatology** has many guidelines regarding use in rheumatoid-type conditions.⁸ ACTH does not have a prominent role and is generally not recommended for use in any of the related American College of Rheumatology guidelines.
- The **American College of Rheumatology** has guidelines for the management of gout (2020).⁹ For gout flare management, using colchicine, non-steroidal anti-inflammatory drugs, or glucocorticoids (oral, intraarticular, or intramuscular) are appropriate first-line therapy for gout flare over interleukin-1 inhibitors or ACTH.
- The **European Respiratory Society** published guidelines on the treatment of sarcoidosis (2021).¹⁰ Repository corticotropin use should be reserved for patients who have failed prior treatments (e.g., steroids, antimetabolites). Only limited data are available. Repository corticotropin should be considered in a case by case basis only when other therapies are not effective or tolerated.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Acthar Gel. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Acthar as well as monitoring required for adverse events and efficacy, approval requires Acthar to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Acthar Gel is recommended in those who meet the following criteria:

FDA-Approved Indication

- 22. Infantile Spasms, Treatment.** Approve Acthar Gel multidose vial for 1 month if the patient meets ALL of the following (A, B, and C):

Note: Acthar Gel single-dose pre-filled SelfJect Injector for subcutaneous use should not be approved.

A) Child is < 2 years of age; AND

B) Acthar is being administered as an intramuscular injection; AND

C) Medication is prescribed by a physician who has consulted with or specializes in neurology.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Acthar is not recommended in the following situations:

- 58. Ankylosing Spondylitis.** The American College of Rheumatology guidelines for the treatment of ankylosing spondylitis do not convey a role for ACTH in this condition.^{11,12}
- 59. Dermatomyositis or Polymyositis.** British Society for Rheumatology guidelines on the management of pediatric, adolescent, and adult patients with idiopathic inflammatory myopathy (2022) do not cite ACTH as an agent to utilize in patients with such conditions.¹³
- 60. Diabetic Nephropathy.** ACTH is not a cited therapy or the standard of care for the management of chronic kidney disease in patients with diabetes.^{5,14}
- 61. Glomerular Kidney Diseases.**
Note: Diagnoses can include nephrotic syndrome, membranous nephropathy, immunoglobulin A nephropathy, minimal change disease, infection-related glomerulonephritis, focal segmental glomerulosclerosis, and membranoproliferative glomerulonephritis. ACTH is not prominent in related guidelines from KDIGO (2021) and there is a lack of quality evidence regarding ACTH to support its use.⁵ KDIGO guidelines for the management of anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (2024) do not mention ACTH.²³
- 62. Gout.** American College of Rheumatology guidelines for gout (2020) recommend other therapies beside ACTH for gout flare management (e.g., colchicine, non-steroidal anti-inflammatory drugs, or glucocorticoids).⁹
- 63. Juvenile Idiopathic Arthritis.** Related guidelines from the American College of Rheumatology regarding the treatment of juvenile idiopathic arthritis (2021) do not mention ACTH as having a role for this disease.¹⁵
- 64. Lupus Nephritis.** The KDIGO guidelines for the management of glomerular disease (2021) cite many other agents besides ACTH for the management of this condition.⁵ The European League Against Rheumatism-European Renal Association-European Dialysis and Transplantation Association joint recommendations on the management of lupus nephritis do not cite ACTH as a therapy to use in this condition.¹⁶ Updated KDIGO guidelines were published regarding the management of lupus nephritis (2024) and do not mention ACTH.²²
- 65. Multiple Sclerosis, Acute Exacerbations.** High-dose corticosteroids, usually intravenous methylprednisolone, are the accepted standard of care short-term for acute relapses or exacerbations.⁶

66. **Ophthalmic Conditions.** Only limited data describe the use of ACTH in ophthalmic-related conditions (e.g., acute optic neuritis, keratitis, retinal vasculitis).^{2,17-19} Prospective data are needed to more rigorously define the efficacy and safety of ACTH in ocular disease.
67. **Psoriatic Arthritis.** The American College of Rheumatology/National Psoriasis Foundation guidelines for the treatment of psoriatic arthritis (2018) do not mention a role for ACTH in this condition.²⁰
68. **Rheumatoid Arthritis.** The American College of Rheumatology guidelines for the treatment of rheumatoid arthritis (2021) do not mention a role for ACTH in this disease state.²¹
69. **Sarcoidosis.** The European Respiratory Society published guidelines on the treatment of sarcoidosis (2021).¹⁰ Repository corticotropin use should be reserved for patients who have failed prior treatments (e.g., steroids, antimetabolites). Only limited data are available. Repository corticotropin should be considered in a case by case basis only when other therapies are not effective or tolerated.
70. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Repository Corticotropin – Cortrophin Gel Prior Authorization Policy

- Purified Cortrophin™ Gel (repository corticotropin subcutaneous and intramuscular injection – ANI)

REVIEW DATE: 05/01/2024

OVERVIEW

Cortrophin Gel, a porcine derived purified corticotropin (adrenocorticotrophic hormone [ACTH] {1-39}) product, is indicated in the following disorders:¹

- **Allergic states**, such as atopic dermatitis and serum sickness.
- **Collagen diseases**, during an exacerbation or as a maintenance therapy in selected cases of systemic lupus erythematosus and systemic dermatomyositis (polymyositis).
- **Dermatologic diseases**, such as severe erythema multiforme (Stevens-Johnson syndrome) and severe psoriasis.
- **Edematous state** including to induce a diuresis or a remission of proteinuria in the nephrotic syndrome without uremia of the idiopathic type or that due to lupus erythematosus.
- **Nervous system**, acute exacerbations of multiple sclerosis.
- **Respiratory diseases** such as symptomatic sarcoidosis.
- **Rheumatoid disorders**, as an adjunctive therapy for short-term administration (to tide the patient over an acute episode or exacerbation) in psoriatic arthritis, rheumatoid arthritis (including juvenile rheumatoid arthritis) [selected cases may require low-dose maintenance therapy], ankylosing spondylitis, and acute gouty arthritis.
- **Ophthalmic diseases** including severe acute and chronic allergic and inflammatory processes involving the eye and its adnexa such as allergic conjunctivitis, keratitis, iritis and iridocyclitis, diffuse posterior uveitis and choroiditis, optic neuritis, chorioretinitis, and anterior segment inflammation.

Clinical Efficacy

A recent review regarding repository corticotropin found few randomized controlled trials supporting the clinical benefit of repository corticotropin or ACTH for various conditions (e.g., use in rheumatoid arthritis, ankylosing spondylitis, optic neuritis, systemic lupus erythematosus, and nephrotic syndrome).² Most data suggest that repository corticotropin or ACTH was not superior to corticosteroids for treating relapses in patients with multiple sclerosis.

Guidelines

Several guidelines discuss repository corticotropin or ACTH.

- **Kidney Disease Improving Global Outcomes (KDIGO)** published clinical practice guidelines for the management of glomerular disease (2021).³ This includes diagnoses such as nephrotic syndrome, membranous nephropathy, immunoglobulin A nephropathy, minimal change disease, infection-related glomerulonephritis, focal segmental glomerulosclerosis, membranoproliferative glomerulonephritis, and lupus nephritis. ACTH is not prominent in the guidelines and there is a lack of quality evidence regarding ACTH.³ Updated KDIGO guidelines were published regarding the management of lupus nephritis (2024), as well as for the management of anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (2024).^{20,21} ACTH is not mentioned in the guidelines.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- The **National Multiple Sclerosis Society** has recommendations regarding corticosteroids in the management of multiple sclerosis relapses or exacerbations.⁴ High-dose corticosteroids are the accepted standard of care short-term. The most common regimen is 500 to 1,000 mg of intravenous methylprednisolone given daily for 3 to 5 days, with or without an oral steroid tapering regimen (most often prednisone) for 1 to 3 weeks. ACTH and high-dose intravenous methylprednisolone have been shown to possess similar efficacy in the management of multiple sclerosis relapses.⁵
- The **American College of Rheumatology** has many guidelines regarding use in rheumatoid-type conditions.⁶ ACTH does not have a prominent role and is generally not recommended for use in any of the related American College of Rheumatology guidelines.
- The **American College of Rheumatology** has guidelines for the management of gout (2020).⁷ For gout flare management, using colchicine, non-steroidal anti-inflammatory drugs, or glucocorticoids (oral, intraarticular, or intramuscular) are appropriate first-line therapy for gout flare over interleukin-1 inhibitors or ACTH.
- The **European Respiratory Society** published guidelines on the treatment of sarcoidosis (2021).⁸ Repository corticotropin use should be reserved for patients who have failed prior treatments (e.g., steroids, antimetabolites). Only limited data are available. Repository corticotropin should be considered in a case by case basis only when other therapies are not effective or tolerated.

POLICY STATEMENT

Due to the lack of updated clinical efficacy data and potential safety concerns with long-term use, **approval is not recommended** for Cortrophin Gel. The current Cortrophin Gel efficacy information is insufficient to determine if the medication demonstrates any clinically meaningful benefits beyond those provided by other available therapies.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cortrophin Gel is not recommended in the following situations:

- 71. Ankylosing Spondylitis.** The American College of Rheumatology guidelines for the treatment of ankylosing spondylitis do not convey a role for ACTH in this condition.^{9,10}
- 72. Dermatomyositis or Polymyositis.** British Society for Rheumatology guidelines on the management of pediatric, adolescent, and adult patients with idiopathic inflammatory myopathy (2022) do not cite ACTH as an agent to utilize in patients with such conditions.¹¹
- 73. Diabetic Nephropathy.** ACTH is not a cited therapy or the standard of care for the management of chronic kidney disease in patients with diabetes.^{3,12}

74. Glomerular Kidney Diseases.

Note: Diagnoses can include nephrotic syndrome, membranous nephropathy, immunoglobulin A nephropathy, minimal change disease, infection-related glomerulonephritis, focal segmental glomerulosclerosis, and membranoproliferative glomerulonephritis. ACTH is not prominent in related guidelines from KDIGO (2021) and there is a lack of quality evidence regarding ACTH to supports its use.³ KDIGO guidelines for the management of anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (2024) do not mention ACTH.²¹

75. Gout. American College of Rheumatology guidelines for gout (2020) recommend other therapies beside ACTH for gout flare management (e.g., colchicine, non-steroidal anti-inflammatory drugs, or glucocorticoids).⁷

76. Infantile Spasms, Treatment. Purified Cortrophin Gel is not FDA-approved for this use.¹

77. Juvenile Idiopathic Arthritis. Related guidelines from the American College of Rheumatology regarding the treatment of juvenile idiopathic arthritis (2021) do not mention ACTH as having a role for this disease.¹³

78. Lupus Nephritis. The KDIGO guidelines for the management of glomerular disease (2021) cite many other agents besides ACTH for the management of this condition.³ The European League Against Rheumatism-European Renal Association-European Dialysis and Transplantation Association joint recommendations on the management of lupus nephritis do not cite ACTH as a therapy to use in this condition.¹⁴ Updated KDIGO guidelines were published regarding the management of lupus nephritis (2024) and do not mention ACTH.²⁰

79. Multiple Sclerosis, Acute Exacerbations. High-dose corticosteroids, usually intravenous methylprednisolone, are the accepted standard of care short-term for acute relapses or exacerbations.⁴

80. Ophthalmic Conditions. Only limited data describes the use of ACTH in ophthalmic-related conditions (e.g., acute optic neuritis, keratitis, retinal vasculitis).^{2,15-17} Prospective data are needed to more rigorously define the efficacy and safety of ACTH in ocular disease.

81. Psoriatic Arthritis. The American College of Rheumatology/National Psoriasis Foundation guidelines for the treatment of psoriatic arthritis (2018) do not mention a role for ACTH in this condition.¹⁸

82. Rheumatoid Arthritis. The American College of Rheumatology guidelines for the treatment of rheumatoid arthritis (2021) do not mention a role for ACTH in this disease state.¹⁹

83. Sarcoidosis. The European Respiratory Society published guidelines on the treatment of sarcoidosis (2021).⁸ Repository corticotropin use should be reserved for patients who have failed prior treatments (e.g., steroids, antimetabolites). Only limited data are available. Repository corticotropin should be considered in a case by case basis only when other therapies are not effective or tolerated.

84. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Rituximab Intravenous Products Prior Authorization Policy
- Riabni™ (rituximab-arx intravenous infusion – Amgen)
 - Rituxan® (rituximab intravenous infusion – Genentech)
 - Ruxience® (rituximab-pvvr intravenous infusion – Pfizer)
 - Truxima® (rituximab-abbs intravenous infusion – Celltrion/Teva)

REVIEW DATE: 08/14/2024

OVERVIEW

Rituximab products are CD20-directed cytolytic antibodies. All approved rituximab intravenous products are indicated for treatment of the following conditions:^{1-3,22}

- **Chronic lymphocytic leukemia (CLL)**, in combination with fludarabine and cyclophosphamide (FC) for the treatment of patients with previously untreated and previously treated CD20-positive disease.
- **Granulomatosis with polyangiitis** (Wegener's granulomatosis) and **microscopic polyangiitis** in adults, in combination with glucocorticoids.
- **Non-Hodgkin lymphoma (NHL)**, for the following uses:
 - previously untreated follicular, CD20-positive disease, in combination with first-line chemotherapy, and in patients achieving a complete or partial response to rituximab in combination with chemotherapy, as a single-agent maintenance therapy.
 - for relapsed or refractory, low-grade or follicular, CD20-positive, B-cell disease.
 - for non-progressing (including stable disease) low-grade, CD20-positive, B-cell disease as a single agent after first-line cyclophosphamide/vincristine/prednisone (CVP) chemotherapy.
 - for previously untreated diffuse large B-cell, CD20-positive disease, in combination with cyclophosphamide/doxorubicin/vincristine/prednisone (CHOP) or other anthracycline-based chemotherapy regimens.
- **Rheumatoid arthritis**, in adult patients with moderately to severely active disease, in combination with methotrexate for patients who have had an inadequate response to one or more tumor necrosis factor inhibitors.

In addition to the above indications, Rituxan intravenous is also indicated for treatment of the following conditions:¹

- **Granulomatosis with polyangiitis** (Wegener's granulomatosis) and **microscopic polyangiitis** in patients ≥ 2 years of age, in combination with glucocorticoids.
- **Pemphigus vulgaris**, for adults with moderate to severe disease.
- **B-cell lymphoma**, in patients ≥ 6 months of age with previously untreated, advanced stage, CD20-positive diffuse large B-cell lymphoma, Burkitt lymphoma, Burkitt-like lymphoma, or mature B-cell acute leukemia in combination with chemotherapy.

Riabni, Ruxience, and Truxima are approved as biosimilar to Rituxan intravenous, indicating no clinically meaningful differences in safety and effectiveness and the same mechanism of action, route of administration, dosage form, and strength as Rituxan intravenous. However, minor differences in clinically inactive components are allowed. At this time, the biosimilars have only demonstrated biosimilarity, not interchangeability.

Guidelines

08/14/2024

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

The use of rituximab is supported in clinical guidelines in numerous situations, both as first-line therapy and in patients who are refractory or have relapsed following treatment with other therapies.⁴⁻²¹

- **Antineutrophil Cytoplasmic Antibody (ANCA)-Associated Vasculitis:** Guidelines from the American College of Rheumatology (ACR) [2021] list rituximab among the alternatives for induction or maintenance of remission. Various regimens are recommended with a typical maximum of 1,000 mg/infusion. For maintenance dosing, at least 4 months should separate doses. The optimal dose of rituximab for remission maintenance remains uncertain. Although scheduled maintenance is conditionally recommended over use of CD19+ B-cell counts and/or ANCA titers to guide retreatment, there are data to support both approaches.
- **Immune Thrombocytopenia (ITP):** Guidelines from the American Society of Hematology for ITP (2019) mention rituximab as an alternative for children and adults with ITP who do not respond to first-line treatment, and for adults who are corticosteroid-dependent.¹⁷
- **Multiple Sclerosis (MS):** In June 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.¹⁸ Rituximab is listed among various options, involving different mechanisms of action and modes of administration, which have shown benefits in patients with MS. The American Academy of Neurology has practice guidelines regarding disease-modifying therapies for adults with MS.¹⁹ The guidelines mention rituximab for use in MS.
- **Neuromyelitis Optica Spectrum Disorders (NMOSD):** The Neuromyelitis Optica Study Group (NEMOS) published revised recommendations for the treatment of NMOSD in 2023.²⁰
- Oncology indications covered in National Comprehensive Cancer Network (NCCN) guidelines:⁶
 - **Acute Lymphoblastic Leukemia:** Guidelines (version 2.2024 – July 19, 2024) list rituximab in multiple regimens for Philadelphia chromosome (Ph)-negative disease for patients with CD20-positive disease.¹¹ In those with Ph-positive disease, rituximab should be considered in addition to chemotherapy for those with CD20-positive disease, especially in those < 60 years of age.
 - **B-Cell Lymphomas:** In the guidelines (version 2.2024 – April 30, 2024), rituximab is included in multiple treatment regimens across the spectrum of disease.⁸ Guidelines for pediatric aggressive mature B-cell lymphomas (version 1.2024 – April 08, 2024) include rituximab intravenous as a component of treatment regimens for induction therapy/initial treatment and as subsequent therapy for relapsed or refractory disease.⁹ For primary cutaneous B-cell lymphomas (version 2.2024 – May 6, 2024), rituximab is a treatment option for patients with primary cutaneous B-cell lymphoma.¹⁰
 - **CLL/Small Lymphocytic Lymphoma:** Rituximab features prominently in the guidelines (version 3.2024 – March 26, 2024) and is included in multiple treatment regimens across the spectrum of disease.⁷
 - **Graft-Versus-Host Disease (GVHD):** The hematopoietic cell transplantation guidelines (version 1.2024 – April 26, 2024) list rituximab among the agents used for steroid-refractory chronic GVHD.¹⁵
 - **Hairy Cell Leukemia:** Guidelines (version 2.2024 – April 22, 2024) recommend rituximab as a component in a preferred primary regimen, and in multiple regimens for relapsed/refractory disease (including in patients with progressive disease after relapsed/refractory therapy).¹²
 - **Hodgkin Lymphoma:** Guidelines (version 3.2024 – March 18, 2024) recommend rituximab ± chemotherapy and/or radiation (depending on the clinical presentation) in the first-line setting for nodular lymphocyte-predominant disease.¹³ Rituximab is also used for relapsed/refractory disease and for maintenance. Guidelines for pediatric disease (version 1.2024 – May 14, 2024) include rituximab in regimens for primary treatment of nodular lymphocyte-predominant disease.²⁵

- **Primary Central Nervous System Lymphoma:** Guidelines for central nervous system cancers (version 2.2024 – July 25, 2024) recommend rituximab in multiple regimens for induction therapy and relapsed or refractory primary central nervous system lymphoma.²⁴
- **Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma:** Guidelines (version 2.2024 – December 5, 2023) include rituximab in regimens across the spectrum of disease (primary therapy, previously treated disease, and maintenance).¹⁴
- **Immunotherapy-Related Toxicities Associated with Checkpoint Inhibitors:** NCCN (version 1.2024 – December 7, 2023) and the American Society of Clinical Oncology guidelines (2021) recommend rituximab as an option for corticosteroid-refractory dermatologic and hematologic immune mediated adverse events, as well as for immune-mediated encephalitis and myositis.^{26,27}
- **Pemphigus Vulgaris:** British guidelines (2017) list rituximab in combination with corticosteroids as a first-line therapy.²³
- **Rheumatoid Arthritis:** Guidelines from ACR (2021) recommend addition of a biologic or a targeted synthetic disease modifying antirheumatic drug (DMARD) for a patient taking the maximum tolerated dose of methotrexate who is not at target.¹⁶
- **Systemic Lupus Erythematosus (SLE):** European League Against Rheumatism recommendations for the management of SLE (2023) mention rituximab as a therapeutic option for patients who are refractory to standard immunosuppressive therapies.²¹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of rituximab intravenous products. Because of the specialized skills required for evaluation and diagnosis of patients treated with rituximab as well as the monitoring required for adverse events and long-term efficacy, initial approval requires rituximab intravenous products to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration listed below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of rituximab intravenous products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

52. Antineutrophil Cytoplasmic Antibody (ANCA)-Associated Vasculitis. Approve for the duration noted if the patient meets ONE of the following (A or B):

- A) Induction Treatment.** Approve for 1 month if the patient meets ALL of the following (i, ii, and iii):
- a. Patient has an ANCA-associated vasculotide; AND
Note: Examples of ANCA-associated vasculitis include granulomatosis with polyangiitis (Wegener's granulomatosis) or microscopic polyangiitis.
 - ~~b.~~ The medication is being administered in combination with glucocorticoids; AND
 - c. The medication is prescribed by or in consultation with a rheumatologist, nephrologist, or immunologist.
- ~~B)~~ Follow-Up Treatment of Patients Who Have Received Induction Treatment for ANCA-Associated Vasculitis.** Approve for 1 year if the patient meets BOTH of the following (i and ii):
Note: This includes a patient who received induction treatment using a rituximab product or other standard of care immunosuppressants.

08/14/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- a. According to the prescriber, the patient achieved disease control with induction treatment;
AND
- b. If the patient previously received a course of therapy, at least 16 weeks will elapse between courses.

53. B-Cell Lymphoma. Approve for 1 year if prescribed by or in consultation with an oncologist.

Note: Examples of B-cell lymphomas include follicular lymphoma, diffuse large B-cell lymphoma, high-grade B-cell lymphoma, acquired immune deficiency (AIDS)-related B-cell lymphoma, Burkitt lymphoma, Castleman's disease, marginal zone lymphoma (e.g., extranodal or MALT [gastric or nongastric], nodal, or splenic marginal zone lymphoma), primary mediastinal large B-cell lymphoma, mantle cell lymphoma, post-transplant lymphoproliferative disorders, gray zone lymphoma, primary cutaneous B-cell lymphoma, pediatric aggressive mature B-cell lymphomas.

54. Chronic Lymphocytic Leukemia or Small Lymphocytic Lymphoma. Approve for 1 year if prescribed by or in consultation with an oncologist.

55. Pemphigus Vulgaris. Approve for the duration noted if the patient meets ONE of the following (A or B):

- a. Initial Treatment. Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets BOTH of the following (i and ii):
 - i. Therapy is initiated in combination with a corticosteroid unless contraindicated; AND
Note: An example of a corticosteroid is prednisone.
 - ii. The medication is prescribed by or in consultation with a dermatologist.
- b. Patient is Being Treated for a Relapse or for Maintenance of Pemphigus Vulgaris. Approve for 1 year if the patient meets BOTH of the following (i and ii):
 - i. Subsequent infusions will be administered no sooner than 16 weeks following the previous infusion of a rituximab product; AND
Note: For example, there will be a minimum of 16 weeks since the first dose of the previous course and the first dose of the next course of a rituximab product.
 - ii. The medication is prescribed by or in consultation with a dermatologist.

56. Rheumatoid Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

- A) Initial Therapy.** Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets ALL of the following (i, ii, and iii):
 - i. Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
Note: Examples of conventional synthetic DMARDs include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient already has a 3-month trial of at least one biologic other than the requested drug. A biosimilar of the requested biologic does not count. Refer to [Appendix A](#) for examples of biologics used for rheumatoid arthritis. A patient who has already tried a biologic is not required to “step back” and try a conventional synthetic DMARD.
 - ii. The medication will not be used concurrently with another biologic or with a targeted synthetic DMARD; AND
Note: Refer to [Appendix A](#) for examples of biologics and targeted synthetic DMARDs.
 - iii. The medication is prescribed by or in consultation with a rheumatologist.

- B) Patient has already Received One or More Courses of a Rituximab Product for Rheumatoid Arthritis.** Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets ALL of the following conditions (i, ii, and iii):
- i.** 16 weeks or greater will elapse between treatment courses; AND
Note: For example, there will be a minimum of 16 weeks since the first dose of the previous course and the first dose of the next course of a rituximab product.
 - ii.** The medication will not be used concurrently with another biologic or with a targeted synthetic DMARD; AND
Note: Refer to [Appendix A](#) for examples of biologics and targeted synthetic DMARDs.
 - iii.** If the patient has already received two or more courses of therapy, the patient meets at least ONE of the following (a or b):
 - a)** Patient experienced a beneficial clinical response when assessed by at least one objective measure; OR
Note: Examples of standardized and validated measures of disease activity include Clinical Disease Activity Index (CDAI), Disease Activity Score (DAS) 28 using erythrocyte sedimentation rate (ESR) or C-reactive protein (CRP), Patient Activity Scale (PAS)-II, Rapid Assessment of Patient Index Data 3 (RAPID-3), and/or Simplified Disease Activity Index (SDAI).
 - b)** Patient experienced an improvement in at least one symptom, such as decreased joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths.

Other Uses with Supportive Evidence

- 6. Acute Lymphoblastic Leukemia.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A)** Patient has CD20-positive disease; AND
 - B)** The medication is prescribed by or in consultation with an oncologist.
- 7. Graft-Versus-Host Disease.** Approve for the duration noted if the patient meets ONE of the following (A or B):
- A) Initial Therapy.** Approve for 1 month if the patient meets BOTH of the following (i and ii):
 - i.** Patient has tried at least one conventional systemic treatment for graft versus host disease; AND
Note: Examples include systemic corticosteroids (methylprednisolone, prednisone), cyclosporine, tacrolimus, mycophenolate mofetil, Imbruvica (ibrutinib capsules and tablets), imatinib, antithymocyte globulin, Nipent (pentostatin infusion), or an infliximab product.
 - ii.** The medication is prescribed by or in consultation with an oncologist, hematologist, or a physician affiliated with a transplant center.
 - B) Patient has Already Received a Course of a Rituximab Product for Graft-Versus-Host Disease.** Approve for 1 year if the patient meets at least ONE of the following (i or ii):
 - i.** When assessed by at least one objective measure, patient experienced a beneficial clinical response from baseline (prior to initiating a rituximab product); OR
Note: An example of objective measures is normalization of liver function tests, red blood cell count, or platelet count; or resolution of fever or rash.
 - ii.** Compared with baseline (prior to initiating a rituximab product), patient experienced an improvement in at least one symptom, such as improvement in skin, oral mucosal, ocular, or gastrointestinal symptoms (e.g., nausea, vomiting, anorexia).
- 8. Hairy Cell Leukemia.** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

9. **Hodgkin Lymphoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- F) Patient has nodular lymphocyte-predominant disease; AND
 - G) The medication is prescribed by or in consultation with an oncologist.
10. **Immune Thrombocytopenia (ITP).** Approve if the patient meets ONE of the following (A or B):
- A) Initial Therapy. Approve for 1 month if the patient meets BOTH of the following (i and ii):
 - i. Patient has tried one other therapy; AND
Note: Examples of therapies for ITP include intravenous immunoglobulin (IVIG), anti-D (RHO) immunoglobulin, corticosteroids, and splenectomy.
 - ii. The agent is prescribed by or in consultation with a hematologist.
 - B) Patient has Already Received a Course of a Rituximab Product for ITP. Approve for 1 month if the patient meets ALL of the following (i, ii, and iii):
 - i. At least 6 months will elapse between treatment courses; AND
Note: For example, there will be a minimum of 6 months separating the first dose of the previous course and the first dose of the requested course of a rituximab product.
 - ii. Patient responded to therapy as determined by the prescriber; AND
Note: Examples of a response include a platelet count increase from baseline following treatment with a rituximab product.
 - iii. The prescriber has determined that the patient has relapsed.
Note: Examples of a relapse include the patient experiences thrombocytopenia after achievement of a remission.
11. **Immunotherapy-Related Toxicities Associated with Checkpoint Inhibitors.** Approve for the duration noted if the patient meets ONE of the following (A or B):
- Note: Examples of checkpoint inhibitors are Keytruda (pembrolizumab intravenous infusion), Opdivo (nivolumab intravenous infusion), Yervoy (ipilimumab intravenous infusion), Tecentriq (atezolizumab intravenous infusion), Bavencio (avelumab intravenous infusion), Imfinzi (durvalumab intravenous infusion), and Libtayo (cemiplimab-rwlc intravenous infusion).
12. Initial Therapy. Approve for 1 month if the patient meets BOTH of the following (i and ii):
- i. Patient is symptomatic despite a trial of at least ONE systemic corticosteroid; AND
Note: Examples of a corticosteroid include methylprednisolone and prednisone.
 - ii. The medication is prescribed by or in consultation with an oncologist, neurologist, rheumatologist, or dermatologist.
13. Patient has Already Received a Course of a Rituximab Product. Approve for 1 month if prescribed by or in consultation with an oncologist, neurologist, rheumatologist, or dermatologist.
14. **Multiple Sclerosis.** Approve for 1 year if the patient meets ONE of the following (A or B):
- A) Initial Therapy. Approve if the patient meets ALL the following (i, ii, iii, and iv):
 - i. According to the prescriber, the patient has experienced inadequate efficacy or significant intolerance to at least TWO other disease-modifying agents for multiple sclerosis; AND
Note: See [Appendix B](#) for examples of disease-modifying agents used for multiple sclerosis.
 - ii. Medication will not be used concurrently with another disease-modifying agent used for multiple sclerosis; AND
Note: See [Appendix B](#) for examples of disease-modifying agents used for multiple sclerosis.
 - iii. Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis; AND
 - iv. At least 6 months will elapse between treatment courses.

Note: For example, if the patient has already received a course of therapy there will be a minimum of 6 months separating the first dose of the previous course and the first dose of the requested course of therapy.

B) Patient is Currently Receiving Rituximab. Approve if the patient meets ONE of the following (i or ii):

i. Patient has been receiving Rituximab for < 1 year. Approve if the patient meets ALL of the following (a, b, and c):

1. Medication will not be used concurrently with another disease-modifying agent used for multiple sclerosis; AND

Note: See [Appendix B](#) for examples of disease-modifying agents used for multiple sclerosis.

2. At least 6 months will elapse between treatment courses; AND

Note: For example, if the patient has already received a course of therapy there will be a minimum of 6 months separating the first dose of the previous course and the first dose of the requested course of therapy.

3. Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis; OR

ii. Patient has been receiving Rituximab for 1 year or more. Approve for 1 year if the patient meets ALL of the following (a, b, c, and d):

- a) Medication will not be used concurrently with another disease-modifying agent used for multiple sclerosis; AND

Note: See [Appendix B](#) for examples of disease-modifying agents used for multiple sclerosis.

- b) At least 6 months will elapse between treatment courses; AND

Note: For example, if the patient has already received a course of therapy there will be a minimum of 6 months separating the first dose of the previous course and the first dose of the requested course of therapy.

- c) Patient meets ONE of the following [(1) or (2)]:

- a. Patient experienced a beneficial clinical response when assessed by at least one objective measure; OR

Note: Examples include stabilization or reduced worsening in disease activity as evaluated by magnetic resonance imaging (MRI) [absence or a decrease in gadolinium enhancing lesions, decrease in the number of new or enlarging T2 lesions]; stabilization or reduced worsening on the Expanded Disability Status Scale (EDSS) score; achievement in criteria for No Evidence of Disease Activity-3 (NEDA-3) or NEDA-4; improvement on the fatigue symptom and impact questionnaire-relapsing multiple sclerosis (FSIQ-RMS) scale; reduction or absence of relapses; improvement or maintenance on the six-minute walk test or 12-Items Multiple Sclerosis Walking Scale; improvement on the Multiple Sclerosis Functional Composite (MSFC) score; and or attenuation of brain volume loss.

- b. Patient experienced stabilization, slow progression, or improvement in at least one symptoms such as motor function, fatigue, vision, bowel/bladder function, spasticity, walking/gait, or pain/numbness/tingling sensation; AND

- d) Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

xiii. **Neuromyelitis Optica Spectrum Disorder.** Approve for 1 month if prescribed by or in consultation with a neurologist.

xiv. **Primary Central Nervous System Lymphoma.** Approve for 1 year if prescribed by or in consultation with an oncologist.

15. Systemic Lupus Erythematosus (SLE) [Lupus]. Approve for the duration noted if the patient meets ONE of the following (A or B):

Note: This includes nephrotic syndrome in a patient with SLE.

A) Initial Therapy. Approve for 1 month (adequate duration to receive one course) if the patient meets BOTH of the following (i and ii):

i. Patient has tried at least ONE standard immunomodulating or immunosuppressant agent; AND
Note: Examples of standard immunomodulating or immunosuppressant agents include hydroxychloroquine, corticosteroids (e.g., prednisone, methylprednisolone), methotrexate, azathioprine, mycophenolate, and cyclophosphamide.

ii. The medication is prescribed by or in consultation with a rheumatologist, nephrologist, or neurologist.

B) Patient has Already Received a Course of a Rituximab Product for SLE. Approve for 1 month (adequate duration to receive one course) if 6 months or greater will elapse between treatment courses.

Note: There will be a minimum of 6 months separating the first dose of the previous rituximab course and the first dose of the requested course of rituximab.

16. Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of rituximab intravenous products is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Scenesse Prior Authorization Policy

- Scenesse® (afamelanotide subcutaneous implant – Clinuvel)

REVIEW DATE: 01/08/2025

OVERVIEW

Scenesse, a melanocortin 1 receptor agonist, is indicated for the treatment of **erythropoietic protoporphyria (EPP)**, to increase pain-free light exposure in adults with a history of phototoxic reactions.¹ Scenesse is a controlled-release dosage form that is implanted subcutaneously (SC). Scenesse should be administered by a healthcare professional. A single implant which contains 16 mg of afamelanotide is inserted SC above the anterior supra-iliac crest once every 2 months.

Disease Overview

Porphyrias are disorders caused by enzyme defects in heme biosynthesis.² There are at least eight different types of porphyrias, which are classified as cutaneous or acute depending on the specific enzyme that is deficient. EPP is a cutaneous porphyria characterized by extreme photosensitivity. It is estimated to occur in 2 to 5 in 1,000,000 individuals.³

EPP occurs due to excessive accumulation of protoporphyrin, a heme precursor. Classic EPP is autosomal recessive and occurs due to a defect in the enzyme ferrochelatase, the final enzymatic step in heme biosynthesis.⁴ An X-linked subtype of EPP, often referred as X-linked protoporphyria (XLP), accounts for 2% to 10% of all EPP cases. This type develops due to a gain-of-function mutation in an upstream enzyme in heme biosynthesis, leading to excess protoporphyrin production.^{3,4} The two subtypes share the same biochemical and clinical features, although females with XLP may be less severely affected. Diagnosis is confirmed by one or both of the following: 1) biochemically via markedly elevated free erythrocyte protoporphyrin, and/or 2) molecular genetic testing.^{2,3}

In both EPP subtypes, protoporphyrin accumulation in superficial skin vessels leads to phototoxicity upon light exposure, resulting in the hallmark symptoms of burning, tingling, and itching, which often occur without visible damage.²⁻⁴ Phototoxic pain is not responsive to analgesics, including narcotics; management is focused on prevention of phototoxic episodes.³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Scenesse. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Scenesse as well as the monitoring required for adverse events and long-term efficacy, approval requires Scenesse to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Scenesse is recommended in those who meet the following criteria:

FDA-Approved Indication

- 8. Erythropoietic Protoporphyria (Including X-Linked Protoporphyria).** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A)** Patient is ≥ 18 years of age; AND
 - B)** Patient has a of at least one porphyric phototoxic reaction; AND
 - C)** The diagnosis is confirmed by at least ONE of the following (i or ii):
 - i.** Free erythrocyte protoporphyrin level above the normal reference range for the reporting laboratory; OR
 - ii.** Molecular genetic testing consistent with the diagnosis; AND
 - D)** The agent is prescribed by or in consultation with a dermatologist, gastroenterologist, hepatologist, or physician specializing in the treatment of cutaneous porphyrias.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Scenesse is not recommended in the following situations:

- 146.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

- Zolpimist® (zolpidem oral spray – Aytu BioScience)

REVIEW DATE: 06/12/2024

OVERVIEW

All of the medications included in this policy are indicated for the **treatment of insomnia**.¹⁻¹²

Zolpidem immediate-release (IR) tablets and extended-release (ER) tablets, Edluar, Zolpimist, zaleplon, and the benzodiazepine sedative hypnotics are indicated for the short-term treatment of insomnia.^{1-3,5,6,12} Zolpidem capsules are indicated for short-term treatment of transient insomnia in adults < 65 years of age.²⁰ Eszopiclone, doxepin (3 mg or 6 mg), and ramelteon are also indicated for the treatment of insomnia, but their product labeling does not specifically limit their use to short-term.^{4,8,9} All of the agents in this category have been shown to decrease sleep latency. Zaleplon and ramelteon are specifically indicated for the treatment of insomnia characterized by difficulty with sleep onset.^{3,8} Zolpidem IR, zolpidem ER, doxepin (3 mg or 6 mg), and eszopiclone have also been shown to improve sleep maintenance or increase the duration of sleep.^{1,2,4,9} Belsomra, Dayvigo, and Quviviq are indicated for the treatment of insomnia characterized by difficulties with sleep onset and/or sleep maintenance.¹⁰⁻¹² Zolpidem sublingual tablets are indicated for use as needed for the treatment of insomnia when a middle-of-the-night awakening is followed by difficulty returning to sleep.⁷

Eszopiclone, zaleplon, zolpidem IR (tablets and capsules), zolpidem ER, zolpidem sublingual tablets, Edluar, Zolpimist, and the benzodiazepine sedative hypnotics are all schedule IV controlled substances.^{1-7,12,20} Belsomra, Dayvigo, and Quviviq are also schedule IV controlled substances.¹⁰⁻¹² Neither ramelteon nor doxepin (3 mg or 6 mg) are controlled substances.^{8,9} Doxepin is also available generically as oral capsules (10 mg, 25 mg, 50 mg, 75 mg, 100 mg, and 150 mg) and oral solution (10 mg/mL).¹³ These higher dose formulations are recommended for use in patients with depression and/or anxiety of varying etiologies.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Disease Overview

Insomnia is defined in the International Classification of Sleep Disorders, Third Edition, as a complaint of trouble initiating or maintaining sleep, resulting in daytime consequences (e.g., daytime fatigue, irritability, and decreased concentration) which is not attributable to environmental circumstances or inadequate opportunity for sleep.¹⁴ Generally, transient insomnia lasts less than 1 week, short-term (acute) insomnia lasts up to 3 months, and chronic insomnia lasts more than 3 months at a frequency of at least three times per week.^{14,15} Describing insomnia by timing (difficulty falling asleep [sleep onset insomnia], difficulty staying asleep or getting back to sleep after awakening [sleep maintenance insomnia], or disrupted or non-refreshing sleep and/or early morning awakening) can be useful in the diagnosis and help to distinguish among sleep disorders. Additionally, the pattern of sleep difficulty provides a basis to match a medication based on timing of onset and duration of effect.

Guidelines

The American Academy of Sleep Medicine (AASM) published a clinical guideline for the evaluation and management of chronic insomnia in adults (2008).¹⁷ The primary treatment goals are to improve sleep quality and quantity and to improve insomnia-related daytime impairments. Initial approaches to treatment should include at least one behavioral intervention such as stimulus control therapy or relaxation therapy, or the combination of cognitive therapy, stimulus control therapy, sleep restriction therapy with or without relaxation therapy. Patients should be instructed to keep a regular schedule; have a healthy diet, regular daytime exercise, and a quiet sleep environment; and avoid napping, caffeine, other stimulants, nicotine, alcohol, excessive fluids, or stimulating activities before bedtime. Short-term hypnotic treatment should be supplemented with behavioral and cognitive therapies when possible. Chronic hypnotic medication may be indicated for long-term use in patients with severe or refractory insomnia or chronic comorbid illness. Whenever possible, patients should receive an adequate trial of cognitive behavioral treatment during long-term pharmacotherapy. Long-term prescribing should be accompanied by regular follow-up, ongoing assessment of effectiveness, monitoring for adverse events, and evaluation for new onset or exacerbation of existing comorbid disorders.

The AASM published an updated clinical practice guideline for the pharmacologic treatment of chronic insomnia in adults (2017).¹⁴ The recommendations are intended as a guide for choosing a specific pharmacological agent (vs. no treatment) for treatment of chronic insomnia in adults, when such treatment is indicated. Each of the recommendations listed is weak, meaning it reflects a lower degree of certainty in the outcome and appropriateness of the patient care strategy for all patients but should not be construed as an indication of ineffectiveness. The guideline suggests that clinicians can use Belsomra as a treatment for sleep maintenance insomnia; eszopiclone can be used as a treatment for sleep onset and sleep maintenance insomnia; zaleplon can be used as a treatment for sleep onset insomnia; zolpidem can be used as a treatment for sleep onset and sleep maintenance insomnia; triazolam can be used as a treatment for sleep onset insomnia; temazepam can be used as a treatment for sleep onset and sleep maintenance insomnia; ramelteon can be used as a treatment for sleep onset insomnia; and doxepin (3 mg or 6 mg) can be used as a treatment for sleep maintenance insomnia. The guideline suggested that clinicians not use trazodone, tiagabine, diphenhydramine, melatonin, tryptophan, or valerian as a treatment for sleep onset or sleep maintenance insomnia. The authors note that cognitive behavioral therapy for insomnia (CBT-I) is a standard of care for this condition; however, the AASM guideline does not address the relative benefits of CBT-I vs. pharmacotherapy.

The American College of Physicians (ACP) developed a guideline on the management of chronic insomnia disorder in adults (2016).^{18,19} The guideline is consistent with the AASM guidelines on chronic insomnia. Psychological therapy options include CBT-I and other interventions, such as stimulus control, relaxation strategies, and sleep restriction. ACP recommends that all adults receive CBT-I as the initial treatment for chronic insomnia disorder (strong recommendation, moderate-quality evidence). ACP recommends that

clinicians use a shared decision-making approach, including a discussion of the benefits, harms, and costs of short-term use of medications, to decide whether to prescribe a medication in adults with chronic insomnia disorder in whom CBT-I alone was unsuccessful (weak recommendation, low-quality evidence). A review of the evidence found that eszopiclone, zolpidem, Belsomra, and Silenor may improve short-term global and sleep outcomes for adults with insomnia disorder (low- to moderate-quality evidence), but the comparative effectiveness and long-term efficacy of pharmacotherapies for insomnia are unknown.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of sedative hypnotics. All approvals are provided for the duration noted below.

Automation: A patient who uses at least 180 days of any sedative/hypnotic medication in a 365-day time period will require Prior Authorization. If the patient has a prescription for a cancer medication (see Appendix A) within a 180-day period, the claim will adjudicate. If a patient has received at least 300 days of a sedative/hypnotic medication in a 545-day time period, the claim will adjudicate. When available, the ICD-10 codes for cancer will be used as part of automation to allow approval of the requested medication (see Appendix B).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of a sedative hypnotic is recommended in those who meet the following criteria:

FDA-Approved Indication

F) Chronic Insomnia. Approve for 1 year if the patient meets ONE of the following (A or B):

I) Patient has a cancer diagnosis; OR

J) Patient meets ALL of the following (i, ii, iii, and iv):

i) Patient has tried at least one form of behavioral therapy for insomnia; AND

Note: Examples of behavioral therapy for insomnia include relaxation training, stimulus control therapy, or sleep restriction therapy.

ii) Patient is not currently taking prescription stimulants (e.g., methylphenidate, amphetamine products); AND

iii) Underlying psychiatric and/or medical conditions that may cause or exacerbate insomnia have been evaluated and are currently being addressed, according to the prescriber; AND

iv) Patient's sleep quality and quantity and/or insomnia-related daytime impairments continue to improve or remain stable while on a sedative hypnotic agent, according to the prescriber.

Note: Prior Authorization is required after 6 months of use of any (or any combination of) sedative-hypnotic agent(s) [not necessarily 6 months of the drug being requested].

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of sedative hypnotics is not recommended in the following situations:

147. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REVIEW DATE: 01/03/2024

OVERVIEW

Adakveo, a monoclonal antibody, is indicated to **reduce the frequency of vasoocclusive crises** due to **sickle cell disease** in patients ≥ 16 years of age.¹

Clinical Efficacy

All of the patients included in the 52-week pivotal study (SUSTAIN) had a of two to ten vasoocclusive crises in the previous 12 months.² Concomitant use of hydroxyurea was allowed during the study and approximately 60% of patients were on concomitant hydroxyurea therapy. At Week 52, compared with placebo, the annual rate of pain crises was significantly lower and the time to first and second sickle cell-related pain crises was significantly delayed in the Adakveo group. In addition, treatment with Adakveo decreased the annual rate of hospitalized days, compared with placebo.

Guidelines

The American Society of Hematology guidelines for sickle cell disease: management of acute and chronic pain associated with sickle cell disease (2020) does not address the use of Adakveo.³ The National Institutes of Health – National Heart, Lung, and Blood Institute issued the Evidence-Based Management of Sickle Cell Disease, Expert Panel Report in 2014.⁴ These guidelines were published prior to the approval of Adakveo. Hydroxyurea has been shown to reduce the frequency of painful episodes, the incidence of acute coronary syndrome events, and the need for transfusions and hospitalizations. Hydroxyurea is recommended for use in most patients with sickle cell disease; however, it is not recommended for use in pregnant females or women who are breastfeeding. Females and males of reproductive potential are advised to use effective contraception during and after treatment with hydroxyurea.⁴⁻⁶ Hydroxyurea can also cause myelosuppression and treatment should not be initiated in patients with depressed bone marrow function.^{5,6}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Adakveo. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Adakveo as well as the monitoring required for adverse events and long-term efficacy, approval requires Adakveo to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Adakveo is recommended in those who meet the following criteria:

FDA-Approved Indication

01/03/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- 1. Sickle Cell Disease.** Approve for 1 year if the patient meets ONE of the following (A or B):
- A) Initial Therapy.** Approve if the patient meets ALL of the following (i, ii, iii, and iv):
- i.** Patient is ≥ 16 years of age; AND
 - ii.** Patient has had at least one sickle-cell related crisis in the previous 12-month period; AND
 - iii.** Patient meets one of the following (a, b, or c):
 - a)** Patient is currently receiving a hydroxyurea product; OR
 - b)** According to the prescriber, patient has tried a hydroxyurea product and has experienced inadequate efficacy or significant intolerance; OR
 - c)** According to the prescriber, patient is not a candidate for hydroxyurea therapy; AND
- Note:** Examples of patients who are not candidates for hydroxyurea therapy include patients who are pregnant or who are planning to become pregnant and patients with an immunosuppressive condition (such as cancer).
- iv.** The medication is prescribed by or in consultation with a physician who specializes in sickle cell disease (e.g., a hematologist).
- B) Patient is Currently Receiving Adakveo.** Approve if the patient meets ALL of the following (i, ii, and iii):
- 15.** Patient is ≥ 16 years of age; AND
 - 16.** According to the prescriber, patient is receiving clinical benefit from Adakveo therapy; AND
- Note:** Examples of clinical benefit include reduction in the number of vasoocclusive crises/sickle cell-related crises; delay in time to sickle cell-related crises; and reduction in the number of days in the hospital.
- 17.** The medication is prescribed by or in consultation with a physician who specializes in sickle cell disease (e.g., a hematologist).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Adakveo is not recommended in the following situations:

- 148.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Sick Cell Disease – L-glutamine Prior Authorization Policy

- Endari™ (L-glutamine oral powder – Emmaus Medical, generic)

REVIEW DATE: 01/03/2024; selected revision 08/28/2024

OVERVIEW

L-glutamine oral powder, an amino acid, is indicated to **reduce the acute complications of sickle cell disease** in patients ≥ 5 years of age.¹

L-glutamine is an essential amino acid and serves as a precursor of nucleic acids and nucleotides including the pyridine nucleotides (nicotinamide adenine dinucleotide and reduced nicotinamide adenine dinucleotide).^{1,2} These pyridine nucleotides play key roles in the regulation and prevention of oxidative damage in red blood cells and studies have shown that oxidative phenomena may play a significant role in the pathophysiology of sickle cell disease.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of L-glutamine oral powder. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with L-glutamine oral powder as well as the monitoring required for adverse events and long-term efficacy, approval requires L-glutamine oral powder to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for use of L-glutamine oral powder as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts, and/or other information.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of L-glutamine oral powder is recommended in those who meet the following criteria:

FDA-Approved Indication

18. Sickle Cell Disease [documentation required]. Approve for 1 year if the patient meets BOTH of the following (A and B):

B) Patient is ≥ 5 years of age; AND

C) The medication is prescribed by or in consultation with a physician who specializes in sickle cell disease (e.g., a hematologist).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of L-glutamine oral powder is not recommended in the following situations:

- 85.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Sick Cell Disease – Oxbryta Prior Authorization Policy

- Oxbryta® (voxelotor tablets, tablets for oral suspension – Global Blood Therapeutics/Pfizer)

REVIEW DATE: 10/01/2024

OVERVIEW

Oxbryta, a hemoglobin S (or sickle hemoglobin) polymerization inhibitor, is indicated for the treatment of **sickle cell disease** in patients ≥ 4 years of age.¹ This indication is approved under accelerated approval based on increase in hemoglobin. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trial(s).

Oxbryta Withdrawal

On September 25, 2024, Pfizer announced that it is voluntarily withdrawing all lots of Oxbryta for the treatment of sickle cell disease, in all markets where it is approved.² Furthermore, all active clinical trials and expanded access programs worldwide are also being discontinued. Pfizer's decision is based on totality of clinical data that shows the overall benefit of Oxbryta no longer outweighs the risk in patients with sickle cell disease. Pfizer notes that physicians should continue to monitor patients for adverse events after their treatment with Oxbryta is discontinued and ensure appropriate follow-up as needed.³ Complications when treatment is interrupted abruptly cannot be excluded and neither efficacy nor a dose for gradual discontinuation have been established.

POLICY STATEMENT

Pfizer is voluntarily withdrawing all lots of Oxbryta for the treatment of sickle cell disease, in all markets where it is approved. Coverage of Oxbryta is not approved.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Oxbryta is not recommended in the following situations:

- 149. Sick Cell Disease.** On September 25, 2024, Pfizer announced that it is voluntarily withdrawing all lots of Oxbryta for the treatment of sickle cell disease, in all markets where it is approved.² Coverage of Oxbryta will not be approved.
- 150.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Sohonos Prior Authorization Policy

- Sohonos® (palovarotene capsules – Ipsen)

REVIEW DATE: 10/09/2024

OVERVIEW

Sohonos, a retinoid, is indicated for the reduction in volume of new heterotopic ossification in females ≥ 8 years of age and males ≥ 10 years of age with **fibrodysplasia ossificans progressiva**.¹

Disease Overview

Fibrodysplasia ossificans progressiva is an ultra-rare, autosomal dominant genetic disorder of connective tissue characterized by progressive heterotopic ossification resulting in disability, immobility, and reduced quality/length of life.² Patients experience episodes of painful inflammatory swelling in soft tissues (flare-ups), some of which will spontaneously resolve, but most will transform soft connective tissues into mature heterotopic bone. Eventually, plates, sheets, and ribbons of heterotopic bone permanently replace muscles and connective tissue, encasing the patient almost like an armor, resulting in progressive and permanent immobility. There are no formal diagnostic criteria for fibrodysplasia ossificans progressiva.^{2,3} A clinical diagnosis can be made in patients with great toe malformations, tissue swelling, and heterotopic ossification, but genetic confirmation of an Activin A Type 1 Receptor (ACVR1) gene mutation is needed. All patients with fibrodysplasia ossificans progressiva have a mutation in ACVR1, a gene encoding a bone morphogenetic protein type I receptor kinase.^{2,4} Approximately 97% of these patients have the same, heterozygous, single-nucleotide change in the glycine-serine activation domain of the ACVR1 (ACVR1^{R206H}).

Clinical Efficacy

In the pivotal study of Sohonos, patients were required to have fibrodysplasia ossificans progressiva as confirmed by a pathogenic variant in ACVR1^{R206H}.^{1,5}

Guidelines

Medical management guidelines from the International Clinical Council on Fibrodysplasia Ossificans Progressiva (2024) recommend that each patient with the disease should have a primary provider who is able to consult with an fibrodysplasia ossificans progressiva expert and help coordinate a local care team.² The diagnosis of fibrodysplasia ossificans progressiva is based on clinical findings, but requires genetic confirmation (i.e., ACVR1 gene mutation), which can be detected by DNA sequence analysis.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Sohonos. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: males are defined as individuals with the biological traits of a male, regardless of the individual's gender identity or gender expression; females are defined as individuals with the biological traits of a female, regardless of the individual's gender identity or gender expression. Because of the specialized skills required for evaluation and diagnosis of patients treated with Sohonos as well as the monitoring required for adverse events and long-term efficacy, approval requires Sohonos to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sohonos is recommended in those who meet the following criteria:

FDA-Approved Indications

- 9. Fibrodysplasia ossificans progressiva.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A)** Patient meets ONE of the following (i or ii):
 - i.** Patient is female* and ≥ 8 years of age; OR
 - ii.** Patient is male* and ≥ 10 years of age; AND
 - B)** Patient has had a genetic test confirming a mutation in Activin A Type 1 Receptor (ACVR1)^{R206H} consistent with a diagnosis of fibrodysplasia ossificans progressiva; AND
 - C)** Patient has heterotopic ossification as confirmed by radiologic testing; AND
Note: Examples of radiologic testing are x-ray, computed tomography (CT), magnetic resonance imaging (MRI), or positron emission tomography (PET) scan.
 - D)** The medication is prescribed by or in consultation with an endocrinologist or physician who specializes in bone disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sohonos is not recommended in the following situations:

- 151. Chronic Obstructive Pulmonary Disease (COPD).** Sohonos is not indicated for the management of COPD.¹ Palovarotene was previously studied for the treatment of COPD, but was found to be ineffective for this condition.⁷
- 152. Osteochondroma(s).** Sohonos is not indicated for the treatment and/or prevention of osteochondroma.¹ One Phase II study was initiated to evaluate Sohonos for the prevention of disease progression in pediatric patients with multiple osteochondromas.⁶ However, this study was terminated early in order to analyze accumulated data and evaluate the future of Sohonos for this use. Results are not available. More data are needed.
- 153.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Mycapssa Prior Authorization Policy

- Mycapssa® (octreotide delayed-release capsules – Amryt)

REVIEW DATE: 05/22/2024

OVERVIEW

Mycapssa, a somatostatin analog, is indicated for long-term maintenance treatment in **acromegaly** patients who have responded to and tolerated treatment with octreotide or lanreotide.¹ Mycapssa maintained growth hormone and insulin-like growth factor 1 levels in patients with acromegaly.

GUIDELINES

The Endocrine Society Clinical Practice Guidelines for Acromegaly (2014) recommend medical therapy as adjuvant treatment after surgical intervention.² Mycapssa is not addressed in the guidelines. Primary medical therapy with somatostatin analogs (no preferred agent) can be recommended for some patients (e.g., surgery is not curative or patient is a poor surgical candidate). Updated recommendations to the 2014 guidelines on therapeutic outcomes for patients with acromegaly were drafted by the Acromegaly Consensus Group (2020).³ The guidelines recommend lanreotide deep subcutaneous injection and octreotide long acting intramuscular injection as first-line medical therapies in patients with persistent disease after surgery. Mycapssa is recommended for patients who respond to and tolerate treatment with injectable lanreotide or octreotide. Signifor® LAR (pasireotide intramuscular injection) is recommended as a second-line medical therapy due to its potential for hyperglycemic-associated adverse events. The Pituitary Society Acromegaly Management Guidelines (2021) recommend oral octreotide capsules as suitable for patients who have demonstrated complete or partial biochemical response to injectable octreotide or lanreotide.⁴

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Mycapssa. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Mycapssa as well as the monitoring required for adverse events and long-term efficacy, approval requires Mycapssa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mycapssa is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Acromegaly.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient has (or had) a pretreatment (baseline) insulin-like growth factor 1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND

Note: Pretreatment (baseline) refers to the IGF-1 level prior to the initiation of a somatostatin analog (e.g., Mycapssa [octreotide delayed-release capsules], an octreotide acetate injection

05/22/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

product [e.g., Bynfezia Pen, Sandostatin {generic}, Sandostatin LAR Depot], Signifor LAR [pasireotide injection], Somatuline Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.

- B) According to the prescriber, patient has responded to one octreotide acetate injection product or Somatuline Depot (lanreotide injection); AND
- C) The medication is prescribed by or in consultation with an endocrinologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mycapssa is not recommended in the following situations:

- 154. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Lanreotide Products Prior Authorization Policy

- Lanreotide subcutaneous injection – Cipla
- Somatuline® Depot (lanreotide subcutaneous injection – Ipsen, generic)

REVIEW DATE: 05/15/2024; selected revision 11/13/2024

OVERVIEW

The lanreotide products are somatostatin analogs indicated for the following uses:^{1,2}

- **Acromegaly**, in patients who have had an inadequate response to surgery and/or radiotherapy, or for those whom surgery and/or radiotherapy, is not an option. The goal of treatment in acromegaly is to reduce growth hormone and insulin-like growth factor-1 levels to normal.
- **Gastroenteropancreatic neuroendocrine tumors (GEP-NETs)**, in adult patients with unresectable, well or moderately differentiated, locally advanced or metastatic GEP-NETs to improve progression-free survival.
- **Carcinoid syndrome**, in adult patients to reduce the frequency of short-acting somatostatin analog rescue therapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for **neuroendocrine and adrenal tumors** (version 2.2024 – August 1, 2024) recommend lanreotide for the management of carcinoid syndrome; tumors of the gastrointestinal tract, lung, thymus (carcinoid tumors), and pancreas (including glucagonomas, gastrinomas, VIPomas, insulinomas); pheochromocytomas; and paragangliomas.³ Patients who have local unresectable disease and/or distant metastases and clinically significant tumor burden or progression should be started on therapy with a somatostatin analog to potentially control tumor growth.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of lanreotide products. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with lanreotide products as well as the monitoring required for adverse events and long-term efficacy, approval requires lanreotide products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of lanreotide products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

2. **Acromegaly.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A) Patient meets ONE of the following (i, ii, or iii):
 - i. Patient has had an inadequate response to surgery and/or radiotherapy; OR
 - ii. Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
 - iii. Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND

05/15/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- B)** Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal (ULN) based on age and gender for the reporting laboratory; AND
Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen, Sandostatin {generics}, Sandostatin LAR Depot], Signifor LAR [pasireotide injection], Somatuline Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.
- C)** The medication is prescribed by or in consultation with an endocrinologist.

- 2. Carcinoid Syndrome.** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, endocrinologist, or gastroenterologist.
- 3. Neuroendocrine Tumor(s) [NETs] of the Gastrointestinal Tract, Lung, Thymus (Carcinoid Tumors), and Pancreas (including glucagonomas, gastrinomas, vasoactive intestinal peptides-secreting tumors [VIPomas], insulinomas).** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, endocrinologist, or gastroenterologist.

Other Uses with Supportive Evidence

- 4. Pheochromocytoma and Paraganglioma.** Approve for 1 year if the medication is prescribed by or in consultation with an endocrinologist, oncologist, or neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of lanreotide products is not recommended in the following situations:

- 155.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Somatostatin Analogs – Octreotide Immediate-Release Products Prior Authorization Policy
- Bynfezia Pen™ (octreotide acetate immediate-release subcutaneous injection – Sun Pharmaceutical [discontinued])
 - Sandostatin® (octreotide acetate immediate-release subcutaneous or intravenous injection – Novartis, generic)

REVIEW DATE: 05/22/2024; selected revision 08/07/2024

OVERVIEW

Octreotide acetate immediate-release injection products (Bynfezia Pen, Sandostatin [generic]), somatostatin analogs, are indicated for the following uses:¹⁻³

- **Acromegaly**, to reduce blood levels of growth hormone and insulin-like growth factor-1 in adults with acromegaly who have had inadequate response to or cannot be treated with surgical resection, pituitary irradiation, and bromocriptine mesylate at maximally tolerated doses.
- **Carcinoid tumors**, in adults with severe diarrhea and flushing episodes associated with metastatic carcinoid tumors. Studies were not designed to show an effect on the size, rate of growth, or development of metastases.
- **Vasoactive intestinal peptide (VIP) tumors**, in adults with profuse watery diarrhea associated with VIP-secreting tumors. Studies were not designed to show an effect on the size, rate of growth, or development of metastases.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of octreotide in multiple conditions.

- **Central Nervous System Cancers:** Guidelines (version 1.2023 – March 24, 2023) note that an octreotide scan may be used to confirm magnetic resonance imaging findings.⁴ NCCN also notes that everolimus and octreotide may be useful for patients with recurrent meningiomas.
- **Neuroendocrine and Adrenal Tumors:** Guidelines (version 1.2023 – August 2, 2023) recommend octreotide for the management of carcinoid syndrome, tumors of the gastrointestinal tract, lung, thymus (carcinoid tumors), and pancreas (including glucagonomas, gastrinomas, VIPomas, insulinomas), pheochromocytomas, and paragangliomas.⁵ Patients who have local unresectable disease and/or distant metastases and clinically significant tumor burden or progression should be started on therapy with a somatostatin analog to potentially control tumor growth.
- **Thymomas and Thymic Carcinomas:** Guidelines (version 1.2024 – November 21, 2023) note that in patients with thymoma who have positive octreotide scan or symptoms of carcinoid syndrome, octreotide therapy may be useful.⁶

Supportive Evidence

- **Enterocutaneous Fistulas:** In case series, octreotide has been effective in patients with enterocutaneous fistulas.⁷ Octreotide, when used with an acid inhibitor agent (omeprazole), reduced the output of enterocutaneous fistulas. The European Journal of Medical Research reported results from a trial where 84 of 154 patients with enterocutaneous fistulas received somatostatin; postoperative use of somatostatin served as a protective factor for developing into

05/22/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

high-output recurrent fistulas. The average time for fistula closure without surgical intervention ranges from 12 to 66 days.¹²

- **Pancreatic Fistulas:** Octreotide demonstrated reduction of output and fistula closure in case studies and retrospective reviews.⁹⁻¹¹ The use of octreotide also showed a reduced risk of postoperative pancreatic fistulae and hospital stay.¹¹ On average, pancreatic fistulas closed between 18 to 35 days.¹⁰

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of octreotide immediate-release products. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with octreotide immediate-release products as well as the monitoring required for adverse events and long-term efficacy, approval requires octreotide immediate-release products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of octreotide immediate-release products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

3. **Acromegaly.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - D) Patient meets ONE of the following (i, ii, or iii):
 - i. Patient has had an inadequate response to surgery and/or radiotherapy; OR
 - ii. Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
 - iii. Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression);AND
 - E) Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND
Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen, Sandostatin {generic}, Sandostatin LAR Depot], Signifor LAR [pasireotide injection], Somatuline Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.
 - F) The medication is prescribed by or in consultation with an endocrinologist.
2. **Neuroendocrine Tumor(s) [NETs] of the Gastrointestinal Tract, Lung, Thymus (Carcinoid Tumors), and Pancreas (including glucagonomas, gastrinomas, vasoactive intestinal peptides-secreting tumors [VIPomas], insulinomas).** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, endocrinologist, or gastroenterologist.

Other Uses with Supportive Evidence

5. **Enterocutaneous Fistulas.** Approve for 3 months.

6. **Meningioma.** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, radiologist, or neurosurgeon.
7. **Pancreatic Fistulas.** Approve for 2 months if the patient is being treated for operative trauma, pancreatic resection, acute or chronic pancreatitis, or pancreatic infection.
8. **Pheochromocytoma and Paraganglioma.** Approve for 1 year if the medication is prescribed by or in consultation with an endocrinologist, oncologist, or neurologist.
9. **Thymoma and Thymic Carcinoma.** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of octreotide immediate-release products is not recommended in the following situations:

156. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Octreotide Long-Acting Products Prior Authorization Policy

- Sandostatin® LAR Depot (octreotide acetate intramuscular injection – Novartis, generic)

REVIEW DATE: 05/15/2024; selected revision 08/07/2024, 11/13/2024

OVERVIEW

Octreotide intramuscular injection, a somatostatin analog, is indicated for the following uses:¹

- **Acromegaly**, in patients who have had an inadequate response to surgery and/or radiotherapy, or for whom surgery and/or radiotherapy, is not an option. The goal of treatment in acromegaly is to reduce growth hormone and insulin-like growth factor-1 levels to normal.
- **Carcinoid tumors**, in patients with severe diarrhea and flushing episodes associated with metastatic carcinoid tumors.
- **Vasoactive intestinal peptide tumors (VIPomas)**, in patients with profuse watery diarrhea associated with vasoactive intestinal peptide (VIP)-secreting tumors.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of octreotide intramuscular injection in multiple conditions:

- **Central Nervous System Cancers:** Guidelines (version 1.2023 – March 24, 2023) recommend octreotide intramuscular injection for the treatment of meningiomas that recur despite surgery and/or radiation therapy, or are not amenable to treatment with surgery or radiation therapy.²
- **Neuroendocrine and Adrenal Tumors:** Guidelines (version 1.2023 – August 2, 2023) recommend octreotide intramuscular injection for the management of carcinoid syndrome; tumors of the gastrointestinal tract, lung, thymus (carcinoid tumors), and pancreas (including glucagonomas, gastrinomas, VIPomas, insulinomas); pheochromocytomas; and paragangliomas.³ Patients who have local unresectable disease and/or distant metastases and clinically significant tumor burden or progression should be started on therapy with a somatostatin analog to potentially control tumor growth. The North American Neuroendocrine Tumor Society (NANETS) consensus guidelines for the surveillance and medical management of midgut NETs (2017) also recommend octreotide intramuscular injection as a first-line initial therapy in most patients with metastatic midgut NETs for control of carcinoid syndrome and inhibition of tumor growth.⁴
- **Thymomas and Thymic Carcinomas:** Guidelines (version 1.2024 – November 21, 2023) recommend octreotide intramuscular injection as a therapy option with or without concomitant prednisone therapy.⁵ In patients with thymoma who have positive octreotide scan or symptoms of carcinoid syndrome, octreotide therapy may be useful.

Supportive Evidence

- **Enterocutaneous Fistulas:** In case series, octreotide has been effective in patients with enterocutaneous fistulas.⁶ Octreotide when used with an acid inhibitor agent (omeprazole) reduced the output of enterocutaneous fistulas. The European Journal of Medical Research reported in a trial where 84 of 154 patients were divided into the somatostatin group.⁷ This trial showed that postoperative use of somatostatin served as a protective factor for developing into high-output recurrent fistulas. The average time for fistula closure without surgical intervention ranges from 12 to 66 days.¹¹

05/15/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- **Pancreatic Fistulas:** In case studies and retrospective reviews, octreotide demonstrated reduction of output and fistula closure.⁸⁻¹⁰ The use of octreotide also showed a reduced risk of postoperative pancreatic fistulae and hospital stay.¹⁰ On average, pancreatic fistulas closed between 18 to 35 days.⁹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of octreotide intramuscular injection. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with octreotide intramuscular injection as well as the monitoring required for adverse events and long-term efficacy, approval requires octreotide intramuscular injection to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of octreotide intramuscular injection is recommended in those who meet one of the following criteria:

FDA-Approved Indications

4. **Acromegaly.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - G) Patient meets ONE of the following (i, ii, or iii):
 - i. Patient has had an inadequate response to surgery and/or radiotherapy; OR
 - ii. Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
 - iii. Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression);
 AND
 - H) Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND

Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen, Sandostatin {generic}, Sandostatin LAR Depot], Signifor LAR [pasireotide injection], Somatuline Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.
 - I) The medication is prescribed by or in consultation with an endocrinologist.
2. **Neuroendocrine Tumor(s) [NETs] of the Gastrointestinal Tract, Lung, Thymus (Carcinoid Tumors), and Pancreas (including glucagonomas, gastrinomas, vasoactive intestinal peptides-secreting tumors [VIPomas], insulinomas).** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, endocrinologist, or gastroenterologist.

Other Uses with Supportive Evidence

10. **Enterocutaneous Fistulas.** Approve for three months.
11. **Meningioma.** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, radiologist, or neurosurgeon.

- 12. Pancreatic Fistulas.** Approve for two months if the patient is being treated for operative trauma, pancreatic resection, acute or chronic pancreatitis, or pancreatic infection.
- 13. Pheochromocytoma and Paraganglioma.** Approve for 1 year if the medication is prescribed by or in consultation with an endocrinologist, oncologist, or neurologist.
- 14. Thymoma and Thymic Carcinoma.** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of octreotide intramuscular injection is not recommended in the following situations:

- 157.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Signifor LAR Prior Authorization Policy

- Signifor® LAR (pasireotide intramuscular injection – Recordati Rare Diseases)

REVIEW DATE: 04/19/2024

OVERVIEW

Signifor LAR, a somatostatin analog, is indicated for the following uses:¹

- **Acromegaly**, in patients who have had an inadequate response to surgery and/or for whom surgery is not an option. *In vivo* studies show that Signifor LAR lowers growth hormone and insulin-like growth factor-1 levels in patients with acromegaly.
- **Cushing's disease**, in patients for whom pituitary surgery is not an option or has not been curative.

Disease Overview

Cushing's syndrome refers to the general state of excessive levels of cortisol (hypercortisolism) in the blood.^{2,3} Hypercortisolism can occur for reasons that are either endogenous or exogenous in nature (e.g., Cushing's disease, cortisol-containing medications, adrenal gland tumor, certain cancers). Cushing's disease (hypercortisolism caused by pituitary adenomas) is the most common type of adrenocorticotropic hormone (ACTH)-dependent Cushing's syndrome. Treatment for Cushing's syndrome requires a multi-modal approach. The goals of treatment are normalization of cortisol excess, long-term disease control, avoidance of recurrence, and reversal of clinical features.⁴

Guidelines

The Endocrine Society published clinical practice guidelines for the treatment of Cushing's syndrome in (2015) and Cushing's disease (2021).^{5,6} Recorlev is recognized in the 2021 guidelines for Cushing's disease as investigational; further details regarding this therapy are not discussed. Treatment goals for Cushing's syndrome are to normalize cortisol levels or its action at the receptors to eliminate signs and symptoms of Cushing's syndrome. Best practice adjunctive management include treating co-morbidities associated with hypercortisolism (psychiatric disorders, diabetes, hypertension, hypokalemia, infections, dyslipidemia, osteoporosis, and poor physical fitness). First-line treatment involves resection of the tumor, unless surgery is not possible or is unlikely to meaningfully reduce excess glucocorticoid. Specifically for Cushing's disease, transsphenoidal selective adenomectomy by a surgeon with extensive experience in pituitary surgery is recommended. In patients with ACTH-dependent Cushing's syndrome who underwent noncurative surgery or for whom surgery was not possible, the guidelines advocate several second-line therapies (e.g., repeat transsphenoidal surgery, radiotherapy, medical therapy, and bilateral adrenalectomy). For Cushing's disease, the guidelines recommend all medical therapies as second-line options after transsphenoidal surgery. These involve steroidogenesis inhibitors (ketoconazole, Metopirone® [metyrapone capsules], Lysodren® [mitotane tablets], etomidate) in patients either with or without radiotherapy/radiosurgery; pituitary-directed medical treatments (cabergoline, Signifor® [pasireotide subcutaneous injection]) in patients who are not surgical candidates or who have persistent disease; and Korlym® (mifepristone tablets) in patients with diabetes or glucose intolerance who are not surgical candidates or who have persistent disease after transsphenoidal surgery.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Signifor LAR. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Signifor LAR as well as the monitoring required for adverse events and long-term efficacy, approval requires Signifor LAR to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Signifor LAR is recommended in those who meet one of the following criteria:

FDA-Approved Indications

5. **Acromegaly.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - J) Patient meets ONE of the following (i, ii, or iii):
 - i. Patient has had an inadequate response to surgery and/or radiotherapy; OR
 - ii. Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
 - iii. Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND
 - K) Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND
Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen, Sandostatin {generic}, Sandostatin LAR Depot], Signifor LAR [pasireotide injection], Somatuline Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.
 - L) The medication is prescribed by or in consultation with an endocrinologist.
2. **Cushing's Disease.** Approve for the duration noted if the patient meets ONE of the following (A or B):
 - A) Initial Therapy. Approve for 4 months of initial therapy if the patient meets BOTH of the following (i and ii):
 - i. According to the prescriber, patient is not a candidate for surgery, or surgery has not been curative; AND
Note: For patients with Cushing's disease/syndrome awaiting surgery, see *Other Uses with Supportive Evidence*.
 - ii. Signifor LAR is prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of Cushing's disease.
 - B) Patient is Currently Receiving Signifor LAR/Signifor. Approve for 1 year of continuation therapy if the patient has responded to Signifor/Signifor LAR, as determined by the prescriber.
Note: An example of patient response is decrease in the mean urinary free cortisol level.

Other Uses with Supportive Evidence

3. **Endogenous Cushing's Syndrome.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient meets ONE of the following (i, ii, or iii)
 - i. According to the prescriber, the patient is not a candidate for surgery or surgery has not been curative; OR
 - ii. Patient is awaiting surgery for **endogenous Cushing's Syndrome**; OR
 - iii. Patient is awaiting therapeutic response after radiotherapy for **endogenous Cushing's Syndrome**; AND
- C) The medication is prescribed by or in consultation with an endocrinologist or a physician who specialized in the treatment of Cushing's syndrome.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Signifor LAR is not recommended in the following situations:

158. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Somavert Prior Authorization Policy

- Somavert® (pegvisomant subcutaneous injection – Pfizer)

REVIEW DATE: 08/28/2024

OVERVIEW

Somavert, a growth hormone receptor antagonist, is indicated for the treatment of **acromegaly** in patients who have had inadequate response to surgery and/or radiation therapy and/or other medical therapies, or for whom these therapies are not appropriate.¹ The goal of treatment is to normalize serum insulin-like growth factor-1 levels.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Somavert. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Somavert as well as the monitoring required for adverse events and long-term efficacy, approval requires Somavert to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Somavert is recommended in those who meet the following criteria:

FDA-Approved Indication

6. Acromegaly. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

M) Patient meets ONE of the following (i, ii, or iii):

i. Patient has had an inadequate response to surgery and/or radiotherapy; OR

ii. Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR

iii. Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND

N) Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND

Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen, Sandostatin {generics}, Sandostatin LAR Depot], Signifor LAR [pasireotide intramuscular injection], Somatuline Depot [lanreotide subcutaneous injection]), dopamine agonist (e.g., cabergoline, bromocriptine), or Somavert.

O) The medication is prescribed by or in consultation with an endocrinologist.

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Somavert is not recommended in the following situations:

- 159. Treatment of Excess Growth Hormone Associated with McCune-Albright Syndrome.** Five patients with growth hormone excess due to McCune-Albright Syndrome were treated with 20 mg of Somavert daily for 12 weeks in a randomized, double-blind, placebo-controlled trial at the National Institutes of Health.² Somavert reduced IGF-1 and IGF binding protein-3 in these patients but had no effect on fibrous dysplasia.
- 160.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Spinal Muscular Atrophy – Evrysdi Prior Authorization Policy

- Evrysdi® (risdiplam oral solution – Genentech/Roche)

REVIEW DATE: 10/02/2024

OVERVIEW

Evrysdi, a survival motor neuron (SMN)2 splicing modifier, is indicated for the **treatment of spinal muscular atrophy** in pediatric patients and adults.¹ The recommended dosing is as follows:

- 0.15 mg/kg once daily (QD) for patients < 2 months of age.
- 0.2 mg/kg QD for patients 2 months to < 2 years of age.
- 0.25 mg/kg QD for patients ≥ 2 years of age and < 20 kg.
- 5 mg QD for patients ≥ 2 years of age and ≥ 20 kg.

Disease Overview

Spinal muscular atrophy is a genetic, autosomal recessive muscular disorder caused by deletion or loss of function mutation in the SMN1 gene.²⁻⁵ The reduced level of SMN protein causes degeneration of lower motor neurons. The phenotypic expression of the disease is impacted by the SMN2 gene copy number. Data have shown that patients with a higher number of SMN2 copies generally have a more mild phenotypic disease expression. Gene deletion testing for spinal muscular atrophy can be performed at many diagnostic laboratories. Table 1 describes the disease types. Of note, various motor ability assessments are used in clinical practice to characterize functional impairment in spinal muscular atrophy. Different functional motor scales are utilized to evaluate patients. When motor neuron function is lost, it cannot be regained, which greatly impacts patients who have experienced progression (e.g., patients with complete paralysis of limbs or permanent ventilator dependence).

Table 1. Types of Spinal Muscular Atrophy.⁴

* Without disease-modifying treatment or mechanical ventilation; SMN2 – Survival motor neuron 2.

In addition to Evrysdi, other therapies are available. **Spinraza**® (nusinersen intrathecal injection), a SMN2-directed antisense oligonucleotide, is indicated for the treatment of spinal muscular atrophy in pediatric patients and adults.⁶ Although studies and experience continue, the primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular atrophy primarily in children. Data are also available with Spinraza in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy. There are some data with Spinraza in adults as well.³

Zolgensma® (onasemnogene abeparvovec-xioi intravenous infusion), an adeno-associated virus vector-based gene therapy, is indicated for the treatment of spinal muscular atrophy with bi-allelic mutations in the SMN1 gene in pediatric patients < 2 years of age.⁷ The agent works by providing a copy of the gene encoding the SMN protein, which increases its production. Zolgensma is administered as a single-dose intravenous infusion over 60 minutes. Pivotal studies mainly involved infants with two or three SMN2 gene copies with primarily Type 1 or Type 2 disease.

Clinical Efficacy

The efficacy of Evrysdi for the treatment of patients with infantile-onset (Type 1), later-onset (Type 2 and 3), and pre-symptomatic spinal muscular atrophy was evaluated in three clinical studies.^{1,8-10} **FIREFISH** involved patients with Type 1 spinal muscular atrophy who had symptom onset between 28 days and 3

10/02/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

months of age.¹ Genetic confirmation of homozygous deletion or compound heterozygosity predictive of loss of function of the SMN1 gene was required for trial entry. Patients had two SMN2 gene copies. Many patients gained improvements in the ability to sit for at least 5 seconds independently, and there was an increase in the percentages of patients who were alive without permanent ventilation. **SUNFISH** evaluated Evrysdi in patients with later-onset (Type 2 or Type 3) spinal muscular atrophy. Most patients (90%) had three SMN2 gene copies; 8% and 2% of patients had four and two SMN2 gene copies, respectively. In Part 2 of the study, benefits of Evrysdi vs. placebo were noted at Month 12 in motor function as well as in upper limb motor performance. **RAINBOWFISH** investigated Evrysdi in infants up to 6 weeks of age (at the first dose) who had been genetically diagnosed with spinal muscular atrophy but did not have symptoms. In total, seven patients have received Evrysdi for at least 12 months. Eight patients had two SMN2 copies, 13 patients had three SMN2 gene copies, and five patients had four or more SMN2 copies. The median age at first dose was 25 days. The primary efficacy endpoint was the proportion of patients with the ability to sit without support for at least 5 seconds at Month 12, which was achieved by 87.5% of all patients with two SMN2 copies (n = 7/8) and 96.2% of patients in the full treated population. Of note, in general, the onset of effect with Evrysdi was observed after approximately 4 months of therapy.

Guidelines

Evrysdi is not addressed in guidelines. According to a treatment algorithm from the Spinal Muscular Atrophy Newborn Screening Multidisciplinary Working Group (2018), immediate treatment is recommended in patients with two or three SMN2 gene copies.¹¹ In 2020, the Working Group updated recommendations that infants diagnosed with spinal muscular atrophy via newborn screening with four SMN2 gene copies should receive immediate treatment.¹² Patients with five (or more) SMN2 gene copies should be observed and screened for symptoms.

Safety

Based on animal data, Evrysdi may cause fetal harm if given to a pregnant woman.¹ Pregnancy testing is recommended for females of reproductive potential prior to initiating Evrysdi. Advise females of reproductive potential to use effective contraception during treatment with Evrysdi and for at least 1 month after the last dose.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Evrysdi. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Evrysdi as well as the monitoring required for adverse events and long-term efficacy, approval requires Evrysdi to be prescribed by a physician who has consulted with or who specializes in the condition. If claims history is available, verification is required for certain criteria as noted by **[verification in claims history required]**. In the criteria for Evrysdi, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: females are defined as individuals with the biological traits of a woman, regardless of the individual's gender identity or gender expression. All reviews will be forwarded to the Medical Director for evaluation.

Automation: None.

Documentation: Documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, laboratory results, medical test results, claims records, prescription receipts, and/or other information. In subsequent coverage reviews for a patient who has previously met the documentation requirements and related criteria in the *Spinal Muscular Atrophy – Evrysdi Prior Authorization Policy* through the Coverage Review Department, and who is requesting

reauthorization, the criteria utilized do NOT require resubmission of documentation for reauthorization, except for the criterion requiring documentation of response or benefit to Evrysdi therapy.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Evrysdi is recommended in those who meet the following criteria:

FDA-Approved Indication

10. Spinal Muscular Atrophy – Treatment. Approve if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets ALL of the following (i, ii, iii, iv, v, vi, vii, and viii):

i. Baseline motor ability assessment that suggests spinal muscular atrophy (based on age, motor ability, and development) has been performed from ONE of the following exams (a, b, c, d, e, f, or g) **[documentation required]**:

a) Bayley Scales of Infant and Toddler Development; OR

b) Children’s Hospital of Philadelphia Infant Test of Neuromuscular Disorders (CHOP-INTEND); OR

c) Hammersmith Functional Motor Scale Expanded (HFMSE); OR

d) Hammersmith Infant Neurological Exam Part 2 (HINE-2); OR

e) Motor Function Measure-32 Items (MFM-32); OR

f) Revised Upper Limb Module (RULM) test; OR

g) World Health Organization motor milestone scale; AND

ii. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic pathogenic variants in the survival motor neuron 1 (SMN1) gene **[documentation required]**; AND

Note: Pathogenic variants may include homozygous deletion, compound heterozygous mutation, or a variety of other rare mutations.

iii. Patient meets ONE of the following (a or b):

a) Patient has two or three survival motor neuron 2 (SMN2) gene copies **[documentation required]**; OR

b) Patient meets BOTH of the following ([1] and [2]):

(1) Patient has four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND

(2) Patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND

iv. For a patient currently receiving or who has received prior treatment with Spinraza (nusinersen intrathecal injection), the prescribing physician confirms that further therapy with Spinraza will be discontinued; AND

v. Patient has not received Zolgensma (onasemnogene abeparvovec-xioi intravenous infusion) in the past **[verification in claims history required]**; AND

Note: If no claim for Zolgensma is present (or if claims history is not available), the prescribing physician confirms that the patient has not previously received Zolgensma.

vi. According to the prescribing physician, a female* patient of reproductive potential must meet BOTH the following (a and b):

a) Patient is not currently pregnant; AND

b) Effective contraception will be utilized during treatment and for 1 month after the last Evrysdi dose; AND

- vii. Dosing of Evrysdi meets ONE of the following based on the current (within the past 1 month) kg weight of the patient (a, b, c, or d):
 - a) 0.15 mg/kg once daily if the patient is < 2 months of age; OR
 - b) 0.2 mg/kg once daily if the patient is 2 months to < 2 years of age; OR
 - c) 0.25 mg/kg once daily if the patient is $\geq$ 2 years of age and weighs < 20 kg; OR
 - d) 5 mg once daily if the patient is $\geq$ 2 years of age and weighs $\geq$ 20 kg; AND
 - viii. The medication is prescribed by a physician who has consulted with a specialist or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; OR
- B) Patient Currently Receiving Evrysdi.** Approve for 4 months if the patient meets ALL of the following (i, ii, iii, iv, v, vi, vii, and viii):
- i. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic pathogenic variants in the survival motor neuron 1 (SMN1) gene **[documentation required]**; AND

Note: Pathogenic variants may include homozygous deletion, compound heterozygous mutation, or a variety of other rare mutations.
 - ii. Patient meets ONE of the following (a or b):
 - a) Patient has two or three survival motor neuron 2 (SMN2) gene copies **[documentation required]**; OR
 - b) Patient meets BOTH of the following [(1) and (2)]:
 - (1) Patient has four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND
 - (2) Patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND
 - iii. For a patient currently receiving or who has received prior treatment with Spinraza (nusinersen intrathecal injection), the prescribing physician confirms that further therapy with Spinraza will be discontinued; AND
 - iv. Patient has not received Zolgensma (onasemnogene abeparvovec-xioi intravenous infusion) in the past **[verification in claims history required]**; AND

Note: If no claim for Zolgensma is present (or if claims is not available), the prescribing physician confirms that the patient has not previously received Zolgensma.
 - v. According to the prescribing physician, a female* patient of reproductive potential must meet BOTH the following (a and b):
 - a) Patient is not currently pregnant; AND
 - b) Effective contraception will be utilized during treatment and for 1 month after the last Evrysdi dose; AND
 - vi. Dosing of Evrysdi meets ONE of the following based on the current (within the past 1 month) kg weight of the patient (a, b, c, or d):
 - a) 0.15 mg/kg once daily if the patient is < 2 months of age; OR
 - b) 0.2 mg/kg once daily if the patient is 2 months to < 2 years of age; OR
 - c) 0.25 mg/kg once daily if the patient is $\geq$ 2 years of age and weighs < 20 kg; OR
 - d) 5 mg once daily if the patient is $\geq$ 2 years of age and weighs $\geq$ 20 kg; AND
 - vii. The medication is prescribed by a physician who has consulted with a specialist or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; AND
 - viii. Patient must meet ONE of the following (a or b):
 - a) Patient must have had a positive clinical response (for example, improvement or stabilization) from pretreatment baseline status (i.e., within the past 4 months) with Evrysdi in one of the following exams [(1), (2), (3), (4), (5), (6), or (7)] **[documentation required]**:
 - (1) Bayley Scales of Infant and Toddler Development; OR

- (2) Children's Hospital of Philadelphia Infant Test of Neuromuscular Disorders (CHOP-INTEND); OR
 - (3) Hammersmith Functional Motor Scale Expanded (HFMSE); OR
 - (4) Hammersmith Infant Neurological Exam Part 2 (HINE-2); OR
 - (5) Motor Function Measure-32 Items (MFM-32); OR
 - (6) Revised Upper Limb Module (RULM) test; OR
 - (7) World Health Organization motor milestone scale; OR
- b)** According to the prescribing physician, the patient has responded to Evrysdi and continues to benefit from ongoing Evrysdi therapy by the most recent (i.e., within the past 4 months) physician monitoring/assessment tools **[documentation required]**.
Note: Examples include pulmonary function tests showing improvement, bulbar function test results suggesting benefits, reduced need for respiratory support, decrease in the frequency of respiratory infections or complications, and/or prevention of permanent assisted ventilation.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Evrysdi is not recommended in the following situations:

- 161. Patient has Complete Paralysis of All Limbs.** Data are needed to determine if this patient population with advanced spinal muscular atrophy would derive benefits from Evrysdi.
- 162. Patient has Permanent Ventilator Dependence.** Data are needed to determine if this patient population with advanced spinal muscular atrophy would derive benefits from Evrysdi.
- 163.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Spinal Muscular Atrophy – Gene Therapy – Zolgensma Prior Authorization Policy

- Zolgensma® (onasemnogene abeparvovec-xioi intravenous infusion – Novartis)

REVIEW DATE: 10/30/2024

OVERVIEW

Zolgensma, an adeno-associated virus vector-based gene therapy, is indicated for the treatment of spinal muscular atrophy with bi-allelic mutations in the survival motor neuron 1 (SMN1) gene in patients who are less than 2 years of age.¹

Limitations of use are that the safety and effectiveness of repeat administration of Zolgensma have not been evaluated.¹ The use of Zolgensma in patients with advanced spinal muscular atrophy (e.g., complete paralysis of limbs, permanent ventilator dependence) has not been assessed. Use of Zolgensma in premature neonates before reaching full-term gestational age is not recommended because concomitant treatment with corticosteroids may adversely affect neurological development. Zolgensma therapy should be delayed until full-term gestational age is achieved. The definition of full-term pregnancy commences at 39 weeks and 0 days gestation.²

Disease Overview

Spinal muscular atrophy is a genetic, autosomal recessive muscular disorder caused by deletion or loss of function mutation in the SMN1 gene.³⁻⁶ The reduced levels of survival motor neuron (SMN) protein causes degeneration of lower motor neurons. The phenotypic expression of the disease is impacted by the survival motor neuron 2 (SMN2) gene copy number. Data have shown that patients with a higher number of SMN2 gene copies generally have a more mild phenotypic disease expression. Gene deletion testing for spinal muscular atrophy can be performed at many diagnostic laboratories. Table 1 describes disease types. Of note, various motor ability assessments are used in clinical practice to characterize functional impairment in spinal muscular atrophy. Different function motor scales are utilized to evaluate patients. When motor neuron function is lost, it cannot be regained, which greatly impacts patients who have experienced progression (e.g., patients with complete paralysis of limbs or permanent ventilator dependence).

Table 1. Types of Spinal Muscular Atrophy.⁵

* Without disease-modifying treatment or mechanical ventilation; SMN2 – Survival motor neuron 2.

Besides Zolgensma, other therapies are available. **Spinraza**® (nusinersen intrathecal injection), a SMN2-directed antisense oligonucleotide, is indicated for the treatment of spinal muscular atrophy in pediatric and adult patients.⁷ Spinraza is given by intrathecal injection. Although studies and experience continue, the primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular atrophy primarily in children. Data are also available with Spinraza in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy. There are some data with Spinraza in adults as well.

Ervysdi® (risdiplam oral solution), a SMN2 splicing modifier, is indicated for the treatment of spinal muscular atrophy in pediatric and adult patients.⁸ The primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular atrophy, primarily in children and adults up to 25 years of age. Other information is available in older adults. Data are also available in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy.

Clinical Efficacy

10/30/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

The efficacy of Zolgensma was evaluated in patients less than 2 years of age with spinal muscular atrophy who had bi-allelic mutations in the SMN1 gene.^{1,9-14} One trial was an open-label, single-arm study which is ongoing (STRIVE [n = 21])¹¹ and the other was an open-label, single-arm, ascending-dose clinical trial (START [n = 15] {12 patients received a therapeutic dose}).^{1,9,10} Symptoms onset occurred before patients were 6 months of age. All patients had genetically confirmed bi-allelic SMN1 gene deletions and two SMN2 gene copies. In both trials, Zolgensma was given as a single-dose intravenous infusion. Efficacy was assessed on parameters such as survival and achievement of developmental motor milestones (e.g., sitting without support, standing without assistance). The definition of survival was the time from birth to either death or permanent ventilation. Other efficacy parameters were evaluated (e.g., assessment of Children's Hospital of Philadelphia Infant Test of Neuromuscular Disorders scores, ventilator use). In general, patients who received Zolgensma experienced better outcomes compared with what would normally be anticipated without treatment. Other data are also available regarding Zolgensma.¹⁰⁻¹⁵

Guidelines

The Spinal Muscular Atrophy Newborn Screening Multidisciplinary Working Group is comprised of clinicians and geneticists with expertise in spinal muscular atrophy who developed a treatment algorithm in 2018 for infants who have positive results from a newborn screening test for spinal muscular atrophy.¹⁶ Spinal muscular atrophy Types 1 and 2 comprise a large majority of cases and account for many patients who screen positively for spinal muscular atrophy with three or fewer SMN2 gene copies. Immediate treatment is recommended in patients with two or three SMN2 gene copies. Treatment recommendations for patients who screen positive for spinal muscular atrophy and have only one SMN2 gene copy are more complicated. It is likely that patients with only one SMN2 gene copy will likely be symptomatic at birth and the physician should determine if treatment is warranted.¹⁶ In 2020, the Working Group updated recommendations that infants diagnosed with spinal muscular atrophy via newborn screening with four SMN2 gene copies should receive immediate treatment.¹⁷ Also, patients with five (or more) SMN2 gene copies should be observed and screened for symptoms.

Dosing

The recommended dose of Zolgensma is 1.1×10^{14} vector genomes (vg) per kg of body weight.¹ Administer Zolgensma as an intravenous infusion over 60 minutes. Starting 1 day prior to Zolgensma infusion, give systemic corticosteroids equivalent to oral prednisolone 1 mg/kg of body weight for a total of 30 days. Examine liver function after this juncture and follow recommended guidelines.

Safety

Zolgensma has a Boxed Warning regarding acute serious liver injury and acute liver failure.¹ Elevated aminotransferases can occur with Zolgensma. Patients with preexisting liver impairment may be at higher risk. Prior to infusion, evaluate liver function in all patients by clinical examination and laboratory testing. One day before Zolgensma infusion, commence administration of systemic corticosteroids equivalent to oral prednisolone at 1 mg/kg of body weight per day for a total of 30 days. Prior to administration of Zolgensma, evaluate creatinine and complete blood counts. Perform baseline anti-AAV9 antibody testing prior to Zolgensma infusion. Patients in the Zolgensma trials were required to have baseline anti-AAV9 antibody titers of $\leq 1:50$.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zolgensma. Approval is recommended for those who meet the Criteria for the listed indication. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zolgensma as well as the specialized training required for administration of Zolgensma, approval requires Zolgensma to be prescribed by a physician who has consulted with or who specializes in the condition. All approvals are provided for one-time (per lifetime) as a single dose. The approval duration is 1 month to allow for an adequate timeframe to prepare and administer one dose of therapy. For the dosing criteria, verification of the appropriate weight-based dosing is required by a Medical Director as noted by **[verification required]**. If claims history is available, verification is required for certain criteria as noted by **[verification in claims history required]**. All reviews (approvals and denials) will be forwarded to the Medical Director for evaluation.

Some clients have elected Embarc Benefit Protection. For these clients, the Medical Director will coordinate with eviCore to ensure the Embarc Benefit Protection portion of the review has been completed. If the Embarc Benefit Protection portion of the review has not been completed, the Medical Director will route to Embarc@eviCore.com prior to completing the review.

Documentation: Documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to chart notes, laboratory results, medical test results, claims records, prescription receipts, and/or other information.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zolgensma is recommended in those who meet the following criteria:

FDA-Approved Indication

59. Spinal Muscular Atrophy – Treatment. Approve for a one-time (per lifetime) single dose if the patient meets ALL of the following (A, B, C, D, E, F, G, H, I, J, K, L, M, N, and O):

A) Patient is less than 2 years of age; AND

B) If the patient is a premature neonate, full-term gestational age of 39 weeks and 0 days has been met; AND

Note: Full-term gestational age can be defined as the postmenstrual age (gestational age plus chronological age) being equal to ≥ 39 weeks and 0 days.

C) Patient has not received Zolgensma in the past **[verification in claims history required]**; AND

Note: If no claim for Zolgensma is present (or if claims is not available), the prescribing physician confirms that the patient has not previously received Zolgensma.

10/30/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- D)** Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic pathogenic variants in the survival motor neuron 1 (SMN1) gene **[documentation required]**; AND

Note: Pathogenic variants may include homozygous deletion, compound heterozygous mutation, or a variety of other rare mutations.

- E)** Patient meets ONE of the following (i or ii):
- i. Patient has three or fewer survival motor neuron 2 (SMN2) gene copies **[documentation required]**; OR
 - ii. Patient meets BOTH of the following (a and b):
 - i. Patient has four SMN2 gene copies **[documentation required]**; AND
 - ii. The number of SMN2 gene copies has been determined by a quantitative assay capable of distinguishing between four SMN2 gene copies and five or greater SMN2 gene copies; AND
- F)** According to the prescribing physician, patient has started or will receive systemic corticosteroids equivalent to oral prednisolone at a dose of 1 mg/kg per day commencing 1 day prior to Zolgensma infusion for a total of 30 days; AND
- G)** Baseline anti-AAV9 antibody titers are $\leq 1:50$ **[documentation required]**; AND
- H)** Patient has undergone liver function testing within the past 30 days and meets ALL of the following (i, ii, iii, and iv):
- i. Alanine aminotransferase levels are ≤ 2 times the upper limit of normal **[documentation required]**; AND
 - ii. Aspartate aminotransferase levels are ≤ 2 times the upper limit of normal **[documentation required]**; AND
 - iii. Total bilirubin levels are ≤ 2 times the upper limit of normal **[documentation required]**; AND
- Note: Patient with elevated bilirubin levels due to neonatal jaundice are acceptable.
- iv. Prothrombin time results are ≤ 2 times the upper limit of normal **[documentation required]**; AND
- I)** Patient has undergone a renal function assessment within the past 30 days and has a creatinine level < 1.0 mg/dL **[documentation required]**; AND
- J)** A complete blood count has been obtained within the past 30 days and the patient meets BOTH of the following (i and ii):
- i. White blood cell count is $\leq 20,000$ cells per mm^3 **[documentation required]**; AND
 - ii. Hemoglobin levels are between 8 g/dL and 18 g/dL **[documentation required]**; AND
- K)** For a patient currently receiving or who has received prior treatment with Spinraza (nusinersen intrathecal injection), the prescribing physician confirms that further therapy with Spinraza will be discontinued; AND
- L)** For a patient currently receiving or who has received prior treatment with Evrysdi (risdiplam oral solution), the prescribing physician confirms that further therapy with Evrysdi will be discontinued; AND
- M)** Medication is prescribed by a physician who has consulted with or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; AND
- N)** Current patient body weight has been obtained within the past 14 days **[documentation required]**; AND
- O)** If criteria A through N are met, approve one dose of Zolgensma to provide for a one-time (per lifetime) single dose of 1.1×10^{14} vector genomes per kg (vg/kg) of body weight by intravenous infusion **[verification required]**. Zolgensma is provided as a customized kit to meet dosing requirements for each patient per their weight (in kilograms). Zolgensma kit sizes (per the cited NDC) are in Table 2.

Table 2. Zolgensma Kit Sizes.¹

[†] Vial nominal concentration is 2.0×10^{13} vg/mL and contains an extractable volume of not less than 5.5 mL; [°] Vial nominal concentration is 2.0×10^{13} vg/mL and contains an extractable volume of not less than 8.3 mL.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zolgensma is not recommended in the following situations:

- 164. Patient has Complete Paralysis of All Limbs.** This is cited as a limitation of use in the Zolgensma prescribing information.¹ Data are needed to determine if this patient population would derive benefits from Zolgensma.
- 165. Patient has Permanent Ventilator Dependence.** This is cited as a limitation of use in the Zolgensma prescribing information.¹ Data are needed to determine if this patient population would derive benefits from Zolgensma.
- 166. Administration to Individuals In Utero.** Zolgensma is not approved for in utero administration per the prescribing information.
- 167. Prior Receipt of Gene Therapy.** Zolgensma has not been studied in patients who previously received gene therapy.
- 168.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Spinal Muscular Atrophy – Spinraza Prior Authorization Policy

- Spinraza® (nusinersen intrathecal injection – Biogen)

REVIEW DATE: 10/02/2024

OVERVIEW

Spinraza, a survival motor neuron 2 (SMN2)-directed antisense oligonucleotide, is indicated for the treatment of spinal muscular atrophy in pediatric and adult patients.¹

Disease Overview

Spinal muscular atrophy is a genetic, autosomal recessive muscular disorder caused by deletion or loss of function mutation in the SMN1 gene.²⁻⁵ The reduced level of SMN protein causes degeneration of lower motor neurons. The phenotypic expression of the disease is impacted by the SMN2 gene copy number. Data have shown that patients with a higher number of SMN2 copies generally have a more mild phenotypic disease expression. Gene deletion testing for spinal muscular atrophy can be performed at many diagnostic laboratories. Table 1 describes the disease types. Of note, various motor ability assessments are used in clinical practice to characterize functional impairment in spinal muscular atrophy. Different functional motor scales are utilized to evaluate patients. When motor neuron function is lost, it cannot be regained, which greatly impacts patients who have experienced progression (e.g., patients with complete paralysis of limbs or permanent ventilator dependence).

Table 1. Types of Spinal Muscular Atrophy.⁴

* Without disease-modifying treatment or mechanical ventilation; SMN2 – Survival motor neuron 2.

Besides Spinraza, other therapies are available. **Evrysdi®** (risdiplam oral solution), a SMN2 splicing modifier, is indicated for the treatment of spinal muscular atrophy in pediatric and adult patients.⁶ The primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular. Data are also available in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy.

Zolgensma® (onasemnogene abeparvovec-xioi intravenous infusion), an adeno-associated virus vector-based gene therapy, is indicated for the treatment of spinal muscular atrophy with bi-allelic mutations in the SMN1 gene in pediatric patients < 2 years of age.⁷ The agent works by providing a copy of the gene encoding the SMN protein, which increases its production. Zolgensma is administered as a single-dose intravenous infusion over 60 minutes. Pivotal studies mainly involve infants with two or three SMN2 gene copies with primarily Type 1 or Type 2 disease.

Clinical Efficacy

Spinraza was investigated in a pivotal trial called ENDEAR, which was a Phase III, multicenter, multinational, randomized, double-blind, sham-procedure controlled study involving 121 symptomatic infants diagnosed with infantile-onset spinal muscular atrophy (Type I).^{1,8} Patients were randomized 2:1 to receive either Spinraza (n = 80) or sham injection (n = 41).¹ Eligible patients were ≤ 7 months of age at the time of the first dose and diagnosed with spinal muscular atrophy with a symptom onset prior to 6 months of age. Baseline demographics were balanced between the Spinraza and control groups with the exception of age at first treatment (median age of 175 and 206 days, respectively).¹ At baseline, all infants were symptomatic, hypotonic and weak, which are features consistent with a phenotype that is most likely to be categorized as spinal muscular atrophy Type 1.⁸ Patients had two SMN2 gene copies. The median

10/02/2024

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

time of treatment was 261 days (range 6 to 442 days).¹ Those who received Spinraza compared with sham-control experienced improvement on achieving motor milestone responses. Outcomes assessing survival also revealed improvements for patients receiving Spinraza vs. sham control.

CHERISH was a multicenter, double-blind, sham-controlled, Phase III trial which involved children with symptomatic later-onset spinal muscular atrophy who were 2 to 12 years of age (n = 126) with likely Type 2 or 3 disease (symptom onset after 6 months of age).^{1,9} Patients were randomized (2:1) to receive Spinraza or sham injection. Three SMN2 gene copies were reported among 88% of patients; approximately 8% of patients had two SMN2 gene copies. The median age at screening was 4 years and 3 years in the Spinraza and sham procedure control groups, respectively.^{1,9} Patients who received Spinraza experienced more improvement in motor milestones compared with sham control.

NURTURE was an open-label uncontrolled trial involving patients with presymptomatic spinal muscular atrophy who ranged in age from 3 days to 42 days at the time of the first dose (n = 25).^{1,10} Patients were required to have two or three SMN2 gene copies.¹⁰ Some patients who were given Spinraza prior to the onset of symptoms related to spinal muscular atrophy survived without requiring permanent ventilation beyond what would be anticipated based on their SMN2 copy number. Also, some patients also met age-appropriate growth and development motor milestones (e.g., ability to sit unassisted, stand, or walk). Data are available from almost a median of 3-year follow-up.

The EMBRACE trial showed benefits of Spinraza in infants/children with infantile- or later-onset spinal muscular atrophy who were not eligible for the ENDEAR or CHERISH studies.¹¹ Other data with Spinraza are also available, including an accumulation of data in adults.¹²⁻²⁵ Follow-up is available for up to 4 years. Patients had a slowing of decline, achieved milestones, and experienced additional improvement in scales assessing motor function.

Dosing

Spinraza is given intrathecally by, or under the direction of, healthcare professionals experienced in performing lumbar punctures.¹ The recommended dosage is 12 mg (5 mL) per administration. Initiate Spinraza treatment with four loading doses. The first three loading doses should be administered at 14-day intervals. The fourth loading dose should be given 30 days after the third dose. A maintenance dose should be given once every 4 months thereafter. There are additional recommendations in patients who have missed doses. The safety and effectiveness of Spinraza in pediatric patients from newborn to 17 years of age have been established.

Guidelines

The Spinal Muscular Atrophy Newborn Screening Multidisciplinary Working Group is comprised of clinicians and geneticists with expertise in spinal muscular atrophy who developed a treatment algorithm in 2018 for infants who have positive results from a newborn screening test for spinal muscular atrophy.²⁶ Spinal muscular atrophy Types 1 and 2 comprise a large majority of cases and account for many patients who screen positively for spinal muscular atrophy with three or fewer SMN2 gene copies. Immediate treatment is recommended in patients with two or three SMN2 gene copies. Treatment recommendations for patients who screen positive for spinal muscular atrophy and have only one SMN2 gene copy is more complicated.²⁶ In 2020, the Working Group updated recommendations that infants diagnosed with spinal muscular atrophy via newborn screening with four SMN2 gene copies should receive immediate treatment.²⁷ Also, patients with five (or more) SMN2 gene copies should be observed and screened for symptoms.

POLICY STATEMENT

10/02/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Prior Authorization is recommended for prescription benefit coverage of Spinraza. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Due to the specialized skills required for evaluation and diagnosis of patients treated with Spinraza, as well as the monitoring required for adverse events and long-term efficacy, approval requires Spinraza to be prescribed by a physician who has consulted with or who specializes in the condition. If claims history is available, verification is required for certain criteria as noted by **[verification in claims history required]**. All reviews will be forwarded to the Medical Director for evaluation.

Documentation: Documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, laboratory results, medical test results, claims records, prescription receipts, and/or other information. Subsequent coverage reviews for a patient who has previously met the documentation requirements and related criteria in the *Spinal Muscular Atrophy – Spinraza Prior Authorization Policy* through the Coverage Review Department, and who is requesting reauthorization, are NOT required to re-submit documentation for reauthorization, except for the criterion requiring documentation of response or benefit to Spinraza therapy.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Spinraza is recommended in those who meet the following criteria:

FDA-Approved Indication

15. Spinal Muscular Atrophy – Treatment. Approve for the duration noted if the patient meets ONE of the following (A or B):

D) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, iii, iv, v, and vi):

ii. Baseline motor ability assessment that suggests spinal muscular atrophy (based on age, motor ability, and development) has been performed from ONE of the following exams (a, b, c, d, e, f, or g) **[documentation required]**:

a) Bayley Scales of Infant and Toddler Development; OR

b) Children’s Hospital of Philadelphia Infant Test of Neuromuscular Disorders (CHOP-INTEND); OR

c) Hammersmith Functional Motor Scale Expanded (HFMSE); OR

d) Hammersmith Infant Neurological Exam Part 2 (HINE-2); OR

e) Motor Function Measure-32 Items (MFM-32); OR

f) Revised Upper Limb Module (RULM) test; OR

g) World Health Organization motor milestone scale; AND

iii. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic pathogenic variants in the survival motor neuron 1 (SMN1) gene **[documentation required]**; AND

Note: Pathogenic variants may include homozygous deletion, compound heterozygous mutation, or a variety of other rare mutations.

iv. Patient meets ONE of the following (a or b):

a) Patient has two or three survival motor neuron 2 (SMN2) gene copies **[documentation required]**; OR

b) Patient meets BOTH of the following [(1) and (2)]:

- (1) Patient has four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND
 - (2) Patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND
 - v. For a patient currently receiving or who has received prior treatment with Evrysdi (risdiplam oral solution), the prescribing physician confirms that further therapy with Evrysdi will be discontinued; AND
 - vi. Patient has not received Zolgensma (onasemnogene abeparvovec-xioi intravenous infusion) in the past **[verification in claims history required]**; AND
Note: If no claim for Zolgensma is present (or if claims history is not available), the prescribing physician confirms that the patient has not previously received Zolgensma.
 - vii. Medication is prescribed by a physician who has consulted with or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; OR
- E) Patient Currently Receiving Spinraza Therapy. Approve for one dose (for a dose to be used once within the next 4 months as maintenance therapy) if the patient meets ALL of the following (i, ii, iii, iv, v, vi, and vii):
- i. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic pathogenic variants in the survival motor neuron 1 (SMN1) gene **[documentation required]**; AND
Note: Pathogenic variants may include homozygous deletion, compound heterozygous mutation, or a variety of other rare mutations.
 - ii. Patient meets ONE of the following (a or b):
 - a) Patient has two or three survival motor neuron 2 (SMN2) gene copies **[documentation required]**; OR
 - b) Patient meets BOTH of the following [(1) and (2)]:
 - (3) Patient has four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND
 - (4) Patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND
 - iii. Four months has elapsed since the last dose; AND
 - iv. For a patient currently receiving or who has received prior treatment with Evrysdi (risdiplam oral solution), the prescribing physician confirms that further therapy with Evrysdi will be discontinued; AND
 - v. Patient has not received Zolgensma (onasemnogene abeparvovec-xioi intravenous infusion) in the past **[verification in claims history required]**; AND
If no claim for Zolgensma is present (or if claims is not available), the prescribing physician confirms that the patient has not previously received Zolgensma.
 - vi. Medication is prescribed a physician who has consulted with or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; AND
 - vii. Patient must meet ONE of the following (a or b):
 - a) Patient must have had a positive clinical response (for example, improvement or stabilization) from pretreatment baseline status (i.e., within the past 4 months) with Spinraza from ONE of the following [(1), (2), (3), (4), (5), (6), or (7)] **[documentation required]**:
 - (1) Bayley Scales of Infant and Toddler Development; OR
 - (2) Children's Hospital of Philadelphia Infant Test of Neuromuscular Disorders (CHOP-INTEND); OR
 - (3) Hammersmith Functional Motor Scale Expanded (HFMSE); OR
 - (4) Hammersmith Infant Neurological Exam Part 2 (HINE-2); OR
 - (5) Motor Function Measure-32 Items (MFM-32); OR

- (6) Revised Upper Limb Module (RULM) test; OR
- (7) World Health Organization motor milestone scale; OR
- b) According to the prescribing physician, the patient has responded to Spinraza and continues to benefit from ongoing Spinraza therapy by the most recent (i.e., within the past 4 months) physician monitoring/assessment tools **[documentation required]**.
Note: Examples include pulmonary function tests showing improvement, bulbar function test results suggest benefits, reduced need for respiratory support, decrease in the frequency of respiratory infections or complications and/or prevention of permanent assisted ventilation.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Spinraza is not recommended in the following situations:

- 169. Patient has Complete Paralysis of All Limbs.** Data are needed to determine if this patient population with advanced spinal muscular atrophy would derive benefits from Spinraza.
- 170. Patient has Permanent Ventilator Dependence.** Data are needed to determine if this patient population with advanced spinal muscular atrophy would derive benefits from Spinraza.
- 171.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Synagis Prior Authorization Policy

- Synagis® (palivizumab intramuscular injection – Sobi)

REVIEW DATE: 08/21/2024; selected revision 10/02/2024

OVERVIEW

Synagis, a respiratory syncytial virus (RSV) F protein inhibitor monoclonal antibody, is indicated for the **prevention of serious lower respiratory tract disease caused by RSV in children at high risk of RSV disease.**¹ Safety and efficacy were established in children with bronchopulmonary dysplasia, infants with a of premature birth, and children with hemodynamically significant congenital heart disease.

The safety and efficacy of Synagis for the treatment of RSV have not been established.¹ The recommended dose is 15 mg/kg intramuscularly once monthly (every 30 days). The first dose of Synagis should be administered prior to commencement of the RSV season and the remaining doses should be administered monthly throughout the RSV season.

RSV Seasonality

The Centers for Disease Control and Prevention National Respiratory and Enteric Virus Surveillance System provides reports determining RSV seasonality, nationally and by region. The COVID-19 pandemic disrupted RSV seasonality from 2020 to 2022.² To describe US RSV seasonality during pre-pandemic and pandemic periods, polymerase chain reaction (PCR) test results reported to the National Respiratory and Enteric Virus Surveillance System during July 2017 through February 2023 were analyzed. Seasonal RSV epidemics were defined as the weeks during which $\geq 3\%$ of PCR test results were positive for RSV. Nationally, pre-pandemic seasons (2017 to 2020) began in October, peaked in December, and ended in April. During 2020/2021, the typical winter RSV epidemic did not occur. The 2021/2022 season began in May, peaked in July, and ended in January. The 2022/2023 season started (June) and peaked (November) later than the 2021/2022 season, but earlier than pre-pandemic seasons. In both pre-pandemic and pandemic periods, epidemics began earlier in Florida and the southeast and later in regions further north and west. Although the timing of the 2022/2023 season suggests that seasonal patterns are returning toward those observed in pre-pandemic years, off-season RSV circulation may continue.

Guidelines

The American Academy of Pediatrics (AAP) Policy Statement on the Updated Guidance for Palivizumab Prophylaxis Among Infants and Young Children at Increased Risk of Hospitalization for RSV Infection was updated in July 2023.³ Additionally, the AAP Red Book was updated in 2024.⁴ The AAP Red Book states that Synagis may be administered if Beyfortus (nirsevimab-alip intramuscular injection) is not available. If Beyfortus becomes available during the RSV season and before the 5th dose of Synagis, a single Beyfortus dose should be given and no additional Synagis doses should be administered. Data are insufficient to justify a recommendation for routine use of prophylaxis in patients with Down syndrome or among those with cystic fibrosis, unless other indications are present. National Perinatal Association 2024 RSV prevention clinical practice guidelines reaffirm the AAP policy statement recommendations.

The Centers for Disease Control and Prevention's (CDC) Advisory Committee on Immunization Practices (ACIP) [August 25, 2023] recommend one dose of Beyfortus for all infants < 8 months of age born during or entering their first RSV season (50 mg for infants < 5 kg and 100 mg for infants ≥ 5 kg).¹¹ ACIP recommends one dose of Beyfortus (200 mg, administered as two 100-mg injections given at the same time

08/21/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

at different injection sites) for infants and children 8 to 19 months of age who are at increased risk for severe RSV disease and entering their second RSV season.

The ACIP and AAP have published considerations for the 2023/2024 RSV season with regard to Synagis vs. Beyfortus in high-risk infants (August 15, 2023).¹² In general, the joint recommendations mirror the ACIP recommendations above. In addition, if Beyfortus is administered, Synagis should not be administered later that season. If Synagis was initially administered for the season and < 5 doses were administered, the infant should receive one dose of Beyfortus. No further Synagis should be administered. If Synagis was administered in the first RSV season, and the child is eligible for RSV prophylaxis in the second RSV season, the child should receive Beyfortus in the second RSV season, if available. An additional recommendation regarding Beyfortus is that in healthy infants born at the end of their first RSV season, who did not receive Beyfortus and are < 8 months of age entering their second RSV season, a single dose of Beyfortus may be given.

On October 23, 2023, the CDC issued a Health Alert Network Health Advisory to provide options for clinicians to protect infants from RSV in the context of a limited supply of Beyfortus.¹⁴ In the context of limited supply during the 2023/2024 RSV season, CDC recommends prioritizing available Beyfortus 100 mg doses for infants at the highest risk for severe RSV disease: young infants (< 6 months of age) and infants with underlying conditions that place them at highest risk for severe RSV disease. Recommendations for using 50 mg doses remain unchanged at this time. The CDC further recommends that providers suspend using Beyfortus in Synagis-eligible children who are 8 to 19 months of age for the 2023/2024 RSV season. These children should receive Synagis according to the AAP recommendations. Beyfortus should continue to be offered to American Indian and Alaska Native children aged 8 to 19 months who are not Synagis-eligible and who live in remote regions, where transporting children with severe RSV for escalation of medical care is more challenging or in communities with known high rates of RSV among older infants and toddlers.

RSV Seasonality and Recommendations

Although typical RSV seasonality in the US occurs primarily in the fall and winter months, there was a rapid decrease in RSV infections in the US beginning in March 2020 following non-pharmacologic interventions to prevent COVID-19.⁶ RSV activity remained very low through the traditional 2020-2021 fall-winter season but began to increase in spring 2021 and cases rose to a level similar to a fall-winter season throughout the US over the summer and fall of 2021.⁷ This was a deviation from usual RSV epidemiology.^{6,7} Because of the change in RSV circulation, AAP strongly supported consideration for use of Synagis in eligible patients during the interseasonal spread of RSV.⁶ According to a statement released by AAP on December 17, 2021, the 2021-2022 winter RSV season is considered a new season, rather than a continuation of the interseason spread in the spring and summer of 2021.

As of July 2022, RSV activity in the US remains variable by region but is increasing in some parts of the country.⁷ Due to the shift in RSV seasonality noted in 2021 and the current regional rise in interseason RSV cases, the AAP continues to support the use of Synagis in eligible infants in any region experiencing rates of RSV activity at any time in 2022 similar to a typical fall-winter season. The standard administration of Synagis, 5 consecutive monthly doses, is recommended by the AAP to provide serum levels associated with protection for 6 months, the length of a typical RSV season. The AAP will continue to monitor the interseasonal trends and update this guidance as needed if the RSV season extends longer than 6 months.

The start of the RSV season has historically been defined as case positivity rate of 10% by antigen or PCR testing.⁸ However, a 10% threshold for PCR tests has been found to be imprecise for characterizing the RSV season. Therefore, other thresholds have been used for PCR tests. A 3% threshold has been found to be a simple method to assess the onset and offset of the RSV season (defining the RSV season onset as the

first of 2 consecutive weeks when the weekly percentage of positive tests for RSV is > 3% and season offset as the last week that the percentage of positive tests is >3%).^{8,9}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Synagis. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because five monthly doses of Synagis at 15 mg/kg per dose will provide more than 6 months of serum Synagis concentrations for most infants, administration of more than five monthly doses is not recommended within the continental US. Children who qualify for five monthly doses of Synagis should receive the first dose at the time of onset of the RSV season. For qualifying infants born during the RSV season, fewer than five monthly doses will be needed to provide protection until the RSV season ends in their region (maximum of five monthly doses). For the purposes of this policy, RSV season onset is defined as the first 2 consecutive weeks when the percentage of positive tests for RSV is > 3% by PCR. RSV season offset is defined as the last week that the percentage of positive tests for RSV is > 3% by PCR.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Synagis is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1. Respiratory Syncytial Virus (RSV), Prevention in a Patient with Chronic Lung Disease.** Approve for a maximum of 5 months during the RSV season if the patient meets ONE of the following (A or B):
 - a. Patient is < 12 months of age at the start of the RSV season and meets BOTH of the following (i and ii):
 - a. Patient was born at < 32 weeks, 0 days gestation; AND
 - b. Patient required > 21% oxygen for at least 28 days after birth; OR
 - ii. Patient is ≥ 12 months of age but < 24 months of age at the start of the RSV season and meets ALL of the following (i, ii, and iii):
 - a. Patient was born at < 32 weeks, 0 days gestation; AND
 - b. Patient required > 21% oxygen for at least 28 days after birth; AND
 - c. Patient has required medical therapy (i.e., supplemental oxygen, diuretic therapy, or chronic corticosteroid therapy) during the 6 months before the start of the second RSV season.
- 2. Respiratory Syncytial Virus (RSV), Prevention in a Patient with Congenital Heart Disease.** Approve for a maximum of 5 months during the RSV season if the patient meets ALL of the following (A, B, and C):
 - a. Patient is < 12 months of age at the start of the RSV season; AND
 - b. According to the prescriber, patient meets ONE of the following (i, ii, iii, or iv):
 - i. Patient is considered to have hemodynamically significant cyanotic congenital heart disease; OR
 - ii. Patient meets ALL of the following (a, b, and c):
 1. Patient has acyanotic heart disease; AND

08/21/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- 2. Patient is receiving medication to control heart failure; AND
 - 3. Patient will require cardiac surgical procedures; OR
 - iii. Patient has moderate to severe pulmonary hypertension; OR
 - iv. Patient meets BOTH of the following (a and b):
 - 1. Patient has lesions that have been adequately corrected by surgery; AND
 - 2. Patient continues to require medication for congestive heart failure; AND
 - c. Synagis is prescribed by or in consultation with a cardiologist or intensivist.
3. **Respiratory Syncytial Virus (RSV), Prevention in a Patient Born Prematurely.** Approve for a maximum of 5 months during the RSV season if the patient meets BOTH of the following (A and B):
- A) Patient is < 12 months of age at the start of the RSV season; AND
 - B) Patient was born before 29 weeks, 0 days gestation ($\leq$ 28 weeks, 6 days gestation).

Other Uses with Supportive Evidence

4. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Anatomic Pulmonary Abnormalities or a Neuromuscular Disorder.** Approve for a maximum of 5 months during the RSV season if the patient meets BOTH of the following (A and B):
- A) Patient is < 12 months of age at the start of the RSV season; AND
 - B) According to the prescriber, the patient's condition compromises the handling of respiratory secretions.
5. **Respiratory Syncytial Virus (RSV), Prevention in an Immunocompromised Patient.** Approve for a maximum of 5 months during the RSV season if the patient meets ALL of the following (A, B, and C):
- Note: Examples of immunocompromised patients include those receiving chemotherapy and those with hematopoietic stem cell transplant or solid organ transplant.
- a. Patient is < 24 months of age at the start of the RSV season; AND
 - b. According to the prescriber, the patient is/will be profoundly immunocompromised during the RSV season; AND
 - c. Synagis is prescribed by or in consultation with an immunologist or an infectious diseases specialist.
6. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Cardiac Transplant.** Approve for a maximum of 5 months during the RSV season if the patient meets ALL of the following (A, B, and C):
- Note: A patient with cardiac transplant may also be immunocompromised. In a patient who does not meet criteria for cardiac transplant below, please see criterion 5 above (Respiratory Syncytial Virus [RSV], Prevention in an Immunocompromised Patient).
- a. Patient is < 24 months of age at the start of the RSV season; AND
 - b. Patient has undergone or will undergo cardiac transplantation during the current RSV season; AND
 - c. Synagis is prescribed by or in consultation with a cardiologist, intensivist, or transplant physician.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Synagis is not recommended in the following situations:

08/21/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

1. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Cystic Fibrosis Who Does Not Meet Any of the Approval Criteria.** The AAP guidelines for RSV note that routine use of Synagis prophylaxis in patients with cystic fibrosis, including neonates diagnosed with cystic fibrosis by newborn screening, is not recommended unless other indications are present.⁴ Available studies indicate the incidence of RSV hospitalization in children with cystic fibrosis is uncommon and unlikely to be different from children without cystic fibrosis.³ A Cochrane Review identified one trial (presented in poster/abstract form) eligible for their review of Synagis prophylaxis in children with cystic fibrosis.⁵ In this prospective, double-blind, placebo-controlled, multi-center study, 14.1% vs. 14.9% of Synagis and placebo-treated patients, respectively were hospitalized within the first 6 months, and only one patient in each group was identified with RSV infection. There were no deaths in either group of patients during the first 6 months of follow-up; this outcome was not reported at 12 months of follow-up.
 2. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Down Syndrome Who Does Not Meet Any of the Approval Criteria.** Data suggest that children with Down syndrome have a slightly higher hospitalization rate for RSV, but the absolute number of hospitalizations is small, and a number of children with Down syndrome are at increased risk because of other qualifying risk factors (e.g., congenital heart disease, abnormalities of the respiratory tract, muscle dystonia).³
 3. **Respiratory Syncytial Virus (RSV), Treatment of Disease.** There are limited data investigating Synagis for the treatment of established RSV infections. Passive antibody administration is not effective in treatment of RSV disease and is not approved or recommended for this indication.^{3,4} If any infant or young child receiving monthly Synagis prophylaxis experiences a breakthrough RSV hospitalization, monthly prophylaxis should be discontinued because of the extremely low likelihood of a second RSV hospitalization (< 0.5%).⁴
 4. **Use in a Patient who has Received Beyfortus (nirsevimab-alip intramuscular injection) in the Same RSV Season.** Synagis should not be administered to infants who have already received Beyfortus for the same RSV season.^{10,11,12} However, if Synagis was initially administered for the season, and < 5 doses were administered, the infant should receive one dose of Beyfortus.¹² No further Synagis should be administered. If Synagis was administered in the first RSV season, and the child is eligible for RSV prophylaxis in the second RSV season, the child should receive Beyfortus in the second RSV season, if available.
- Note: The RSV season is generally 6 months in duration.
5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Tasimelteon Products Prior Authorization Policy
- Hetlioz™ (tasimelteon capsules – Vanda, generic)
 - Hetlioz LQ™ (tasimelteon oral suspension – Vanda)

REVIEW DATE: 01/17/2024

OVERVIEW

Tasimelteon products are melatonin receptor agonists indicated for the following uses:^{1,2}

- Tasimelteon capsule is indicated for the treatment of:
 - i. **Non-24-Hour Sleep-Wake Disorder** (Non-24) in adults.
 - ii. **Nighttime Sleep Disturbances in Smith-Magenis Syndrome (SMS)**, in patients ≥ 16 years of age.
- Hetlioz LQ is indicated for the treatment of **nighttime sleep disturbances in SMS**, in patients 3 to 15 years of age.

Disease Overview

Non-24 is a chronic circadian rhythm disorder that is due to the misalignment of the endogenous master body clock to the 24-hour day which disrupts the sleep-wake cycle and commonly is thought to be caused by the failure of light to reach the suprachiasmatic nuclei. Patients who are completely blind are particularly susceptible to this condition; as many as one-half to three-quarters of totally blind patients have Non-24, which is approximately 65,000 to 95,000 Americans.³⁻⁸ Patients can be diagnosed using circadian phase markers (e.g., measurement of urinary melatonin levels, dim light melatonin onset [assessed in blood or saliva], or assessing core body temperature).^{3,8,9} Alternative forms of diagnosis include actigraphy and assessment of sleep logs (sleep diaries).^{3,8,9} Actigraphy is a non-invasive method of monitoring human rest and activity cycles and involves the use of a portable device to document movement. Other reviews confirm these diagnostic methods.^{8,9}

SMS is a rare disorder identified by an array of physical, neurobehavioral, and developmental characteristics.¹⁵ In the United States, the incidence is estimated to be 1 in 15,000 to 25,000 people in the general population. Cases of SMS are predominantly related to either a deletion or mutation in the *RAI1* gene. Sleep disturbances start as early as one year of age and continue into adulthood and include shortened sleep cycles with multiple awakenings during the night, early morning arousal from sleep, and increased somnolence during daytime hours. Inability to achieve a normal sleeping pattern appears to aggravate behavioral issues such as impulsivity, aggression, hyperactivity and frequent temper tantrums. Sleep issues in SMS have been attributed to a primary disturbance of the circadian clock disruption and instabilities in melatonin secretion. Physical traits such as muscle weakness, obesity-related breathing difficulties, and facial composition can be underlying factors that affect sleep.

Clinical Efficacy

The efficacy of Hetlioz for Non-24 was established in two Phase III pivotal studies involving totally blind patients who reported no light perception with Non-24 for up to 6 months and evaluated the effects of Hetlioz withdrawal.^{1,3} In the Hetlioz group, 29% of patients (n = 12) met responder criteria, defined as patients with both a ≥ 45 minute increase in nighttime sleep and a ≥ 45 minute decrease in daytime nap time, compared with 12% of patients (n = 5) who received placebo (time of endpoint assessment not stated).¹ During the withdrawal period of the trial, which lasted 8 weeks, 90% of patients who continued

01/17/2024

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Hetlioz (n = 9/10) remained entrained (circadian rhythm synchronized to 24-hour day) compared with 20% of patients randomized to receive placebo (n = 2/10).^{3,4}

The data of Hetlioz and Hetlioz LQ supporting benefits for nighttime sleep disturbances in SMS are underwhelming.^{1,17} The pivotal trial for SMS included very few patients and was relatively short-term; this condition would likely require long-term therapy. Only one of the two primary efficacy endpoints was statistically significant after controlling for multiple comparisons.

Guidelines

In 2015, clinical practice guidelines were published by the American Academy of Sleep Medicine that address Non-24.⁶ The condition mainly occurs in patients who are blind. The Task Force states that there is no evidence to support the use of sleep-promoting medications in patients with Non-24. Data suggest that melatonin entrainment occurs with melatonin at a greater rate than placebo and melatonin can be an effective treatment for Non-24. The Task Force recommendation was that clinicians use strategically timed melatonin for the treatment of Non-24 in adults who are blind (versus no treatment). There are insufficient data to support use of melatonin among sighted patients with Non-24 (versus no treatment).

The Parents and Researchers Interested in SMS (PRISMS) created medical management guidelines for the diagnosis, treatment of manifestations, and ongoing surveillance of SMS.¹⁶ The guidelines do not address Hetlioz/Hetlioz LQ. Multidisciplinary treatment is recommended. The guidelines recognize sleep management is a challenge and no well controlled treatment trials have been reported. The first suggestion is to incorporate a good sleep routine (e.g., consistent bedtime and bedtime routine, quiet/non-stimulating activities, use of white noise or a rhythmic sound, and a comfortably cool/dark room). Concerns for sleep apnea should be addressed. Melatonin is endorsed as monotherapy for sleep management. The concomitant use of a morning beta-blocker (acebutolol) with an evening dose of melatonin for 6 to 8 weeks could be beneficial to restore circadian plasma melatonin rhythmicity, decrease daytime sleepiness, improve daytime behavior, and enhance sleep in children with SMS.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of tasimelteon capsules. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with tasimelteon capsules as well as the monitoring required for adverse events and long-term efficacy, approval requires tasimelteon capsules to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Due to insufficient clinical efficacy data for its FDA-approved use, **approval is not recommended** for Hetlioz LQ.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of tasimelteon capsule is recommended in those who meet the following criteria:

FDA-Approved Indication

16. Non-24-Hour Sleep-Wake Disorder (Non-24). Approve for the duration noted if the patient meets one of the following conditions (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets all of the following (i, ii, iii, iv, and v):

- i. Patient is ≥ 18 years of age; AND
- ii. Patient is totally blind with no perception of light; AND
- iii. Diagnosis of Non-24 is confirmed by meeting ONE of the following conditions (a or b):
 - a) Assessment of at least one physiologic circadian phase marker; OR
Note: Examples of physiologic circadian phase markers include measurement of urinary melatonin levels, dim light melatonin onset (as measured in blood or saliva), and assessment of core body temperature.
 - b) If assessment of at least one physiologic circadian phase marker cannot be done, the diagnosis must be confirmed by actigraphy performed for ≥ 1 week plus evaluation of sleep logs recorded for ≥ 1 month; AND
- iv. Patient meets BOTH of the conditions (a and b):
 - a) Patient has received at least 6 months of continuous therapy (i.e., 6 consecutive months of daily treatment) with melatonin under the guidance of a physician who specializes in the treatment of sleep disorders; AND
 - b) Patient had inadequate efficacy with melatonin therapy according to the prescriber; AND
Note: Examples of efficacy with melatonin therapy include entrainment, clinically meaningful or significant increases in nighttime sleep, and clinically meaningful or significant decreases in daytime sleep.
- v. The medication is prescribed by, or in consultation with, a physician who specializes in the treatment of sleep disorders.

B) Patient is Currently Receiving Tasimelteon Capsules. Approve for 1 year if the patient meets all of the following (i, ii, iii, iv, v, and vi):

- i. Patient is ≥ 18 years of age; AND
- ii. Patient is totally blind with no perception of light; AND
- iii. Patient meets both of the following conditions (a and b):
 - a) Patient has received at least 6 months of continuous therapy (i.e., 6 consecutive months of daily treatment) with melatonin under the guidance of a physician who specializes in the treatment sleep disorders; AND
 - b) Patient had inadequate efficacy with melatonin therapy according to the prescriber; AND
Note: Examples of efficacy with melatonin therapy include entrainment, clinically meaningful or significant increases in nighttime sleep, and clinically meaningful or significant decreases in daytime sleep.
- iv. Patient meets both of the following conditions (a and b):
 - a) Patient has received at least 6 months of continuous therapy (i.e., 6 consecutive months of daily treatment) with tasimelteon capsules under the guidance of a physician who specializes in the treatment of sleep disorders; AND
Note: A patient who has not received at least 6 months of continuous tasimelteon capsules therapy, or if the therapy has not been continuous (i.e., 6 consecutive months of daily treatment), should follow criterion 1 (initial therapy).

- b) Patient has achieved adequate results with tasimelteon capsules therapy according to the prescriber; AND
Note: Examples of adequate results with tasimelteon capsules therapy include entrainment, clinically meaningful or significant increases in nighttime sleep, clinically meaningful or significant decreases in daytime sleep.
- v. The medication is prescribed by, or in consultation with, a physician who specializes in the treatment of sleep disorders.

II. Coverage of Hetlioz LQ is not recommended.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of tasimelteon /Hetlioz LQ is not recommended in the following situations:

- 86. Insomnia, Primary.** Many other agents are available.¹⁰ Only limited data have investigated use of Hetlioz in patients with primary insomnia.¹⁰ Further data are needed to establish the safety and efficacy of Hetlioz.
- 87. Nighttime Sleep Disturbances in Smith-Magenis Syndrome (SMS).** Efficacy data for Hetlioz/Hetlioz LQ supporting benefits for nighttime sleep disturbances in SMS are underwhelming.^{1,17}
- 88. Ramelteon Tablets (Rozerem™, generic), Concomitant Therapy.** Ramelteon, a melatonin receptor agonist, is indicated for the treatment of insomnia characterized by difficulty with sleep onset.¹² The safety and efficacy of concomitant use of ramelteon tablets and Hetlioz have not been studied and it is suspected that the adverse events with use of these agents with a similar mechanism of action taken together may be additive (e.g., central nervous system effects [somnolence], hepatic impairment). Ramelteon has not been studied in Non-24. In the clinical trials with Hetlioz, patients were not permitted to use medications that could interfere with the assessment of circadian rhythms.
- 89. Sedative Hypnotic Medications or Other Medications for Insomnia or Other Sleep-Related Disorders, Concomitant Therapy** (e.g., benzodiazepines [triazolam, temazepam], nonbenzodiazepine hypnotics [e.g., zolpidem, zaleplon], chloral hydrate). There are no data to support the safety and efficacy of hypnotic medications in patients with Non-24.⁶ Also, there are no data to determine the safety and efficacy of Hetlioz when used with other sedative hypnotic medications or other medications for insomnia or sleep-related disorders.¹³
- 90. Sleep-Related Disorders, Other Types** (e.g. shift work disorder, jet lag disorder, advanced sleep phase disorder, delayed sleep phase disorder, irregular sleep-wake rhythm disorder). A published investigation details a Phase II study (n = 29) and a Phase III study (n = 411) assessing Hetlioz treatment in adults with transient insomnia associated with shifted sleep and wake time.¹⁴ Further studies are needed to establish the efficacy and safety of Hetlioz in patients with other types of sleep-related disorders.
- 91.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Nasal Gel

- Natesto[™] (testosterone nasal gel – Acerus)

REVIEW DATE: 11/20/2024

OVERVIEW

The oral, topical, and nasal testosterone replacement products are all indicated for testosterone replacement therapy in adult males for conditions associated with a deficiency or absence of endogenous testosterone.^{1-10,15,16} The labels for the FDA-approved products define those patients and/or conditions for which use of testosterone replacement products is indicated:

- **Primary hypogonadism (congenital or acquired):** Testicular failure due to conditions such as cryptorchidism, bilateral torsion, orchitis, vanishing testis syndrome, orchiectomy, Klinefelter's syndrome, chemotherapy, or toxic damage from alcohol or heavy metals. These men usually have low serum testosterone concentrations and above-normal gonadotropins (follicle-stimulating hormone [FSH], luteinizing hormone [LH]).
- **Hypogonadotropic hypogonadism (congenital or acquired):** Gonadotropin or luteinizing hormone-releasing hormone (LHRH) deficiency or pituitary-hypothalamic injury from tumors, trauma, or radiation. These men have low serum testosterone concentrations, but have gonadotropins in the normal or low range.

The diagnosis of male hypogonadism is based on both signs/symptoms and low testosterone levels. By restoring normal levels of testosterone, the replacement regimens correct symptoms of hypogonadism, which can include malaise, loss of muscle strength, depressed mood, and decreased libido.¹²

All of the oral, topical, and nasal testosterone replacement product labeling states that due to the lack of controlled evaluations in women and potential virilizing effects, the products are not indicated for use in women.^{1-10,15}

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Guidelines

- **Hypogonadism:** Guidelines from the American Urological Association (2018) note that clinicians should use a total testosterone level below 300 ng/dL as a reasonable cutoff in support of the diagnosis of low testosterone.¹³ A clinical diagnosis requires low testosterone levels (two separate levels, both conducted in the early morning) combined with signs and symptoms. The Endocrine Society guidelines on testosterone therapy in men with hypogonadism (2018) recommend diagnosing hypogonadism in men with symptoms and signs of testosterone deficiency and unequivocally and consistently low serum total testosterone and/or free testosterone concentrations (when indicated).¹¹
- **Gender-Dysphoric/Gender-Incongruent Persons; Persons Undergoing Female-To-Male (FTM) Gender Reassignment (i.e., Endocrinologic Masculinization):** A clinical practice guideline published by the Endocrine Society (2017) recommends that, prior to initiation of hormonal therapy, the treating endocrinologist should confirm the diagnostic criteria of gender dysphoria/gender incongruence and the criteria for the endocrine phase of gender transition.¹⁴ The clinician should also evaluate and address medical conditions that can be exacerbated by hormone depletion and treatment with sex hormones of the affirmed gender before beginning treatment. Guidelines mention that clinicians can use either parenteral or transdermal preparations to achieve appropriate testosterone values.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of oral, topical, and nasal testosterone products. In the approval indications, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: males are defined as individuals with the biological traits of a male, regardless of the individuals' gender identity or gender expression. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of some patients treated with testosterone, certain approval conditions require testosterone to be prescribed by or in consultation with a physician who specializes in the conditions being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of oral, topical, and nasal testosterone products is recommended in those who meet one of the following criteria:

FDA-Approved Indication

11. Hypogonadism (Primary or Secondary) in Males* [Testicular Hypofunction/Low Testosterone with Symptoms]. Approve for 1 year if the patient meets ONE of the following (A or B):

Note: The pretreatment timeframe refers to signs and symptoms of androgen deficiency and serum testosterone levels prior to the initiation of any testosterone therapy.

- A) Initial Therapy. Patient with hypogonadism as confirmed by ALL of the following (i, ii, and iii):
- i. Patient has had persistent signs and symptoms of androgen deficiency (pretreatment); AND
Note: Signs and symptoms of androgen deficiency include depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, and loss of libido.
 - ii. Patient has had two pretreatment serum testosterone (total or bioavailable) measurements, each taken in the morning, on two separate days; AND
 - iii. The two serum testosterone levels are both low, as defined by the normal laboratory reference values.

- B) Patient is Currently Receiving Testosterone Therapy.** Approve if the patient meets BOTH of the following (i and ii):
- i.** Patient has had persistent signs and symptoms of androgen deficiency (pretreatment); AND
Note: Signs and symptoms of androgen deficiency include depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, and loss of libido.
 - ii.** Patient has had at least one pretreatment serum testosterone (total or bioavailable) level, which was low, as defined by the normal laboratory reference value.

*Refer to the Policy Statement.

Other Uses with Supportive Evidence

- 12. Gender-Dysphoric/Gender-Incongruent Persons; Persons Undergoing Female-To-Male (FTM) Gender Reassignment (i.e., Endocrinologic Masculinization).** Approve for 1 year if prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of transgender patients.
Note: For a patient who has undergone gender reassignment, use this FTM criterion for hypogonadism indication.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of oral, topical, and nasal testosterone products is not recommended in the following situations:

- 172. To Enhance Athletic Performance.** Topical testosterone products are not recommended for approval because this indication is excluded from coverage in a typical pharmacy benefit.
- 173.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

OVERVIEW

Testosterone regimens can be administered orally, parenterally, or transdermally. All of the injectable agents are indicated for testosterone replacement therapy in adult males for conditions associated with a deficiency or absence of endogenous testosterone.^{1-5,10} The prescribing information define these patients and/or conditions for which use of testosterone replacement products are indicated:

- **Primary hypogonadism (congenital or acquired)**, for testicular failure due to cryptorchidism, bilateral torsion, orchitis, vanishing testis syndrome, or orchiectomy.
- **Hypogonadotropic hypogonadism (congenital or acquired)**, for gonadotropin or luteinizing hormone-releasing hormone (LHRH) deficiency or pituitary-hypothalamic injury from tumors, trauma, or radiation.

The diagnosis of male hypogonadism is based on both signs/symptoms and low testosterone levels. By restoring normal levels of testosterone, the replacement regimens correct symptoms of hypogonadism, which can include malaise, loss of muscle strength, depressed mood, and decreased libido.⁶

Testopel and testosterone enanthate are also indicated for **delayed puberty**.^{2,3} Testosterone enanthate (per the product labeling) may also be used secondarily in **advanced inoperable metastatic mammary cancer** in women who are 1 to 5 years postmenopausal.² The goal of therapy is ablation of ovaries. Per labeling, it also can be used in premenopausal women with breast cancer who have benefited from oophorectomy and are considered to have hormone-responsive tumors.

Guidelines

- **Hypogonadism:** Guidelines from the American Urological Association (2018) note that clinicians should use a total testosterone level below 300 ng/dL as a reasonable cut-off in support of the diagnosis of low testosterone.⁷ The guidelines additionally note that a diagnosis of low testosterone should be made only after two total testosterone measurements are taken on separate occasions with both conducted in an early morning fashion and that a clinical diagnosis should be made when patients have low testosterone levels combined with signs and symptoms. The Endocrine Society guidelines on testosterone therapy in men with hypogonadism (2018) recommend diagnosing hypogonadism in men with symptoms and signs of testosterone deficiency and unequivocally and consistently low serum total testosterone and/or free testosterone concentrations (when indicated).⁸
- **Gender-Dysphoric/Gender-Incongruent Persons; Persons Undergoing Female-To-Male (FTM) Gender Reassignment (i.e., Endocrinologic Masculinization):** A clinical practice guideline published by the Endocrine Society (2017) recommends that, prior to initiation of hormonal therapy, the treating endocrinologist should confirm the diagnostic criteria of gender dysphoria/gender incongruence and the criteria for the endocrine phase of gender transition.⁹ The clinician should also evaluate and address medical conditions that can be exacerbated by hormone

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

depletion and treatment with sex hormones of the affirmed gender before beginning treatment. Guidelines mention that clinicians can use either parenteral or transdermal preparations to achieve appropriate testosterone values.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of injectable testosterone. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: males are defined as individuals with the biological traits of a male, regardless of the individual's gender identity or gender expression; females are defined as individuals with the biological traits of a female, regardless of the individual's gender identity or gender expression. Because of the specialized skills required for evaluation and diagnosis of some patients treated with testosterone, certain approval requires testosterone to be prescribed by or in consultation with a physician who specializes in the conditions being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of injectable testosterone is recommended in those who meet one of the following criteria:

FDA-Approved Indications

13. Hypogonadism (Primary or Secondary) in Males* [Testicular Hypofunction/Low Testosterone with Symptoms]. Approve for 1 year if the patient meets ONE of the following (A or B):

Note: The pre-treatment timeframe refers to sign and symptoms of androgen deficiency and serum testosterone levels prior to the initiation of any testosterone therapy.

A) Initial Therapy. Approve in a patient with hypogonadism as confirmed by ALL of the following (i, ii, and iii):

- i.** Patient has had persistent signs and symptoms of androgen deficiency (pre-treatment); AND
Note: Signs and symptoms of androgen deficiency include depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, and loss of libido.
- ii.** Patient has had two pre-treatment serum testosterone (total or bioavailable) measurements, each taken in the morning, on two separate days; AND
- iii.** The two serum testosterone levels are both low, as defined by the normal laboratory reference values.

B) Patient Currently Receiving Testosterone Therapy. Approve if the patient meets BOTH of the following (i and ii):

- i.** Patient has had persistent signs and symptoms of androgen deficiency (pre-treatment); AND
Note: Signs and symptoms of androgen deficiency include depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, and loss of libido.
- ii.** Patient has had at least one pre-treatment serum testosterone (total or bioavailable) level, which was low, as defined by the normal laboratory reference values.

* Refer to the Policy Statement

14. Delayed Puberty or Induction of Puberty in Males* 14 years of Age or Older. Approve Depo-Testosterone (testosterone cypionate intramuscular injection, generics), Azmiro, testosterone enanthate intramuscular injection, or Testopel for 6 months.

09/11/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

*Refer to the Policy Statement

- 15. Breast Cancer in Females*.** Approve testosterone enanthate intramuscular injection for 6 months if prescribed by or in consultation with an oncologist.

*Refer to the Policy Statement.

Other Uses with Supportive Evidence

- 16. Gender-Dysphoric/Gender-Incongruent Persons; Persons Undergoing Female-to-Male (FTM) Gender Reassignment (i.e., Endocrinologic Masculinization).** Approve for 1 year if prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of transgender patients.

Note: For a patient who has undergone gender reassignment, use this FTM criterion for hypogonadism indication.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of injectable testosterone is not recommended in the following situations:

- 174. To Enhance Athletic Performance.** Injectable testosterone products are not recommended for approval because this indication is excluded from coverage in a typical pharmacy benefit.
- 175.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Doptelet Prior Authorization Policy

- Doptelet® (avatrombopag tablets – Dova/AkaRx)

REVIEW DATE: 04/24/2024

OVERVIEW

Doptelet, a thrombopoietin receptor agonist, is indicated for the following uses:¹

- **Immune thrombocytopenia (ITP)**, chronic, for treatment in adults who have had an insufficient response to a previous treatment.
- **Thrombocytopenia**, as treatment in adults with **chronic liver disease** who are scheduled to undergo a procedure.

For chronic ITP, Doptelet should be discontinued if the platelet count does not increase to $\geq 50 \times 10^9/L$ within 4 weeks at the maximum dose of 40 mg once daily. The safety and efficacy of Doptelet have not been established in pediatric patients. For chronic liver disease in patients undergoing a procedure, Doptelet is given as a 5-day course beginning 10 to 13 days before the scheduled procedure. In general, patients in the pivotal studies had a platelet count $< 50 \times 10^9/L$.

Guidelines

In 2019, the American Society of Hematology updated guidelines for ITP.⁴ Doptelet is not addressed specifically, but there are several recommendations. For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to corticosteroid, a thrombopoietin receptor agonist (either Promacta® [eltrombopag tablets and oral suspension] or Nplate® [romiplostim subcutaneous injection]) or a splenectomy are recommended. In children with newly diagnosed ITP who have non-life-threatening mucosal bleeding, corticosteroids are recommended. For children who have non-life-threatening mucosal bleeding and did not respond to first-line treatment, thrombopoietin receptor agonists are recommended. Other treatment options in children and adults include intravenous immunoglobulin, anti-D immunoglobulin, and rituximab.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Doptelet. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Doptelet as well as the monitoring required for adverse events and long-term efficacy, approval for certain indications require Doptelet to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Doptelet is recommended in those who meet ONE of the following criteria:

04/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indications

17. Chronic Immune Thrombocytopenia. Approve if the patient meets ALL of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, iii, and iv):

- i. Patient is ≥ 18 years of age; AND
- ii. Patient meets ONE of the following (a or b):
 - a) Patient has a platelet count $< 30 \times 10^9/L$ ($< 30,000/mcL$); OR
 - b) Patient meets BOTH of the following [(1) and (2)]:
 - (1) Patient has a platelet count $< 50 \times 10^9/L$ ($< 50,000/mcL$); AND
 - (2) According to the prescriber, the patient is at an increased risk of bleeding; AND
- iii. Patient meets ONE of the following (a or b):
 - a) Patient has tried at least ONE other therapy; OR
Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Promacta (eltrombopag tablets and oral suspension), Nplate (romiplostim subcutaneous injection), Tavalisse (fostamatinib tablets), and rituximab.
 - b) Patient has undergone splenectomy; AND
- iv. The medication is prescribed by or in consultation with a hematologist; OR
 - B) Patient is Currently Receiving Doptelet.** Approve for 1 year if the patient meets BOTH of the following (i and ii):
 - i. According to the prescriber, the patient demonstrates a beneficial clinical response; AND
Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes.
 - ii. Patient remains at risk for bleeding complications.

18. Thrombocytopenia in a Patient with Chronic Liver Disease. Approve for 5 days if the patient meets ALL of the following (A, B, and C):

G) Patient is ≥ 18 years of age; AND

H) Patient has a current platelet count $< 50 \times 10^9/L$ ($< 50,000/mcL$); AND

I) Patient is scheduled to undergo a procedure within 10 to 13 days after starting Doptelet therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Doptelet is not recommended in the following situations:

- 92.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Thrombocytopenia – Eltrombopag Products Prior Authorization Policy
- Alvaiz™ (eltrombopag choline tablets – Teva)
 - Promacta® (eltrombopag olamine tablets and oral suspension – Novartis)

REVIEW DATE: 04/24/2024

OVERVIEW

Promacta, a thrombopoietin receptor agonist, is indicated for the following uses:¹

- **Aplastic anemia**, severe, in combination with standard immunosuppressive therapy for the first-line treatment of adults and pediatric patients ≥ 2 years of age as well as for treatment in patients who have had an insufficient response to immunosuppressive therapy.
- **Chronic hepatitis C, treatment of thrombocytopenia**, to allow the initiation and maintenance of interferon-based therapy.
- **Immune thrombocytopenia (ITP), treatment, in adults and pediatric patients ≥ 1 year of age** with persistent or chronic ITP who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy. Of note, Promacta should only be used in patients whose degree of thrombocytopenia and clinical condition increase the risk for bleeding.

Alvaiz, a thrombopoietin receptor agonist, is indicated for the following uses:²

- **Aplastic anemia**, severe, in adults who have had an insufficient response to immunosuppressive therapy.
- **Chronic hepatitis C, treatment of thrombocytopenia**, in adults to allow the initiation and maintenance of interferon-based therapy.
- **ITP, treatment, in adults and pediatric patients ≥ 6 year of age** with persistent or chronic ITP who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy. Of note, Alvaiz should only be used in patients whose degree of thrombocytopenia and clinical condition increase the risk for bleeding.

For patients with refractory severe aplastic anemia, if no hematologic response has occurred after 16 weeks of treatment with eltrombopag, discontinue therapy. For ITP, eltrombopag should be discontinued if the platelet count does not increase to a level sufficient to avoid clinically important bleeding after 4 weeks of therapy with eltrombopag at the maximum daily dose. Use eltrombopag only in patients with chronic hepatitis C whose degree of thrombocytopenia prevents the initiation of interferon-based therapy or limits the ability to maintain interferon-based therapy.¹ The safety and efficacy of eltrombopag have not been established in combination with direct-acting antiviral agents used without interferon for the treatment of chronic hepatitis C infection. For the management of chronic hepatitis C, eltrombopag should be stopped upon discontinuation of antiviral treatment futility.

Guidelines

Eltrombopag is addressed in several guidelines.

- **Aplastic Anemia:** Guidelines for the diagnosis and management of adults with aplastic anemia are available from the British Society for Standards in Hematology (2024).³ Standard treatment for newly diagnosed acquired aplastic anemia is anti-thymocyte globulin (ATG)-based immunosuppressive therapy with eltrombopag or allogeneic hematopoietic stem cell transplantation (HSCT) from a matched sibling donor. The current standard first-line immunosuppressive therapy is horse ATG combined with cyclosporine, but horse ATG-ATAGAM

04/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

with cyclosporine and eltrombopag should be recommended. Eltrombopag is an option in some clinical scenarios (e.g., heavily pre-treated patients, those unsuitable for HSCT).

- **Immune Thrombocytopenia (ITP):** In 2019, the American Society of Hematology updated guidelines for ITP.⁴ There are several recommendations. For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to corticosteroid, a thrombopoietin receptor agonist (eltrombopag or Nplate[®] [romiplostim subcutaneous injection]) or a splenectomy are recommended. In children with newly diagnosed ITP who have non-life-threatening mucosal bleeding, corticosteroids are recommended. For children who have non-life-threatening mucosal bleeding and did not respond to first-line treatment, thrombopoietin receptor agonists are recommended. Other treatment options in children and adults include intravenous immunoglobulin, anti-D immunoglobulin, and rituximab.
- **Myelodysplastic Syndrome (MDS):** Recommendations from the National Comprehensive Cancer Network (NCCN) for MDS (version 1.2024 – February 12, 2024) state that treatment with a thrombopoietin receptor agonist should be considered in patients with lower-risk MDS who have significant, severe, life-threatening, or refractory thrombocytopenia.⁵ The data with eltrombopag are discussed noting an increased rate of platelet response and decreased overall bleeding events in patients with low- to intermediate-risk MDS. Other data are also available that describe the use of eltrombopag in patients with MDS.⁶⁻⁸
- **Thrombocytopenia in a Patient Post-Allogeneic Transplantation:** Recommendations from the NCCN for Hematopoietic Growth Factors (version 3.2024 – January 30, 2024) state to consider eltrombopag for the treatment of prolonged thrombocytopenia in patients post-allogeneic transplant and poor graft function (category 2A).⁹ Other data are also available that describe the use of eltrombopag in this clinical scenario.¹⁰⁻¹⁷

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of eltrombopag products. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with eltrombopag products as well as the monitoring required for adverse events and long-term efficacy, approval may require eltrombopag products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

- I. Coverage of Promacta is recommended in those who meet ONE of the following criteria:

FDA-Approved Indications

23. Aplastic Anemia. Approve if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets ALL of the following (i, ii, and iii):

- i. Patient has low platelet counts at baseline (pretreatment); AND

Note: An example of a low platelet count is $< 30 \times 10^9/L$ ($< 30,000/mcL$).

- ii. Patient meets ONE of the following (a or b):

a) Patient had tried at least one immunosuppressant therapy; OR

Note: Examples of therapies are cyclosporine, Atgam (lymphocyte immune globulin, anti-thymocyte globulin [equine] sterile solution for intravenous use only), mycophenolate mofetil, or sirolimus.

- b) Patient will be using eltrombopag in combination with standard immunosuppressive therapy; AND

Note: Examples of therapies are cyclosporine, Atgam (lymphocyte immune globulin, anti-thymocyte globulin [equine] sterile solution for intravenous use only), mycophenolate mofetil, or sirolimus.

- iii. The medication is prescribed by or in consultation with a hematologist; OR

- B) Patient is Currently Receiving Eltrombopag. Approve for 1 year if, according to the prescriber, the patient demonstrates a beneficial clinical response.

Note: Examples include increases in platelet counts, reduction in red blood cell transfusions, hemoglobin increase, and/or absolute neutrophil count increase.

24. Immune Thrombocytopenia. Approve if the patient meets ONE of the following (A or B):

- A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and iii):

- i. Patient meets ONE of the following (a or b):

- a) Patient has a platelet count $< 30 \times 10^9/L$ ($< 30,000/mcL$); OR

- b) Patient meets BOTH of the following [(1) and (2)]:

- (1) Patient has a platelet count $< 50 \times 10^9/L$ ($< 50,000/mcL$); AND

- (2) According to the prescriber, the patient is at an increased risk for bleeding; AND

- ii. Patient meets ONE of the following (a or b):

- a) Patient has tried at least one other therapy; OR

Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Nplate (romiplostim subcutaneous injection), Tavalisse (fostamatinib tablets), Doptelet (avatrombopag tablets), and rituximab.

- b) Patient has undergone splenectomy; AND

- iii. The medication is prescribed by or in consultation with a hematologist; OR

- B) Patient is Currently Receiving Eltrombopag. Approve for 1 year if the patient meets BOTH of the following (i and ii):

- i. According to the prescriber, the patient demonstrates a beneficial clinical response; AND

Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes.

- ii. Patient remains at risk for bleeding complications.

25. Thrombocytopenia in a Patient with Chronic Hepatitis C. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

- A) Patient has low platelet counts at baseline (pretreatment); AND

Note: An example of a low platelet count is $< 75 \times 10^9/L$ ($< 75,000/mcL$).

- B) Patient will be receiving interferon-based therapy for chronic hepatitis C; AND

Note: Examples of therapies are pegylated interferon (Pegasys [peginterferon alfa-2a injection], PegIntron [peginterferon alfa-2b injection]), and Intron A (interferon alfa-2b).

- C) The medication is prescribed by or in consultation with a gastroenterologist, a hepatologist, or a physician who specializes in infectious diseases.

Other Uses with Supportive Evidence

4. Thrombocytopenia in a Patient with Myelodysplastic Syndrome. Approve if the patient meets ONE of the following (A or B):

- A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and, iii):

- i. Patient has low- to intermediate-risk myelodysplastic syndrome; AND

- ii. Patient meets ONE of the following (a or b):

- a) Patient has a platelet count $< 30 \times 10^9/L$ ($< 30,000/mcL$); OR

- b) Patient meets BOTH of the following [(1) and (2)]:
 - (1) Patient has a platelet count $< 50 \times 10^9/L$ ($< 50,000/mcL$); AND
 - (2) According to the prescriber, the patient is at an increased risk for bleeding; AND
 - iii. The medication is prescribed by or in consultation with a hematologist or oncologist; OR
 - B) Patient is Currently Receiving Eltrombopag. Approve for 1 year if the patient meets BOTH of the following (i and ii):
 - i. According to the prescriber, the patient demonstrates a beneficial clinical response; AND
Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or decreased frequency of bleeding episodes.
 - ii. Patient remains at risk for bleeding complications.

5. **Thrombocytopenia in a Patient Post-Allogeneic Transplantation.** Approve if the patient meets ONE of the following (A or B):
- A) Initial Therapy. Approve for 3 months if the patient meets ALL the following (i, ii, and, iii):
 - i. According to the prescriber, the patient has poor graft function; AND
 - ii. Patient has a platelet count $< 50 \times 10^9/L$ ($< 50,000/mcL$); AND
 - iii. The medication is prescribed by or in consultation with a hematologist, an oncologist, or a stem cell transplant specialist physician; OR
 - B) Patient is Currently Receiving Eltrombopag. Approve for 6 months if according to the prescriber, the patient demonstrated a beneficial clinical response.
Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or decreased frequency of bleeding episodes.

II. Coverage of Alvaiz is recommended in those who meet ONE of the following criteria:

FDA-Approved Indications

1. **Aplastic Anemia.** Approve if the patient meets ONE of the following (A or B):
 - A) Initial Therapy. Approve for 4 months if the patient meets ALL of the following (i, ii, iii, and iv):
 - i. Patient is ≥ 18 years of age; AND
 - ii. Patient has low platelet counts at baseline (pretreatment); AND
Note: An example of a low platelet count is $< 30 \times 10^9/L$ ($< 30,000/mcL$).
 - iii. Patient meets ONE of the following (a or b):
 - a) Patient had tried at least one immunosuppressant therapy; OR
Note: Examples of therapies are cyclosporine, Atgam (lymphocyte immune globulin, anti-thymocyte globulin [equine] sterile solution for intravenous use only), mycophenolate mofetil, and sirolimus.
 - b) Patient will be using eltrombopag in combination with standard immunosuppressive therapy; AND
Note: Examples of therapies are cyclosporine, Atgam (lymphocyte immune globulin, anti-thymocyte globulin [equine] sterile solution for intravenous use only), mycophenolate mofetil, and sirolimus.
 - iv. The medication is prescribed by or in consultation with a hematologist; OR
 - B) Patient is Currently Receiving Eltrombopag. Approve for 1 year if, according to the prescriber, the patient demonstrates a beneficial clinical response.
Note: Examples include increases in platelet counts, reduction in red blood cell transfusions, hemoglobin increase, and/or absolute neutrophil count increase.
2. **Immune Thrombocytopenia.** Approve if the patient meets ONE of the following (A or B):
 - A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, iii, and iv):
 - i. Patient is ≥ 6 years of age; AND

- ii. Patient meets ONE of the following (a or b):
 - a) Patient has a platelet count $< 30 \times 10^9/L$ ($< 30,000/mcL$); OR
 - b) Patient meets BOTH of the following [(1) and (2)]:
 - (1) Patient has a platelet count $< 50 \times 10^9/L$ ($< 50,000/mcL$); AND
 - (2) According to the prescriber, the patient is at an increased risk for bleeding; AND
 - iii. Patient meets ONE of the following (a or b):
 - a) Patient has tried at least one other therapy; OR
Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Nplate (romiplostim subcutaneous injection), Tavalisse (fostamatinib tablets), Doptelet (avatrombopag tablets), and rituximab.
 - b) Patient has undergone splenectomy; AND
 - iv. The medication is prescribed by or in consultation with a hematologist; OR
 - B) Patient is Currently Receiving Eltrombopag.** Approve for 1 year if the patient meets BOTH of the following (i and ii):
 - i. According to the prescriber, the patient demonstrates a beneficial clinical response; AND
Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes.
 - ii. Patient remains at risk for bleeding complications.
- 3. Thrombocytopenia in a Patient with Chronic Hepatitis C.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has low platelet counts at baseline (pretreatment); AND
Note: An example of a low platelet count is $< 75 \times 10^9/L$ ($< 75,000/mcL$).
 - C) Patient will be receiving interferon-based therapy for chronic hepatitis C; AND
Note: Examples of therapies are pegylated interferon (Pegasys [peginterferon alfa-2a injection], PegIntron [peginterferon alfa-2b injection]), and Intron A (interferon alfa-2b).
 - D) The medication is prescribed by or in consultation with a gastroenterologist, a hepatologist, or a physician who specializes in infectious diseases.

Other Uses with Supportive Evidence

- 4. Thrombocytopenia in a Patient with Myelodysplastic Syndrome.** Approve if the patient meets ONE of the following (A or B):
- A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and, iii):
 - i. Patient has low- to intermediate-risk myelodysplastic syndrome; AND
 - ii. Patient meets ONE of the following (a or b):
 - a) Patient has a platelet count $< 30 \times 10^9/L$ ($< 30,000/mcL$); OR
 - b) Patient meets BOTH of the following [(1) and (2)]:
 - (1) Patient has a platelet count $< 50 \times 10^9/L$ ($< 50,000/mcL$); AND
 - (2) According to the prescriber, the patient is at an increased risk for bleeding; AND
 - iii. The medication is prescribed by or in consultation with a hematologist or oncologist; OR
 - B) Patient is Currently Receiving Eltrombopag.** Approve for 1 year if the patient meets BOTH of the following (i and ii):
 - i. According to the prescriber, the patient demonstrates a beneficial clinical response; AND
Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or decreased frequency of bleeding episodes.
 - ii. Patient remains at risk for bleeding complications.

5. **Thrombocytopenia in a Patient Post-Allogeneic Transplantation.** Approve if the patient meets ONE of the following (A or B):
- A) **Initial Therapy.** Approve for 6 months if the patient meets ALL the following (i, ii, and, iii):
- According to the prescriber, the patient has poor graft function; AND
 - Patient has a platelet count $< 50 \times 10^9/L$ ($< 50,000/mcL$); AND
 - The medication is prescribed by or in consultation with a hematologist, an oncologist, or a stem cell transplant specialist physician; OR
- B) **Patient is Currently Receiving Eltrombopag.** Approve for 6 months if according to the prescriber, the patient demonstrated a beneficial clinical response.
- Note:** A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or decreased frequency of bleeding episodes.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Promacta or Alvaiz is not recommended in the following situations:

- Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Mulpleta Prior Authorization Policy

- Mulpleta® (lusutrombopag tablets – Shionogi/Quotient)

REVIEW DATE: 04/24/2024

OVERVIEW

Mulpleta, a thrombopoietin receptor agonist, is indicated for the treatment of **thrombocytopenia** in adults with **chronic liver disease** who are scheduled to undergo a procedure.¹

Begin Mulpleta treatment 8 to 14 days before the scheduled procedure. The recommended dose is 3 mg once daily with or without food for 7 days. In the pivotal clinical studies for the approved indication, patients had a platelet count $< 50 \times 10^9/L$.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Mulpleta. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mulpleta is recommended in those who meet the following criteria:

FDA-Approved Indication

- 19. Thrombocytopenia in a Patient with Chronic Liver Disease.** Approve for 7 days if the patient meets ALL of the following (A, B, and C):
- J)** Patient is ≥ 18 years of age; AND
 - K)** Patient has a current platelet count $< 50 \times 10^9/L$ ($< 50,000/mcL$); AND
 - L)** Patient is scheduled to undergo a procedure within 8 to 14 days after starting Mulpleta therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mulpleta is not recommended in the following situations:

- 6. Chronic Immune Thrombocytopenia.** Data are not available regarding use of Mulpleta in patients with persistent and chronic immune thrombocytopenia. Many other agents are FDA-approved for this condition and are recommended in standard guidelines and have established efficacy and safety.²
- 7.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Nplate Prior Authorization Policy

- Nplate® (romiplostim subcutaneous injection – Amgen)

REVIEW DATE: 04/24/2024

OVERVIEW

Nplate, a thrombopoietin receptor agonist, is indicated for the treatment of:¹

- **Hematopoietic syndrome of acute radiation syndrome**, to increase survival in adults and pediatric patients (including term neonates) acutely exposed to myelosuppressive doses of radiation.
- **Immune thrombocytopenia (ITP), in adults** who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy.
- **Immune thrombocytopenia (ITP), in pediatric patients ≥ 1 year of age** with ITP for at least 6 months who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy.

Nplate should only be utilized in patients with ITP whose degree of thrombocytopenia and clinical condition increase the risk for bleeding.¹ Nplate should not be used in an attempt to normalize platelet counts.

Guidelines

Nplate is mentioned in various clinical guidelines.

- **Chemotherapy Induced Thrombocytopenia:** The National Comprehensive Cancer Network (NCCN) guidelines for hematopoietic growth factors (version 3.2024 – January 30, 2024) recommend consideration of Nplate for the management of suspected chemotherapy induced thrombocytopenia (category 2A) in addition to other modalities (e.g., platelet transfusion, chemotherapy dose reduction, or change in treatment regimen).¹⁴
- **Immune Thrombocytopenia:** The American Society of Hematology has updated guidelines for ITP (2019). For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to a corticosteroid, a thrombopoietin receptor agonist (Nplate or Promacta® [eltrombopag tablets and oral suspension]) or a splenectomy are recommended.² In children with newly diagnosed ITP who have non-life-threatening mucosal bleeding, corticosteroids are recommended. For children who have non-life-threatening mucosal bleeding and do not respond to first-line treatment, thrombopoietin receptor agonists are recommended.
- **Myelodysplastic Syndrome (MDS):** NCCN recommendations regarding MDS (version 1.2024 – February 12, 2024) state to consider treatment with a thrombopoietin receptor agonist in patients with lower-risk MDS who have severe or life-threatening thrombocytopenia.³ Data are available that describe the use of Nplate in patients with MDS.⁴⁻¹³ The data with Nplate are discussed noting an increased rate of platelet response and decreased overall bleeding events among patients with low to intermediate risk MDS.

04/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nplate. All approvals are provided for the duration noted below. Regarding the approval duration of one dose, the approval is for 30 days, which is an adequate duration for the patient to receive one dose. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nplate as well as the monitoring required for adverse events and efficacy, approval for some indications requires Nplate to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nplate is recommended in those who meet ONE of the following criteria:

FDA-Approved Indications

26. Hematopoietic Syndrome of Acute Radiation Syndrome. Approve for one dose if the patient has been acutely exposed to myelosuppressive doses of radiation.

27. Immune Thrombocytopenia. Approve if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and iii):

i. Patient meets ONE of the following (a or b):

a) Patient has a platelet count $< 30 \times 10^9/L$ ($< 30,000/mcL$); OR

b) Patient meets BOTH of the following [(1) and (2)]:

(1) Patient has a platelet count $< 50 \times 10^9/L$ ($< 50,000/mcL$); AND

(2) According to the prescriber the patient is at an increased risk of bleeding; AND

ii. Patient meets ONE of the following (a or b):

a) Patient has tried at least one other therapy; OR

Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Promacta (eltrombopag tablets and oral suspension), Tavalisse (fostamatinib tablets), Doptelet (avatrombopag tablets), or ritixumab.

b) Patient has undergone splenectomy; AND

iii. Medication is prescribed by or in consultation with a hematologist; OR

B) Patient is Currently Receiving Nplate. Approve for 1 year if the patient meets BOTH of the following (i and ii):

iii. According to the prescriber the patient demonstrates a beneficial clinical response; AND

Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes.

iv. Patient remains at risk for bleeding complications.

Other Uses with Supportive Evidence

3. Thrombocytopenia, Chemotherapy-Induced. Approve if the patient meets ONE of the following (A or B):

B) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND

ii. Patient has a platelet count $< 100 \times 10^9/L$ ($< 100,000/mcL$); AND

iii. Patient meets ONE of the following (a or b):

a) Patient has thrombocytopenia at least 3 weeks after the most recent dose of chemotherapy;
OR

- b) Patient has experienced a delay in chemotherapy administration related to thrombocytopenia; AND
 - iv. Medication is prescribed by or in consultation with a hematologist or an oncologist; OR
 - B) Patient is Currently Receiving Nplate. Approve for 6 months if the patient meets ALL of the following (i, ii, and iii):
 - i. Patient is ≥ 18 years of age; AND
 - ii. Patient continues to receive treatment with chemotherapy; AND
 - iii. Patient demonstrates a beneficial clinical response according to the prescriber.

Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or decreased frequency of bleeding episodes.
- 4. **Thrombocytopenia in Myelodysplastic Syndrome.** Approve if the patient meets ONE the following (A or B):
 - A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and iii):
 - i. Patient has low- to intermediate-risk myelodysplastic syndrome; AND
 - ii. Patient meets ONE of the following (a or b):
 - a) Patient has a platelet count $< 30 \times 10^9/L$ ($< 30,000/mcL$); OR
 - b) Patient meets BOTH of the following [(1) and (2)]:
 - (1) Patient has a platelet count $< 50 \times 10^9/L$ ($< 50,000/mcL$); AND
 - (2) According to the prescriber the patient is at an increased risk for bleeding; AND
 - iii. Medication is prescribed by or in consultation with a hematologist or an oncologist; OR
 - B) Patient is Currently Receiving Nplate. Approve for 1 year if the patient meets BOTH of the following (i and ii):
 - iii. According to the prescriber the patient demonstrates a beneficial clinical response; AND

Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or decreased frequency of bleeding episodes.
 - iv. Patient remains at risk for bleeding complications.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nplate is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Tavalisse Prior Authorization Policy

- Tavalisse® (fostamatinib disodium hexahydrate tablets – Rigel/Patheon)

REVIEW DATE: 04/24/2024

OVERVIEW

Tavalisse, a tyrosine kinase inhibitor with demonstrated activity against spleen tyrosine kinase, is indicated for the treatment of thrombocytopenia in adults with **chronic immune thrombocytopenia (ITP)** who have had an insufficient response to a previous treatment.¹

The safety and efficacy of Tavalisse have not been established in pediatric patients. Use of Tavalisse is not recommended for patients < 18 years of age because adverse events on actively growing bones were observed in nonclinical studies. Discontinue Tavalisse if after 12 weeks of treatment, the platelet count does not increase to a sufficient level to control bleeding.

Guidelines

In 2019, the American Society of Hematology updated guidelines for ITP.² Tavalisse is noted as an agent that has been studied in the third-line setting and its role is not specifically addressed. However, there are several other recommendations. For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to corticosteroid, a thrombopoietin receptor agonist (either Promacta® [eltrombopag tablets and oral suspension] or Nplate® [romiplostim subcutaneous injection]) or a splenectomy are recommended. Other treatment options in children and adults include intravenous immunoglobulin, anti-D immunoglobulin, and rituximab.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tavalisse. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tavalisse as well as the monitoring required for adverse events and long-term efficacy, approval requires Tavalisse to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tavalisse is recommended in those who meet the following criteria:

FDA-Approved Indication

20. Chronic Immune Thrombocytopenia. Approve if the patient meets ONE of the following (A or B):

M) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, iii, and iv):

- i.** Patient is ≥ 18 years of age; AND
- ii.** Patient meets ONE of the following (a or b):

04/24/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- a) Patient has a platelet count $< 30 \times 10^9/L$ ($< 30,000/mcL$); OR
- b) Patient meets BOTH of the following [(1) and (2)]:
 - (1) Patient has a platelet count $< 50 \times 10^9/L$ ($< 50,000/mcL$); AND
 - (2) According to the prescriber, the patient is at an increased risk of bleeding; AND
- iii. Patient meets ONE of the following (a or b):
 - a) Patient has tried at least ONE other therapy; OR

Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Promacta (eltrombopag tablets and oral suspension), Nplate (romiplostim subcutaneous injection), Doptelet (avatrombopag tablets), and rituximab.
 - b) Patient has undergone splenectomy; AND
- iv. The medication is prescribed by or in consultation with a hematologist; OR
 - B) Patient is Currently Receiving Tavalisse. Approve for 1 year if the patient meets BOTH of the following (i and ii):
- iii. According to the prescriber, the patient demonstrates a beneficial clinical response; AND

Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes; AND
- iv. Patient remains at risk for bleeding complications.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tavalisse is not recommended in the following situations:

5. **B-Cell Lymphomas.** Tavalisse has been investigated in patients with various B-cell lymphomas (e.g., non-Hodgkin's lymphoma, diffuse large B-cell lymphoma [DLBCL]).^{3,4} Many other therapies are available for this use.
6. **Rheumatoid Arthritis.** Although Tavalisse has been studied in patients with rheumatoid arthritis, other therapies are more well-established and are recommended in guidelines.⁵⁻⁹
7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Tolvaptan Products – Jynarque Prior Authorization Policy

- Jynarque® (tolvaptan tablets – Otsuka)

REVIEW DATE: 06/26/2024

OVERVIEW

Jynarque, a selective vasopressin V₂-receptor antagonist, is indicated to slow kidney function decline in adults at risk of rapidly-progressing **autosomal dominant polycystic kidney disease (ADPKD)**.¹

Disease Overview

ADPKD is a heterogeneous, inherited kidney disorder associated with the development of kidney cysts, which result in kidney pain, hypertension, renal failure, and other clinical sequelae.²⁻⁵ The condition is a common cause of end-stage renal disease; however, other organs are also impacted (e.g., hepatic and vascular systems). Progressive kidney enlargement occurs; however, manifestations generally do not occur until later in life (fourth decade) due to compensatory renal mechanisms. If a parent has the condition, a child has a 50% chance of inheritance. Approximately 600,000 people in the US have this condition.

Guidelines

The European Renal Association Working Groups on Inherited Kidney Disorders, the European Rare Kidney Disease Reference Network, and the Polycystic Kidney Disease International published a consensus statement regarding use of tolvaptan in ADPKD (2022).⁷ A confirmed annual estimated glomerular filtration rate decline ≥ 3.0 mL/min/1.73 m² over a period of ≥ 4 years defines rapid progression. Also, a Mayo Classification of 1D or 1E indicates rapid disease progression. Patients with Mayo Classification of 1C should be further evaluated for additional evidence of rapid disease progression. Total kidney volume changes should not be used as a marker of progression in individual patients. Finally, Jynarque should be discontinued when the patient approaches kidney failure (i.e., the need for renal replacement therapy).

The National Kidney Foundation and the Polycystic Kidney Disease Foundation list tolvaptan as an FDA-approved treatment option for patients with ADPKD.^{5,8}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Jynarque. All approvals are provided for the duration noted below. Due to the specialized skills required for evaluation and diagnosis of patients treated with Jynarque as well as the monitoring required for adverse events and long-term efficacy, approval requires Jynarque to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Jynarque is recommended in those who meet the following:

06/26/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

FDA-Approved Indication

21. Autosomal Dominant Polycystic Kidney Disease. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

N) Patient is ≥ 18 years of age; AND

O) According to the prescriber, the patient has rapidly-progressing autosomal dominant polycystic kidney disease; AND

Note: Examples of rapidly declining renal function include estimated glomerular filtration rate decline of ≥ 3.0 mL/min/1.73 m², and Mayo Classification of 1D or 1E.

P) Patient does not have Stage 5 chronic kidney disease; AND

Note: Stage 5 chronic kidney disease is defined as glomerular filtration rate < 15 mL/min/1.73 m² or receiving dialysis.

Q) The medication is prescribed by or in consultation with a nephrologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Jynarque is not recommended in the following situations:

- 8. Patient is Currently Receiving Samsca (tolvaptan tablets).** Samsca is a tolvaptan product that is indicated for the treatment of clinically-significant hypervolemic and euvoletic hyponatremia, including patients with heart failure and syndrome of inappropriate antidiuretic hormone (SIADH).⁶ Concomitant use is not recommended.
- 9. Hyponatremia.** Samsca is another tolvaptan product indicated for the treatment of clinically-significant hypervolemic and euvoletic hyponatremia (serum sodium < 125 mEq/L or less marked hyponatremia that is symptomatic and has resisted correction and fluid restriction), including patients with heart failure and SIADH. Samsca should be used for this condition.
- 10.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Tolvaptan Products – Tolvaptan (Samsca) Prior Authorization Policy

- Samsca® (tolvaptan tablets – Otsuka, generic)

REVIEW DATE: 06/26/2024

OVERVIEW

Tolvaptan (Samsca, generic), a selective vasopressin V₂-receptor antagonist, is indicated for the treatment of **clinically significant hypervolemic and euvoletic hyponatremia** (serum sodium < 125 mEq/L or less marked hyponatremia that is symptomatic and has resisted correction with fluid restriction), including patients with heart failure and syndrome of inappropriate antidiuretic hormone (SIADH). Patients requiring intervention to raise serum sodium urgently to prevent or to treat serious neurological symptoms should not be treated with Samsca. It has not been established that raising serum sodium with Samsca provides a symptomatic benefit to patients.

Clinical Data

Two trials (Study of Ascending Levels of Tolvaptan in Hyponatremia 1 and 2 [SALT-1 and SALT-2; n = 424]) demonstrated that Samsca increased serum sodium effectively in patients with euvoletic or hypervolemic hyponatremia that was due to many underlying causes (e.g., heart failure, liver cirrhosis, SIADH).^{1,2} Patients ≥ 18 years of age received therapy for 30 days with Samsca or placebo and were followed for an additional 7 days after study withdrawal. Patients in the trial had a serum sodium < 135 mEq/L at study entry (baseline 129 mEq/L). In both trials, Samsca therapy led to a greater increase in serum sodium compared with baseline for the measured endpoints at Day 4 and Day 30. The effects of sustained serum sodium were demonstrated for up to 1 year in an open-label study.¹

SALTWATER (the Safety and sodium Assessment of Long-term Tolvaptan With hyponatremia: A year-long, open-label Trial to gain Experience under Real-world conditions [SALTWATER]) was an open-label extension study of the SALT-1 and SALT-2 trials.^{1,3} Patients were eligible if they had completed either SALT-1 or SALT-2 and had a need and desire to continue therapy. There were 111 patients enrolled in the study with a mean baseline serum sodium concentration of 130.8 ± 4.4 mmol/L. Patients received Samsca for a mean of 701 days (1.92 years). Serum sodium concentrations increased to a mean of > 135 mmol/L by Day 14 and remained above this level at all observation time points going forward. Upon discontinuation of tolvaptan, the serum sodium concentration declined by ≥ 3 mmol/L in 68% of patients and an equal amount had serum sodium concentrations fall to < 135 mmol/L. One patient discontinued tolvaptan due to hypernatremia.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of tolvaptan. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of tolvaptan is recommended in those who meet the following criteria:

FDA-Approved Indication

28. Hyponatremia. Approve for the duration noted if patient meets ONE of the following (A or B):

- A) Initial Therapy. Approve for 30 days if the patient meets BOTH of the following (i and ii):
- i. Patient is ≥ 18 years of age; AND
 - ii. Patient meets ONE of the following criteria (a, b, or c):
 - a) Patient has a serum sodium < 125 mEq/L at baseline; OR
 - b) Patient meets the following criteria [(1) and (2)]:
 - (1) Patient has less marked hyponatremia, defined as serum sodium < 135 mEq/L at baseline; AND
 - (2) Patient has symptomatic hyponatremia; OR

Note: Symptoms of hyponatremia include nausea, vomiting, headache, lethargy, confusion.
 - c) Patient has already been started on tolvaptan and has received < 30 days of therapy.

Note: For a patient who has been started on tolvaptan and has received < 30 days of therapy, approve for a sufficient duration to complete 30 total days of therapy.
- B) Patient is Currently Receiving Tolvaptan. Approve for 3 months if the patient meets BOTH of the following (i and ii):
- i. Patient has been established on therapy for at least 30 days; AND

Note: A patient who has received < 30 days of therapy or is restarting therapy is reviewed under criterion A (Initial Therapy).
 - ii. Patient meets at least ONE of the following (a or b):
 - a) According to the prescriber, the serum sodium level has increased from baseline (prior to initiating the requested drug); OR
 - b) According to the prescriber, patient experienced improvement in at least one symptom, such as nausea, vomiting, headache, lethargy, or confusion.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of tolvaptan is not recommended in the following situations:

- 11. Autosomal Dominant Polycystic Kidney Disease (ADPKD).** Jynarque[®] (tolvaptan tablets) is another tolvaptan product that is indicated to slow kidney function decline in adults at risk of rapidly-progressing ADPKD. The recommended dosing differs.⁴ The Samsca prescribing information states that tolvaptan should not be prescribed or used to treat ADPKD outside of the FDA-approved Risk Evaluation and Mitigation Strategies for ADPKD.¹
- 12. Patient is Currently Receiving Jynarque.** Jynarque is another tolvaptan product that is indicated to slow kidney function decline in adults at risk of rapidly-progressing ADPKD. Concomitant use is not recommended.
- 13. Patients Requiring Intervention to Raise Serum Sodium Urgently to Prevent or to Treat Serious Neurological Symptoms.** Samsca has not been studied in a setting of urgent need to raise serum sodium acutely.¹
- 14.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Acne – Winlevi Prior Authorization Policy

- Winlevi® (clascoterone 1% cream – Sun)

REVIEW DATE: 06/05/2024

OVERVIEW

Winlevi, an androgen receptor inhibitor, is indicated for the topical treatment of **acne vulgaris** in patients ≥ 12 years of age.¹

Safety

Winlevi is the only topical acne product with a Warning about hypothalamic-pituitary-adrenal (HPA) axis suppression.¹ This may result when Winlevi is used over large surface areas or if use is prolonged. In addition, pediatric patients may be more susceptible. This adverse event was not observed in the pivotal studies or in the long-term open-label extension study. However, it was observed in a small group of patients on Day 14 in a pharmacokinetic study. Normal HPA axis function was observed at follow-up at 4 weeks after end of treatment.

Guidelines

The most recent guidelines for management of acne from the American Academy of Dermatology was published in 2024.² Topical therapies, either as monotherapy or in combination with other topical agents or oral agents, are recommended for initial control and maintenance therapy of acne. Topical retinoids (tretinoin, adapalene, tazarotene) are the cornerstone of acne management due to their comedolytic and anti-inflammatory properties. Other topical therapies mentioned in the guidelines for management and treatment of acne include antibiotics (e.g., clindamycin, erythromycin), azelaic acid, dapsone, and salicylic acid. Winlevi was given a conditional recommendation for mild acne as part of a multimodal approach to treatment.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Winlevi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Winlevi is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Acne Vulgaris.** Approve for 1 year if the patient meets the following (A, B, and C):

29. Patient is ≥ 12 years of age; AND

30. Patient has tried at least one prescription topical retinoid.

Note: Examples of a prescription topical retinoid are adapalene (Differin, generic), Aklief (trifarotene 0.005% cream), tazarotene 0.1% cream (Tazorac, generic), tazarotene 0.1% gel (Tazorac, generic), and tretinoin; AND

06/05/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

31. Patient has tried at least three other prescription non-retinoid topical therapies.

Note: Topical retinoids do not count. Examples of other prescription non-retinoid topical therapies for acne include: dapsone gel (Aczone, generic), Azelex (azelaic acid 20% cream), topical clindamycin, topical erythromycin, and topical minocycline (Amzeeq [minocycline 4% foam]). For combination products, each active chemical entity counts as one trial. Example: If one prescription product has 2 non-retinoids, this would fulfill a trial of 2 non-retinoid topical therapies.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Winlevi is not recommended in the following situations:

15. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Topical Acyclovir Products Prior Authorization Policy
- Zovirax® (acyclovir 5% cream –Bausch Health, generic)
 - Zovirax® (acyclovir 5% ointment – Bausch Health, generic)

REVIEW DATE: 07/31/2024

OVERVIEW

Acyclovir 5% cream (Zovirax, generic) is indicated for the treatment of **recurrent herpes labialis (cold sores)** in immunocompetent patients ≥ 12 years of age.¹

Acyclovir 5% ointment (Zovirax, generics) is indicated for the following uses:²

- **Genital herpes**, initial treatment.
- **Limited non-life-threatening mucocutaneous herpes simplex virus infections**, in immunocompromised patients.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of topical acyclovir products. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

- I.** Coverage of acyclovir 5% cream (Zovirax 5% cream, generic) is recommended in those who meet the following criteria:

FDA-Approved Indication

- 3. Herpes Labialis (Cold Sores).** Approve for 1 year if the patient meets BOTH of the following (A and B):
- a) Patient is ≥ 12 years of age; AND
 - b) Patient is immunocompetent.

- II.** Coverage of acyclovir 5% ointment (Zovirax 5% ointment, generic) is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1. Genital Herpes.** Approve for 1 year if the patient meets ONE of the following (A or B):
- A) Generic acyclovir 5% ointment is requested; OR
 - B) Patient meets BOTH of the following (i and ii):
 - i. Patient has tried generic acyclovir 5% ointment; AND
 - ii. Patient cannot use the generic product due to a formulation difference in the inactive ingredient(s) [e.g., difference in buffers, emollients, emulsifiers, preservatives, surfactants]

07/31/2024

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

between the brand and the bioequivalent generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

2. **Limited Non-Life-Threatening Mucocutaneous Herpes Simplex Virus Infections.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is immunocompromised; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Generic acyclovir 5% ointment is requested; OR
 - ii. Patient meets BOTH of the following (a and b):
 - a) Patient has tried generic acyclovir 5% ointment; AND
 - b) Patient cannot use the generic product due to a formulation difference in the inactive ingredient(s) [e.g., difference in buffers, emollients, emulsifiers, preservatives, surfactants] between the brand and the bioequivalent generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of topical acyclovir products are not recommended in the following situation:

1. **Shingles (Herpes Zoster).** Shingles is a viral infection caused by the varicella zoster virus, the same virus that causes chickenpox.³ The Centers for Disease Control and Prevention cite the use of oral antivirals (acyclovir capsules/tablets/suspension, famciclovir tablets, and valacyclovir caplets) for the treatment of shingles. Oral antivirals speed healing and reduce the risk of complications. Topical antivirals are not noted as treatment options for shingles.
2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Alpha-Adrenergic Agonists for Rosacea – Brimonidine Prior Authorization Policy

- Mirvaso® (brimonidine gel, 0.33% – Galderma, generic)

REVIEW DATE: 1/31/2024

OVERVIEW

Brimonidine 0.33% gel, an alpha₂-adrenergic agonist, is indicated for the topical treatment of persistent (non transient) **facial erythema of rosacea** in patients ≥ 18 years of age.¹

Brimonidine 0.33% gel has been shown to decrease the erythema associated with rosacea; brimonidine 0.33% gel has not been shown to exert any beneficial effects on inflammatory lesions.¹⁻³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of brimonidine 0.33% gel. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of brimonidine 0.33% gel is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Facial Erythema.** Approve for 1 year if the patient meets the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has facial erythema due to rosacea.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of brimonidine 0.33% gel is not recommended in the following situations:

16. Erythema Caused by Conditions Other Than Rosacea.

17. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Alpha-Adrenergic Agonists for Rosacea – Rhofade Prior Authorization Policy

- Rhofade® (oxymetazoline 1% hydrochloride cream – EPI Health)

REVIEW DATE: 07/03/2024

OVERVIEW

Rhofade, an alpha_{1A}-adrenergic agonist, is indicated for the topical treatment of persistent **facial erythema associated with rosacea** in adults.¹

Rhofade has been shown to decrease the erythema associated with rosacea and has not been shown to exert any beneficial effects on inflammatory lesions.¹⁻³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rhofade. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rhofade is recommended in those who meet the following criteria:

FDA-Approved Indication

2. **Facial Erythema.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has facial erythema associated with rosacea.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rhofade is not recommended in the following situations:

18. Erythema Caused by Conditions Other Than Rosacea.

19. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Anesthetic – Lidocaine, Tetracaine Products Prior Authorization with Step Therapy Policy

- Pliaglis® (lidocaine 7%/tetracaine 7% topical cream – Taro/Oba, generic)
- Synera® (lidocaine 70 mg/tetracaine 70 mg topical patches – Galen [obsolete 2022])

REVIEW DATE: 05/15/2024

OVERVIEW

Lidocaine 7%/tetracaine 7% topical cream (Pliaglis, generic) is indicated to provide topical local analgesia for **superficial dermatological procedures** (e.g., dermal filler injection, pulsed dye laser therapy, facial laser resurfacing, laser-assisted tattoo removal) in adults, for use on intact skin.¹

Synera is indicated to provide local dermal analgesia in patients ≥ 3 years of age on intact skin for the following uses:²

- **Superficial dermatological procedures.**
- **Venipuncture or intravenous cannulation.**

Lidocaine cream and combination lidocaine/prilocaine cream are other topical local anesthetics used for various conditions.^{3,4}

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of lidocaine 7%/tetracaine 7% topical cream (Pliaglis, generic) and Synera. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

- I. Coverage of lidocaine 7%/tetracaine 7% topical cream (Pliaglis, generic) is recommended in those who meet the following criteria:

FDA-Approved Indication

17. Superficial Dermatological Procedures. Approve for 1 week if the patient meets ALL of the following (A, B, C, and D):

- A) Patient is ≥ 18 years of age; AND
- B) The procedure is for a non-cosmetic condition; AND
- C) The medication will be applied to intact skin; AND
- D) Patient has tried both of the following topical anesthetics (i and ii):
 - i. One lidocaine cream product; AND
 - ii. One lidocaine/prilocaine cream product.

05/15/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

II. Coverage of Synera is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1. Superficial Dermatological Procedures.** Approve for 1 week if the patient meets ALL of the following (A, B, C, and D):
 - A)** Patient is ≥ 3 years of age; AND
 - B)** The procedure is for a non-cosmetic condition; AND
 - C)** The medication will be applied to intact skin; AND
 - D)** Patient has tried both of the following topical anesthetics (i and ii):
 - i.** One lidocaine cream product; AND
 - ii.** One lidocaine/prilocaine cream product.
- 2. Venipuncture or Intravenous Cannulation.** Approve for 1 week if the patient meets ALL of the following (A, B, and C):
 - A)** Patient is ≥ 3 years of age; AND
 - B)** The medication will be applied to intact skin; AND
 - C)** Patient has tried both of the following topical anesthetics (i and ii):
 - i.** One lidocaine cream product; AND
 - ii.** One lidocaine/prilocaine cream product.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of lidocaine 7%/tetracaine 7% topical cream (Pliaglis, generic) and Synera is not recommended in the following situations:

- 176. Cosmetic Conditions.** Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.
Note: Examples of cosmetic conditions include dermal filler injection, pulsed dye laser therapy, facial laser resurfacing, and laser-assisted tattoo removal.
- 177.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Diclofenac Sodium 3% Gel Prior Authorization Policy

- diclofenac sodium 3% gel (generic only)

REVIEW DATE: 08/14/2024

OVERVIEW

Diclofenac sodium 3% gel, a nonsteroidal anti-inflammatory drug, is indicated for the topical treatment of **actinic keratoses**.¹ It is also noted in the labeling that sun avoidance is indicated during therapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) Squamous Cell Skin Cancer guidelines (version 1.2024 – November 9, 2023) cite topical diclofenac (formulation is not specified) as a treatment option for the treatment of actinic keratoses.² The guidelines also note diclofenac as a (potential) treatment option for the treatment of actinic keratosis on the lips (actinic cheilitis); other treatment options are: surgical vermilionectomy, lip shave, electrodessication, laser vermilion ablation, laser resurfacing, 5-fluorouracil, laser + 5-fluorouracil, trichloroacetic acid chemical peel, photodynamic therapy, and photodynamic therapy plus imiquimod.

Other Uses

Disseminated Superficial Actinic Porokeratosis (DSAP)

Diclofenac gel is noted as a treatment that may be effective for DSAP.³ Pharmacologic treatment options for DSAP include topical 5-fluorouracil, topical vitamin D₃ analogs, topical imiquimod, topical tacrolimus, oral retinoids (e.g., isotretinoin, acitretin) and topical retinoids (tretinoin, tazarotene), and diclofenac. Diclofenac was studied in an open-label study where patients (n = 17) received 12 weeks of therapy with diclofenac sodium 3% gel and at the end of 12 weeks, treatment could be extended for an additional 12 weeks.⁴ At Week 12, the target area lesions (treated lesions) had a mean reduction of 4% vs. a 12% mean increase in the total body lesions (global). Ten patients received 24 weeks of treatment and there was a mean increase of 10% in lesions in the target area vs. a 19% increase in global lesions.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of diclofenac sodium 3% gel. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of diclofenac sodium 3% gel is recommended in those who meet one of the following criteria:

FDA-Approved Indication

32. Actinic Keratoses. Approve for 6 months.

Other Uses with Supportive Evidence

08/14/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

33. Actinic Cheilitis (Actinic Keratoses of the Lip[s]). Approve for 6 months.

- 3. Disseminated Superficial Actinic Porokeratosis.** Approve for 6 months if the patient has tried at least two other therapies used for the management of disseminated superficial actinic porokeratosis.

Note: Examples of therapies for management of disseminated superficial actinic porokeratosis include topical 5-fluorouracil (5-FU), imiquimod, topical corticosteroids, topical vitamin D₃ analogs, topical or oral retinoids, cryotherapy, photodynamic therapy, and laser.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of diclofenac sodium 3% gel is not recommended in the following situations:

- 20. Osteoarthritis (OA).** The benefit of topical diclofenac gel 3% in osteoarthritis is uncertain. There has been one small, randomized, placebo-controlled study assessing the efficacy of a topical diclofenac 3%/sodium hyaluronate 2.5% gel (Canadian formulation) applied as 2 grams four times daily to one joint for 2 weeks in patients (n = 119) with uncontrolled OA pain despite chronic (≥ 1 month) oral nonsteroidal anti-inflammatory drug (NSAID) use.⁵ The addition of topical diclofenac 3%/sodium hyaluronate to oral NSAID therapy resulted in only marginally greater analgesic effect than NSAID alone. Other topical agents are indicated for this use.

- 21.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Retinoids – Akliel Prior Authorization Policy

- Akliel® (trifarotene cream – Galderma)

REVIEW DATE: 12/18/2024

OVERVIEW

Akliel, a topical retinoid, is indicated for the topical treatment of **acne vulgaris** in patients ≥ 9 years of age.¹

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Akliel. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Akliel is recommended in those who meet the following criteria:

FDA-Approved Indication

34. Acne Vulgaris. Approve for 1 year if the patient is ≥ 9 years of age.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Akliel is not recommended in the following situations:

22. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Retinoids – Panretin Prior Authorization Policy

- Panretin® (alitretinoin topical gel – Eisai)

REVIEW DATE: 08/14/2024

OVERVIEW

Panretin, a topical retinoid, is indicated for the topical treatment of cutaneous lesions in patients with Acquired Immunodeficiency Syndrome (AIDS)-related **Kaposi sarcoma**.¹ It is not indicated when systemic anti-Kaposi sarcoma therapy is required (e.g., more than 10 new Kaposi sarcoma lesions in the prior month, symptomatic lymphedema, symptomatic pulmonary Kaposi sarcoma, or symptomatic visceral involvement). Per the prescribing information, there is no experience to date using Panretin gel with systemic anti-Kaposi sarcoma treatment.

Guidelines

Use of Panretin is addressed in the National Comprehensive Cancer Network guidelines for Kaposi sarcoma (version 1.2024 – November 7, 2023).² Topical agents are among the first-line therapy recommendations for symptomatic and/or cosmetically unacceptable cutaneous disease; this applies both for patients with human immunodeficiency virus (HIV) and patients without HIV. Panretin is listed as an option for topical treatment (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Panretin. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Panretin, approval requires Panretin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Prior authorization and prescription benefit coverage are not recommended for cosmetic uses.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Panretin is recommended in those who meet the following criteria:

FDA-Approved Indication

- 4. Kaposi Sarcoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is not receiving systemic therapy for Kaposi sarcoma; AND
 - B) The medication is prescribed by or in consultation with a dermatologist, oncologist, or infectious disease specialist.

08/14/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Panretin is not recommended in the following situations:

- 2. Cosmetic Uses.** Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.

Note (this is not an all-inclusive list): Examples of cosmetic conditions include actinic purpura, age spots (also called liver spots, solar lentigines, sunspots), melasma/cholasma, milia, mottled hyperpigmentation, mottled hypopigmentation, photo-aged or photo-damaged skin, pokiloderma (of Civatte), premature aging, scarring, sebaceous hyperplasia, seborrheic keratosis, skin laxity, skin roughness, solar elastosis, solar purpura, stretch marks, and wrinkles.

- 3.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Topical Retinoids – Tazarotene Products Prior Authorization Policy
- Arazlo™ (tazarotene 0.045% lotion – Bausch Health)
 - Fabior® (tazarotene 0.1% foam – Mayne Pharma, generic)
 - Tazorac® (tazarotene 0.05% cream, 0.05% gel, 0.1% cream, and 0.1% gel – Allergan, generics to 0.1% cream, 0.05% gel, and 0.1% gel only)

REVIEW DATE: 08/14/2024

OVERVIEW

Tazorac gel is indicated for the following uses:¹

- **Plaque psoriasis**, in patients with up to 20% body surface area involvement (0.05% and 0.1% strengths).
- **Facial acne vulgaris**, in patients with mild to moderate severity (0.1% strength only).

Tazorac cream is indicated for the following uses:²

- **Plaque psoriasis** (0.05% and 0.1% strengths).
- **Acne vulgaris** (0.1% strength only).

Both Arazlo lotion and Fabior foam are indicated for the topical treatment of **acne vulgaris**.^{3,4}

In addition to acne vulgaris and plaque psoriasis, topical tazarotene products have been used to treat other medical skin conditions, such as basal cell carcinoma and congenital ichthyoses.⁵⁻¹³ Topical tazarotene products have also been used to treat cosmetic skin conditions such as wrinkles, premature aging, and treatment of photo-aged or photo-damaged skin.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of topical tazarotene products. All approvals are provided for the duration noted below.

Prior authorization and prescription benefit coverage are not recommended for cosmetic uses.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of topical tazarotene products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Acne Vulgaris.** Approve for 1 year.
2. **Plaque Psoriasis.** Approve for 1 year.

08/14/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Other Uses with Supportive Evidence

3. Treatment of Other Non-Cosmetic Conditions. Approve for 1 year.

Note: Examples of other non-cosmetic conditions include: acne keloidalis nuchae, basal cell carcinoma, comedonal acne, cystic acne, cutaneous T-cell lymphoma, ichthyosis (e.g., congenital, lamellar, vulgaris, X-linked), keratoderma blennorrhagicum, keratosis (e.g., keratosis follicularis [Darier's disease], keratosis pilaris), mycosis fungoides, nail psoriasis, oral lichen planus, and warts.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of topical tazarotene products is not recommended in the following situations:

1. Cosmetic Conditions. Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.

Note (this is not an all-inclusive list): Examples of cosmetic conditions include actinic purpura, age spots (also called liver spots, solar lentigines, sun spots), melasma/cholasma, milia, mottled hyperpigmentation, mottled hypopigmentation, photo-aged or photo-damaged skin, pokiloderma (of Civatte), premature aging, scarring, sebaceous hyperplasia, seborrheic keratosis, skin laxity, skin roughness, solar elastosis, solar purpura, stretch marks, and wrinkles.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Uplizna Prior Authorization Policy

- Uplizna® (inebilizumab-cdon intravenous infusion – Horizon Therapeutics)

REVIEW DATE: 04/10/2024

OVERVIEW

Uplizna, a CD19-directed cytolytic antibody, is indicated for the treatment of **neuromyelitis optica spectrum disorder** (NMOSD) in adults who are anti-aquaporin-4 antibody-positive.¹

Disease Overview

NMOSD is a rare, relapsing, autoimmune disorder of the brain and spinal cord with optic neuritis and/or myelitis as predominant characteristic symptoms.² NMOSD often causes significant, permanent damage to vision and/or spinal cord function resulting in blindness or impaired mobility.³ Patients may experience pain, paralysis, loss of bowel and bladder control, loss of visual acuity, and uncontrolled motor functions. Complications can lead to death.

Recommendations

The Neuromyelitis Optica Study Group (NEMOS) published revised recommendations for the treatment of NMOSD in 2024.⁴ The standard of care for the treatment of NMOSD attacks (for both AQP4-IgG-positive and double-negative cases) are high-dose glucocorticoids and/or apheresis therapy. Long-term immunotherapy is recommended for patients with AQP4-IgG-positive NMOSD. NEMOS notes the first-choice therapies for the treatment of AQP4-IgG-positive NMOSD are Uplizna, Enspryng® (satralizumab-mwge subcutaneous injection), Soliris® (eculizumab intravenous infusion), Ultomiris® (ravulizumab-cwvz intravenous infusion), and rituximab. The order of preference for these therapies is unclear and further comparative trials and real-world data are needed. The choice of treatment is dependent on several factors, including disease activity and severity, mode and onset of action, possibility to combine it with immunosuppressive drugs, effect on autoimmune and other comorbidities, gender (family planning issues), frequency and route of administration, side effect profile as well as patient and physician preference. In general, if a patient fails a first-choice treatment, another first-choice treatment should be tried; other options include use of a second-choice treatment (azathioprine, mycophenolate mofetil, low-dose oral glucocorticoids) or the addition of a second-choice treatment to the regimen.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Uplizna. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Uplizna as well as the monitoring required for adverse events and long-term efficacy, approval requires Uplizna to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

04/10/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Uplizna is recommended in those who meet the following criteria:

FDA-Approved Indication

22. Neuromyelitis Optica Spectrum Disorder. Approve if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):

- i.** Patient is ≥ 18 years of age; AND
- ii.** Diagnosis of neuromyelitis optica spectrum disorder was confirmed by blood serum test for anti-aquaporin-4 antibody positive disease; AND
- iii.** The medication is being prescribed by or in consultation with a neurologist.

B) Patient is Currently Receiving Uplizna. Approve for 1 year if the patient meets ALL of the following (i, ii, iii, and iv):

- i.** Patient is ≥ 18 years of age; AND
- ii.** Diagnosis of neuromyelitis optica spectrum disorder was confirmed by blood serum test for anti-aquaporin-4 antibody-positive disease; AND
- iii.** According to the prescriber, patient has had clinical benefit from the use of Uplizna; AND
Note: Examples of clinical benefit include reduction in relapse rate, reduction in symptoms (e.g., pain, fatigue, motor function), and a slowing progression in symptoms.
- iv.** The medication is being prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Uplizna is not recommended in the following situations:

178. Concomitant Use With a Rituximab Product, Enspryng (satralizumab-mwge subcutaneous injection, Soliris (eculizumab intravenous infusion), or Ultomiris (ravulizumab-cwvz intravenous infusion). There is no evidence to support additive efficacy of combining Uplizna with rituximab, Enspryng, Soliris, or Ultomiris.

179. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vasculitis – Tavneos Prior Authorization Policy

- Tavneos® (avacopan capsules – ChemoCentryx)

REVIEW DATE: 07/10/2024

OVERVIEW

Tavneos, a complement 5a receptor antagonist, is indicated as an adjunctive treatment for **severe active anti-neutrophil cytoplasmic autoantibody (ANCA)-associated vasculitis** (granulomatosis with polyangiitis [GPA] and microscopic polyangiitis [MPA]) in combination with standard therapy including glucocorticoids in adults.¹ Tavneos does not eliminate glucocorticoid use.¹

Disease Overview

ANCA-associated vasculitis is a group of diseases, which includes GPA (Wegener's granulomatosis), MPA, and eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome).² Patients who have ANCA-associated vasculitis produce antibodies that cause inflammation, which damages small blood vessels. The clinical signs and symptoms vary and affect several organs, such as the kidneys, lungs, stomach, and intestine. Many patients are positive for proteinase 3 or myeloperoxidase antibodies.² Patients normally undergo two phases of treatment; one designed to induce the remission of symptoms (induction treatment), and a second phase meant to keep patients in remission for as long as possible (maintenance treatment).² Response is measured by achieving remission or improvement of signs and symptoms, which can be assessed by improvement in the Birmingham Vasculitis Activity Score. Other indicators of clinical response include improvement in kidney function (i.e. improvement in estimated glomerular filtration rate), or decrease in urinary albumin creatinine ratio.³

Clinical Efficacy

The efficacy of Tavneos was evaluated in one Phase III, randomized, double-blind, active-controlled pivotal study that assessed the efficacy of Tavneos in patients with newly diagnosed or relapsing active ANCA-associated vasculitis.³ Patients were randomized in a 1:1 ratio to receive Tavneos twice daily orally plus prednisone-matching placebo or a tapering oral regimen of prednisone plus Tavneos-matching placebo in a double-dummy design. Patients in both groups also received an immunosuppressive regimen (cyclophosphamide followed by azathioprine or mycophenolate mofetil; or rituximab). Patients included were positive for either proteinase 3 or myeloperoxidase antibodies.³ Glucocorticoid use was allowed in each treatment group, if needed for certain situations.³ The primary endpoints were remission at Week 26 and sustained remission at Week 52.³ This pivotal trial demonstrated that Tavneos was noninferior but not superior to the prednisone taper with respect to remission at Week 26 and was superior to prednisone taper with respect to sustained remission at Week 52.³

Guidelines

The American College of Rheumatology/Vasculitis Foundation guidelines (2021) for the management of ANCA-associated vasculitis mention that a clinical trial of Tavneos in patients with GPA and MPA was published.² Treatment for ANCA-associated vasculitis is based on the severity of the disease, the disease status, and type. The following are recommendations from the guidelines for active, severe GPA/MPA. For remission induction, the guidelines recommend rituximab with reduced-dose glucocorticoids; cyclophosphamide may be used in certain clinical scenarios (i.e., contraindication or failure with rituximab).² If remission is not induced, the guidelines recommend switching to a different remission induction agent. For disease relapse, rituximab is recommended if the patient is not receiving rituximab

07/10/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

for remission maintenance; if the patient is taking rituximab for disease maintenance, the guidelines recommend switching from rituximab to cyclophosphamide.²

The European League against Rheumatism (EULAR)/European Renal Association – European Dialysis and Transport Association (2022) also have guidelines for ANCA-associated vasculitis.⁴ The guidelines state that Tavneos, in combination with rituximab or cyclosporine may be considered for induction of remission in GPA or MPA as part of a strategy to substantially reduce exposure to glucocorticoids. Tavneos should be stopped after a duration of treatment of 6-12 months as there is no data on the use of Tavneos beyond 1 year, so longer-term use cannot be recommended.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tavneos. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tavneos as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Tavneos to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tavneos is recommended in those who meet the following criteria:

FDA-Approved Indication

18. Anti-Neutrophil Cytoplasmic Autoantibody (ANCA)-Associated Vasculitis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets ALL of the following (i, ii, iii, iv, v and vi):

- i.** Patient is ≥ 18 years of age; AND
- ii.** Patient has granulomatosis with polyangiitis or microscopic polyangiitis; AND
Note: Granulomatosis with polyangiitis is also known as Wegener's granulomatosis.
- iii.** Patient has active disease; AND
Note: This includes patients that have newly diagnosed or relapsed disease. This does not include patients already in remission.
- iv.** Patient is positive for proteinase 3 antibodies, myeloperoxidase antibodies, or anti-neutrophil cytoplasmic autoantibody (ANCA); AND
- v.** Patient is using this medication in combination with at least one immunosuppressant; AND
Note: Examples of immunosuppressants include rituximab, methotrexate, azathioprine, and mycophenolate mofetil.
- vi.** The medication is prescribed by or in consultation with a rheumatologist, nephrologist, or immunologist.

B) Patient is Currently Receiving Tavneos. Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):

- i.** Patient is ≥ 18 years of age; AND
- ii.** Patient has been established on Tavneos for at least 6 months; AND
- iii.** Patient meets at least ONE of the following (a or b):
 - a)** When assessed by at least one objective measure, patient experienced a beneficial clinical response from baseline (prior to initiating Tavneos); OR

07/10/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Note: Examples of objective measure include improvement in estimated glomerular filtration rate, decrease in urinary albumin creatinine ratio, or improvement in the Birmingham Vasculitis Activity Score [BVAS].

- b) Compared with baseline (prior to receiving Tavneos), patient experienced an improvement in at least one symptom, such as joint pain, ulcers, myalgia, persistent cough, skin rash, abdominal pain, or improvement in function or activities of daily living.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tavneos is not recommended in the following situations:

- 180. Eosinophilic Granulomatosis with Polyangiitis (EGPA).** There are no data evaluating Tavneos for EGPA. Patients with this condition were excluded from the pivotal study.

Note: EGPA is also known as Churg-Strauss syndrome.

- 181.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vecamyl Prior Authorization Policy

- Vecamyl™ (mecamylamine hydrochloride tablets – Vyera)

REVIEW DATE: 07/03/2024

OVERVIEW

Vecamyl, a nicotinic parasympathetic ganglionic blocker, is indicated for the following uses:¹

- **Moderately severe to severe essential hypertension.**
- **Uncomplicated malignant hypertension.**

Guidelines

The clinical practice guidelines from the American College of Cardiology (ACC)/American Heart Association (AHA) Task Force (2017) state the prevalence of severe hypertension has been declining, but approximately 12.3% of US adults with hypertension have an average systolic blood pressure ≥ 160 mm Hg or average diastolic blood pressure ≥ 100 mm Hg. Numerous classes of antihypertensive agents are available to treat high blood pressure. Vecamyl is not suggested as a primary or secondary agent in the treatment of hypertension. The ACC/AHA guidelines advise selection among four specific medication classes (thiazide-type diuretics, calcium channel blockers, angiotensin-converting enzyme inhibitors, or angiotensin receptor blockers) as initial and secondary choices in treatment.²

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vecamyl. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vecamyl is recommended in those who meet one of the following criteria:

FDA-Approved Indications

19. Essential Hypertension, Moderately Severe to Severe. Approve for 1 year if the patient meets BOTH of the following (A and B):

- A) Patient has tried four antihypertensive therapies, each from different pharmacologic classes (e.g., diuretics, calcium channel blockers, angiotensin-converting enzyme inhibitors, and angiotensin receptor blockers [as single-entity or as combination products]); AND
- B) For each of these agents, patient meets ONE of the following (i or ii):
 - i. Patient has had inadequate efficacy; OR
 - ii. Patient has experienced adverse event(s) severe enough to warrant discontinuation of this agent, according to the prescriber.

20. Uncomplicated Malignant Hypertension. Approve for 1 year if the patient meets BOTH of the following (A and B):

07/03/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- A) Patient has tried four antihypertensive therapies, each from different pharmacologic classes (e.g., diuretics, calcium channel blockers, angiotensin-converting enzyme inhibitors, and angiotensin receptor blockers [as single-entity or as combination products]); AND
- B) For each of these agents, patient meets ONE of the following (i or ii):
 - i. Patient has had inadequate efficacy; OR
 - ii. Patient has experienced adverse event(s) severe enough to warrant discontinuation of this agent, according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vecamyl is not recommended in the following situations:

- 23. **Tourette Syndrome.** Limited data are available to validate the use of mecamylamine in Tourette Syndrome. A clinical trial has shown mecamylamine to not be an effective treatment for tics or for the total spectrum of symptoms associated with Tourette Syndrome.⁴
- 24. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Veregen Prior Authorization Policy

- Veregen® (sinecatechins ointment – Fougera)

REVIEW DATE: 02/07/2024

OVERVIEW

Veregen, a botanical drug product, is indicated for the topical treatment of **external genital and perianal warts** (*Condylomata acuminata*) in immunocompetent patients ≥ 18 years of age.¹

Guidelines

The Centers for Disease Control and Prevention (CDC) Sexually Transmitted Diseases Treatment Guidelines (2021) detail the patient-applied and provider-applied treatment options for the management of external anogenital warts (i.e., penis, groin, scrotum, vulva, perineum, external anus, or perianus).² The CDC guidelines note that treatment should be guided by wart size, number of lesions, location of the wart(s), the preference of the patient, cost of treatment, convenience, adverse effects, and the experience of the healthcare provider with the various provider-applied options. There is no definitive evidence available which has demonstrated the superiority of one product over others for all patients and all warts. Most patients will require a course of therapy vs. a single treatment. Most warts will typically respond to therapy in 3 months, but if response does not occur, then treatment options should be reassessed and modified if needed. The CDC recommended patient-applied regimens include: imiquimod 3.75% or 5% cream, podofilox 0.5% solution or gel, or Veregen.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Veregen. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Veregen is recommended in those who meet the following criteria:

FDA-Approved Indication

21. Genital or Perianal Warts, External. Approve for 4 months if the patient meets the following (A, B, and C):

- A) Patient is ≥ 18 years of age; AND
- B) Patient is immunocompetent, according to the prescriber; AND
- C) Patient has tried BOTH of the following (i and ii):
 - i. Podofilox gel or solution; AND
 - ii. Imiquimod cream.

02/07/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Veregen is not recommended in the following situations:

- 182.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vesicular Monoamine Transporter Type 2 Inhibitors – Austedo Prior Authorization Policy

- Austedo® (deutetrabenazine tablets – Teva)
- Austedo® XR (deutetrabenazine extended-release tablets – Teva)

REVIEW DATE: 04/10/2024

OVERVIEW

Austedo and Austedo XR, vesicular monoamine transporter type 2 inhibitors, are indicated in adults for the following uses:¹

- **Chorea associated with Huntington’s disease.**
- **Tardive dyskinesia.**

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Austedo/Austedo XR. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Austedo/Austedo XR as well as the monitoring required for adverse events and long-term efficacy, approval requires Austedo/Austedo XR to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Austedo/Austedo XR is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1. Chorea Associated with Huntington’s Disease.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** Diagnosis of Huntington’s disease is confirmed by genetic testing (for example, an expanded HTT CAG repeat sequence of at least 36); AND
 - C)** The medication is prescribed by or in consultation with a neurologist.
- 2. Tardive dyskinesia.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** The medication is prescribed by or in consultation with a neurologist or psychiatrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Austedo/Austedo XR is not recommended in the following situations:

- 25.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

OVERVIEW

Ingrezza and Ingrezza Sprinkle, a vesicular monoamine transporter type 2 inhibitor, are indicated in adults for the treatment of the following uses:¹

- **Chorea associated with Huntington’s disease.**
- **Tardive dyskinesia.**

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ingrezza or Ingrezza Sprinkle. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ingrezza or Ingrezza Sprinkle as well as the monitoring required for adverse events and long-term efficacy, approval requires Ingrezza or Ingrezza Sprinkle to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ingrezza or Ingrezza Sprinkle are recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 3. Chorea Associated with Huntington’s Disease.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
 - D)** Patient is ≥ 18 years of age; AND
 - E)** Diagnosis of Huntington’s disease is confirmed by genetic testing (for example, an expanded HTT CAG repeat sequence of at least 36); AND
 - F)** The medication is prescribed by or in consultation with a neurologist.
- 4. Tardive Dyskinesia.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A)** Patient is ≥ 18 years of age; AND
 - B)** The medication is prescribed by or in consultation with a neurologist or psychiatrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ingrezza or Ingrezza Sprinkle are not recommended in the following situations:

05/15/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

26. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vesicular Monoamine Transporter Type 2 Inhibitors – Tetrabenazine Prior Authorization Policy

- Xenazine® (tetrabenazine tablets – Lundbeck, generic)

REVIEW DATE: 04/10/2024

OVERVIEW

Tetrabenazine, a vesicular monoamine transporter type 2 inhibitor, is indicated for the treatment of **chorea associated with Huntington's disease** in adults.¹

Clinical Efficacy

There are several published studies which have assessed the efficacy and safety of tetrabenazine for the treatment of other hyperkinetic movement disorders (e.g., tics in Tourette syndrome and tardive dyskinesia).²⁻⁴ While most of the data for treatment of Tourette syndrome indicate that antipsychotic medications, both typical and atypical, are most effective, other medications (including tetrabenazine) may be used first to avoid the potential side effects of dopamine blockade.⁵

Guidelines

The American Academy of Neurology (AAN) evidence-based guidelines on pharmacologic treatment of chorea in Huntington's disease (2012) state that if chorea in Huntington's disease requires treatment, clinicians should prescribe tetrabenazine, amantadine, or Rilutek® (riluzole tablets) [Level B].⁶

The AAN published an evidence-based guideline for the treatment of tardive syndromes (2013).⁷ The authors found that tetrabenazine possibly reduces tardive syndrome symptoms (based on two consistent Class III studies). Therefore, tetrabenazine may be considered in treating tardive syndromes (Level C).

The AAN published practice guideline recommendations for the treatment of tics in patients with Tourette syndrome and chronic tic disorders (2019).⁸ The guidelines state that the dopamine depleters, tetrabenazine, deutetabenazine, and valbenazine, are lacking published, randomized, controlled trials in the treatment of tics but note that these drugs are increasingly used off-label. When appropriately dosed, these drugs are generally well-tolerated but may be associated with drowsiness, depression, and parkinsonism.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of tetrabenazine. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with tetrabenazine as well as the monitoring required for adverse events and long-term efficacy, approval requires tetrabenazine to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of tetrabenazine is recommended in those who meet one of the following criteria:

FDA-Approved Indication

5. **Chorea Associated with Huntington's Disease.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- C) Patient is ≥ 18 years of age; AND
 2. Diagnosis of Huntington's disease is confirmed by genetic testing (for example, an expanded HTT CAG repeat sequence of at least 36); AND
 3. The medication is prescribed by or in consultation with a neurologist.

Other Uses with Supportive Evidence

6. **Hyperkinetic Dystonia.** Approve for 1 year if the patient meets BOTH of the following (A and B):
1. Patient is ≥ 18 years of age; AND
 2. The medication is prescribed by or in consultation with a neurologist.
7. **Tardive Dyskinesia.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) The medication is prescribed by or in consultation with a neurologist or psychiatrist.
8. **Tourette Syndrome and Related Tic Disorders.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) The medication is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of tetrabenazine is not recommended in the following situations:

27. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vioice Prior Authorization Policy

- Vioice® (alpelisib tablets and oral granules – Novartis)

REVIEW DATE: 05/15/2024; selected revision 06/19/2024

OVERVIEW

Vioice, a kinase inhibitor, is indicated for the treatment severe manifestations of phosphatidylinositol- 4,5-bisphosphate 3-kinase catalytic subunit alpha (**PIK3CA**)-Related Overgrowth Spectrum (PROS) in adults and pediatric patients ≥ 2 years of age who require systemic therapy.¹

This indication is approved under accelerated approval based on response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial(s).

Disease Overview

PROS is a heterogeneous group of diseases caused by mutations in *PIK3CA* and characterized by a range of clinical features.² Examples of PROS include patients with congenital lipomatous overgrowth, vascular malformations, epidermal nevi, scoliosis/skeletal and spinal (CLOVES) syndrome; megalencephaly-capillary malformation (MCAP) syndrome; Klippel-Trenaunay syndrome (KTS); facial infiltrating lipomatosis (FIL); dysplastic megalencephaly (DMEG); hemimegalencephaly (HMEG); focal cortical dysplasia (FCD); or capillary vascular malformation of the lower lip, lymphatic malformations of the head and neck, asymmetry and partial or generalized overgrowth (CLAPO) syndrome.^{2,3} The core features are congenital or early-childhood onset of segmental/focal overgrowth, predominantly affecting the brain, limbs (including fingers and toes), trunk (including abdomen and chest), and face, all usually in an asymmetric distribution. PROS-related complications can include hemorrhages; embolisms; vascular or lymphatic anomalies; congenital neurological complications; developmental delays; functional impairments; organ abnormalities, including cardiac and renal; superficial infections; chronic pain; skeletal anomalies; and psychological impact.³ The diagnosis of PROS is often suspected by clinical features of the syndrome and can be confirmed with genetic testing of the *PIK3CA* gene.² Review articles state that management of PROS includes treatment of the manifestations, such as surgery, laser therapy, sclerotherapy, or oral medications such as sirolimus.^{2,3,6}

Clinical Efficacy

The efficacy of Vioice was evaluated in one single-arm pivotal study in patients who were treated as part of an expanded access program for compassionate use.^{1,3} Eligible patients with PROS were ≥ 2 years of age, had severe or life-threatening clinical manifestations of PROS necessitating systemic treatment, and had documented evidence of mutation in the *PIK3CA* gene as determined by a local laboratory. The efficacy of Vioice was evaluated in a total of 37 patients with at least one target lesion identified on imaging. The major efficacy outcome measure for the study was the proportion of patients with radiological response at Week 24, defined as a $\geq 20\%$ reduction from baseline in the sum of measurable target lesion volume (1 to 3 lesions), in the absence of a $\geq 20\%$ increase from baseline in any target lesion, progression of non-target lesions, or appearance of a new lesion. This trial demonstrated that the response rate of Vioice was 27% (10 out of 37 patients) and the proportion of patients with duration of response ≥ 6 months was 70% (60% of patients had duration of response ≥ 12 months).^{1,3} Clinically meaningful improvement in PROS-related signs and symptoms (e.g., pain, fatigue, vascular malformation, limb asymmetry, or disseminated intravascular coagulation) were observed.³

05/15/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vijoice. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vijoice is recommended in those who meet the following criteria:

FDA-Approved Indication

- 4. PIK3CA-Related Overgrowth Spectrum (PROS).** Approve for the duration noted if the patient meets ONE of the following (A or B):

Note: Examples of PROS include congenital lipomatous overgrowth, vascular malformations, epidermal nevi, scoliosis/skeletal and spinal (CLOVES) syndrome; megalencephaly-capillary malformation (MCAP) syndrome; Klippel-Trenaunay syndrome (KTS); facial infiltrating lipomatosis (FIL), dysplastic megalencephaly (DMEG); hemimegalencephaly (HMEG); focal cortical dysplasia (FCD); or capillary vascular malformation of the lower lip, lymphatic malformations of the head and neck, asymmetry and partial or generalized overgrowth (CLAPO) syndrome.

- A) Initial Therapy.** Approve for 6 months if the patient meets ALL of the following (i, ii, iii, and iv):

- i.** Patient is ≥ 2 years of age; AND
- ii.** Patient has at least one severe clinical manifestation of PROS, as determined by the prescriber; AND

Note: Examples of severe clinical manifestations include excessive tissue growth, blood vessel malformations, scoliosis, vascular tumors, cardiac or renal manifestations, and those who require systemic treatment.

- iii.** Patient has a *PIK3CA* mutation as confirmed by genetic testing; AND
- iv.** The medication is being prescribed by or in consultation with a physician that specializes in treatment of genetic disorders.

- B) Patient is Currently Receiving Vijoice.** Approve for 1 year if the patient meets ALL of the following (i, ii and iii):

- i.** Patient has been established on Vijoice for at least 6 months; AND
Note: A patient who has received < 6 months of therapy or who is restarting therapy with Vijoice is reviewed under criterion A (Initial Therapy).
- ii.** Patient has experienced a reduction in volume from baseline (prior to initiating Vijoice) in at least one lesion, as confirmed by measurement; AND
- iii.** Patient has experienced an improvement in at least one sign or symptom of PROS from baseline (prior to initiating Vijoice).

Note: Examples of signs or symptoms of PROS include pain, fatigue, vascular malformation, limb asymmetry, or disseminated intravascular coagulation.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vioice is not recommended in the following situations:

8. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION WITH STEP THERAPY POLICY

POLICY: Wakefulness-Promoting Agents – Armodafinil, Modafinil Prior Authorization with Step Therapy Policy

- Nuvigil® (armodafinil tablets – Cephalon, generic)
- Provigil® (modafinil tablets – Cephalon, generic)

REVIEW DATE: 10/02/2024

OVERVIEW

Armodafinil and modafinil, agents with wake-promoting actions that are similar to sympathomimetic agents (e.g., amphetamine and methylphenidate), are indicated to improve wakefulness in adults with **excessive sleepiness** associated with the following conditions:^{1,2}

- **Narcolepsy.**
- **Obstructive sleep apnea/hypoapnea syndrome** (approved as adjunctive therapy).
- **Shift work sleep disorder.**

Armodafinil and modafinil are Schedule IV controlled substances.^{1,2} Review of the medical literature notes many other uses of modafinil that are considered off-label or investigational. While armodafinil has not been studied off-label to the same extent as modafinil, it is expected that armodafinil will have similar clinical efficacy for these uses. Additionally, in the pivotal trials for shift work sleep disorder, enrolled patients were required to work a minimum of five night shifts per month.

Two specialized tests, which can be performed in a sleep disorders clinic, are required to establish a diagnosis of narcolepsy.³ Polysomnogram (PSG) is an overnight recording of brain and muscle activity, breathing, and eye movements. The multiple sleep latency test assesses daytime sleepiness by measuring how quickly a person falls asleep and whether they enter rapid eye movement (REM) sleep. On the day after PSG, the patient is asked to take five short naps separated by two hours over the course of a day. If an individual falls asleep in < 8 minutes on average over the five naps, this indicates excessive daytime sleepiness. However, patients with narcolepsy also have an abnormally quick start to REM sleep. If REM sleep happens within 15 minutes at least two times out of the five naps and the sleep study the night before, this is likely an abnormality caused by narcolepsy.

Guidelines

Pertinent medical guidelines related to modafinil and armodafinil are summarized below.

Narcolepsy and Cataplexy

The American Academy of Sleep Medicine (AASM) practice parameters for the treatment of central disorders of hypersomnolence were updated in 2021.^{4,5}

- Modafinil, Wakix® (pitolisant tablets), Xyrem® (sodium oxybate oral solution), and Sunosi™ (solriamfetol tablets) are recommended as effective treatments for daytime sleepiness due to narcolepsy and reducing disease severity in adults (Strong Recommendation for each).
- Wakix and Xyrem have also demonstrated efficacy for the treatment of cataplexy in patients with narcolepsy (Strong Recommendation for each).
- Xyrem and armodafinil have Conditional Recommendations for the treatment of narcolepsy, showing efficacy for daytime sleepiness due to narcolepsy and reducing disease severity.
- Dextroamphetamine has a Conditional Recommendation for the treatment of narcolepsy, showing efficacy for excessive daytime sleepiness and cataplexy.

10/02/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- Methylphenidate has a Conditional Recommendation for the treatment of narcolepsy, showing efficacy in reducing disease severity.
- There was insufficient and inconclusive evidence to make recommendations for l-carnitine, scheduled naps, selegiline, triazolam, selective serotonin reuptake inhibitors (SSRIs), and serotonin-norepinephrine reuptake inhibitors (SNRIs).
- Modafinil and Xyrem have Conditional Recommendations for the treatment of narcolepsy in pediatric patients.
- A Strong Recommendation should be followed by clinicians under most circumstances. A Conditional Recommendation requires that the clinician use clinical knowledge and experience and strongly consider the individual patient's values and preferences to determine the best course of action.

Excessive Daytime Sleepiness Associated with Obstructive Sleep Apnea/Hypoapnea Syndrome

- According to the AASM guideline on medical therapy for obstructive sleep apnea (OSA) [2006], continuous positive airway pressure (CPAP) is the most uniformly effective therapy, and, to date, this is the only intervention for OSA shown to have favorable impacts on both cardiovascular and neurobehavioral morbidities.⁶
- Modafinil, in patients compliant with nasal CPAP, consistently improved subjective and objective sleepiness, quality of life, and vigilance compared with placebo.

Adjunctive/Augmentation Treatment for Major Depressive Disorder

- According to the American Psychiatric Association (APA) practice guideline for the treatment of patients with major depressive disorder (2010), modafinil (or methylphenidate) are potential treatments for sedation associated with antidepressant medications.⁷
- The APA guidelines state that modafinil has shown benefit when combined with an SSRI, related to specific effects on residual symptoms such as fatigue and hypersomnolence.
- The guidelines note that there is no clear guidance regarding the length of time modafinil should be co-administered.
- While armodafinil has not been studied for this use, it is considered to be interchangeable with modafinil for this condition.

Excessive Daytime Sleepiness Associated with Myotonic Dystrophy

- Practice parameters from the AASM, last updated in 2021, suggest that clinicians use modafinil for the treatment of hypersomnia secondary to myotonic dystrophy in adults (Conditional Recommendation).^{4,5}
- While armodafinil has not been studied for this use, it is considered to be interchangeable with modafinil for this condition.

Excessive Daytime Sleepiness Associated with Parkinson's Disease

- Practice parameters from the AASM (2021) suggest that clinicians use modafinil for the treatment of hypersomnia secondary to Parkinson's disease in adults (Conditional Recommendation).^{4,5}
- While armodafinil has not been studied for this use, it is considered to be interchangeable with modafinil for this condition.

Fatigue Associated with Multiple Sclerosis

- Practice parameters from the AASM (2021) suggest that clinicians use modafinil for the treatment of hypersomnia secondary to multiple sclerosis in adults (Conditional Recommendation).^{4,5}
- While armodafinil has not been studied for this use, expert opinion considers it to be interchangeable with modafinil for this condition.

Idiopathic Hypersomnia

Idiopathic hypersomnia, a condition similar to narcolepsy, is characterized by constant or recurrent daytime sleepiness with no other cause of sleepiness, prolonged nocturnal sleep, difficulty awakening with sleep drunkenness, and long unrefreshing naps with no cataplexy.⁸⁻¹⁰ The AASM practice parameters for the treatment of central disorders of hypersomnolence (2021) include recommendations for the treatment of idiopathic hypersomnia.^{4,5}

- Only modafinil has a Strong Recommendation for use.
- Clarithromycin, methylphenidate, Wakix, and Xyrem have Conditional Recommendations for the treatment of idiopathic hypersomnia in adults.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of modafinil (brand and generic) and armodafinil (brand and generic). This Prior Authorization Policy also contains a Step Therapy component. When clinically appropriate, the patient is directed to try one Step 1 Product (generic modafinil or generic armodafinil) prior to brand Nuvigil or brand Provigil (Step 2). All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of modafinil (brand and generic) and armodafinil (brand and generic) is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1. Excessive Daytime Sleepiness Associated with Narcolepsy.** Approve for 1 year if the patient meets the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has been evaluated using polysomnography and a multiple sleep latency test; AND
 - C) Diagnosis of narcolepsy has been confirmed, according to the prescriber; AND
 - D) The medication is prescribed by or in consultation with a sleep specialist physician or a neurologist; AND
 - E) If brand Provigil or Nuvigil is being requested, the patient meets BOTH of the following (i and ii):
 - iii. Patient has tried generic modafinil or generic armodafinil; AND
 - iv. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.
- 2. Excessive Daytime Sleepiness Associated with Obstructive Sleep Apnea/Hypoapnea Syndrome.** Approve for 1 year if the patient meets the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. Armodafinil/modafinil will be used in conjunction with continuous positive airway pressure therapy; OR
 - ii. Patient is unable to initiate or tolerate continuous positive airway pressure therapy; AND
 - C) If brand Provigil or Nuvigil is being requested, the patient meets BOTH of the following (i and ii):
 - i. Patient has tried generic modafinil or generic armodafinil; AND

- ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.
- 3. **Excessive Sleepiness Associated with Shift Work Sleep Disorder.** Approve for 1 year if the patient meets the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient works at least five overnight shifts per month; AND
 - C) If brand Provigil or Nuvigil is being requested, the patient meets BOTH of the following (i and ii):
 - i. Patient has tried generic modafinil or generic armodafinil; AND
 - ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

Other Uses with Supportive Evidence

- 4. **Adjunctive/Augmentation Treatment for Depression in Adults.** Approve for 1 year if the patient meets the following (A, B, and C):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient is concurrently receiving other medication therapy for depression; AND
Note: Examples of other medications for the treatment of depression include selective serotonin reuptake inhibitors (SSRIs) and serotonin norepinephrine reuptake inhibitors (SNRIs).
 - C) If brand Provigil or Nuvigil is being requested, the patient meets BOTH of the following (i and ii):
 - i. Patient has tried generic modafinil or generic armodafinil; AND
 - ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.
- 5. **Excessive Daytime Sleepiness Associated with Myotonic Dystrophy.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) If brand Provigil or Nuvigil is being requested, the patient meets BOTH of the following (i and ii):
 - i. Patient has tried generic modafinil or generic armodafinil; AND
 - ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.
- 6. **Excessive Daytime Sleepiness Associated with Parkinson's Disease.** Approve for 1 year if the patient meets BOTH of the following (A and B):
 - A) Patient is ≥ 18 years of age; AND
 - B) If brand Provigil or Nuvigil is being requested, the patient meets BOTH of the following (i and ii):
 - i. Patient has tried generic modafinil or generic armodafinil; AND
 - ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the

corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

7. **Fatigue Associated with Multiple Sclerosis.** Approve for 1 year if the patient meets BOTH of the following (A and B):
- A) Patient is ≥ 18 years of age; AND
 - B) If brand Provigil or Nuvigil is being requested, the patient meets BOTH of the following (i and ii):
 - i. Patient has tried generic modafinil or generic armodafinil; AND
 - ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.
8. **Idiopathic Hypersomnia.** Approve for 1 year if the patient meets the following (A, B, and C):
- A) Patient is ≥ 18 years of age; AND
 - B) The diagnosis is confirmed by a sleep specialist physician or at an institution that specializes in sleep disorders (i.e., sleep center); AND
 - C) If brand Provigil or Nuvigil is being requested, the patient meets BOTH of the following (i and ii):
 - 1. Patient has tried generic modafinil or generic armodafinil; AND
 - 2. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of modafinil (brand and generic) and armodafinil (brand and generic) is not recommended in the following situations:

5. **Attention Deficit Hyperactivity Disorder (ADHD).** The American Academy of Pediatrics clinical practice guidelines for the treatment of ADHD in children and adolescents (2011 and 2019) do not address the use of modafinil/armodafinil.^{11,12} These guidelines note that with the greater availability of approved medications for children/adolescents with ADHD, it has become increasingly unlikely that clinicians need to consider the off-label use of other medications. Many options exist for the treatment of ADHD in adults (e.g., methylphenidate, dextroamphetamine) and further large scale trials that demonstrate benefit for modafinil in adults with ADHD are needed.
6. **Bipolar Disorder, including Bipolar Depression.** Limited data (one small study [n = 85] and case reports [n = 2]) are available that describe the use of modafinil for bipolar disorder and bipolar depression.¹³⁻¹⁵ In one study (n = 257), armodafinil was not more effective than placebo in treating bipolar depression.¹⁶ Only limited data support modafinil for this condition and more data are needed.
7. **Cancer-Related Fatigue.** The National Comprehensive Cancer Network guidelines on cancer-related fatigue (version 2.2024 – October 30, 2023) no longer consider modafinil or armodafinil to be effective for the treatment of cancer-related fatigue and recommend against its use.¹⁷
8. **Chronic Fatigue Syndrome.** Limited data characterize modafinil therapy in those with chronic fatigue syndrome.¹⁸ In a randomized, double-blind, crossover study in 14 patients with chronic fatigue

syndrome, use of modafinil for 20 days had minimal effects on cognitive function and no significant effects on fatigue, health-related quality of life, or mood.¹⁹ More data are required to assess efficacy in this patient population.

9. **Excessive Daytime Sleepiness Associated with Primary Insomnia.** One randomized, placebo-controlled study found that neither combination therapy with modafinil and cognitive behavioral therapy nor modafinil as monotherapy significantly decreased daytime sleepiness associated with primary insomnia.²⁰
10. **Enhancement of Performance in Situations of Induced Sleep Deprivation.** Studies are needed to define the role/appropriateness of modafinil in these situations for the general population (as opposed to military personnel, etc.). Studies have shown that modafinil may enhance performance and sustain alertness in individuals subjected to situations that deprive sleep (e.g., military aviation, emergency physicians).²¹⁻²⁴ Further studies are needed before its use in the general population in these types of situations can be promoted.
11. **Fibromyalgia.** Limited data are available regarding the use of modafinil in fibromyalgia with most of the data being observational.²⁵⁻²⁷ Larger-sized, randomized, placebo-controlled trials are required to better assess and validate the efficacy of modafinil in patients with fibromyalgia before it can be recommended as a therapeutic modality.
12. **Hypersomnia, Fatigue or Sleepiness Due to Other Conditions (not Idiopathic Hypersomnia, see Other Uses with Supportive Evidence).** More data are needed in specific conditions to define the role of modafinil and armodafinil.
13. **Post-Stroke Sleep-Wake Disorders or Sleep Disorders.** Sleep-wake disorders occur in approximately 20% to 40% of patients who have experienced a stroke, which includes hypersomnia and excessive daytime sleepiness. Very limited data (i.e., case reports and one small study) have explored the use of modafinil in these patients to improve alertness.^{28,29} More data are needed to determine effectiveness in this condition.
14. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION WITH STEP THERAPY POLICY

POLICY: Wakefulness-Promoting Agents – Sunosi Prior Authorization with Step Therapy Policy

- Sunosi® (solriamfetol tablets – Jazz)

REVIEW DATE: 09/04/2024

OVERVIEW

Sunosi, a dopamine and norepinephrine reuptake inhibitor, is indicated to improve wakefulness in adults with **excessive daytime sleepiness** associated with the following conditions:¹

- **Narcolepsy.**
- **Obstructive sleep apnea (OSA).**

Limitations of Use: Sunosi is not indicated to treat the underlying airway obstruction in OSA.¹ The underlying airway obstruction should be treated (e.g., with continuous positive airway pressure [CPAP]) for at least 1 month prior to initiating Sunosi for excessive daytime sleepiness. Modalities to treat the underlying airway obstruction should be continued during treatment with Sunosi.

Sunosi is a Schedule IV controlled substance.¹

Armodafinil and modafinil are wakefulness-promoting agents with actions similar to sympathomimetic agents (e.g., amphetamine and methylphenidate).^{2,3} They are indicated to improve wakefulness in adults with excessive sleepiness associated with narcolepsy, OSA, or shift work disorder. Armodafinil and modafinil are Schedule IV controlled substances. Wakix® (pitolisant tablets), an antagonist/inverse agonist of the histamine-3 receptor, is indicated for the treatment of excessive daytime sleepiness or cataplexy in adult patients with narcolepsy and for the treatment of excessive daytime sleepiness in pediatric patients ≥ 6 years of age with narcolepsy.¹³ Wakix is the only wakefulness-promoting agent that is not a controlled substance. Stimulant medications (e.g., amphetamine, methamphetamine, dextroamphetamine, and methylphenidate) are used off-label for the treatment of daytime sleepiness due to narcolepsy and OSA and are mentioned in guidelines.⁴⁻⁷

Two specialized tests, which can be performed in a sleep disorders clinic, are required to establish a diagnosis of narcolepsy.⁸ Polysomnogram (PSG) is an overnight recording of brain and muscle activity, breathing, and eye movements. The multiple sleep latency test assesses daytime sleepiness by measuring how quickly a person falls asleep and whether they enter rapid eye movement (REM) sleep. On the day after PSG, the patient is asked to take five short naps separated by two hours over the course of a day. If an individual falls asleep in < 8 minutes on average over the five naps, this indicates excessive daytime sleepiness. However, patients with narcolepsy also have an abnormally quick start to REM sleep. If REM sleep happens within 15 minutes at least two times out of the five naps and the sleep study the night before, this is likely an abnormality caused by narcolepsy.

Guidelines

Narcolepsy and Cataplexy

The American Academy of Sleep Medicine (AASM) practice parameters for the treatment of central disorders of hypersomnolence were updated in 2021.^{4,5}

- Modafinil, Wakix (pitolisant tablet), Xyrem® (sodium oxybate oral solution), and Sunosi are recommended as effective treatments for daytime sleepiness due to narcolepsy and reducing disease severity in adults (Strong Recommendation for each).

09/04/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- Wakix and Xyrem have also demonstrated efficacy for the treatment of cataplexy in patients with narcolepsy (Strong Recommendation for each).
- Xyrem and armodafinil have Conditional Recommendations for the treatment of narcolepsy, showing efficacy for daytime sleepiness due to narcolepsy and reducing disease severity.
- Dextroamphetamine has a Conditional Recommendation for the treatment of narcolepsy, showing efficacy for excessive daytime sleepiness and cataplexy.
- Methylphenidate has a Conditional Recommendation for the treatment of narcolepsy, showing efficacy in reducing disease severity.
- There was insufficient and inconclusive evidence to make recommendations for l-carnitine, scheduled naps, selegiline, triazolam, selective serotonin reuptake inhibitors (SSRIs), and serotonin-norepinephrine reuptake inhibitors (SNRIs).
- Modafinil and Xyrem have Conditional Recommendations for the treatment of narcolepsy in pediatric patients.
- A Strong Recommendation should be followed by clinicians under most circumstances. A Conditional Recommendation requires that the clinician use clinical knowledge and experience and strongly consider the individual patient's values and preferences to determine the best course of action.

Excessive Daytime Sleepiness Associated with Obstructive Sleep Apnea/Hypoapnea Syndrome

- According to the AASM guideline on medical therapy for OSA (2006), CPAP is the most uniformly effective therapy, and, to date, this is the only intervention for OSA shown to have favorable impacts on both cardiovascular and neurobehavioral morbidities.^{6,7}
- Modafinil, in patients compliant with nasal CPAP, consistently improved subjective and objective sleepiness, quality of life, and vigilance compared with placebo.
- Sunosi is not addressed in these guidelines.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Sunosi. This Prior Authorization Policy also contains a Step Therapy component. When clinically appropriate, the patient is directed to try one Step 1 Product (modafinil or armodafinil) prior to Sunosi (Step 2). All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sunosi is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 22. Excessive Daytime Sleepiness Associated with Narcolepsy.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- A) Patient is ≥ 18 years of age; AND
 - B) Patient has been evaluated using polysomnography and a multiple sleep latency test; AND
 - C) Diagnosis of narcolepsy has been confirmed, according to the prescriber; AND
 - D) The medication is prescribed by or in consultation with a sleep specialist physician or a neurologist; AND
 - E) Patient has tried at least ONE of the following treatments: a central nervous system (CNS) stimulant, generic modafinil, or generic armodafinil.

09/04/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Note: Examples of CNS stimulants include methylphenidate, dexamethylphenidate, and dextroamphetamine. An exception to this requirement is allowed if the patient has previously tried brand Provigil or brand Nuvigil.

2. **Excessive Daytime Sleepiness Associated with Obstructive Sleep Apnea.** Approve for 1 year if the patient meets the following (A, B, and C):
- D) Patient is ≥ 18 years of age; AND
 - E) Patient meets one of the following (i or ii):
 - i. Sunosi will be used in conjunction with continuous positive airway pressure (CPAP) therapy; OR
 - ii. Patient is unable to initiate or tolerate CPAP therapy; AND
 - F) Patient has tried generic modafinil or generic armodafinil.
- Note: An exception to this requirement is allowed if the patient has previously tried brand Provigil or brand Nuvigil.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sunosi is not recommended in the following situations:

183. **Concomitant Use of Sunosi with an Oxybate Product and/or Wakix (pitolisant tablets).** Sunosi, a dopamine and norepinephrine reuptake inhibitor, is indicated to improve wakefulness in adults with excessive daytime sleepiness due to narcolepsy or obstructive sleep apnea.¹ Oxybate products include Xyrem (sodium oxybate oral solution), Lumryz (sodium oxybate extended-release oral suspension), and Xywav (calcium, magnesium, potassium, and sodium oxybates oral solution).¹⁰⁻¹² These have the same active ingredient (oxybate, a central nervous system depressant) and have not been studied for use in combination or as alternating treatments. Wakix, an antagonist/inverse agonist of the histamine-3 receptor, is indicated for excessive daytime sleepiness and cataplexy in adults with narcolepsy.¹³ Currently, there are no published studies evaluating combination use of these medications.
184. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION WITH STEP THERAPY POLICY

POLICY: Wakefulness-Promoting Agents – Wakix Prior Authorization with Step Therapy Policy

- Wakix® (pitolisant tablets – Harmony)

REVIEW DATE: 07/03/2024; selected revision 09/04/2024 and 11/20/2024

OVERVIEW

Wakix, an antagonist/inverse agonist of the histamine-3 receptor, is indicated for the following uses:¹

- **Excessive daytime sleepiness in adults and pediatric patients ≥ 6 years of age with narcolepsy.**
- **Cataplexy in adults with narcolepsy.**

Wakix is the only wakefulness-promoting agent that is not a controlled substance.¹⁻⁴

Armodafinil and modafinil are wakefulness-promoting agents with actions similar to sympathomimetic agents (e.g., amphetamine and methylphenidate).^{2,3} They are indicated to improve wakefulness in adults with excessive sleepiness associated with narcolepsy, obstructive sleep apnea (OSA), or shift work disorder. Sunosi® (solriamfetol tablets), a dopamine and norepinephrine reuptake inhibitor, is indicated to improve wakefulness in adults with excessive daytime sleepiness associated with narcolepsy or OSA.⁴ Armodafinil, modafinil, and Sunosi are Schedule IV controlled substances.²⁻⁴ Armodafinil, modafinil, and Sunosi are not indicated for the treatment of cataplexy.

Two specialized tests, which can be performed in a sleep disorders clinic, are required to establish a diagnosis of narcolepsy.⁷ Polysomnogram is an overnight recording of brain and muscle activity, breathing, and eye movements. The multiple sleep latency test assesses daytime sleepiness by measuring how quickly a person falls asleep and whether they enter rapid eye movement (REM) sleep. On the day after polysomnogram, the patient is asked to take five short naps separated by two hours over the course of a day. If an individual falls asleep in < 8 minutes on average over the five naps, this indicates excessive daytime sleepiness. However, patients with narcolepsy also have an abnormally quick start to REM sleep. If REM sleep happens within 15 minutes at least two times out of the five naps and the sleep study the night before, this is likely an abnormality caused by narcolepsy.

Guidelines

Narcolepsy and Cataplexy

The American Academy of Sleep Medicine (AASM) practice parameters for the treatment of central disorders of hypersomnolence were updated in 2021.^{5,6}

- Modafinil, Wakix, Xyrem® (sodium oxybate oral solution), and Sunosi are recommended as effective treatments for daytime sleepiness due to narcolepsy and reducing disease severity in adults (Strong Recommendation for each).
- Wakix and Xyrem have also demonstrated efficacy for the treatment of cataplexy in patients with narcolepsy (Strong Recommendation for each).
- Xyrem and armodafinil have Conditional Recommendations for the treatment of narcolepsy, showing efficacy for daytime sleepiness due to narcolepsy and reducing disease severity.
- Dextroamphetamine has a Conditional Recommendation for the treatment of narcolepsy, showing efficacy for excessive daytime sleepiness and cataplexy.
- Methylphenidate has a Conditional Recommendation for the treatment of narcolepsy, showing efficacy in reducing disease severity.

07/03/2024

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- There was insufficient and inconclusive evidence to make recommendations for l-carnitine, scheduled naps, selegiline, triazolam, selective serotonin reuptake inhibitors, and serotonin-norepinephrine reuptake inhibitors.
- Modafinil and Xyrem have Conditional Recommendations for the treatment of narcolepsy in pediatric patients.
- A Strong Recommendation should be followed by clinicians under most circumstances. A Conditional Recommendation requires that the clinician use clinical knowledge and experience and strongly consider the individual patient's values and preferences to determine the best course of action.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Wakix. This Prior Authorization Policy also contains a Step Therapy component. When clinically appropriate, the patient is directed to try one Step 1 Product (dextroamphetamine for cataplexy in narcolepsy; modafinil or armodafinil for excessive daytime sleepiness in narcolepsy) prior to Wakix (Step 2). All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Wakix is recommended in those who meet one of the following criteria:

FDA-Approved Indications

- 1. Cataplexy Treatment in a Patient with Narcolepsy.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient has been evaluated using polysomnography and a multiple sleep latency test; AND
 - C) Diagnosis of narcolepsy has been confirmed, according to the prescriber; AND
 - D) The medication is prescribed by or in consultation with a sleep specialist physician or a neurologist; AND
 - E) Patient meets ONE of the following (i or ii):
 1. Patient has tried dextroamphetamine; OR
 2. Patient has a contraindication or intolerance to dextroamphetamine, according to the prescriber.
Note: Contraindications to dextroamphetamine include a history of substance use disorder; advanced arteriosclerosis, symptomatic cardiovascular disease, and/or moderate to severe hypertension; hyperthyroidism; known hypersensitivity to sympathomimetic amines; glaucoma; agitated states; concomitant administration with monoamine oxidase inhibitors (MAOIs), or within 14 days of stopping MAOIs.
- 2. Excessive Daytime Sleepiness Associated with Narcolepsy.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
 - A) Patient is ≥ 6 years of age; AND
 - B) Patient has been evaluated using polysomnography and a multiple sleep latency test; AND
 - C) Diagnosis of narcolepsy has been confirmed, according to the prescriber; AND
 - D) The medication is prescribed by or in consultation with a sleep specialist physician or a neurologist; AND
 - E) Patient meets ONE of the following (i or ii):

07/03/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

- i. Patient has tried at least ONE of the following treatments: a central nervous system (CNS) stimulant, generic modafinil, or generic armodafinil; OR
Note: Examples of CNS stimulants include methylphenidate, dexamethylphenidate, and dextroamphetamine. An exception to this requirement is allowed if the patient has previously tried brand Provigil or brand Nuvigil.
- ii. Patient has a of substance use disorder and a wakefulness-promoting agent that is not a controlled substance is necessary, per the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Wakix is not recommended in the following situations:

185. Concomitant Use of Wakix with an Oxybate Product and/or Sunosi (solriamfetol tablets).

Wakix, an antagonist/inverse agonist of the histamine-3 receptor, is indicated for excessive daytime sleepiness and cataplexy in adults with narcolepsy.¹ Oxybate products include Xyrem (sodium oxybate oral solution), Lumryz (sodium oxybate extended-release oral suspension), and Xywav (calcium, magnesium, potassium, and sodium oxybates oral solution).⁸⁻¹⁰ These products have the same active ingredient (oxybate, a central nervous system depressant) and have not been studied for use in combination or as alternating treatments. Sunosi, a dopamine and norepinephrine reuptake inhibitor, is indicated to improve wakefulness in adults with excessive daytime sleepiness due to narcolepsy or obstructive sleep apnea.² Currently, there are no published studies evaluating combination use of these medications.

186. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Weight Loss – Glucagon-Like Peptide-1 Agonists Prior Authorization Policy
- Saxenda® (liraglutide subcutaneous injection – Novo Nordisk)
 - Wegovy® (semaglutide subcutaneous injection – Novo Nordisk)
 - Zepbound® (tirzepatide subcutaneous injection – Eli Lilly)

REVIEW DATE: 07/17/2024; selected revision 01/08/2025

OVERVIEW

Saxenda, Wegovy, and Zepbound are glucagon-like peptide-1 (GLP-1) receptor agonists; Zepbound is also a glucose-dependent insulintropic polypeptide (GIP) receptor agonist.^{1,2,9}

Saxenda is indicated as an adjunct to a reduced-calorie diet and increased physical activity for **chronic weight management** in the following settings:²

- Adults with an initial body mass index (BMI) ≥ 30 kg/m² (obese), or ≥ 27 kg/m² (overweight) in the presence of at least one weight-related comorbid condition (e.g., hypertension^{2,9}, dyslipidemia^{2,9}, type 2 diabetes^{2,9}, obstructive sleep apnea⁹, or cardiovascular disease⁹).
- Pediatric patients ≥ 12 years of age with body weight > 60 kg and an initial BMI corresponding to 30 kg/m² for adults (obese) by international cutoffs.²

Wegovy and Zepbound are indicated in combination with a reduced-calorie diet and increased physical activity:^{1,9}

- To **reduce excess body weight and maintain weight reduction long term** in:
 - **Wegovy and Zepbound:** Adults with overweight in the presence of at least one weight-related comorbid condition.^{1,9,11}
 - **Wegovy and Zepbound:** Adults with obesity.^{1,9}
 - **Wegovy:** Pediatric patients ≥ 12 years of age with obesity.^{1,12}

Wegovy is indicated in combination with a reduced-calorie diet and increased physical activity:¹

- To **reduce the risk of major adverse cardiovascular (CV) events (MACE)** [CV death, non-fatal myocardial infarction, or non-fatal stroke] in adults with established CV disease and either obesity or overweight.^{1,10}

Zepbound is indicated in combination with a reduced-calorie diet and increased physical activity:⁹

- To treat **moderate to severe obstructive sleep apnea (OSA)** in adults with obesity.

Dosing

In the prescribing information for Wegovy, a recommended dose escalation schedule of 16 weeks is outlined.¹ If a patient does not tolerate a dose during dose escalation, consider delaying dose escalation for 4 weeks. In adults, the maintenance dose of Wegovy is 2.4 mg (recommended) or 1.7 mg injected subcutaneously once weekly (QW); consider treatment response and tolerability when selecting the maintenance dose. In pediatric patients, the maintenance dose of Wegovy is 2.4 mg; if a pediatric patient ≥ 12 to < 18 years of age does not tolerate the maintenance dose of 2.4 mg QW, the dose can be reduced to 1.7 mg QW. Discontinue Wegovy if the patient cannot tolerate the 1.7 mg dose. The 0.25 mg, 0.5 mg, and 1 mg QW doses are initiation and escalation doses; they are not approved doses for chronic weight management.

07/17/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

In the prescribing information for Saxenda, a recommended dose escalation schedule of 4 weeks is outlined.² If a patient does not tolerate an increased dose during dose escalation, consider delaying dose escalation for approximately one additional week. For adults, the recommended maintenance dose of Saxenda is 3 mg once daily; discontinue Saxenda if the patient cannot tolerate the 3 mg dose. Additionally, for adults, the prescribing information states to evaluate the change in body weight 16 weeks after initiating Saxenda and discontinue Saxenda if the patient has not lost $\geq 4\%$ of baseline body weight, since it is unlikely the patient will achieve and sustain clinically meaningful weight loss with continued treatment.

In the prescribing information for Zepbound, the recommended starting dose is 2.5 mg injected subcutaneously QW.⁹ The 2.5 mg dose is for treatment initiation and is not intended for chronic weight management. After 4 weeks, the dose can be increased to 5 mg subcutaneously QW. The dose can then be increased in 2.5 mg increments, after at least 4 weeks on the current dose. The recommended maintenance doses for weight reduction and long-term maintenance are 5 mg, 10 mg, or 15 mg subcutaneously QW. The recommended maintenance dose in OSA is 10 mg or 15 mg subcutaneously QW. The treatment response and tolerability should be considered when selecting the maintenance dose. If a patient does not tolerate a maintenance dose, consider a lower maintenance dose. The maximum dose is 15 mg subcutaneously QW. The 5 mg, 10 mg, and 15 mg maintenance doses are reached after Week 4, Week 12, and Week 20, respectively.

None of the GLP-1 or GLP-1/GIP agonists are recommended for coadministration with other GLP-1 or GLP-1/GIP agonists.^{1,2,9}

Clinical Efficacy

Secondary Prevention of MACE

SELECT was a randomized, double-blind, placebo-controlled, event-driven study that assessed Wegovy (2.4 mg QW) vs. placebo, when added to standard of care, for the secondary prevention of CV events in adults ≥ 45 years of age with BMI ≥ 27 kg/m² and established CV disease without diabetes (n = 17,604).¹⁰ Established CV disease was defined as one of the following: prior myocardial infarction, prior stroke (ischemic or hemorrhagic), and/or symptomatic peripheral arterial disease (as evidenced by intermittent claudication with ankle-brachial index < 0.85 , peripheral arterial revascularization procedure, or amputation due to atherosclerotic disease). Patients who developed diabetes during the study remained in the study and received treatment (excluding use of another GLP-1 agonist). Wegovy was titrated to reach the 2.4 mg maintenance dose over 16 weeks. However, if dose escalation led to unacceptable effects, the dose escalation intervals could be extended, treatment could be paused, or maintenance doses < 2.4 mg QW could be used. Most patients were male (72%) and White (84%). The mean weight was 97 kg. The mean BMI was 33.3 kg/m²; 28.5% of patients had a BMI of 27 to < 30 kg/m², 42.5% of patients had a BMI of 30 to < 35 kg/m², 19% of patients had a BMI of 35 to < 40 kg/m², 7% of patients had a BMI of 40 kg/m² to < 45 kg/m², and just over 3% of patients had a BMI ≥ 45 kg/m². Very few patients ($< 0.1\%$) were treated with weight-lowering pharmacotherapy at baseline (further detail is not available; however, concomitant GLP-1 agonist use was not allowed).¹¹ The mean hemoglobin A_{1c} (HbA_{1c}) was just over 5.7%; 67% of patients had an HbA_{1c} $\geq 5.7\%$ (pre-diabetes). The most common prior CV event was myocardial infarction (68% of patients), followed by stroke (18%), and 4.5% of patients had symptomatic peripheral arterial disease; 8% of patients had two or more of these conditions. At baseline, 91.8% of patients were receiving CV risk-lowering pharmacotherapy, 90% of patients were receiving lipid-lowering agents (87.3% of patients were taking statins, 13.0% of patients were taking ezetimibe, 2.7% of patients were taking fibrates, and 2.0% of patients were taking proprotein convertase subtilisin/kexin type 9 inhibitors), 86.2% of patients were receiving platelet aggregation inhibitors, and 12.6% of patients were receiving antithrombotic medications.^{10,11} In addition, 70.2% of patients were taking beta-blockers, 45.0% of patients were taking angiotensin converting enzyme inhibitors, and 29.5% of patients were taking angiotensin receptor blockers.¹¹ The primary efficacy endpoint was a composite of death from CV causes, non-fatal MI, or non-

fatal stroke.¹⁰ Confirmatory secondary endpoints, assessed in a time-to-first-event analysis and tested in hierarchical order were: death from CV causes, a composite heart failure endpoint (death from CV causes or hospitalization for heart failure [HHF] or an urgent medical visit for heart failure), and death from any cause. A gatekeeping approach was used with statistical significance at each step required in order to test the next hypothesis.

Results. Patients were followed for a mean of 39.8 months.¹⁰ At Week 104, approximately 77% of patients receiving Wegovy were taking the target 2.4 mg QW dose (details on the exact proportions of patients on other Wegovy doses are not available; efficacy results are only provided for the 2.4 mg dose). The trial achieved its primary endpoint, demonstrating a statistically significant and superior reduction in MACE for Wegovy vs. placebo. A primary endpoint event occurred in 6.5% vs. 8.0% of patients in the Wegovy vs. placebo groups, respectively (hazard ratio [HR] 0.80; 95% CI: 0.72, 0.90; $P < 0.001$). Death from CV events, the first confirmatory secondary endpoint, occurred in 2.5% vs. 3.0% of Wegovy- vs. placebo-treated patients, respectively (HR 0.85; 95% CI: 0.71, 1.01; $P =$ not significant for superiority). Because the difference between groups for death from CV events did not meet the required P -value for superiority, testing was not performed for the remaining confirmatory and secondary endpoints. The mean change in body weight at Week 104 was -9.39% vs. -0.88% with Wegovy and placebo, respectively (estimated treatment difference -8.51%; 95% CI: -8.75%, -8.27%; no P -value provided).⁷ Among patients with prediabetes at baseline ($HbA_{1c} \geq 5.7\%$), the odds of achieving a normal HbA_{1c} level ($< 5.7\%$) by Week 104 were greater with Wegovy vs. placebo (65.7% [$n = 3,775/5,750$] vs. 21.4% [$n = 1,211/5,663$] of patients, respectively, achieved a normal HbA_{1c} ; odds ratio 8.74; 95% CI: 7.91, 9.65; no P -value provided). Other secondary endpoints generally favored Wegovy at Week 104 (e.g., waist circumference, blood pressure, lipids).

OSA

The SURMOUNT-OSA ($n = 469$) [published] trials were two 52-week, Phase III, multicenter, double-blind, randomized trials that evaluated the efficacy and safety of maximally tolerated Zepbound (10 mg or 15 mg QW) in adults with obesity (without diabetes) and moderate to severe OSA.¹⁴ **Inclusion/exclusion.** Two patient populations were included. In Trial 1, patients were unable or unwilling to use positive airway pressure (PAP) therapy, and in Trial 2, patients had been using PAP therapy for ≥ 3 months at the time of screening and planned to continue PAP therapy during the trial. All patients had a diagnosis of moderate to severe OSA with an apnea-hypopnea index (AHI) ≥ 15 events/hour as diagnosed with polysomnography, home sleep apnea test, or other method that met local guidelines prior to Visit 1. Patients had a BMI of ≥ 30 kg/m² (≥ 27 kg/m² in Japan) despite the history of at least one self-reported unsuccessful dietary effort to lose weight. Key exclusion criteria were the presence of type 1 or type 2 diabetes ($HbA_{1c} \geq 6.5\%$ at Visit 1), change in weight of > 5 kg in the past 3 months, planned surgery for sleep apnea or obesity, diagnosis of central or mixed sleep apnea with the percentage of mixed or central apneas/hypopneas $\geq 50\%$, or diagnosis of Cheyne Stokes respiration, diagnosis of obesity hypoventilation syndrome or daytime hypocapnia, active device treatment of OSA other than PAP therapy (e.g., dental appliance), and major craniofacial abnormalities that may affect breathing. In addition, use of medications (prescribed or over-the-counter) or alternative remedies to promote weight loss in the past 3 months were not allowed, this included other GLP-1 agonists. Of note, although patients with diabetes at baseline were excluded, if a patient developed diabetes while in the study, the patient was referred to their usual care provider. The decision to further evaluate, to initiate antihyperglycemic therapy, and the choice of antihyperglycemic medication was at the discretion of the provider.

Study design. Following a 4-week screening period, patients were assigned to Trial 1 or Trial 2 and randomly assigned to receive Zepbound or placebo SC QW.¹⁴ All patients received regular lifestyle counseling sessions focused on the maintenance of healthy nutrition, adherence to a 500 calorie/day deficit, and ≥ 150 minutes per week of physical activity. The dose of Zepbound was escalated over a period of up

to 20 weeks starting at 2.5 mg SC QW and increased by 2.5 mg every 4 weeks during the dose-escalation period until the patient reached the maximum tolerated dose of 10 mg or 15 mg SC QW at Week 20. Dose modification was permitted for the management of intolerable GI symptoms. Patients who did not tolerate ≥ 10 mg even after one de-escalation and re-escalation attempt, were discontinued from the study intervention but remained in the study for continued follow-up. During the first 24 weeks of the treatment period (20-week dose escalation plus 4 weeks), participants unable to tolerate 2.5 mg or 5 mg were discontinued from the study intervention but remained in the study. For patients unable to tolerate any dose escalation between 7.5 mg and 15 mg (inclusive), a dose de-escalation step with subsequent re-escalation by 2.5 mg every 4 weeks up to the maximum tolerated dose was allowed in a blinded fashion, to reach either the 10 mg or 15 mg dose. Only one cycle of dose de-escalation and re-escalation was permitted during the first 24 weeks of the treatment period. The 10 mg maintenance dose was used in patients who tolerated 10 mg, but not 12.5 mg or 15 mg even following one de-escalation and re-escalation attempt. In addition, patients who tolerated 12.5 mg, but not 15 mg even after one de-escalation and re-escalation attempt, continued 10 mg as their maximum tolerated dose. Patients who tolerated 15 mg continued 15 mg as their maximum tolerated dose. **Endpoints.** The primary endpoint was the superiority of Zepbound vs. placebo for the change in the AHI from baseline. Several key secondary endpoints were assessed including the proportion of patients with an AHI reduction of $\geq 50\%$, the proportion of patients with an AHI of < 5 events/hour or with an AHI of 5 to 14 events/hour and a score of ≤ 10 on the Epworth Sleepiness Scale (ESS; scores range from 0 to 24 with higher scores indicating greater daytime sleepiness), percent change in body weight, change in high-sensitivity C-reactive protein (hsCRP), change in sleep apnea specific hypoxic burden, changes in patient reported outcome measures, and the change in systolic blood pressure. The primary endpoint was assessed using the treatment-regimen estimand (average treatment effect of Zepbound relative to placebo for all patients who had received at least one dose of Zepbound or placebo regardless of whether they discontinued trial treatment for any reason). **Baseline characteristics.** In Trial 1, the mean age was 47.9 years, most patients were male (67.1% of patients) and White (65.8% of patients); 41.9% of patients were Hispanic or Latino, 10.1% of patients were Asian, 7.7% of patients were American Indian or Alaska Native, and 5.6% of patients were Black or African American. The mean BMI was 39.1 kg/m² and the mean AHI was 51.5 events/hour. Most patients had severe OSA (63%). In Trial 2, the mean age was 51.7 years, most patients were male (72.3% of patients) and White (73.1% of patients); 32.3% of patients were Hispanic or Latino, 14.1% of patients were Asian, 8.1% of patients were American Indian or Alaska Native, and 4.7% of patients were Black or African American. The mean BMI was 38.7 kg/m² and the mean AHI was 49.5 events/hour. Most patients had severe OSA (68%).

Results. In both trials, Zepbound was superior to placebo for the primary endpoint. In Trial 1, the change in AHI at Week 52 with Zepbound was superior to placebo (-25.3 events/hour [95% CI: -29.3, -21.2] vs. -5.3 events/hour [95% confidence interval [CI]: -9.4, -1.1]), respectively; estimated treatment difference of -20.0 events/hour; 95% CI: -25.8, -14.2; $P < 0.001$). In Trial 2, the change in AHI at Week 52 with Zepbound was superior to placebo (-29.3 events/hour [95% CI: -33.2, -25.4] vs. -5.5 events/hour [95% CI: -9.9, -1.2]; estimated treatment difference -23.8 events/hour; 95% CI: -26.9, -17.9; $P < 0.001$). Additionally, patients in both trials who received Zepbound had significant reductions in sleep apnea-specific hypoxic burden. The proportion of patients with a reduction in the AHI of $\geq 50\%$ at Week 52 and the proportion of patients with an AHI of < 5 events/hour or an AHI of 5 to 14 events/hour and an ESS of ≤ 10 at Week 52 also favored Zepbound. Patients receiving Zepbound in both trials had significant reductions in body weight, systolic blood pressure, and hsCRP concentrations as well.

Guidelines

Weight Management

Adult

Guidelines from the American Gastroenterological Association on pharmacological interventions for adults with obesity (2022) state that in adults with obesity or overweight with weight-related complications, who have had an inadequate response to lifestyle interventions, it is recommended to add pharmacological agents to lifestyle interventions over continuing lifestyle interventions alone (strong recommendation, moderate quality evidence).⁶ Wegovy and Saxenda are listed among the therapeutic options. It is also noted that given the magnitude of net benefit, Wegovy may be prioritized over other approved anti-obesity medications for the long-term treatment of obesity for most patients.

Guidelines from the Endocrine Society regarding pharmacological management of obesity (2015) recommend pharmacotherapy as adjunct to behavioral modification to reduce food intake and increase physical activity for patients with BMI ≥ 30 kg/m² or ≥ 27 kg/m² in the presence of at least one comorbidity, such as hypertension, dyslipidemia, type 2 diabetes, or obstructive sleep apnea.³ If a patient's response to a weight loss medication is deemed effective (weight loss $\geq 5\%$ of body weight at 3 months) and safe, it is recommended that the medication be continued. In clinical studies of Saxenda and semaglutide, eligible patients were required to have a prior unsuccessful dietary weight loss attempt. The American Diabetes Association also cites weight loss $\geq 5\%$ of body weight at 3 months as "effective"; when early response is insufficient (typically $< 5\%$ weight loss after 3 months), other therapies should be evaluated.⁸

Per American Association of Clinical Endocrinologists/American College of Endocrinology obesity guidelines (2016), pharmacotherapy for overweight and obesity should be used only as an adjunct to lifestyle therapy and not alone.⁴ The addition of pharmacotherapy produces greater weight loss and weight-loss maintenance compared with lifestyle therapy alone. The concurrent initiation of lifestyle therapy and pharmacotherapy should be considered in patients with weight-related complications that can be ameliorated by weight loss. Pharmacotherapy should be offered to patients with obesity, when potential benefits outweigh the risks, for the chronic treatment of the disease. Short-term treatment (3 to 6 months) using weight-loss medications has not been demonstrated to produce longer-term health benefits and cannot be generally recommended based on scientific evidence.

Pediatric

Guidelines from the American Academy of Pediatrics on evaluation and treatment of children and adolescents with obesity (2023) note that pediatricians and other primary healthcare providers should offer adolescents ≥ 12 years of age with obesity (BMI $\geq 95^{\text{th}}$ percentile) weight loss pharmacotherapy, according to medication indications, risks, and benefits, as an adjunct to health behavior and lifestyle treatment.⁷

A 2017 Endocrine Society clinical practice guideline on pediatric obesity recommends that pharmacotherapy in combination with lifestyle modification be considered in obese children or adolescents only after failure of a formal program of intensive lifestyle (dietary, physical activity and behavioral) modification to limit weight gain or to ameliorate comorbidities.⁵ The Endocrine Society recommends pharmacotherapy in overweight children and adolescents < 16 years of age only in the context of a clinical trial. Pharmacotherapy should be provided only by clinicians who are experienced in the use of anti-obesity agents and aware of the potential for adverse events. These guidelines recommend limited use of pharmacotherapy because pediatric obesity should be managed preferably as a serious lifestyle condition with important lifelong consequences. The Endocrine Society defines overweight as BMI in at least the 85th percentile but less than the 95th percentile, and obesity as BMI in at least the 95th percentile for age and sex against routine endocrine studies, unless the height velocity is attenuated or inappropriate for the family background or stage of puberty.⁵

Sleep Apnea

07/17/2024

© 2024. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

The American Academy of Sleep Medicine (2017) recommends that diagnostic testing for obstructive sleep apnea (OSA) be performed in combination with a comprehensive sleep evaluation.¹⁵ Polysomnography is the standard diagnostic test for the diagnosis of OSA in adults in whom there is concern for OSA based on the sleep evaluation. Polysomnography is accepted as the gold standard test for the diagnosis of OSA. In some cases, and within the appropriate context, the use of home sleep apnea test as the initial sleep study may be acceptable, however, polysomnography should be used when home sleep apnea test results does not provide satisfactory posttest probability of confirming or ruling out OSA.

Available treatment guidelines for OSA do not specifically mention the GLP-1 agonists. The American Thoracic Society clinical practice guideline on the role of weight management in the treatment with adults with OSA (2018) recommend patients with OSA who are overweight or obese ($\text{BMI} \geq 25 \text{ kg/m}^2$) participate in comprehensive lifestyle intervention that includes a reduced calorie diet, exercise/increased physical activity, and behavioral counseling.¹⁶ For patients with OSA and a $\text{BMI} \geq 27 \text{ kg/m}^2$ who have not had an improvement in weight despite a comprehensive weight-loss lifestyle program, and have no contraindications (no active CV disease), evaluation for anti-obesity medication is suggested. The guideline also cites agreement with the American Association of Clinical Endocrinologists and the American College of Endocrinology guidelines (2016)⁴, which state the weight-loss goal in patients with overweight or obesity with OSA should be at least $\geq 7\%$ to 11% of total body weight.¹⁶ In patients with a $\text{BMI} \geq 35 \text{ kg/m}^2$ referral for bariatric surgery evaluation is suggested.

The American College of Physicians clinical practice guideline for the management of OSA (2013) recommend that all overweight and obese patients diagnosed with OSA be encouraged to lose weight.¹⁷ Continuous positive airway pressure (PAP) is recommended as initial therapy for patients with OSA. Mandibular advancement devices are recommended for patients with OSA who prefer such devices or for those with adverse events associated with continuous PAP treatment.

Clinical success in OSA has been described by several publications. The American Academy of Sleep Medicine (2019) cites a clinically significant threshold of ≥ 15 events/hour (on AHI)¹⁸ and a clinical practice guideline for the treatment of OSA and snoring with oral appliance therapy (2015) from the American Academy of Sleep Medicine and American Academy of Dental Sleep Medicine¹⁹ note that treatment success has usually defined as a reduction in the AHI to a specific level (e.g., post-treatment AHI < 5 events/hour, or a $> 50\%$ reduction in AHI). Of note, a meta-analysis on the impact of weight reduction on AHI reported that weight reduction in patients with obesity and OSA was associated with improvements in the severity of OSA. A BMI reduction of 20% was associated with an AHI reduction of 57% ; further weight reduction beyond 20% in BMI was associated with a smaller effect on AHI.²⁰

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Saxenda, Wegovy, and Zepbound. Of note, this policy targets Saxenda, Wegovy, and Zepbound; other glucagon-like peptide-1 agonists which do not carry an FDA-approved indication for weight loss are not targeted in this policy. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Saxenda is recommended in those who meet ONE of the following criteria:

FDA-Approved Indications

1. **Weight Loss, Adult.** Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets ALL of the following (i, ii, iii, and iv):

- i. Patient is ≥ 18 years of age; AND
- ii. Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months; AND

iii. Patient meets ONE of the following (a or b):

a) At baseline patient had a BMI ≥ 30 kg/m²; OR

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

b) Patient meets BOTH of the following [(1) and (2)]:

(1) At baseline, patient had a BMI ≥ 27 kg/m²; AND

(2) At baseline, patient had, or patient currently has, at least ONE of the following weight-related comorbidities: hypertension, type 2 diabetes, dyslipidemia, obstructive sleep apnea, cardiovascular disease, knee osteoarthritis, asthma, chronic obstructive pulmonary disease, metabolic-dysfunction associated steatotic liver disease/non-alcoholic fatty liver disease, polycystic ovarian syndrome, or coronary artery disease; AND

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

iv. The medication will be used concomitantly with behavioral modification and a reduced-calorie diet.

B) Patient is Continuing Therapy with Saxenda. Approve for 1 year if the patient meets ALL of the following (i, ii, iii, and iv):

Note: For a patient who has not completed 4 months of initial therapy, refer to Initial Therapy criteria above.

i. Patient is ≥ 18 years of age; AND

ii. Patient meets ONE of the following (a or b):

a) At baseline, patient had a BMI ≥ 30 kg/m²; OR

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

b) Patient meets BOTH of the following [(1) and (2)]:

(1) At baseline, patient had a BMI ≥ 27 kg/m²; AND

(2) At baseline, patient had, or patient currently has, at least ONE of the following weight-related comorbidities: hypertension, type 2 diabetes, dyslipidemia, obstructive sleep apnea, cardiovascular disease, knee osteoarthritis, asthma, chronic obstructive pulmonary disease, metabolic-dysfunction associated steatotic liver disease/non-alcoholic fatty liver disease, polycystic ovarian syndrome, or coronary artery disease; AND

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

- iii. Patient has lost $\geq 4\%$ of baseline body weight; AND
Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
 - iv. The medication will be used concomitantly with behavioral modification and a reduced-calorie diet.
2. **Weight Loss, Pediatric.** Approve for the duration noted if the patient meets ONE of the following (A or B):
- A) **Initial Therapy.** Approve for 4 months if the patient meets ALL of the following (i, ii, iii, and iv):
 - i. Patient is ≥ 12 years of age and < 18 years of age; AND
 - ii. Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months; AND
 - iii. At baseline, patient had a BMI $\geq 95^{\text{th}}$ percentile for age and sex; AND
Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
 - iv. The medication will be used concomitantly with behavioral modification and a reduced-calorie diet.
 - B) **Patient is Continuing Therapy with Saxenda.** Approve for 1 year if the patient meets ALL of the following (i, ii, iii, and iv):
Note: For a patient who has not completed 4 months of initial therapy, refer to Initial Therapy criteria above.
 - i. Patient is ≥ 12 years of age and < 18 years of age; AND
 - ii. At baseline, patient had a BMI $\geq 95^{\text{th}}$ percentile for age and sex; AND
Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
 - iii. Patient has had a reduction in BMI of $\geq 1\%$ from baseline; AND
Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
 - iv. The medication will be used concomitantly with behavioral modification and a reduced-calorie diet.

II. Coverage of Wegovy is recommended in those who meet ONE of the following criteria:

FDA-Approved Indications

1. **Weight Loss, Adult.** Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 7 months if the patient meets ALL of the following (i, ii, iii, and iv):

- i. Patient is ≥ 18 years of age; AND
- ii. Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months; AND

iii. Patient meets ONE of the following (a or b):

a) At baseline, patient had a BMI ≥ 30 kg/m²; OR

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

b) Patient meets BOTH of the following [(1) and (2)]:

(1) At baseline, patient had a BMI ≥ 27 kg/m²; AND

(2) At baseline, patient had, or patient currently has, at least ONE of the following weight-related comorbidities: hypertension, type 2 diabetes, dyslipidemia, obstructive sleep apnea, cardiovascular disease, knee osteoarthritis, asthma, chronic obstructive pulmonary disease, metabolic-dysfunction associated steatotic liver disease/non-alcoholic fatty liver disease, polycystic ovarian syndrome, or coronary artery disease; AND

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

iv. The medication will be used concomitantly with behavioral modification and a reduced-calorie diet.

B) Patient is Continuing Therapy with Wegovy. Approve for 1 year if the patient meets ALL of the following (i, ii, iii, and iv):

Note: For a patient who has not completed 7 months of initial therapy, refer to Initial Therapy criteria above.

i. Patient is ≥ 18 years of age; AND

ii. Patient meets ONE of the following (a or b):

a) At baseline, patient had a BMI ≥ 30 kg/m²; OR

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

b) Patient meets BOTH of the following [(1) and (2)]:

(1) At baseline, patient had a BMI ≥ 27 kg/m²; AND

(2) At baseline, patient had, or patient currently has, at least ONE of the following weight-related comorbidities: hypertension, type 2 diabetes, dyslipidemia, obstructive sleep apnea, cardiovascular disease, knee osteoarthritis, asthma, chronic obstructive pulmonary disease, metabolic-dysfunction associated steatotic liver disease/non-alcoholic fatty liver disease, polycystic ovarian syndrome, or coronary artery disease; AND

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

iii. Patient has lost $\geq 5\%$ of baseline body weight; AND

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

- iv. The medication will be used concomitantly with behavioral modification and a reduced-calorie diet.

2. Weight Loss, Pediatric. Approve for the duration noted if the patient meets ONE of the following (A or B):

1) Initial Therapy. Approve for 7 months if the patient meets ALL of the following (i, ii, iii, and iv):

- 1. Patient is ≥ 12 years of age and < 18 years of age; AND
- 2. Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months; AND
- 3. At baseline, patient had a BMI $\geq 95^{\text{th}}$ percentile for age and sex; AND

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

- 4. The medication will be used concomitantly with behavioral modification and a reduced-calorie diet.

2) Patient is Continuing Therapy with Wegovy. Approve for 1 year if the patient meets ALL of the following (i, ii, iii, and iv):

Note: For a patient who has not completed 7 months of initial therapy, refer to Initial Therapy criteria above.

- 1. Patient is ≥ 12 years of age and < 18 years of age; AND
- 2. At baseline, patient had a BMI $\geq 95^{\text{th}}$ percentile for age and sex; AND

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

- 3. Patient has had a reduction in BMI of $\geq 1\%$ from baseline; AND

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).

- 4. The medication will be used concomitantly with behavioral modification and a reduced-calorie diet.

3. Major Adverse Cardiovascular Event(s) Risk Reduction in a Patient with Established Cardiovascular Disease who is Either Obese or Overweight. Approve for 1 year if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve if the patient meets ALL of the following (i, ii, iii, iv, and v):

- i. Patient is ≥ 18 years of age; AND
- ii. Patient has a current BMI $\geq 27 \text{ kg/m}^2$; AND
- iii. Patient meets ONE of the following (a, b, or c):
 - a) Patient has had a prior myocardial infarction; OR
 - b) Patient has had a prior stroke; OR
 - c) Patient has a history of symptomatic peripheral arterial disease as evidenced by ONE of the following [(1), (2), or (3)]:
 - (1) Intermittent claudication with ankle-brachial index < 0.85 ; OR
 - (2) Peripheral arterial revascularization procedure; OR
 - (3) Amputation due to atherosclerotic disease; AND
- iv. According to the prescriber, the medication will be used in combination with optimized pharmacotherapy for established cardiovascular disease; AND

- v. The medication will be used concomitantly with behavioral modification and a reduced-calorie diet.
- B) Patient is Continuing Therapy with Wegovy.** Approve if the patient meets ALL of the following (i, ii, iii, iv, and v):

Note: For a patient who has not completed 1 year of initial therapy, refer to Initial Therapy criteria above.

 - i. Patient is ≥ 18 years of age; AND
 - ii. At baseline, patient had a BMI ≥ 27 kg/m²; AND

Note: This refers to baseline prior to Wegovy.
 - iii. Patient meets ONE of the following (a, b, or c):
 - a) Patient has had a prior myocardial infarction; OR
 - b) Patient has had a prior stroke; OR
 - c) Patient has a history of symptomatic peripheral arterial disease as evidenced by ONE of the following [(1), (2), or (3)]:
 - (1) Intermittent claudication with ankle-brachial index < 0.85 ; OR
 - (2) Peripheral arterial revascularization procedure; OR
 - (3) Amputation due to atherosclerotic disease; AND
 - iv. According to the prescriber, the medication will be used in combination with optimized pharmacotherapy for established cardiovascular disease; AND
 - v. The medication will be used concomitantly with behavioral modification and a reduced-calorie diet.

Coverage of Zepbound is recommended in those who meet ONE of the following criteria:

FDA-Approved Indications

- 1. Weight Loss, Adult.** Approve for the duration noted if the patient meets ONE of the following (A or B):
 - A) Initial Therapy.** Approve for 8 months if the patient meets ALL of the following (i, ii, iii, and iv):
 - i. Patient is ≥ 18 years of age; AND
 - ii. Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months; AND
 - iii. Patient meets ONE of the following (a or b):
 - a) At baseline, patient had a BMI ≥ 30 kg/m²; OR

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
 - b) Patient meets BOTH of the following [(1) and (2)]:
 - (1) At baseline, patient had a BMI ≥ 27 kg/m²; AND
 - (2) At baseline, patient had, or patient currently has, at least ONE of the following weight-related comorbidities: hypertension, type 2 diabetes, dyslipidemia, obstructive sleep apnea, cardiovascular disease, knee osteoarthritis, asthma, chronic obstructive pulmonary disease, metabolic-dysfunction associated steatotic liver disease/non-alcoholic fatty liver disease, polycystic ovarian syndrome, or coronary artery disease; AND

Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
 - iv. The medication will be used concomitantly with behavioral modification and a reduced-calorie diet.

- B) Patient is Continuing Therapy with Zepbound.** Approve for 1 year if the patient meets ALL of the following (i, ii, iii, and iv):

Note: For a patient who has not completed 8 months of initial therapy, refer to Initial Therapy criteria above.

- i. Patient is ≥ 18 years of age; AND
- ii. Patient meets ONE of the following (a or b):
 - a) At baseline, patient had a BMI ≥ 30 kg/m²; OR
Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
 - b) Patient meets BOTH of the following [(1) and (2)]:
 - (1) At baseline, patient had a BMI ≥ 27 kg/m²; AND
 - (2) At baseline, patient had, or patient currently has, at least ONE of the following weight-related comorbidities: hypertension, type 2 diabetes, dyslipidemia, obstructive sleep apnea, cardiovascular disease, knee osteoarthritis, asthma, chronic obstructive pulmonary disease, metabolic-dysfunction associated steatotic liver disease/non-alcoholic fatty liver disease, polycystic ovarian syndrome, or coronary artery disease; AND
Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
- iii. Patient has lost $\geq 5\%$ of baseline body weight; AND
Note: This refers to baseline prior to any glucagon-like peptide-1 (GLP-1) agonist (e.g., Saxenda, Wegovy) or GLP-1/glucose-dependent insulinotropic polypeptide (GIP) receptor agonist (e.g., Zepbound).
- iv. The medication will be used concomitantly with behavioral modification and a reduced-calorie diet.

- 2. Obstructive Sleep Apnea, Moderate to Severe, in a Patient with Obesity.** Approve for 1 year if the patient meets ONE of the following (A or B):

- A) Initial Therapy.** Approve if the patient meets ALL of the following (i, ii, iii, iv, and v):

- i. Patient is ≥ 18 years of age; AND
- ii. Patient has a current BMI ≥ 30 kg/m²; AND
- iii. Patient has had a sleep study within the past 1 year that shows BOTH of the following (a and b):
 - a) Patient has been diagnosed with moderate to severe obstructive sleep apnea; AND
 - b) Patient has an apnea-hypopnea index ≥ 15 events per hour; AND
Note: A diagnosis of moderate obstructive sleep apnea is an apnea-hypopnea index of ≥ 15 events per hour, a diagnosis of severe sleep apnea is an apnea-hypopnea index ≥ 30 events per hour. The apnea-hypopnea index is the number of apneas and hypopneas during 1 hour of sleep.
- iv. The patient does NOT meet either of the following (a or b):
Note: A patient who has one or more of the following conditions/diagnoses below is not approved.
 - a) Central sleep apnea with percent of central apneas/hypopneas $\geq 50\%$; OR
 - b) Cheyne Stokes respiration; OR
- v. The medication will be used in concomitantly with behavioral modification and a reduced-calorie diet. OR

- B) Patient is Continuing Therapy with Zepbound.** Approve if the patient meets ALL of the following (i, ii, iii, and iv):

Note: For a patient who has not completed 1 year of initial therapy, refer to Initial Therapy criteria above.

i. Patient is ≥ 18 years of age; AND

ii. At baseline, patient had a BMI ≥ 30 kg/m²; AND

Note: This refers to baseline before Zepbound.

iii. Patient has completed ≥ 1 year of therapy with Zepbound AND the patient meets BOTH of the following (a and b):

a) Patient has lost $\geq 10\%$ of baseline body weight; AND

b) Patient has stability in obstructive sleep apnea signs or symptoms, according to the prescriber; AND

Note: Examples of signs or symptoms of obstructive sleep apnea include but are not limited to snoring, excessive daytime sleepiness, fatigue.

iv. The medication will be used concomitantly with behavioral modification and a reduced-calorie diet.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Saxenda, Wegovy, and Zepbound is not recommended in the following situations:

187. Concomitant Use with Other Weight Loss Medications. Concomitant use with other medications intended for weight loss is not recommended.^{2,9,12,14} Note: Examples of other medications FDA-approved for weight loss include but are not limited to phentermine (Lomaira, generic), benzphetamine, diethylpropion, phendimetrazine, Contrave (naltrexone/bupropion extended-release tablets), Qsymia (phentermine/topiramate extended-release capsules), and Xenical (orlistat 120 mg capsules). Additionally, Alli (orlistat 60 mg capsules) is available over-the-counter.

188. Concomitant Use with Glucagon-Like Peptide-1 (GLP-1) Agonists or GLP-1/ Glucose-Dependent Insulinotropic Polypeptide (GIP) Agonists. The GLP-1 agonists and the GLP-1/GIP agonist should not be combined with each other or with any other GLP-1 agonists or GLP-1/GIP agonist.^{1,2,9,14} There are other GLP-1 and GLP-1/GIP products not included in this policy that are FDA-approved for type 2 diabetes, and not for chronic weight management. Note: Examples of other GLP-1 agonists include but are not limited to Adlyxin (lixisenatide subcutaneous [SC] injection), Byetta (exenatide SC injection), Bydureon BCise (exenatide extended-release SC injectable suspension), Ozempic (semaglutide SC injection), Rybelsus (semaglutide tablets), Trulicity (dulaglutide SC injection), and liraglutide SC injection (Victoza, authorized generic). An example of a GLP-1/GIP agonist is Mounjaro (tirzepatide SC injection).

189. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

- POLICY:** Weight Loss – Other Appetite Suppressants and Orlistat Prior Authorization Policy
- Adipex-P® (phentermine hydrochloride capsules and tablets – Teva, generic [brand capsules obsolete 07/12/2023])
 - benzphetamine 50 mg tablets (generic only)
 - Contrave® (naltrexone HCl/bupropion HCl extended-release tablets – Nalpropion/Currax)
 - diethylpropion hydrochloride immediate-release and controlled-release tablets (generic only)
 - Lomaira™ (phentermine hydrochloride tablets – KVK-Tech)
 - phendimetrazine tartrate tablets and extended-release capsules (generic only)
 - phentermine hydrochloride orally disintegrating tablets (generic only)
 - benzphetamine 25 mg tablets (generic only)
 - Qsymia™ (phentermine and topiramate extended-release capsules – Vivus)
 - Xenical® (orlistat 120 mg capsules, authorized generic – Roche, generic)

REVIEW DATE 01/03/2024

OVERVIEW

The appetite suppressant products vary slightly in the wording of their FDA-approved indications.

- **Benzphetamine, diethylpropion, and phendimetrazine** are indicated for the management of exogenous obesity as a short-term adjunct (a few weeks) to a regimen of weight reduction based on caloric restriction in patients with an initial body mass index (BMI) of ≥ 30 kg/m² who have not responded to a weight reducing regimen (diet and/or exercise) alone.¹⁻³
- **Phentermine** hydrochloride is indicated for short-term (a few weeks) adjunctive therapy in a regimen of weight reduction based on exercise, behavioral modification, and caloric restriction in the management of exogenous obesity in those with an initial BMI ≥ 30 kg/m², or a BMI ≥ 27 kg/m² when other risk factors are present (e.g., controlled hypertension, diabetes mellitus, or dyslipidemia).⁴⁻⁶
- **Qsymia** is indicated as an adjunct to reduced-calorie diet and increased physical activity for chronic weight management in:⁷
 - Adults with an initial BMI of ≥ 30 kg/m² (obese), or ≥ 27 kg/m² (overweight) in the presence of at least one weight-related comorbid condition (e.g., hypertension, dyslipidemia, type 2 diabetes).
 - Pediatric patients ≥ 12 years of age with BMI in the 95th percentile or greater standardized for age and sex.
- **Contrave** is indicated as an adjunct to a reduced-calorie diet and increased physical activity for chronic weight management in adults with an initial BMI of ≥ 30 kg/m² (obese), or ≥ 27 kg/m² (overweight) in the presence of at least one weight-related comorbid condition (e.g., hypertension, dyslipidemia, type 2 diabetes).⁸
- **Orlistat 120 mg** (Xenical, authorized generic) is indicated for obesity management including weight loss and weight maintenance when used in conjunction with a reduced-calorie diet in patients with an initial body mass index ≥ 30 kg/m², or ≥ 27 kg/m² in the presence of at least one weight-related comorbidity (e.g., hypertension, diabetes, dyslipidemia), and to reduce the risk for weight gain after prior weight loss.⁹

Contrave

The recommended maintenance dose of Contrave is achieved at Week 4.⁸ Response to therapy should be evaluated after 12 weeks at the maintenance dosage (Week 16, if dosed according to the prescribing information). If a patient has not lost $\geq 5\%$ of baseline body weight, discontinue Contrave, as it is unlikely that the patient will achieve and sustain clinically meaningful weight loss with continued treatment.

Qsymia

The recommended starting dose of Qsymia is 3.75 mg/23 mg once daily for 14 days.⁷ After 14 days, increase to 7.5 mg/46 mg once daily. Response to therapy should be evaluated by Week 12 of the 7.5 mg/46 mg dose. If an adult patient has not lost $\geq 3\%$ of baseline body weight or pediatric patient has not lost $\geq 3\%$ BMI, escalate the dose to 11.25 mg/69 mg once daily for 14 days, followed by an increase to 15 mg/92 mg once daily. If an adult patient has not lost $\geq 5\%$ of baseline body weight (or a pediatric patient has not lost $\geq 5\%$ baseline BMI) after an additional 12 weeks of treatment on Qsymia 15 mg/92 mg, discontinue Qsymia as directed as it is unlikely the patient will achieve and sustain clinically meaningful weight loss with continued treatment.

Guidelines

Guidelines from the Endocrine Society regarding pharmacological management of obesity (2015) recommend pharmacotherapy as adjunct to behavioral modification to reduce food intake and increase physical activity for patients with BMI ≥ 30 kg/m² or ≥ 27 kg/m² in the presence of at least one comorbidity, such as hypertension, dyslipidemia, type 2 diabetes, or obstructive sleep apnea.¹⁰ If a patient's response to a weight loss medication is deemed effective (weight loss $\geq 5\%$ of body weight at 3 months) and safe, it is recommended that the medication be continued. Although the noradrenergic weight loss medications are only labeled for short-term use, the Endocrine Society notes that off-label, long-term prescribing of phentermine is reasonable for most patients, as long as the patient has been informed that other medications for weight loss are FDA-approved for long-term use.

Per American Association of Clinical Endocrinologists/American College of Endocrinology obesity guidelines (2016), pharmacotherapy for overweight and obesity should be used only as an adjunct to lifestyle therapy and not alone.¹¹ The addition of pharmacotherapy produces greater weight loss and weight-loss maintenance compared with lifestyle therapy alone. The concurrent initiation of lifestyle therapy and pharmacotherapy should be considered in patients with weight-related complications that can be ameliorated by weight loss. Pharmacotherapy should be offered to patients with obesity, when potential benefits outweigh the risks, for the chronic treatment of the disease. Short-term treatment (3 to 6 months) using weight-loss medications has not been demonstrated to produce longer-term health benefits and cannot be generally recommended based on scientific evidence.

According to the American Gastroenterological Association (AGA) guideline on pharmacological interventions for adults with obesity (2022), in adults with obesity or overweight with weight-related complications who have had an inadequate response to lifestyle interventions, pharmacological agents are recommended to be added to lifestyle rather than continuing lifestyle interventions alone.¹² Wegovy® (semaglutide 2.4 mg subcutaneous injection), Saxenda® (liraglutide 3.0 mg subcutaneous injection), Qsymia, Contrave, phentermine, and diethylpropion are all listed among the suggested treatment options. Of note, although the AGA guideline suggests against the use of orlistat, it is noted that for patients who place a high value on the potential small weight loss benefit and low value on gastrointestinal adverse events, orlistat may reasonably be considered. Regarding phentermine and diethylpropion, it is noted that these are only approved as monotherapy for short-term use (12 weeks); however, given the chronic nature of weight management, many practitioners use these agents off-label for longer than 12 weeks.

Guidelines in Pediatric Obesity

07/12/2023

© 2023. All Rights Reserved.

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

Guidelines from the American Academy of Pediatrics on evaluation and treatment of children and adolescents with obesity (2023) note that pediatricians and other primary health care providers should offer adolescents ≥ 12 years of age with obesity ($\text{BMI} \geq 95^{\text{th}}$ percentile) weight loss pharmacotherapy, according to medication indications, risks, and benefits, as an adjunct to health behavior and lifestyle treatment.¹⁴

A 2017 Endocrine Society clinical practice guideline on pediatric obesity recommends pharmacotherapy in combination with lifestyle modification be considered in obese children or adolescents only after failure of a formal program of intensive lifestyle (dietary, physical activity and behavioral) modification to limit weight gain or to ameliorate comorbidities.¹³ The Endocrine Society recommends pharmacotherapy in overweight children and adolescents < 16 years only in the context of a clinical trial. Pharmacotherapy should be provided only by clinicians who are experienced in the use of anti-obesity agents and aware of the potential for adverse events. These guidelines recommend limited use of pharmacotherapy because pediatric obesity should be managed preferably as a serious lifestyle condition with important lifelong consequences.

The Endocrine Society defines overweight as BMI in at least the 85th percentile but less than the 95th percentile, and obesity as BMI in at least the 95th percentile for age and sex against routine endocrine studies, unless the height velocity is attenuated or inappropriate for the family background or stage of puberty.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of benzphetamine, diethylpropion, phendimetrazine tartrate, phentermine hydrochloride, Qsymia, Contrave, and orlistat 120 mg (Xenical, authorized generic). All approvals are provided for the durations noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Prior Authorization and prescription benefit coverage is not recommended for Alli® (orlistat 60 mg capsules).

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

- I. Coverage of benzphetamine, diethylpropion, phendimetrazine tartrate, or phentermine hydrochloride is recommended in those who meet the following:

FDA-Approved Indication

4. **Weight Loss.** Approve for the duration noted if the patient meets one of the following (A or B):
- A) **Initial Therapy.** Approve for 3 months if the patient meets all of the following (i, ii, iii, and iv):
- a. Patient is ≥ 16 years of age; AND
 - b. Patient currently has a body mass index (BMI) $\geq 30 \text{ kg/m}^2$, or a $\text{BMI} \geq 27 \text{ kg/m}^2$ for those with comorbidities besides obesity; AND
- Note:** Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
- c. Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
 - d. Patient is currently engaged in behavioral modification and on a reduced calorie diet.
- B) **Patient is Continuing Therapy.** Approve for 1 year if the patient meets all of the following (i, ii, iii, and iv):

Note: For a patient who has not completed 3 months of initial therapy, criterion (1A) must be met (do not use continuation criteria if the initial 3 months were not completed).

- a. Patient is ≥ 16 years of age; AND
- b. Patient had an initial BMI ≥ 30 kg/m², or a BMI ≥ 27 kg/m² for those with comorbidities besides obesity; AND

Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.

- c. Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
- d. Patient has lost $\geq 5\%$ of baseline body weight.

II. Coverage of Contrave is recommended in those who meet the following:

FDA-Approved Indication

1. Weight Loss. Approve for the duration noted if the patient meets one of the following (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets the following (i, ii, iii, and iv):

- a. Patient is ≥ 18 years of age; AND
- b. Patient currently has a body mass index (BMI) ≥ 30 kg/m², or a BMI ≥ 27 kg/m² for those with comorbidities besides obesity; AND

Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.

- c. Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
- d. Patient is currently engaged in behavioral modification and on a reduced calorie diet.

B) Patient is Continuing Therapy. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):

Note: For a patient who has not completed 4 months of initial therapy, criterion (1A) must be met (do not use continuation criteria if the initial 4 months were not completed).

- a. Patient is ≥ 18 years of age; AND
- b. Patient had an initial BMI ≥ 30 kg/m², or a BMI ≥ 27 kg/m² for those with comorbidities besides obesity; AND

Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.

- c. Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
- d. Patient has lost $\geq 5\%$ of baseline body weight.

III. Coverage of Qsymia is recommended in those who meet one of the following:

FDA-Approved Indications

1. Weight Loss, Adult. Approve for the duration noted if the patient meets one of the following (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets the following (i, ii, iii, and iv):

- a. Patient is ≥ 18 years of age; AND
- b. Patient currently has a BMI ≥ 30 kg/m², or a BMI ≥ 27 kg/m² for those with comorbidities besides obesity; AND

Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.

- c. Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
- d. Patient is currently engaged in behavioral modification and on a reduced calorie diet.
- B) Patient is Continuing Therapy.** Approve for 1 year if the patient meets the following (i, ii, iii, and iv):

Note: For a patient who has not completed 6 months of initial therapy, criterion (1A) must be met (do not use continuation criteria if the initial 6 months were not completed).

- a. Patient is ≥ 18 years of age; AND
- b. Patient had an initial BMI ≥ 30 kg/m², or a BMI ≥ 27 kg/m² for those with comorbidities besides obesity; AND

Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.

- c. Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
- d. Patient has lost $\geq 5\%$ of baseline body weight.

2. Weight Loss, Pediatric. Approve for the duration noted if the patient meets one of the following (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets the following (i, ii, iii, and iv):

- i. Patient is ≥ 12 years of age and < 18 years of age; AND
- ii. Patient currently has a body mass index (BMI) of $\geq 95^{\text{th}}$ percentile for age and sex; AND
- iii. Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to limit weight gain or to modify comorbidities; AND
- iv. Patient is currently engaged in behavioral modification and on a reduced calorie diet.

B) Patient is Continuing Therapy. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):

Note: For a patient who has not completed 6 months of initial therapy, criterion (2A) must be met (do not use continuation criteria if the initial 6 months were not completed).

- i. Patient is ≥ 12 years of age and < 18 years of age; AND
- ii. Patient had an initial BMI of $\geq 95^{\text{th}}$ percentile for age and sex; AND
- iii. Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
- iv. Patient has had a reduction in BMI of $\geq 5\%$ from baseline (prior to the initiation of Qsymia).

IV. Coverage of orlistat 120 mg (Xenical, authorized generic) is recommended in those who meet one of the following:

FDA-Approved Indications

1. Weight Loss, Adult. Approve for the duration noted if the patient meets one of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following (i, ii, iii, and iv):

- a. Patient is ≥ 18 years of age; AND
- b. Patient meets ONE of the following (a or b):
- i. Patient currently has a BMI ≥ 30 kg/m², or a BMI ≥ 27 kg/m² for those with comorbidities besides obesity; OR
- Note: Examples of comorbidities include diabetes, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
- ii. Patient had an initial BMI ≥ 30 kg/m², or a BMI ≥ 27 kg/m² for those with comorbidities besides obesity if maintaining weight loss after using a low calorie diet; AND

Note: Examples of comorbidities include diabetes, dyslipidemia, hypertension, coronary heart disease, sleep apnea.

c. Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND

d. Patient is currently engaged in behavioral modification and on a reduced calorie diet.

B) Patient is Continuing Therapy. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):

Note: For a patient who has not completed 3 months of initial therapy, criterion (1A) must be met (do not use continuation criteria if the initial 3 months were not completed).

a. Patient is ≥ 18 years of age; AND

b. Patient had an initial BMI ≥ 30 kg/m², or a BMI ≥ 27 kg/m² for those with comorbidities besides obesity; AND

Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.

c. Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND

d. Patient has lost $\geq 5\%$ of baseline body weight.

2. Weight Loss, Pediatric. Approve for the duration noted if the patient meets one of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following (i, ii, iii, and iv):

i. Patient is ≥ 12 years of age and < 18 years of age; AND

ii. Patient currently has a body mass index (BMI) of $\geq 95^{\text{th}}$ percentile for age and sex; AND

iii. Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to limit weight gain or to modify comorbidities; AND

iv. Patient is currently engaged in behavioral modification and on a reduced calorie diet.

B) Patient is Continuing Therapy. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):

Note: For a patient who has not completed 3 months of initial therapy, criterion (2A) must be met (do not use continuation criteria if the initial 3 months were not completed).

i. Patient is ≥ 12 years of age and < 18 years of age; AND

ii. Patient had an initial BMI of $\geq 95^{\text{th}}$ percentile for age and sex; AND

iii. Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND

iv. Patient's current BMI percentile has decreased for age and weight (taking into account that the patient is increasing in height and will have a different normative BMI from when orlistat 120 mg [Xenical, authorized generic] was started).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of benzphetamine, diethylpropion, phendimetrazine tartrate, phentermine hydrochloride, Qsymia, Contrave, and orlistat 120 mg (Xenical, authorized generic) is not recommended in the following situations:

190. Concomitant Use with Other Weight Loss Medications. Concomitant use with other medications intended for weight loss is not recommended. Of note, examples of medications FDA-approved for weight loss include phentermine, benzphetamine, diethylpropion, phendimetrazine, Contrave, Qsymia, orlistat 120 mg (Xenical, authorized generic), Saxenda (liraglutide subcutaneous injection), and Wegovy (semaglutide subcutaneous injection). Additionally, Alli (orlistat 60 mg capsules) is available over-the-counter.

- 191.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Xiaflex Prior Authorization Policy

- Xiaflex® (collagenase clostridium histolyticum intralesional injection – Endo)

REVIEW DATE: 09/04/2024

OVERVIEW

Xiaflex, a combination of bacterial collagenases, is indicated for the following uses:¹

- **Dupuytren's contracture** with a palpable cord in adults.
- **Peyronie's disease** with a palpable plaque and curvature deformity of at least 30 degrees at the start of therapy in adult men.

Disease Overview

Dupuytren's contracture is a disorder of the palmar and digital fascia of the hand.² Abnormal deposition of collagen initially causes nodules in the palm of the hand, which may thicken and lead to formation of cords. As the disease progresses, the cords gradually contract, leading to flexion deformities of the fingers. Joint contractures are typically painless but are associated with significant functional impairment. In clinical studies of Dupuytren's contracture, patients were eligible to participate if they had a finger contraction of 20 degrees to 100 degrees in a metacarpophalangeal joint or 20 degrees to 80 degrees in a proximal interphalangeal joint.¹

Peyronie's disease is an acquired penile abnormality caused by fibrosis of the tunica albuginea, which may lead to pain, deformity, erectile dysfunction, and/or distress.³ Peyronie's disease has a variable course; for most patients, pain will resolve over time without intervention, but curvature deformities are less likely to resolve without treatment. Intralesional therapy with Xiaflex may be used to treat curvature associated with Peyronie's disease and is supported by American Urological Association guidelines (2015).

Dosing Considerations

For treatment of Dupuytren's contracture, the dose of Xiaflex is 0.58 mg per injection into a palpable cord with a contracture of a metacarpophalangeal or proximal interphalangeal joint.¹ Two palpable cords affecting two joints or one palpable cord affecting two joints in the same finger may be injected per treatment visit. Injections may be administered up to three times per cord at approximately 4-week intervals.

For treatment of Peyronie's disease, one treatment course consists of four cycles.¹ Each cycle consists of two Xiaflex injection procedures (1 to 3 days apart). Up to four cycles of Xiaflex may be administered, given at approximately 6-week intervals. The safety of more than one treatment course (8 total injections) is unknown. If the curvature deformity is less than 15 degrees after the first, second, or third treatment cycle, or if further treatment is not clinically indicated, then subsequent treatment cycles should not be administered.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xiaflex. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated

This document is confidential and proprietary. Unauthorized use and distribution are prohibited.

with Xiaflex, approval requires it to be administered by a healthcare provider with expertise in the condition being treated.

Prescription benefit coverage is not recommended for Xiaflex for cosmetic uses.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xiaflex is recommended in those who meet one of the following criteria:

FDA-Approved Indications

5. **Dupuytren's Contracture.** Approve Xiaflex for 3 months if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) At baseline (prior to initial injection of Xiaflex), the patient has a contracture of a metacarpophalangeal or proximal interphalangeal joint of at least 20 degrees; AND
 - C) As part of the current treatment course, the patient will be treated with up to three injections (maximum) per affected cord; AND
 - D) Xiaflex is administered by a healthcare provider experienced in injection procedures of the hand and in the treatment of Dupuytren's contracture.
6. **Peyronie's Disease.** Approve Xiaflex for 6 months if the patient meets ALL of the following (A, B, C, and D):
 - A) Patient is ≥ 18 years of age; AND
 - B) Patient meets ONE of the following (i or ii):
 - i. At baseline (prior to initial injection of Xiaflex), the patient has a penile curvature deformity of at least 30 degrees; OR
 - ii. In a patient who has received prior treatment with Xiaflex, the patient has a penile curvature deformity of at least 15 degrees; AND
 - C) Patient has not previously been treated with a complete course (8 injections) of Xiaflex for Peyronie's disease; AND
 - D) Xiaflex is administered by a healthcare provider experienced in the treatment of male urological diseases.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xiaflex is not recommended in the following situations:

192. **Cosmetic Uses (e.g., cellulite of buttocks).** Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.
193. **Retreatment for Peyronie's Disease.** For Peyronie's disease, the safety of more than one treatment course (8 injections) is unknown.¹
194. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Zokinvy Prior Authorization Policy

- Zokinvy™ (lonafarnib capsules – Eiger Biopharmaceuticals)

REVIEW DATE: 01/17/2024

OVERVIEW

Zokinvy, a protein farnesyltransferase inhibitor, is indicated in patients ≥ 12 months of age with a body surface area ≥ 0.39 m² for the following conditions:¹

- **Hutchinson-Gilford Progeria Syndrome (HGPS)**, to reduce risk of mortality.
- **Progeroid laminopathies** that are processing-deficient, with either:
 - Heterozygous *LMNA* mutation with progerin-like protein accumulation; or
 - Homozygous or compound heterozygous *ZMPSTE24* mutations.

Disease Overview

Hutchinson-Gilford Progeria Syndrome (HGPS)

HGPS is an ultra-rare, fatal, autosomal dominant genetic disorder with an estimated incidence of 1:4,000,000 live births and prevalence of 1:20,000,000 living individuals.² As of December 31, 2023, there were 16 patients identified with HGPS in the US.³ HGPS results from a heterozygous mutation in *LMNA*, the gene encoding lamin A, a nuclear membrane protein.⁴ “Classic” HGPS is caused by a single point mutation in *LMNA* involving c.1824C>T (G608G mutation) and accounts for 90% of HGPS cases.^{4,5} Other *LMNA* mutations have also been identified in either the exon 11 splice junction or intron 11; these mutations increase activation of the cryptic splice site, thus producing progerin. These are referred to as “non-classic” HGPS and comprise the remaining 10% of HGPS cases (refer to Appendix). The mutated prelamins A is referred to as progerin. Accumulation of progerin causes stiffening of the nuclear membrane and disorganized nuclear pores and chromatin, leading to hallmark symptoms including rapidly progressive atherosclerosis. Severe, rapidly progressing atherosclerosis results in an average mortality at 14.6 years of age due to myocardial infarction or stroke.⁴ It is estimated that 50% of affected children have had a radiographically detectable stroke by 8 years of age.

Progeroid Laminopathies

To date, over 400 mutations in the *LMNA* gene have been identified, giving rise to different laminopathies which encompass a range of phenotypes including muscular dystrophy, peripheral neuropathy, lipodystrophy, and premature aging diseases.⁴ Some of these may have phenotypic overlap with HGPS (“progeroid” laminopathies).^{5,6} In addition, pathogenic variants in *ZMPSTE24* can result in excess prelamins A proteins and a related phenotype. As of December 31, 2023, there were 12 patients identified with progeroid laminopathies in the US.³ Of note, mortality data are not available regarding the effect of Zokinvy in patients with progeroid laminopathies; the pivotal study only included patients with HGPS in its analysis.

Guidelines

Formal guidelines for progeria are not in place. The Progeria Research Foundation provides a Progeria Handbook (updated March 2019) with information about the disease for patients and families, as well as for healthcare providers.⁶ Clinical data with Zokinvy are acknowledged in the handbook as having positive results with regard to cardiovascular, bone, and survival outcomes. Diagnosis is made on the basis of clinical examination and genetic testing. It is noted that other progeroid laminopathies are closely related genetic diseases; less is known about these conditions. These conditions may be more or less severe than

HGPS. Applying knowledge from classic progeria (i.e., HGPS) to other progeroid syndromes may be helpful, but good judgment must be applied since patients with other progeroid syndromes will have different needs.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zokinvy. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zokinvy as well as the monitoring required for adverse events and long-term efficacy, approval requires Zokinvy to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zokinvy is recommended in those who meet the following criteria:

FDA-Approved Indication

23. Hutchinson-Gilford Progeria Syndrome. Approve for 1 year if the patient meets the following (A, B, C, and D):

A) Patient is ≥ 12 months of age; AND

B) Patient has a body surface area of ≥ 0.39 m²; AND

C) Genetic testing demonstrates a confirmed pathogenic mutation in the *LMNA* gene consistent with Hutchinson-Gilford Progeria Syndrome; AND

Note: Refer to Appendix for listing of genetic mutations associated with Hutchinson-Gilford Progeria Syndrome.

D) The medication is prescribed by or in consultation with a geneticist or pediatric cardiologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zokinvy is not recommended in the following situations:

195. Progeroid Laminopathies. The efficacy of Zokinvy has not been established for patients with genetic disorders other than Hutchinson-Gilford Progeria Syndrome.² Although FDA labeling includes processing-deficient progeroid laminopathies, there are no clinical data demonstrating a treatment effect of Zokinvy in this population. Zokinvy is not indicated for use in processing-proficient progeroid laminopathies; based on its mechanism of action, Zokinvy would not be expected to be effective in this population.¹

196. Other Progeroid Syndromes. Zokinvy is not indicated for use in other progeroid syndromes.¹ Based on its mechanism of action, Zokinvy would not be expected to be effective in this population.

197. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX

Genetic mutations consistent with a diagnosis of Hutchinson-Gilford Progeria Syndrome are outlined below.^{2,3} Of note, all of the following mutations are heterozygous; only one affected gene copy is required for confirmation of the diagnosis.

Appendix Table 1. Genetic Mutations Associated with Hutchinson-Gilford Progeria Syndrome.
